The Christmas Bullet For Mining Transportation

MANY mines are so located that to get the precious metal or stones to market by transportation on the surface of the earth requires slow and expensive round-about travel.

For such mines the most efficient means of transport is the airplane — particularly the Christmas Bullet. The strutless, flexible wings of this biplane make it at once the speediest, safest and most easily controlled of all airplanes. For particulars write to the

VOL. IX NEW YORK, MARCH 17, 1919

Aerial Age's Fourth Anniversary As A Weekly

TO-DAY AERIAL AGE celebrates its fourth birthday as a weekly magazine recording the latest developments in aeronautics throughout the world. We believe that our four years of existence has done much to broaden and elevate the business and to increase interest in and respect for the aeroplane and internal combustion engine as an adjunct of modern warfare, and as a medium of speeding up commerce and the intercommunication of nations.

AERIAL AGE was established to help pull American aeronautics through those "Dark Ages" when Congress was allowing only about $100,000 a year for aeronautics. Half of that sum had to be spent in maintenance and it took a whole lot of energetic workers to create public interest to force Congress to give more and to enthuse a few sportsmen to purchase aeroplanes for sport.

It required courage to adopt the name AERIAL AGE. At that time the possible value of aeroplanes for military purposes was still a matter of opinion—and the general opinion was that aeroplanes could not be more than scouts. It was held that aeroplanes could not be used for effective offensive and defensive because the recoil of a gun or the dropping of a bomb large enough to do damage would upset them.

The possibility of large aeroplanes equipped with two motors was denied on these grounds: 1, That the thickness of the wings of the aeroplanes must increase in proportion to the span of the wings; 2, that a machine equipped with two motors would spin around out of control as soon as one of the motors stopped.

The very term "factor of safety" was unknown at the time and every machine built was an experiment.

AERIAL AGE was established in March, 1915. Clouds from the war storm which was raging in Europe were beginning to darken America's horizon and energetic work was necessary to awaken this country to the need of aerial preparedness on a large scale.

The United States Army and Navy combined had less than fifty aviators, including those in charge of the administration of the Aviation Section. There were no dirigibles or kite balloons in either the Army or Navy.

The aeronautic industry consisted of a handful of courageous pioneers who had and were doing business at a loss. Congress had only allowed $300,000 for Army aeronautics and $1,000,000 for Navy aeronautics. The Allied countries were ready to give substantial orders, but they would only place orders for prompt deliveries, and as the manufacturers were not in a position to deliver, they would not place the orders.

The editors of AERIAL AGE realized that the war would be decided in the air; and that it was essential for the security of the United States to develop a substantial aeronautic industry, so as to have large sources of supplies of aircraft to meet an emergency. They undertook the huge task of getting together the factors necessary to create a large industry. That meant the creating of public and official interest in aeronautics in America; making known to the Allies what American manufacturers could do and to make known to American manufacturers and prospective manufacturers the needs of the Allies. It meant more than publishing a good national technical and trade journal well—it meant also the shaping of courses of events in the industry, the directing of purchases and arranging the financing of manufacturers, and fathering the young industry in a general way, supplying speakers and moving pictures; supplying "pen pictures" of the status of different aspects of aeronautics to government officials, etc.

To do this AERIAL AGE had to establish four separate departments, one to do the national defense work, one to do the "Service and Advisory" work, one to do the regular work of publishing a national technical and trade journal and one to run a "photo and news service" to supply the aeronautic movement and the press and public with special aeronautic information and educational material.

These four departments have been maintained throughout these years and have rendered invaluable services to Country, to the Aeronautic Industry and to the Aeronautic Movement in general.

With a glance backward, over a year of constructive service, AERIAL AGE looks forward to even greater opportunities for its Fourth Year.

Secretary Roosevelt Demands that America Be Made First in the Air

STANDING in the cockpit of a Handley-Page bombing plane and addressing an immense crowd in the Aeronautical Exposition at Madison Square Garden, Franklin D. Roosevelt, Assistant Secretary of the Navy, insisted upon America gaining supremacy of the air not only for defence in event of possible future conflict but for commercial and traveling purposes as well.

While he told of America having originated the science of flying, only to have other countries take its development and control out of her grasp, a De Haviland aeroplane, manned by two American pilots, sailed over the roof of the Garden, its manœuvres directed by wireless telephony, an aerial device also produced by American genius. In the rear of the Garden auditorium the voices of the pilot aloft and of the man directing his operations from the roof could be heard through the amplifier which megaphoned the communications.

"The people of the country have a right to say to the Government that the United States shall remain in the van of aircraft production and enterprise," said Mr. Roosevelt, "but only the interest of the people and its cooperation will make such possible. This exposition shows the future possibilities of aerial navigation, but a united public, thoroughly interested, must back up the manufacturers if America is to keep pace with Italy, France and Great Britain, who are now preparing craft for future use in all conceivable fields.

"Control of the air is necessary in the United States for commercial purposes, for travel and for defense in future possible wars. I hope the public will take sufficient interest to

(*Continued on page 23*)

AERO CLUB OF AMERICA COMMENDED BY ACES JUST RETURNED FROM FRANCE AS AIRMEN'S BEST FRIEND IN MEMORABLE RESOLUTION

TWENTY-FOUR American aviators, headed by Lieut. Col. Thaw, dean of American aviators; Capt. Edward V. Rickenbacker, American Ace of Aces, and Capt. Reed Jean Landis, who has twelve Germans to his credit and ranks next to Capt. Rickenbacker as leading Ace of Aces, and including a large number of the most prominent officers from overseas, surprised Mr. Alan R. Hawley, the President, and other officers of the Aero Club of America on March 10, by presenting them with the following hearty resolution, expressing their opinion of the club's great work for aerial preparedness and the substantial help given to aviators.

Resolution reads as follows:

Whereas the Aero Club of America has, since its foundation in 1905, been the airman's best friend and is to-day the mainspring of the aeronautic movement in this country; and

Whereas before the war Amercan aeronautcs was supported mainly by the Aero Club of America's activities; and

Whereas before America's entry in the war, when the U. S. Army and Navy had less than thirty aviators, the Club, guided by its extraordinary foresight and splendid patriotism undertook to train aviators and form aerial reserves; and through these efforts succeeded in training over three hundred aviators, some of whom went wtih the Lafayette Flying Corps and the others were commissioned in the Army and Naval Reserves, which were authorized by Congress and organized by President Wilson, upon the recommendation and urgings of the Club, and were the first A. E. F. aviators to be sent overseas; and

Whereas the pioneer work of the Club in creating college aeronautic units and fostering interest in aerial preparedness in colleges and universities in 1915, 1916, 1917 and its helpful advice and guidance were directly responsible for bringing thousands of college men into the Air Service; and

Whereas before and after America's entry in the war the Club, by means of energetic national campaigns was responsible for securing large appropriations for military and naval aeronautics and urged unfalteringly the adoption of adequate plans for aerial preparedness; and

Whereas the Club heartily supported the work of the Lafayette Escadrille and Flying Corps, which were organized and supervised by Major Edmund Gros and Lieut. Com. F. H. Allen and generously supported by Mr. W. K. Vanderbilt, all members of the Club; and

Whereas, through its generous offer to pay the salaries of flight surgeons when there was no provision for same, the Club was of great help in establishing the Medical Section of the U. S. Army Air Service, which, when put in operation, resulted in saving hundreds of lives of aviators; and

Whereas the Club organized a Foreign Service Committee in Paris, composed of prominent Americans, members of the Club, residents of Paris, whose high standing in France and personal knowledge of the country enabled them to be of great assistance to American aviators at the front and elsewhere, and visited the American aeronautic centers in France and supplied them as well as aero squadrons at the front with magazines, books, athletic equipment, tobacco and other needs, which greatly added to the personal comfort and well-being of the aviators; and

Whereas the Club soon after America's entry in the war, when there were no American decorations to be awarded for distinguished service, created the Club's Medal of Honor and Merit and Diploma to be awarded for distinguished service; thereby being the first national American body to express in a tangible way the appreciation of the American nation to those who fought at the front for civilization and humanity; and

Whereas, it was the Club's efforts that kept the aviators flying pay from being abolished during the war; and

Whereas during the war the Club, with rare kindness and sympathy, sought to comfort the parents of the aviators who lost their lives or met with accidents, and with great trouble found and supplied information to parents regarding the whereabouts of their sons who were in the Air Service; and

Whereas the Club had created The Airmen's Memorial Fund, for the purpose of erecting a suitable memorial to the airmen who have died and has taken other steps to honor and perpetuate the names of the airmen who fought and died for the cause of humanity and civilization; and

Whereas the employment of aircraft for general purposes has been advanced at least one year because the club had the foresight to make plans for the employment of aircraft for transportation, sport, scientific and civil purposes; and

Whereas the Club contributed and is contributing in many other ways not made public and not mentioned herewith to the upbuilding of our Air Forces, to the attaining of the final victory over Germany and her allies, and to the placing of American aeronautics on a sound, permanent basis;

Be It Resolved that we among the hundreds of others have seen the great value of the Club's inspiring patrioism, progressive work and liberal contributions, herewith express our heartfelt gratitude; and be it further

Resolved that we hereby pledge our hearty support to the Club and its great work; and further

Resolved that a copy of these resolutions duly engrossed be transmitted to each and every member of the Board of Governors of the Club and the Chairman of the Committees and those members of the Club and cooperating organizations who have contributed to the club's splendid work.

The Resolutions were signed by:

Lieut. Col. William Thaw, dean of American aviators; Geo. A. Vaughn, who has ten German machines to his credit; R. S. Landis, son of Judge Landis, with twelve machines to his credit; Capt. Edward V. Rickenbacker, American Ace of Aces; Major Melvin Hall, A. S. A.; Major Cushman Rice, U. S. Air Service, who was in command of the first three Air Squadrons to go overseas; Capt. Herbert S. Mapes, A. S. A.; Lieut. Samuel Mustain, A. S. A.; Capt. Hobert A. Bartlett, Army Transport Service; Lieut. Granville A. Pollock, one of the members of the Lafayette Escadrille, now in the U. S. Air Service; Capitaine Lahoulle, French Ace representing the French government; Capitaine de Fenmestiame, of the French Army; Lieut. Col. Isaac Jones, of the staff of Brig. Gen. T. C. Lyster, Medical Corps, Air Service; Brig. Gen. T. C. Lyster, Medical Corps, Air Service; Major Louis Fisher, Medical Corps, Air Service; Capt. A. J. Boyrivan, French Flying Corps; Ensign D. E. Huger, U. S. N., of the Lafayette Escadrille; Wainwright Abbott, French Flying Corps; Capt. M. Yorsaf, of Guatemala; Ensign T. I. Turner, Ensign C. J. Coatsworth, Jr., U. S. N.; George E. Turnure, Jr. (Lafayette); Lieut. Raymond N. Betey, of the 59th Aero Squadron.

(*Continued from page* 21)

see to it that the Government adopts a definite policy toward the control of the air and the control of building and the cooperation—the friendly cooperation—of the people who are building and of the people who are using private planes.

"Once upon a time, not so very long ago, the United States discovered how to fly, but during the intervening years other nations of the world took up our inventions, and four years ago—even two years ago—they knew a lot more about it than we did, and had done a lot more. But to-day we have got back on even terms, and the question now is, are we going to fall behind again in the race? I have been over on the other side just lately and have seen preparations in England, France and Italy for the development of use of the air, and I must say it is time we need in addition to the efforts of all these manufacturers represented at this exhibit the hearty cooperation and interest of the American public in the promotion of air endeavors."

ADMIRAL SIMS' APPRECIATION OF WORK OF NAVAL AVIATORS

ADMIRAL SIMS, Commander of the United States Naval Forces in European waters, has sent the following radiogram to Mr. Alan R. Hawley, the President of the Aero Club of America:

"Please express to the Naval aviators of America my most sincere appreciation of their courageous and loyal performance of Duty at home and abroad throughout the war. Their brilliant exploits, their determination to win, will ever remain one of the highest tributes to American manhood. The performance of duty of those young naval aviators under my command has not only been in keeping with the very best traditions, but won for America the enthusiastic praise of her Allies."

The radiogram was in answer to a cable sent to Admiral Sims by the Aero Club of America, asking for an expression of appreciation from him regarding the work done by American naval aviators

EXTENSIVE CONTESTS DURING AERONAUTIC CONVENTION AND EXPOSITION AT ATLANTIC CITY, MAY 1st TO JUNE 1st

GREAT enthusiasm and hope for American aeronautics has been created by the Aero Club of America's announcement that the first aerial meet and contests to be held since the beginning of the war and the first dirigible races and kite balloon contests ever held will be held at Atlantic City during the Second Pan-American Aeronautic Convention and Exposition, the program of which is printed elsewhere in this number of AERIAL AGE.

The contests, which are sanctioned by the Contest Committee of the Aero Club of America, under the rules of the International Aeronautic Federation, which govern all aerial contests, are as follows:

The Valentine Efficiency Marine Flying Contest

The prizes (awarded under the terms of the Samuel H. Valentine will) are to be awarded for the greatest number of laps covered in flying over a 60 mile course with the Steel Pier, Atlantic City, as starting point and Cape May Naval Air Station as turning point, during the five Saturdays of the Convention:

First Prize	$1,000
Second Prize	500
Third Prize	250
Fourth Prize	100

The race is to start at 10 A. M. and last until 5 P. M., each of the five Saturdays in the month of May.

The laps start and end at the Steel Pier. Only complete laps count.

Curtiss 1,000 Miles Non-Stop Seaplane Contest

Mr. Glenn H. Curtiss has offered a prize of $1,000 to go to the first entrant for the Curtiss Marine Flying Trophy who covers the distance of 1,000 miles without stopping. The contest for this prize will open on May 1 and continue until it has been accomplished.

The entrants who wish to compete for this prize during the Convention can fly over the 60 miles course between the Steel Pier and Cape May Air Station, and can compete for the Valentine Efficiency Marine Flying Prizes at the same time.

The entrant's record will be counted as a flight for the Curtiss Marine Flying Trophy under the rules for the 1919 competition for this trophy.

Open Seaplane Speed Contest (with handicap)

for 42 laps of 5 miles each. To be held on Decoration Day, May 30.

First Prize	$1,000
Second Prize	500
Third Prize	250

Dirigible Speed Contest (with handicap) for the Aerial League of America Silver Trophy

This contest is open to Army, Navy, Aero Clubs, Colleges and Aeronautic Organizations. It will be held on the afternoon of Saturday, May 3; Saturday, May 10; Saturday, May 17; Saturday, May 24; Friday, May 30; and Saturday, May 31.

Each member of the winning crew of each race will receive a silver plaque of the trophy.

The names of the members of the winning crew of each race will be inscribed on the trophy, which is to be competed for annually.

The race will be for the best speed (under the conditions of the handicap) made at each race.

Aerial Commuting Prizes

(1) To be awarded to entrants who cover the greatest total distance in commuting by air from anywhere to Atlantic City during the period of the Convention.

First Prize	Gold Medal
Second Prize	Silver Medal
Third Prize	Bronze Medal

(Distance to be measured in straight line.)

(2) To be awarded to entrants who make the greatest number of trips in commuting by air from anywhere to Atlantic City during the period of the Convention.

First Prize	Gold Medal
Second Prize	Silver Medal
Third Prize	Bronze Medal

(3) To be awarded to entrants who make the longest flight in commuting from anywhere to Atlantic City during the period of the Convention. (Distance to be measured in straight line.)

First Prize	Gold Medal
Second Prize	Silver Medal
Third Prize	Bronze Medal

Intercollegiate Seaplane Speed Race

Over a five-mile course, for the $2,000 Intercollegiate Trophy.

This event is open to graduates and under-graduates whether in military or civilian life.

Intercollegiate Land Aeroplane Speed Race

To be held on Decoration Day for the $2,000 Intercollegiate Trophy.

This event is open to graduates and under-graduates whether in military or civilian life.

Army, Navy and Marine Corps Contest for Accuracy in Bomb Dropping on a Floating Target

This contest is to be held every Saturday during the Convention and on Decoration Day.

Both land machines and seaplanes are permitted to compete, but slow machines must fly higher than fast machines, to equalize the chances of hitting the target.

First Prize	Gold Medal
Second Prize	Silver Medal
Third Prize	Bronze Medal

An international contest in which the Allied aces already in this country or on their way over would compete, is being considered by the Contest Committee of the Aero Club of America, which includes the following prominent military and civilian authorities in aeronautics and intercollegiate sports: Alan R. Hawley, Chairman; Lieut. Com. P. N. L. Bellinger, U. S. N.; Col. G. C. Brant, U. S. A.; W. Redmond Cross, Lieut. Godfrey L. Cabot, U. S. N.; Walter Camp; Col. Milton F. Davis, U. S. A.; Col. C. de F. Chandler, U. S. A.; Major A. B. Lambert, U. S. A.; Major William McIlvain, U. S. M. C.; Col. James Prentice, U. S. A.; Major J. C. McCoy, U. S. A.; Com. H. C. Mustin, U. S. N.; Lieut. Com. John H. Towers, U. S. N.; Henry A. Wise Wood and Henry Woodhouse.

THE NEWS OF THE WEEK

Informal War Contracts Adjustment Bill Signed

Washington.—President Wilson on March 2d signed the bill validating so-called informal war contracts which had been made by telegraph, telephone or in other ways not "legally" executed. Payment of these contracts had been refused by the Treasury and the new bill therefore validates them and authorizes payment. The contracts that came under the informal classification totaled $2,000,000,000, of which more than $300,000,000 were held by automotive manufacturers. The delay in paying these was said to be one of the chief causes of unemployment, as many manufacturers were unable to secure funds to proceed with peace-time work.

The bill as signed following numerous amendments and revisions in Congress provides the Secretary of War power to authorize payment, allows for appeals from his decision to the Court of Claims, insures that sub-contractors be protected by direct investigation by the War Department of all prime contractor's contracts, and limits the filing of claims under the act of June 30, 1919. The Secretary of War is also ordered to report all payments made under the act at the next session after June 30, 1919.

Those contracts which were properly executed prior to the signing of the bill will come under Class A and the claims will be forwarded directly to the various claim boards handling the respective products called for by the contracts. For example, an ordnance contract, after being prepared for claim in quadruplicate form, will be sent directly to the Ordnance Claims Board, where it will receive an identifying number, be reduced to certificate form embodying the important details and the award made. No awards will be paid until the approval and acceptance of the claimant is secured.

In those instances where the Government officials decide it is best to make direct payments to the sub-contractors who are interested in the contract of a prime contractor this will be done.

Those contracts which have not been reduced to the proper legal form and which are still merely in the form of a telegram or verbal will come under Class B. Special blank forms are provided for reducing these to concrete form. All Class B contracts will come before the Board of Contract Adjustments, which will investigate their proof of claims and refer them to the Bureau Claims Board, Ordnance, Air Service or Quartermaster, as the case may be.

In event a claimant is not satisfied with the award of the Bureau Claims Board he may appeal to the Board of Contract Adjustment.

Swedish Postmaster General Flies from Washington to New York

Julius Juhlin, the Postmaster General of Sweden, who is making a study of the postal service of the United States, and who is especially interested in the air mail service, flew as a passenger in the air mail plane from Washington to New York, leaving at 11.30 and arriving at New York at 2.30, with Pilot Robert Shanks.

Second Assistant Postmaster General Otto Praeger with his air mail staff, J. B. Corridon, L. T. Bussler, J. C. Edgerton and J. A. Jordan, left by train to join the Swedish Postmaster General at the Aeronautic Exhibition at Madison Square Garden on March 10, "Air Mail Day."

Navy Planes Fly from New York to Hampton Roads in Fast Time

Norfolk, Va., March. 7.—Four Navy aeroplanes which left New York City at 10.45 o'clock on the morning of March 7 arrived at the Naval Base, Hampton Roads, early in the afternoon. The first plane arrived at 2.42 o'clock, the second at 2.55, the third 3.02, and the fourth 3.08. Each plane carried three men and all of them report that the trip was made without incident. The first plane arrived nearly forty minutes sooner than expected and the last landed twenty-eight minutes sooner than the first one was due at the Naval Base.

Dayton-New York Record Established

What is regarded by experts as a record for both distance and flying time was made on March 7 by two army officers in a flight in a De Haviland-9 from Dayton, Ohio, to Hazlehurst Field, Mineola, L. I.

Major Ruben F. Fleet, on special duty at Cook Field, Dayton, and Captain Earl F. White, in charge of the field, left Dayton at nine minutes before nine o'clock on the morning of March 7, Central time (nine minutes to ten, New York time), and landed at Hazlehurst Field at ten minutes after four o'clock in the afternoon. The actual flying time, with an enforced stop of about two hours at Newburgh, N. Y., was four hours and thirty-three minutes. The distance covered was 664 miles. The actual air line distance between the two points is 540 miles, but the aviators, steering by compass, got off their course, as was shown by their landing at Newburgh, sixty miles north of New York, and flew an additional 124 miles.

The average speed for the entire distance was about 130 miles an hour.

Reports from Dayton indicated snowstorms throughout that district. The aviators, however, said they encountered no snow. They were hampered at the start by fogs. To overcome this handicap they mounted to an elevation of from 10,000 to 12,000 feet and steered the entire distance above the clouds by compass.

Major Fleet has the distinction of having been the chief of the Aerial Mail Service upon its inauguration between Washington and New York City. He was the first American to learn how to fly by voice commands by radio from the ground. Major Fleet and Captain White relieved each other as pilot of the flight yesterday.

The De Haviland-9 is the product of the Dayton-Wright Aeroplane Company, of Dayton, of which Orville Wright is a director and consulting engineer.

Henry Woodhouse, a director of the Aero Club of America, pronounced the flight "most significant." Records not being available at the time, he could not say whether a record for distance had been established, but he believed it was a speed record for cross-country flight.

Planes Directed By Radio Telephone Over Armory

New York, N. Y.—Under the supervision of Major Henry J. Miller, a squadron of four JN4H planes manœuvred over Madison Square Garden, their movements being directed by orders transmitted by radio telephone from the roof of the Garden. An SCR-67 radiophone transmitter and receiver was used, in charge of Lieutenant C. C. Shangraw, the squadron of planes above being in command of Lieutenant J. Adams. The station on the roof was installed on March 6 and the first demonstration given in the afternoon of that day. Grouped about the apparatus were Harry Payne Whitney, Vance McCormack, Captain Eddie Rickenbacker, Lawrence Waterbury, George F. McLoughlin, who served the Department of Military Aeronautics as aeronautical mechanical engineer and is technical editor of AERIAL AGE; Edgar H. Felix, associate editor of AERIAL AGE, until recently radio engineer in the Signal Corps, where he was concerned with the development of radio telephone and telegraph sets, and several newspaper men.

Atmospheric conditions were not entirely favorable to communication and commands had to be repeated several times. Messages from the planes, however, came in very strong. The planes circled about the city for more than an hour, executing the commands of the officers and visitors to the installation. Voice-commanded flights were continued throughout the exposition.

Aerial Photo Map of New York Made By Army Airmen

New York, N. Y.—A speed test in aerial photography, unique in New York history, was made on March 8 when an army photographic plane in charge of Captain M. A. McKinney, Jr., left Mineola Aviation Field at 1 o'clock flew over the city, photograph Madison Square Garden, the newspaper offices, and various other points of interest.

These photographic plates were rushed by special messenger to the Sixty-ninth Regiment Armory where the army exhibit of the Aeronautical Exposition is housed, for developing and finishing in record time as photographs are finished at the front, and were exhibited at the exposition in the evening.

The photographs were taken by Captain Leroy E. Gahris, wing photographic officer at Hazelhurst Field, Mineola. The pilot will be Lieutenant George McDonald, R.M.A.

The Leviathan, with New York troops on board, being escorted up the North River by flying boat

Kenly and Crowell Fly to Aero Show In Record Time

Major-General William L. Kenly, with Major Ocker as pilot, flew from Washington to New York on March 6 to attend the Aeronautical Exposition at Madison Square Garden in a De Haviland-4, in the record time for this plane of 1 hour and 41 minutes.

Benedict Crowell, Assistant Secretary of War, Senator Pittman of Nevada, Major M. Connelly and Captain Roy N. Francis, who acted as pilot, made the same trip in a Glenn Martin bomber.

Among other prominent visitors of the day was Rear Admiral Nathaniel R. Usher, who addressed the crowds at the Armory from a platform erected under the F-5-L flying boat.

Augustus Post Reveals Caproni Plans

Caproni has signed a contract to carry passengers and mail between Portugal and Brazil, and probably will begin within two months, Augustus Post, secretary of the Aero Club, said at Amy Grant's Studio, 78 West Fifty-fifth Street, on March 9, in an address on the progress of aviation. It was a benefit to buy musical instruments for the Colonia Reconstruction Hospital at Rahway, N. J.

Just before the armistice was signed, Mr. Post declared, Caproni had a plan whereby General Pershing could send a message from the front to Washington and back within two days. The route would have been from the battle line to Portugal, to the Azores, to Newfoundland, and then to Washington.

Mr. Post announced that a chain of municipal landing fields for aeroplanes soon would be established in the United States, as in France.

General Traub Defends Air Service Before House Committee

Washington, D. C.—Major General Peter E. Traub, who commanded the 35th Division during the Argonne fighting, in testimony before the House Rules Committee, defended the work of th Air Service in France. The official testimony, taken on February 20, was as follows:

"It is claimed that Germany was supreme in her command of the air at the battle of Argonne," said Representative Garrett, of Tennessee. "What about that?"

"You must realize what that battlefront was," said General Traub. "You cannot have planes enough to protect your battlefront at all times. There is no power on God's earth that can protect one against an individual plane. They fly high, perhaps out of sight in the fog or above the clouds, and then swoop down in a few minutes, fire, observe, and then swoop back again. All we can do is to report that there is a plane, ask for protection, and our planes go out and do exactly what the German plane has done."

"Can the criticism properly be made and be sustained that the German dominated the air at all times," asked Representative Pou.

"No, sir," replied General Traub. "At times whole squadrons would be flying over. It all depended upon what the higher command thought as to the movements and need for aeroplanes."

"Then you found no culpable negligence in a shortage of aeroplanes?" asked Representative Harrison, of Mississippi.

"No," said General Traub.

Two Air Records Smashed By American-Built 'Plane

Washington.—Establishment by an American built and designed aeroplane of what officials believe are new world's records for speed and climbing ability was disclosed with receipt by the War Department of results of preliminary tests of a machine constructed at Ithaca, N. Y. The 'plane attained a speed of 163 2-3 miles an hour and climbed 10,000 feet in 4 minutes and 52 seconds.

Government Stock of Hardwood to Be Sold

Washington, D. C.—The War Department authorizes the following statement from the Office of the Director of Sales:

As a result of the recent conference between representative members of the hard-wood industry and representatives of the Office of the Director of Sales in regard to the disposition of the surplus stocks of hard-wood lumber in possession of the War Department, the hard-wood industry has chosen a committee to act with the Government in this matter. The members of the committee are: C. A. Goodman, president of the National Hard Wood Association; Horace F. Taylor and R. M. Carrier, and their function will be to act in an official capacity in disposing of surplus hard-wood lumber owned by the War Department. It is the intention of the War Department to work in conjunction with this committee in offering its hard-wood in such a way that the market for hard-wood lumber will not be unduly disturbed.

N. Y. to Washington By Air in 80 Minutes

Washington, March 6.—After smashing all previous flying records between Washington and New York by covering the distance in 80 minutes in a De Haviland-4 aeroplane, Col. H. A. Dargue of the Bureau of Military Aeronautics and Lieut. Philip Lucas, Adjutant at Bolling Field, landed here at 12.15 o'clock on March 6. It was an official non-stop flight.

The Aeroplane in Agriculture

In connection with scouting and other survey work in Texas the United States Department of Agriculture is putting the aeroplane to its first practical application in agriculture. A try-out of this method of survey was made last year along the Trinity River and resulted in the discovery of several outlaw cotton fields in heavy timber, which had previously escaped detection. This year the aeroplane is to be used more extensively. It has been found a valuable aid in pink bollworm work, as it makes possibel the easy mapping, by means of photographs, of the quarantined territory, and facilitates the inspection work in forested areas, especially in such long stretches of country as the valley of the Rio Grande and its tributaries.

Aero Club of America Honors General Lyster

Brigadier General Theodore L. Lyster, United States Air Medical Service, who served the lives of hundreds of aviators and was awarded the Distinguished Service Medal by Secretary Baker on Tuesday for efficient work in establishing air medical standards and organizing the Air Medical Service in this country and France, was tendered a reception at the Aero Club of America on March 5.

Captain Augustine Lahoulle, French ace; Rear Admiral Bradley A. Fiske, Colonel James Prentice, United States Army Balloon Service; Captain M. Idigords of the Special Guatemala Mission; Captain James Boyriven, the French aviator who flew under all the New York bridges a few months ago; Ensing Daniel E. Huger, U. S. N., late of the Lafayette Escadrille, who holds the French, Italian and American military aviator certificates, were among those present.

President Alan R. Hawley of the Aero Club, in welcoming General Lyster, said he had been told by Allied authorities that when the General and Lieutenant Colonel Isaac H. Jones of the United States Air Medical Service went to France, Italy and England in 1917 and brought to the attention of the Allied Governments the United States Air Medical tests those governments were perplexed by the serious problems of casualties due to accidents. The system offered by General Lyster and Lieutenant Colonel Jones for testing aviators physically and keeping them in good condition solved the most difficult problems and through its application the percentage of casualties from accidents was cut down greatly, Mr. Hawley said.

Reporter-Lieutenant Flies to Aero Show

Leaving Boston at 9.50 A. M. in a Whittemore-Hamm machine, Aviation Lieutenant Theodore Hedlund flew to New York, arriving before 2 o'clock.

The flier is covering the Aero Show for the Boston *Post*. His machine is a new model, built too late to be used in the war. Lieutenant Hedlund saw active service in France, being attached to a squadron engaged in night bombing behind the German lines.

American Aces back from France. Left to right: Capt. Roscoe Fawcett, of Portland, Oregon; Capt. James Normal Hall, of Colfax, Iowa; Major Kenneth P. Littauer, of Washington, D. C.; Lieut. Col. H. E. Hartney, of Washington, D. C., and Capt. Benjamin P. Harwood, of Billings, Mont., all of whom returned on the S. S. Mauretania. Members of the flying corps

The AIRCRAFT TRADE REVIEW

A. E. J.

Porter Opens New York Office

Dayton, Ohio.—Finley R. Porter, who completed his work with the Division of Military Aeronautics on March 1st, will open headquarters in New York at the Engineers' Club on March 6th. R. B. Porter, his son, will be associated with him in his future plans. Mr. Porter's immediate plans call for designs of some heavy engines for transatlantic ships, and after that he will no doubt enter the automobile field again to begin production of the F. R. P. cars in addition to building two or three types of aeronautical engines. Mr. Porter has been with the Bureau of Aircraft Production for the last ten months as chief motor engineer.

Commercial Treaties With South America

Washington, March 3.—The United States is negotiating with the countries of Latin-America to secure uniform recognition and taxes for traveling salesmen representing American firms in those countries. The new treaty has already been ratified with Uruguay and Guatemala, and provides that the business representatives will be accredited by the United States Department of Commerce and given a special single license that will carry them throughout the country they desire to visit without the payment of special taxes in every section as has heretofore been the custom. Provisions also arrange for a schedule to be drawn whereby samples will be admitted, in some instances free of duty, and in others by bond to re-export them within six months of entry.

Aluminum Production Falls 10 Per Cent

Washington, March 4.—Aluminum production in 1918 was valued at $41,159,225, a decrease of $4,722,775, or 10 per cent from the value in 1917. The decrease is due very largely to a decline in the price of that metal during 1918, and does not represent a corresponding decline in quantity of output.

Sperry Wants Enemy Gyroscope Patents

Washington, March 1.—The Sperry Gyroscope Co., Brooklyn, has asked the Federal Trade Commission for licenses to use nine alleged enemy patents covering the manufacture of gyroscopic apparatus. The commission is considering the application.

Stromberg Extra Dividend

The Stromberg Motor Devices Co., Chicago, has declared an extra dividend of 25 cents a share in addition to the regular quarterly dividend of 75 cents a share, payable April 1st, to stockholders of record March 15th.

Texas to Have Aeroplane Company

Dallas, March 5.—Incorporation papers of the Texas Aeroplane Manufacturing Co. will be filed soon. The company will have a paid-up capital stock of $1,000,000, and its purpose is to construct and operate an aeroplane manufacturing plant here. Lt. C. G. Taylor, of Lexington, Ky., is chief promoter of the project.

New York S. A. E. Visits Splitdorf Plant

New York, March 5.—The Splitdorf Electrical Co. invited the Metropolitan Section of the S. A. E. to make an inspection trip through its plant in Newark on March 7th. Automobiles met the party at the station and entertained them at luncheon.

Curtiss Future Plans Broad

With the transition from a war to peace basis practically completed, the Curtiss Aeroplane and Motor Corporation has launched its campaign to establish aerial transportation as a thing of the present.

The Buffalo and Garden City plants are now in operation on peace orders and sales offices have been established at 52 Vanderbilt Avenue, New York City, with Mr. J. P. Davies as sales manager.

Although a young man, Mr. Davies has had considerable experience in salesmanship and office management and, in addition, he has had flying experience both in this country and abroad.

Graduating from the University of Wisconsin in 1913, he entered the life insurance business as general agent for the Northwestern Mutual Life Insurance Company. He organized and developed the first and largest university agency in the United States.

When war was declared, he entered the aviation service and, upon completing his ground school training at the University of Illinois, he was sent to Ellington Field, Texas, as instructor. He specialized in night flying and bombing

J. P. Davies, Sales Manager of the Curtiss Aeroplane & Motor Corporation

work and, early last summer, he was detailed by the Government to visit the fighting fronts in order to study these phases of aviation and to work out a uniform course of instruction for the schools in the United States.

He spent three months abroad, studying French, English and Italian methods.

He returned to America shortly before the armistice was signed and on January 1st he entered the Curtiss organization.

Mr. Davies predicts a great and immediate future for aviation. He believes that the aeroplane industry holds greater opportunity for aggresive young men than any other business in the world.

"Aviation today is often compared with the automobile industry ten years ago," he said.

"As far as the public appreciation of aviation is concerned, it is undoubtedly a very fair comparison, but as far as size of the business and progress in aeronautical engineering, as compared with automobile engineering ten years ago, there is no comparison.

"As a matter of fact, the aeroplane engineering of today is actually ahead of automobile engineering of today and the enormous aeroplane factories bear no resemblance to the small automobile plants of a few years ago.

"The aeroplane completes the transportation facilities by supplementing steamships, railroads, and automobiles. Contrary to the general opinion, it is no more subject to weather limitations than are steamships or automobiles. It has proven itself in peace uses to be as safe, if not safer, than any other form of transportation. As a sport, it combines the fine air of the yacht with the adaptability of the yacht and automobile combined.

"Flying fields are being established all over the world to take care of the commercial developments of the aeroplane and new types of planes are being developed to care for the various problems involved by local conditions in various parts of the country.

"Oil men and ranchers are using the aeroplane to visit distant property and look after their interests, precisely as they have been using high-powered automobiles in the past.

"Business men are using planes to make short trips, thus enabling them, in a good many cases, to save a day or more on each trip.

"First-class mail will eventually be entirely carried by aeroplane; as will all light express. The aeroplane will aid materially in bringing down the prices of food because it will enable the grower in the interior to rush his perishable goods to distant city markets—a thing he is unable to do today unless he is favorably located."

Goodrich Sales Increase 41 Per Cent in 1918

Akron.—Net sales of the B. F. Goodrich Co. for 1918 amounted to $123,470,188, an increase of $36,315,116 over last year.

Personal Pars

Lieut.-Cob. Benjamin Briscoe, of the Briscoe Motor Co., Jackson, Mich., has returned from Europe, where he was in charge of navy aeroplanes, air bases and supply depots.

Samuel E. Ryder, for a number of years in the employ of the Motometer Co., Long Island City, is now affiliated with the Detroit branch of the company opened recently.

Lieut. F. M. Young, formerly in the aviation service, has returned from overseas and is now sales engineer with the Perfex Radiator Co., Racine, Wis.

Capt. A. E. Callanan has been appointed general purchasing agent of the Cleveland Tractor Co. He was formerly in charge of production of de Haviland battle planes at the Dayton-Wright Co., Dayton.

W. B. Folwell has been appointed sales manager of the Stan-Par Axle division of the Standard Parts Co.

G. M. Rymarczick, until recently supervising senior inspector of the magneto section of the Bureau of Aircraft Production, is now connected with the Simms Magneto Co., East Orange, N. J., as production engineer.

Alexander A. Koswick, formerly with the Wright-Martin Aircraft Corporation at their Long Island plant, has accepted a position as an engineer with Ford, Bacon & Davis, in their vluation and report department, with headquarters in New York City.

R. Chauveau, formerly aeronautical mechanical engineer, with the Bureau of Aircraft Production, Washington, has been appointed engineering manager of the Ericsson Manufacturing Company, Buffalo, N. Y.

V. W. Dow, who was formerly sales manager for the American Bronze Corporation, has been appointed New England representative of the corporation, with offices at 348 Tremont Building, Boston, Mass.

S. F. Dupree, formerly vice-president and sales manager, Caskey-Dupree Manufacturing Company, Marietta, Ohio, has been appointed vice-president of the Automotive Products Company, Detroit, Mich.

Joseph Leopold has resigned his commission as lieutenant in the Air Service, U. S. A., and accepted the position of mechanical engineer and sales manager with the Jones-Motrola, Inc., New York City. Prior to the war Mr. Leopold was the chief engineer of the Walker M. Levett Co., New York City.

F. W. Sutton has been appointed chief engineer for the Charles E. Bedaux Company, industrial engineers, Cleveland, Ohio. He resigned as general superintendent of the Dayton Wright Airplane Company, Dayton, Ohio, to accept the new position in Cleveland, and prior to that was production manager of the Continental Motors Corporation.

Fred I. Tone, formerly aeronautical mechanical engineer, research department, Bureau of Aircraft Production, stationed at Dayton, Ohio, has accepted a position with the U. S. Ball Bearing Manufacturing Company, Chicago, Ill.

P. G. Van de Velde, who has been associated with the French High Commission in New York City, has returned to France.

J. G. Zimmerman has been appointed engineer in charge of the ignition development work of the Jefferson Electric Manufacturing Company, Chicago, Ill. He was formerly associated with the technical publicity department of the Splitdorf Electrical Company, Newark, N. J.

Baseball Team to Use Curtiss Planes

The New York National League Baseball Team has been invited by the Curtiss Company, according to information in the press, to fly to Philadelphia on April 23, when they start their series of games at that city. The invitation was extended by Mr. J. P. Davies.

Instruction and Pleasure Flights at Long Island School

The Long Island Aviation Co., of Central Park, Long Island, New York, is not only giving thorough courses in flying but is arranging to take up passengers for flights of reasonable length, giving all the thrills of flying, for a small fee. The field is very conveniently located for motorists.

Aero-Mail Speed Record Broken in Washington-New York Flight

Washington.—The quickest trip between Washington and New York ever made in a Curtiss J. N. V. mail 'plane with a 150-horsepower motor was made on February 28, when Aviator Biffle took the aeroplane mail from College Park to Belmont Park, a distance of 218 miles, in 2 hours and 6 minutes flying time. He carried 200 pounds of mail, starting at 11.36 A. M., and arrived at Philadelphia at 12.55 P. M. This lap of 128 miles was covered in 1 hour and 19 minutes.

Leaving Bustleton Field, Philadelphia, at 1.12 P. M., he arrived at Belmont Park at 1.55 P. M. This 90 miles was covered in 43 minutes. The speed between Washington and Philadelphia was 97½ miles an hour and between Philadelphia and New York 125½ miles an hour.

Biplanes to Carry Mail to Ships

New York, March 5.—The Kerr Steamship Co. is to operate a fleet of planes to deliver mail from twenty-four to thirty-six hours after the ships leave port. Mail will be carried in waterproof sacks and will be dropped on deck by the aviators.

Post Office Wants Navy's Capronis

Washington, D. C.—Otto Praeger, Second Assistant Postmaster General, in charge of the air mail, recently said the New York-Chicago service could be put on a regular schedule if the fifteen three-motored Capronis now being used by the Navy Department in France were obtained.

"They are powerful enough to carry a tremendous load of mail, carry a special navigator, as a ship does, and the engines are so arranged that the craft is in no danger of having to descend suddenly because of engine trouble," he said. "We have been trying to get them from the Navy Department, which now seems inclined to store the planes until it needs them.

"Our small appropriation, $850,000 for all air mail, is holding back development. If we had these Capronis the problem would be solved. They are capable of great speed, and we could use them singly for the New York-Chicago flights, making only one stop at Cleveland to overhaul and to pick up and drop mail. These machines would serve until American manufacturers could work out designs that would replace them. If the engines wear out, Liberty motors could be substituted.

"We are confident we can operate the big machines, because in the Washington-New York service our carriers have now flown more than 112,000 miles with only thirty-four forced landings due to engine trouble."

Paris-Lille Mail Service

The aeroplanes engaged in the Paris-Lille mail service which has recently been instituted start from Le Bourget aerodrome. It is expected that this latter service will be resumed at an early date. The machines and pilots engaged have been lent to the postal authorities by the military authorities.

Another Giant Aeroplane

It is now permissible to state that Mr. G. W. Tarrant, of Byfleet, Surrey, England, the manufacturer of the famous Tarrant army huts, is constructing a huge triplane with a wing span of 150 feet and a length of 75 feet. It will be fitted with six engines, developing in all 3,000 horsepower, and it is expected to show a speed of 80 to 100 miles an hour for a 500-mile flight. The machine was originally designed as a bomb-carrier, but it has been adapted to carry passengers or cargo.

Should an attempt be made on an Atlantic crossing, cargo and passenger carrying space will be sacrificed for a provision of extra gasoline tanks of sufficient capacity to give the machine the necessary range of action.

Planes 1 to 6, inclusive, are Standard type JR-1, with 150 H. P. Hispano-Suiza motors.
Planes 37944, 38262, 38274, 38275, 38276 and 38278 are Curtiss type JN-4-H, with 150 H. P. Hispano-Suiza motors; and
Planes 39262 to 39367, inclusive, are Curtiss type R-4-LM, with 400 H. P. Liberty motors.

OTTO PRAEGER, Second Assistant Postmaster General.

THE FUTURE OF AERONAUTICS

By G. DOUGLAS WARDROP

THE verdict of the Aeronautic Exposition is that a great volume of business awaits the aeronautic manufacturers whose product will satisfy the demands of the critical public interested in sport and commercial aerial transportation.

Alike in industrial matters and military operations the time element is the supreme factor, and success or failure is finally determined by rapid decisions, which, more often than not, are irrevocable. In either case there usually arrives a moment, when, however promising the initial stages may have appeared, the issue hangs in the balance; the scales are wavering and the slightest weight added will incline them definitely to one side or the other. The critical moment has now arrived for the aircraft industry, whose future for some decades to come depends upon the decisions which must be taken now. Six months hence it will be too late. Inaction at the present time would be fatal.

Energetic action must be taken promptly; things must not be allowed to drift; a settled policy regarding the future must be laid down. The Air Service is in process of demobilization, and those who are going, or have gone, are amongst its best men. If the investment of time and the knowledge acquired by these men is to be properly capitalized, the industry must show definite reason why those men should maintain and sustain their interest.

The absence of all information regarding the future Government policy towards aerial transport is already causing the industry grave embarrassment. It is acknowledged on all hands that for some years to come the aircraft industry cannot be self-supporting without the assistance of the State, and that some considerable time must elapse before commercial aerial transport can be made to pay. Such support has repeatedly been officially promised, but until now has failed to materialize; and while war contracts are being liquidated wholesale, the ban on civil flying still remains, and the aircraft industry is living from hand to mouth, subsisting on an unsubstantial diet of uncertain hopes.

It may be thought that time will cure this uncertainty and provide the basis for a stable policy. But such is not the case, for in a rapidly progressive science such as aeronautics time once lost can never be wholly regained. Not only is the present highly efficient industry beginning to disintegrate and to turn its activities into other channels, but its highly skilled technical staff, which at present has no equal throughout the world, is rapidly dispersing and becoming absorbed in other industries. And once it has dispersed, it will never come together again, but will be finally lost to aeronautical science. So long as the future of the industry remains uncertain, so long will it fail to attract the best men who can find a more profitable and a securer career elsewhere.

Congress Being Out of Session, Government Action Delayed

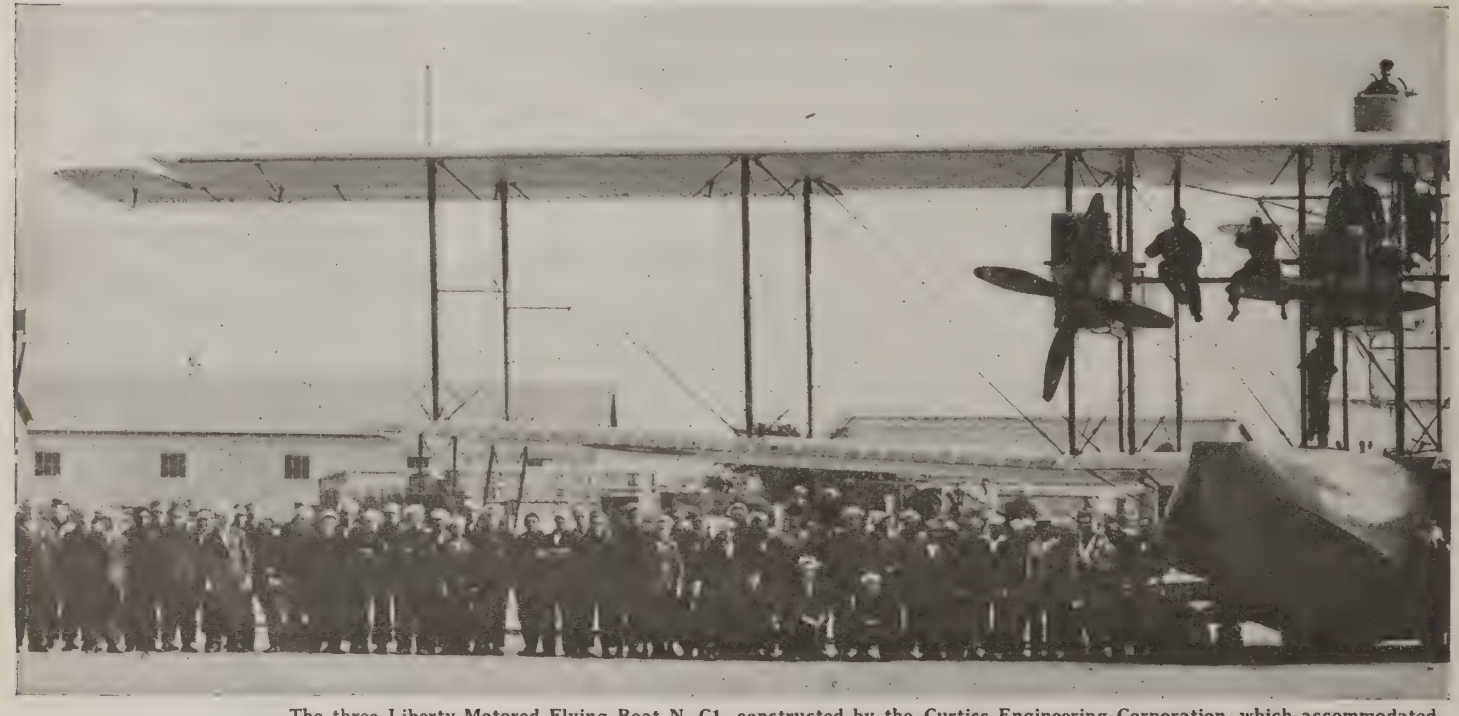
The great problems of aerial transportation have but lightly been touched, but they have been touched sufficiently to demonstrate their immense possibilities to mankind and civilization.

Nothing is more important at this time than to stabilize the aeronautic industry, and it is necessary to do so quickly, before aeronautic talent and trained aviators and skilled labor look elsewhere for positions.

The Government should be the main factor in stabilizing the aeronautic industry, at least for the next six months, while the plans for the employment of aircraft for special purposes are put into effect. Unfortunately, Congress is out of session, and there seems to be no prospect for an extra session to be called on time to insure Government action on the aircraft situation in time to benefit the aeronautic industry this year.

Atlantic City Convention and Races Aeronautic Industry's Best Asset

The one month Aeronautic Convention, Exposition and Races to be held at Atlantic City from May 1 to June 1, inclusive, are the aeronautic industry's best assets.



With the convention there will be held aeroplane, seaplane and dirigible races and other demonstrations, together with an extensive Aeronautic Exhibition.

The Convention and Races are to be held under the auspices of the Aero Club of America, the Aerial League of America and the Pan-American Aeronautic Federation.

The Governments of all the Allied and Latin-American countries and their aeronautic, sporting, scientific, industrial and educational organizations are invited to send commissions to the covention.

The races to be held each Saturday will include:

(1) Seaplane Contests (general)
(2) Curtiss Marine Flying Trophy and Prizes
(3) Intercollegiate Seaplane Contests
(4) Land Aeroplane Contests
(5) Dirigible Contests
(6) Kite Balloon Speed in Ascending and Descending and Maneuvering Contests
(7) Parachute Competition.
(8) Aviette (bicycles and motorcycles with wings) Contests.

The three Liberty-Motored Flying Boat N. C1. constructed by the Curtiss Engineering Corporation, which accommodated

The Daily Program for the thirty days will comprise:

(1) Exhibits of aeroplanes, motors and accessories on the Steel Pier.
(2) Demonstrations and tests of seaplanes, land aeroplanes, motors, dirigibles, kite balloons to prospective customers.
(3) Aerial passenger carrying by seaplanes and dirigibles and kite balloon ascensions.
(4) Moving pictures and addresses on most important phases of aeronautics.

The convention aims, for the first time in the history of aeronautics to permit thorough discussion of each of the important phases of aeronautics, so that people interested in each phase may acquire all the information available on the subject.

The program is most thorough and complete. Tens of thousands of people of different lines of endeavor related to aeronautics are invited to attend. For instance, on the fifth day, when "The Large Dirigible and Its Value for Transportation" is discussed, there are invited the representatives of railroads, express, steamship and other transportation organizations to attend.

For the illustrated addresses on "Aerial Forest Patrol" the Forestry Department of every State are invited to attend. For the discussion of the "Work of Aerial Police Squadrons, and Why Every City Should Have One," the police commissioners are all invited.

For the illustrated address on, and consideration of, "Aerial Mail Plans," the Chairman of Post Office and Post Roads Committees of House of Representatives and Senate and Postmaster General Burleson and 26,000 United States Postmasters and Chambers of Commerce of 13,000 cities are invited to attend.

Likewise for the illustrated addresses on the "Need of Municipal Aerodromes and the Part to Be Played by Aircraft in City Planning," the Chambers of Commerce and City Planning Commissions are invited to attend.

For the Presentation of the Flags by each State of the United States to the Aero Squadrons representing the States, all the States and Cities are invited to send delegates, and the Army, Navy and Marine Corps to send representatives.

For the Demonstrations and Illustrated Addresses on the "Value of Aircraft for Advertising by Day and Night," all national advertisers and advertising agents are invited to attend. For the discussion of "Pan-American Aerial Transport," the commissions of the twentyLatin-American Republics are invited to attend.

For the addresses on 'Aerial Photography," all the photographers, professional and amateur, and makers of photographic apparatus are invited to attend.

For the discussion of "Aerial Navigation Instruments for Flying Over Land and Water," aviators, navigators, scientific instrument makers and aeronautic experts are invited to attend.

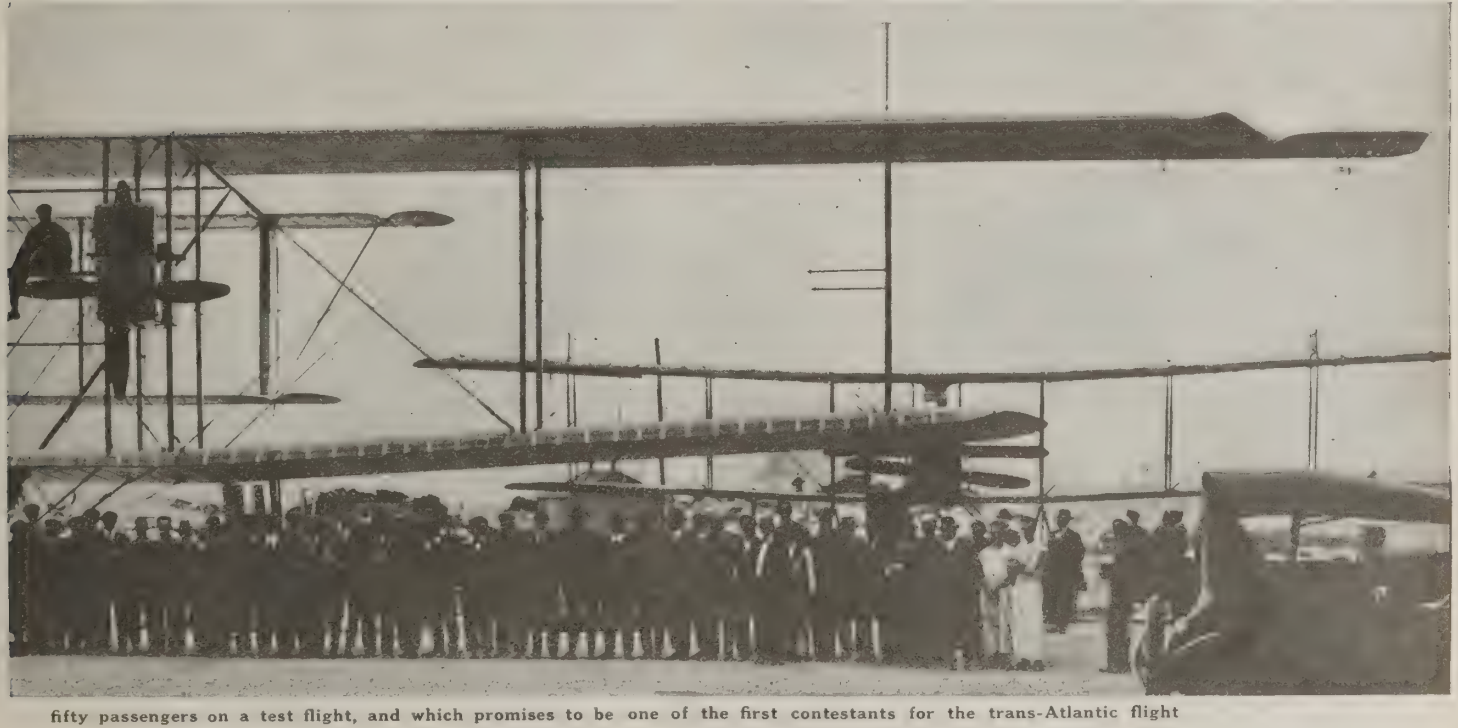
For the addresses on "Aerial Exploration and the Use of Aircraft for Coast and Geodetic Survey," all people interested in exploration and surveying are invited to attend.

For the addresses on "Need of Broader Attitude Regarding Insurance for Aircraft and Aviators," all the Insurance Companies and agents are invited to attend.

For the addresses on "Aerial Jurisprudence—Aerial Laws and Regulation of Air Traffic," all lawyers, traffic commissioners and police authorities of different countries are invited to attend.

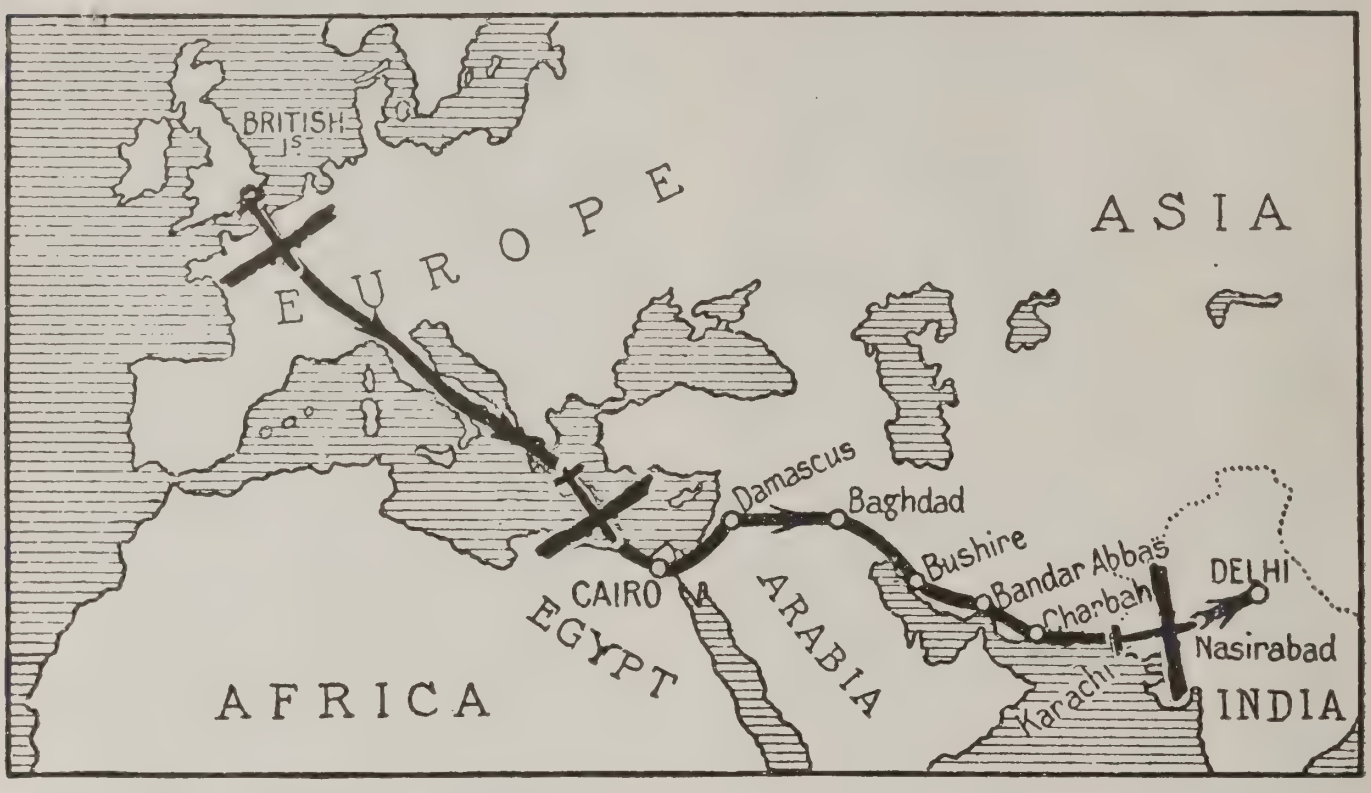
For the Aeronautic Art Day, when an address on "Aerial Painting and Sculpture of Different Countries" will be delivered and exhibition of aerial paintings by Lieut. Farre and Lieut. Rutan and others, all the prominent artists, managers of art galleries and art patrons are invited to attend.

The engineers are invited to attend engineering week, when basis problems of aeronautic engineering are to be considerd.



For the discussions of "Meteorology—How the Weather Forecasts Can Be Extended and Made More Efficient by the Use of Aircraft in Exploring the Upper Air," also "How the Weather Forecasts Help Aerial Navigation" and "Telegraphic and Climatic Factors in Relation to Aeronautics," people interested in the subjects are invited to attend.

For the discussion of "International Medical Standards for Aviators in War and Peace," when reports from different countries will be presented by the highest authorities on the subject, 50,000 medical men are invited to attend.



The Aerial Mail Service

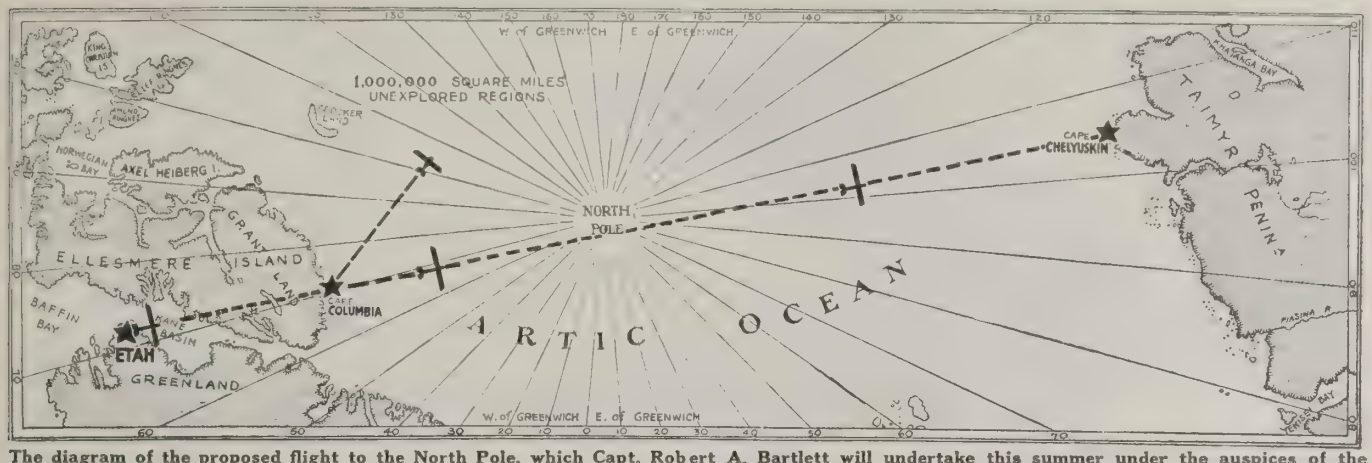
The Aerial Mail Service was inaugurated May 15, 1918, and during the first six months of its existence its operations covered 68,892 miles, at a cost of $75,165.94, including 6 per cent on investment and 33 1/3 per cent for depreciation. In that period it carried between Washington and New York 7,452½ pounds of aeroplane mail. The revenue derived was $60,653.28. The net deficit, not taking into account the 6 per cent interest on investment, was $8,969.08. In addition to the aeroplane mail carried there was dispatched between Washington, Philadelphia and New York in the six months' period a total of 91,926½ pounds of first-class mail, aggregating 3,667,040 letters. This mail was advanced in dispatch from 6 to 12 hours, which many times made up for the small deficit in the operation of this service. This ordinary mail was letter mail from distant States, which was carried in addition to the aeroplane mail. Thus the ordinary mail put on the planes at Washington was usually mail from the South Atlantic Coast States and the Gulf States, distributed to carriers by the Railway Mail Service before reaching Washington, and by reason of aeroplane dispatch was delivered in New York on the same afternoon instead of the following morning.

The Washington-New York route was established not as a typical commercial line, but to solve the problems that had to be met to establish a daily dependable schedule. The flying

fifty passengers on a test flight, and which promises to be one of the first contestants for the trans-Atlantic flight

The remarkable flight of Major-General W. G. H. Salmond, Captain Ross Smith, British Air Force, and two mechanics, from Cairo, Africa, to Delhi, India, a distance of over 3,000 miles

record made on the New York-Washington line has never been equaled in the history of aviation, and its operation by civilian flyers of the Post Office Department has far exceeded its operation while under military control, the civilian fliers having a record of but 7 forced landings in 100 consecutive flights and only 2 failures in that time on account of fog or storm conditions. The mail has been carried in blinding rain and hail, on fog-bound days with visibility of not over half a mile, and in the face of gales. Only two winter gales were strong enough to prevent the aeroplanes from completing their journey. On Thursday, January 23, the mail was brought south as far as Silverside, Del., in the face of a 65-mile gale at an altitude of a few thousand feet.



The fastest time of flight, carrying the mail from College Park to Belmont Park, N. Y., a distance of 218 miles, was 1 hour and 30 minutes, and the slowest time for a continuous flight was 4 hours and 56 minutes. The average time is 2 hours and 40 minutes. The common experience of the users of aeroplane mail is that a letter posted in the down-town station in Washington as late as 10.50 a. m., and leaving the aviation field at 11.30 a. m., is usually delivered between 4 and 4.30 in the afternoon, which is in ample time before close of business.

The greater the distance between the points on an aerial mail route the greater is the service rendered to commerce and the greater is the patronage of the line. A mail service leaving New York at 6 in the morning and arriving in Chicago before 3 o'clock in the afternoon, in time to connect with carrier deliveries, will advance the mail between the two cities by 16 hours over any train dispatch that can be made after the departure of the Twentieth Century Limited from New York at 2.45 p. m. The department desires to establish this line immediately and extend it west to the foot of the Rockies during the coming fiscal year, with the view of reaching the seaports of Seattle and San Francisco, if Congress authorizes the appropriation necessary. The air mail time between New York and San Francisco will be less than 40 hours. It is desired that this transcontinental trunk line shall be tapped by lines from Minneapolis, St. Paul, St. Louis, Kansas City and other points, and ultimately by a line from Boston, via Albany, Buffalo and Detroit, to Chicago.

A north and south trunk line from Boston to Atlanta should

The Kite Balloon was an effective observation unit in the Great War—it can be made an

The diagram of the proposed flight to the North Pole, which Capt. Robert A. Bartlett will undertake this summer under the auspices of the Aero Club of America

likewise be established with an ultimate extension from Boston to Montreal, Canada, and from Atlanta, via Key West, to Havana. Based on the accurate cost accounting kept in the operation of the Washington-New York air mail line, the cost of an east and west trunk line from New York as far as Omaha and a north and south trunk line from Boston to Atlanta has been carefully estimated at $1,600,000. To this should be added $400,000 for several essential feeders that would connect up Detroit, Minneapolis, St. Paul, St. Louis, Kansas City and other points, and would admit of an extension as far west as Salt Lake City, this extension, however, dependent upon the extent to which the Government equipment can be transformed into strong and safe mail-carrying machines.

Aerial Program of Foreign Countries

Italy: (1) Civitavecchia-Terranova, Sardinia (150 miles). Daily mail service by means of flying boats. Inaugurated June 27, 1917; temporarily discontinued during the winter of 1917-18; reopened in March, 1918. Average time, 2 hours. (2) Venice-Trieste (170 miles). (3) Venice-Pola (80 miles). (4) Ancona-Fiume (130 miles). (5) Ancona-Zara (90 miles). (6) Brindisi-Cattaro (150 miles). (7) Brindisi-Valeona (100 miles).

Organized shortly after the signing of the armistice with Austria; operating: (8) Genoa-Nice (100 miles). (9) Genoa-Florence (120 miles). (10) Florence-Rome (140 miles). (11) Rome-Brindisi (290 miles).

Air mail lines (8) to (11), now being worked out, will constitute the Italian section of an interallied air mail service to be established between London, Paris, Rome and Constantinople.

France: (1) Paris-Mans-St. Nazaire (250 miles). Daily mail service by means of twin-engined Letord biplanes (Hispano-Suiza engines). Inaugurated August 15, 1918. Average time, 3 hours. Postage 75 centimes (15 cents). (2) Paris-London (240 miles). (3) Paris-Lyons (240 miles). (4) Lyons-Marseilles (165 miles). (5) Marseilles-Nice (140 miles).

Air mail lines (3) to (5), now being organized, will constitute the French section of an interallied air mail service to be established between London, Paris, Rome and Constantinpole.

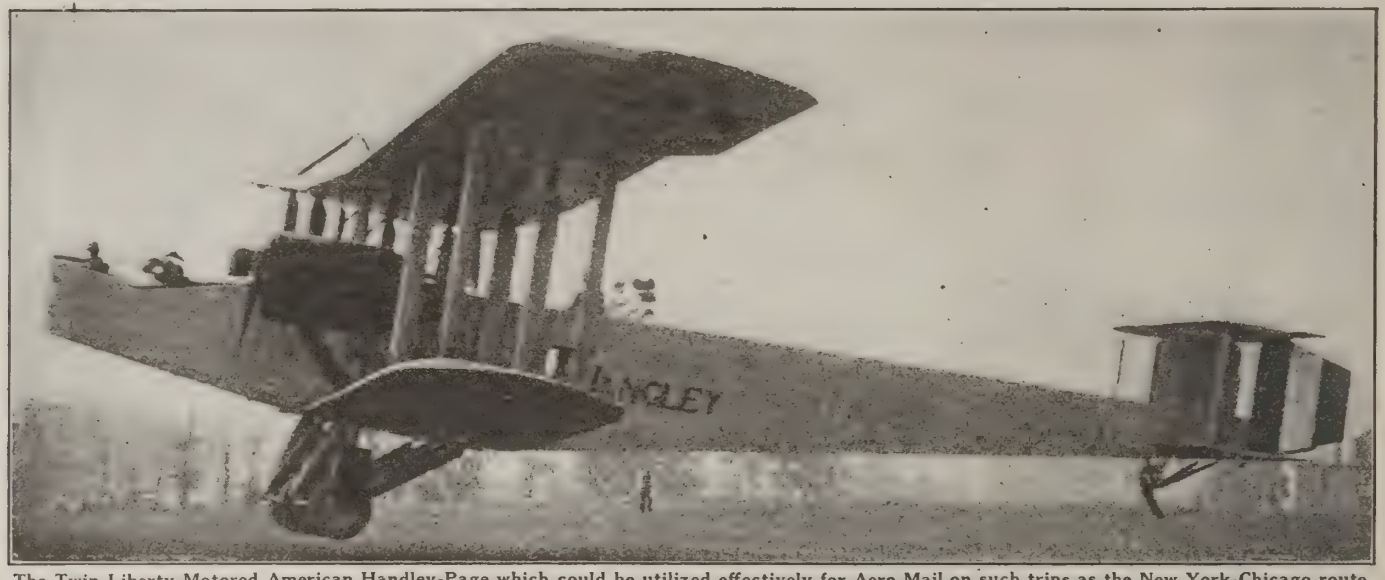
(6) Nice-Ajaccio, Corsica (150 miles). Daily air mail service by means of flying boats about to begin operations.

Various air mail lines, operated by the military, are functioning in southern Algeria and Morocco, chiefly for carrying official correspondence. The organization of an air mail line from Marseilles via Algiers to Timbuctoo is now being worked out. The sections, Biskra-Wargia (240 miles), and Wargia-Inifel (211 miles) and Inifel-In Salah (223 miles), are in operation.

Great Britain: (1) London-Paris (240 miles). Daily passenger service, weather permiting, by means of twin-engined DH-10 biplanes. Now being jointly organized by the Aircraft Transport & Travel (Ltd.) of London, and the Compagnie Generale Transaerienne, of Paris. Average time, two and one-half to three hours.

Greece: (1) Athens-Janina (200 miles). Daily mail service; inaugurated August 8, 1918. (2) Athens-Salonica (220 miles). Daily mail service projected.

Denmark: (1) Copenhagen-Odense-Fredericia-Esierg (170 miles). (2) Copenhagen-Kalundborg-Aarhus (105 miles). (3) Copenhagen-Gothenburg-Christiania (330 miles). Daily mail service projected.



Austria: (1) Vienna-Budapest (140 miles). Daily mail service, inaugurated July 5, 1918. Postage, 5.10 kronen ($1).

Norway: (1) Christiania-Stavanger-Bergen-Trondhjem (670 miles). Oversea route. (2) Christiania-Bergen (200 miles). Overland route. (3) Stavanger-Bergen (100 miles). Oversea route.

Projected air mail lines to be operated by the Norvegian Air Routes Co.: (4) Stavanger-Aberdeen, Scotland (320

equally effective adjunct of the Meteorological office in connection with weather forecasting

The Glenn L. Martin twin motored biplane, the manufacturers of which are now offering to construct similar machines for pleasure and commercial cruising

miles). Projected air mail line to be jointly operated by the Norvegian Air Routes Co. and Aircraft Transport & Travel (Ltd.), London.

Spain: (1) Madrid-Barcelona (320 miles). Barcelona-Palma Balears (170 miles). Projected air mail lines to be operated by a Spanish company.

Future of American Aerial Mail

A comprehensive plan for the development of the U. S. Aerial Mail Service has been adopted by Postmaster General Burleson.

This program directs, first, the establishment of an aerial mail service, connecting the principal commercial centers of the country by a system of trunk lines and feeders, and, secondly, connecting this country with the West Indies and Central and South America. The trunk lines and feeders decided on under this program are:

1. New York to San Francisco, with feeders from—
   - *a* Chicago to St. Louis and Kansas City,
   - *b* Chicago to St. Paul and Minneapolis,
   - *c* Cleveland to Pittsburgh.
2. Boston to Key West, with feeders from—
   - *a* Philadelphia to Pittsburgh,
   - *b* Washington to Cincinnati,
   - *c* Atlanta to New Orleans.
3. Key West via Havana, to Panama.
4. Key West, via the West Indies, to South America.

On this program Postmaster Burleson reports progress as follows:

(1) Boston to Key West—Of this route the Washington-New York division has been operated since May 15th and is functioning perfectly.

The Boston-New York division has been tentatively laid out and will be established as soon as sufficient funds and planes are made available.

The Washington-Atlanta and Atlanta-Key West routes are now being worked out with a view to their early establishment.

(2) New York to San Francisco—Of this route the division from New York to Chicago has been carefully worked out. The War Department, under act of Congress of July 2, 1918, has released to the Post Office Department, for the use of this division, aeroplanes of 650 pounds mail carrying capacity, which are no longer suitable for war needs. The hangars have been ordered, landing fields obtained, and the route has been ordered established before the close of the present year. In a series of aeroplane flights by the Post Office Department, early in September, the route was carefully charted for emergency and regular landing fields. In this work one aeroplane made a record flight from Chicago to New York in less than fourteen hours, including all stops en route. The flights were made through storms and heavy rains over parts of the route. The reconnaissance developed that it will be feasible to maintain a nine-hour schedule between New York and Chicago, as compared with the twenty-one-hour schedule of the Twentieth Century Limited. The New York-Chicago schedule for the present will call for departing from New York at 6 a.m., and arriving at Chicago about 3 p.m., thus connecting with all city deliveries. The principal mail stop will be Cleveland. The time between Chicago and Cleveland will be cut to 3 hours 45 minutes, and between New York and Cleveland to 5 hours 15 minutes. Mail from the Atlantic Seaboard will be advanced from 12 to 24 hours to the West and Southwest by this new service. The feeder routes from Chicago to St. Louis, Kansas City, St. Paul, Minneapolis, and the remainder of the trunk line from Chicago to San Francisco will be worked out during the ensuing year, with a view to their early inauguration.

(3) Key West to Panama, and

(4) Key West to West Indies and South America—Negotiations looking to the conclusion of special aerial mail conventions between the United States and the foreign countries involved for the establishment of these routes to the West Indies and Central and South America are now in progress. It is realized that these oversea routes will require the most powerful aeroplanes with wireless installation and special construction to make them safe over the seas, but the enormous commercial advantage that will result by materially reducing the time between this country and Central and South America will justify the expenditure that such a service will entail.

It is a stupendous plan, which opens the great airways of South and Central America and Canada—the maps and details of which have been worked out and are to be published in *Flying* in the near future.

This is the dawn of the Aerial Age, when those of us who have assisted the development of aeronautics for—well, a lifetime—will see things happen such as we never dared to hope.

Aerial Transportation Lines Planned the World Over

Aerial transportation lines were planned while the war was still on, and the plans began to be put into effect soon after the signing of the armistice.

Thousands of aerial transportation lines are being planned, a few of which are quoted herewith:

(1) From London to Salonica, by way of Nice, Rome, Brindisi and Vallona.

(2) From England to the United States, proposed by Lord Morris, who has championed the project in Parliament.

(3) From Spain to the United States, proposed by Captain Herrera, chief of the Spanish Air Force, which has been discussed by the Spanish Cabinet and is understood to have the approval of King Alfonso of Spain.

(4) From the United States to England, proposed for next June by Captain Benjamin B. Lipsner and a group of other very public-spirited men, who are planning to establish a number of aerial transportation lines in the United States.

(5) Between Australia and London, proposed at a meeting

In carrying out international aerial laws the "aerial police," international or national, will, no doubt, have to use "aerodrome ships," which will house the aeroplanes needed at sea to "head off" aeroplanes of doubtful identity or "pirates of the air" and other lawbreakers. On receipt of a wireless message that the lawbreaker is at large, the planes will be sent up from the aerodrome ship, just as they were sent up daily to head off the German air raiders during the war. In this case the aerial policeman will order the lawbreaker by radio phone to land at a given aerodrome. If it fails to fly in the direction indicated, the "policeman" will probably fire at the motors, to cripple the 'plane and force the lawbreaker to obey. The photograph shows the British aerodrome ship "Furious," which is reported to be 800 feet long, 30,000 tons displacement

First Aerial Fire Fighters during the huge blaze which wiped out many of the new barracks at Camp Mills, Long Island, about noon December 11, 1918, Lieut. Carroll and Lieut. Welsh flew their planes through the thick clouds of rolling smoke and at a very low altitude poured the contents of fire extinguishers over the burning buildings. In spite of the intense heat, both pilots kept within two hundred feet of the conflagration and found very little difficulty in overcoming the immense "bumps" which tended to throw the ship out of control. As the flames were gotten under control, Lieut. Carroll was able to secure several good aerial photographs of the blaze

The "Felixtowe Fury," the Porte triplane flying boat. This monster flying boat, the largest in existence, is a British machine with British engines. It is fitted with five Rolls-Royce "Eagles" engines arranged in tandem sets and one single "pusher" propellers in the tandem sets are four-bladed, and the others two-bladed. The total span of the wings is 123 feet; the length of the fuselage, 60 ft.; the height from keel to ring post, 27 ft. 6 in.; and the total weight 23,400 lbs.—R.A.F. Official Photograph

of business men at Sydney on October 2. The aerial service would take only 150 hours for the trip.

(6) From London to everywhere, proposed and being carried out by Holt Thomas, the managing director of the British Aircraft Manufacturing Company, who explains his plans as follows: "We are opening air routes all over the world in conjunction with local companies. In France we will operate in connection with a French company, and already arrangements for such a service are practically completed in Norway, Denmark, Italy, India and Africa. Later we will extend the service to Japan, China and the West Indies."

(7) From India to other parts of the British Empire, proposed by the Government of India as a postal service.

(8) From India, via Alexandria, and the Red Sea to Australia, via Cape Town, to New Zealand.

(10) From London to Brindisi, by way of Paris, Lyon, Marseilles, Turin, Florence, Rome.

(11) Across the Sahara Desert from Algiers to Biskra, Ouargla, Bourassa, Timbuctoo, Koulikoro and Dakar.

(12) The British Civil Aerial Committee, like the United States Post Office and the Aero Club of America and the Aerial League of America, has planned air lines to every direction of the compass, by aeroplane and dirigible. A report made public on December 13 says, in part: "Airships now exist," the report says, "with a range of more than 4,000 miles, and they can travel at a speed of seventy-eight miles an hour. By running their engines slower a maximum range of 8,000 miles can be obtained.

"On first speed Cape Town, South Africa, is today aerially only a little more than three days from Southampton, while this ship could fly across the Atlantic and return without stopping.

"The committee points out that the future airship will soon develop a speed of 100 miles an hour, that it will be fitted with ample saloons, staterooms, with an elevator to a roof garden, and will be able to remain in the air for over a week."

Mr. Edward M. Thierry, the Berlin staff correspondent of the N. E. A., has reported that Germany is building super-Zeppelins for trans-Atlantic flight. His report follows: "I have visited the immense works outside Berlin at Staaken.

"I have been told by Ferdinand Rasch, director of the Zeppelin works at Friedrichshaven a secret hitherto unrevealed—that on a record distance flight in November, 1917, a Zeppelin flew from Jamboli in Bulgaria to Khartoum in Egypt and return, a distance of 1,030 miles in 96 hours.

"On this flight the Zeppelin carried a crew of 22 men and 25 tons of munitions and medicine intended for the relief of General Lettow-Vorbeck, in German East Africa.

"The Zeppelin received a wireless from Berlin when it was above Khartoum, ordering its return because of a rumor that Lettow-Vorbeck had been captured. It turned back without landing.

"This machine had a gas space of 67,000 cubic meters (87,634 cubic yards).

"The new super-Zeppelin, which is now building, has a gas capacity of 100,000 cubic meters.

"It will have nine engines and eight propellers.

Trans-Atlantic Zeppelin Is 800 Feet in Length

"It will be more than 800 feet in length.

"This super-Zeppelin will cost nearly $1,000,000.

"It will have a carrying capacity of 100 passengers and 45 tons of mail and baggage and 30 tons of petrol, oil and water and provisions.

"The first machine for the trans-Atlantic service is to be completed in July. For maintenance of the service planned, eight active machines and four in reserve will be required.

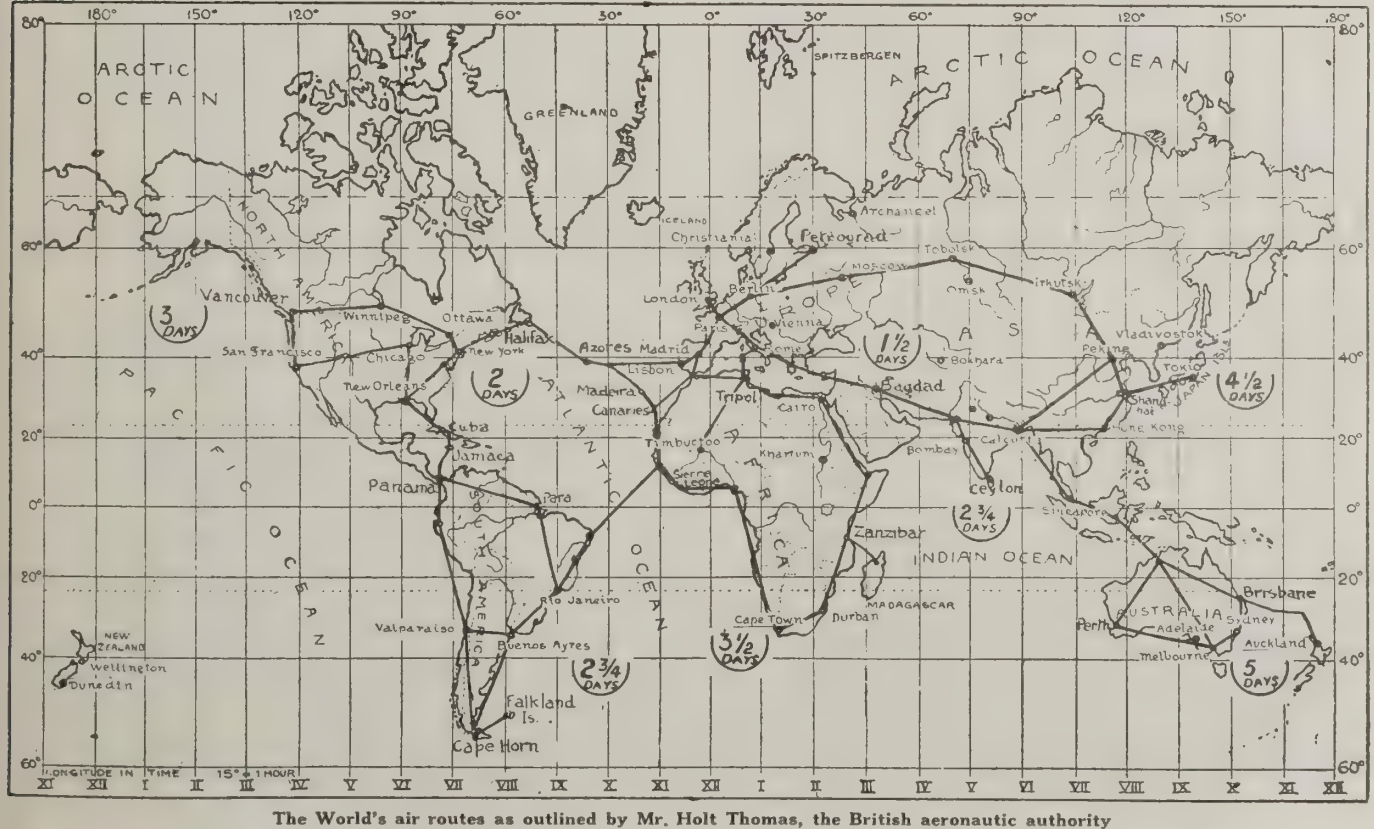
"As soon as the international situation is clarified, it is proposed to establish the service with a hangar in New York."

Roosevelt Arctic Expedition

The Executive Committee of the Aero Club of America have decided to make Captain Bartlett's Arctic Expedition the "Roosevelt Memorial Expedition."

It was Roosevelt, while he was President of the United States, who gave Admiral Peary leave of absence to organize and take charge of the expedition, which led to the discovery of the North Pole. It will be recalled that Peary's ship was named "The Roosevelt" in appreciation of President Roosevelt's interest in the expedition. Captain Bartlett was Captain of the Roosevelt in two Peary expeditions.

Colonel Roosevelt was a veteran supporter of aeronautics. As early as 1897, when he was Assistant Secretary of the Navy, he used his influence to secure the appropriations needed by Professor Langley to continue his work.



Colonel Roosevelt was also responsible for giving the U. S. Army an aeroplane before any other nation had one. In 1907 he approved the ordering of a Wright biplane and a dirigible.

The Roosevelt Memorial Expedition will have four important missions, as follows:

(1) To explore as much as possible of the 1,000,000 miles of unexplored Polar Arctic regions.

(2) To fly across the top of the world from Cape Columbia on the American side to Cape Chelyuskin on the Siberian side.

(3) To conduct extensive soundings in the Polar Basin and collect flora and fauna from the ocean bottom.

The World's air routes as outlined by Mr. Holt Thomas, the British aeronautic authority

(4) To send up sounding balloons and explore the upper air of the Polar regions, gathering meteorological data.

It is also fitting that the first land, if any land is discovered in this first use of aeroplanes for Arctic exploration, shall be named "Roosevelt Land."

The expedition is to start from the United States next June. There are six weeks of fair weather to July and August when, even in the Polar regions, it is seldom lower than sixty degrees above zero. The plans are to have a ship go to Etah, about 600 miles from the North Pole, in June, when the ice is sufficiently broken to permit the ship to cross Mellville Bay.

The ship would carry a large seaplane or land aeroplane for the final flight across the top of the earth, and for long distance exploration of the unexplored Polar regions, as well as smaller planes for the scouting flights for short distance survey.

Immediately upon arrival at Etah a base will be established, and while waiting for the ice to break up further north to permit the ship to go as far as Cape Columbia, the small seaplanes will fly to Cape Columbia and establish a base there for the large plane which is to be used for the flight across the top of the world, from Cape Columbia on the American side, over the Pole, to Cape Chelyuskin on the Siberian side and for exploration over longer distances.

For the six weeks after the middle of July, when the weather conditions are best for flying in the Polar regions, the large plane as well as the small planes will be put into service, and the important work of the expedition will be done, including sending up sounding balloons in the upper air to gather meteorological data.

Results of inestimable value to the United States and to science will surely be obtained from this expedition. There is no doubt whatever that this expedition can explore, survey and photograph the unexplored parts of the Arctic regions and establish the existence or non-existence of land or lands in that region.

The Committee of the Aero Club of America assisting Captain Bartlett consists of Rear Admiral Robert E. Peary, discoverer of the Porth Pole; Alan R. Hawley, Henry A. Wise Wood, Henry Woodhouse, Rear Admiral Bradley A. Fiske, John Hays Hammond, Jr., Rear Admiral William E. Little, U.S.N.; Professor Charles L. Poor, Colonel E. Lester Jones, U.S.A.; Charles Jerome Edwards, Major Cushman A. Rice, U.S.A.; Augustus Post, Major J. C. McCoy.

British Polar Aerial Expedition

Plans have been quietly laid for a British aeroplane expedition to start for the North Pole in April. The British party will travel via Spitzenbergen, where, under the direction of Captain Wild, who was second in command of Sir Ernest Shackleton's South Polar venture, a landing place is in the course of construction at Lawe Sound, and where a camp with abundant supplies has been established.

Captain Frank Wild is a veteran in Antarctic exploration. He was second in command of the Scott expedition in 1901-4 and was a member of the Dr. Douglas Mawson exploring party some years later. He was with Sir Ernest Shackleton first in 1907-9.

Captain Wild commanded the twenty-two men who were left on Elephant Island April 16, 1916, by Shackleton, when he made his famous journey of 750 miles in an open boat with six comrades to South Georgia Island for relief. Wild and his men lived until August 20 on one meal a day, consisting mainly of penguin fried in blubber, unaware that Shackleton had been successful and that help was on the way. They endured incredible hardships.

Aero Club of America Organized Aerial Transportation Committee

Soon after the signing of the armistice the Aero Club of America organized an Aerial Transportation Committee of important members of the Club to develop plans for the drafting of regulations to govern aerial navigation.

Rear-Admiral Robert E. Peary has been selected as Chairman of this important "Aerial Transportation Committee", of which the following prominent members of the Club have been nominated to be members:

Col. Bion J. Arnold, Roger W. Babson, Sir F. W. Baillie, Major T. F. Baldwin, U. S. A.; Bernard M. Baruch, Capt. R. A. Bartlett, Alexander Graham Bell, Major August Belmont, U. S. A.; Laurence V. Benet, Walter Berry, Lieut. Commander P. N. L. Bellinger, U. S. N.; Lieut. Commander W. Starling Burgess, U. S. N.; James M. Beck, General Theodore A. Bingham, Lieut. Col. James A. Blair, Jr., William H. Bliss, Col. G. C. Brant, U. S. A.; Rear Admiral Mark S. Bristol; Lieut. Col. A. R. Christie, Col. C. C. Culver, U. S. A., Lieut. Godfrey L. Cabot, U. S. N.; Manuel Estrada Cabrera, President of Guatamala; Gianni M. E. Caproni, Col. Charles deF. Chandler, Edward B. Close, Alexander Smith Cochran, T. Jefferson Coolidge, J. Parke Channing, W. Redmond Cross, J. S. Cullinan, Glenn H. Curtiss, Capt. Bronson M. Cutting, Edgar B. Davis, Col. Milton F. Davis, U. S. A.; H. P. Davison, James Deering, Charles Dickenson, Capt. Earl W. Dodge, Lieut. W. E. Doherty, U. S. N.; Eben S. Draper, Irenee duPont, T. Coleman duPont, Brig.-Gen. Robert K. Evans, U. S. A.; Rear-Admiral Bradley A. Fiske, Major Max Fleischmann, Col. A. F. Fuller, U. S. A.; Major Robert Glendenning, Major Howard L. Goodhart, Major C. C. Goodrich, Major David M. Goodrich, Major Edwin Gould, Alan R. Hawley, William Hawley, John Hays Hammond, Jr., J. R. Harbeck, A. A. Harriman, Peter Cooper Hewett, Dr. A. L. Hipwell, W. S. Logan, Lt. Col. F. L. V. Hoppin, Hon. Murray Hulbert, Col. H. B. Hersey, Prof. J. F. Haworth, Col. E. Lester Jones, Major-General W. A. Kenly, Major Fiorello H. La Guardia, Capt. B. B. Lipsner, Henry Lockhart, Jr., Capt. Pierre Lorrilard, Harold F. McCormick, Clarence H. Mackay, Emerson McMillan, Lord Northcliffe, Glenn L. Martin, Col. Archie Miller, U. S. A.; Major J. C. McCoy; W. W. Miller, Harry Bowers Mingle, Wm. H. Page, Augustus Post, George W. Perkins, L. C. Phipps, Col. James Prentice, Major Cushman A. Rice, U. S. A.; Prof. C. L. Poor, R. B. Price, N. G. Rost, Hon. William G. Sharp, Allan A. Ryan, Alberto Santos-Dumont, Herbert L. Saterlee, F. L. Seiberling, J. DeMont Thompson, Rodman Wanamaker, Lt. Col. Wm. Thaw, Brig. Gen. Cornelius Vanderbilt, W. K. Vanderbilt, G. Douglas Wardrop, managing editor of AERIAL AGE; Felix M. Warburg, Sidney B. Veit, Henry Woodhouse, Major Orville Wright, Harry Payne Whitney, John N. Willys, K. M. Turner.

"One of the purposes of the Aerial Transportation Committee," said Mr. Hawley, "will be to advise the representatives of scores of cities in the United States who are constantly applying to the Aero Club of America and the Aerial League of America for information, advice and guidance in establishing aerodromes.

"Another purpose will be to cooperate with the Post Office in establishing aerial mail lines and extending the aerial mail service.

"Preliminary reports on the subject of aerial transportation and regulations to govern aerial navigation have been made to the Board of Governors of the club and data has been collected showing what England, France and Italy are planning to do. These countries are planning most extensive air lines, although their geographic conditions are not as favorable for aerial transportation as they are in the United States. We should do likewise in this country and utilize the 20,000 Liberty motors which are being stored away and the tens of millions of dollars' worth of aeroplanes which will be entirely wasted unless used during the coming six months, as aeronautic equipment deteriorates fast."

Recommendation for the Solution of National Aeronautic Problems

In an address before the Convention of the National Rivers and Harbors Congress, President Hawley of the Aero Club of America, offered the following recommendations:

(1) The organization of a Government organization simliar to the Grain Corporation, to be known as the Aerial Transportation Corporation, or a similar name, capitalized at $50,000,000, which shall take over the $800,000,000 worth of aeroplanes, motors and aeronautic equipment which the Army and Navy cannot use and are trying to dispose of. This corporation shall devise ways and means for salvaging this equipment, utilizing whatever can be used to establish aerial transportation lines in the United States and supplying the South and Central American countries which are anxious to have aerial transportation lines.

(2) Let this Government owned Aerial Transport Company take over the twenty or so Army aviation stations and aviation depots which the Army has abandoned or is abandoning and operate them as public aerodromes where the Post Office as well as civilian aviators can use the hangars and facilities by paying rent.

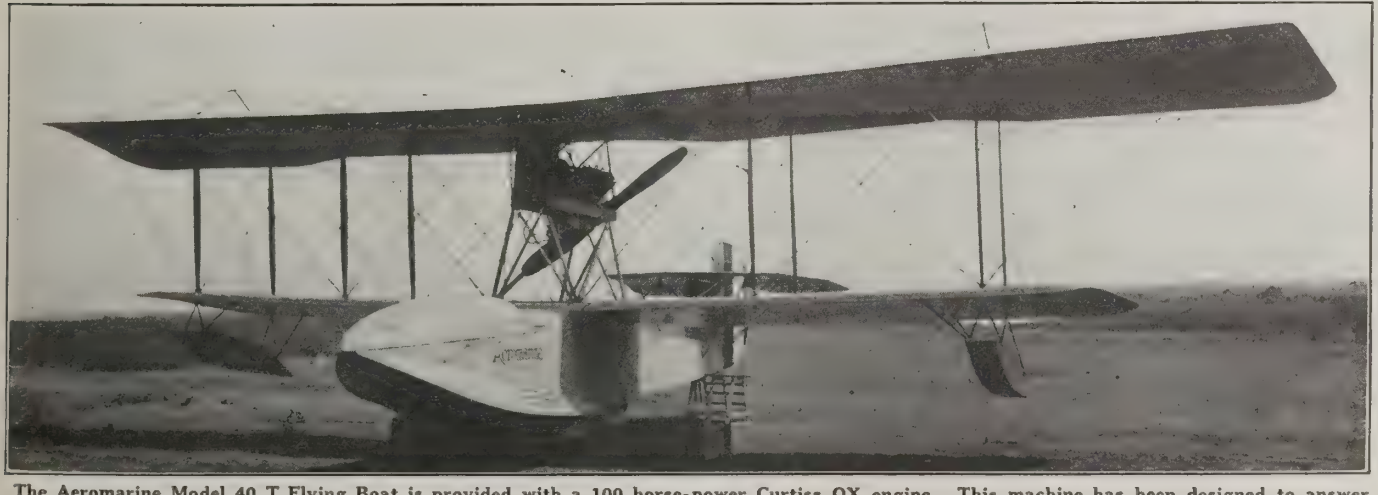
(3) Let this corporation establish and operate aerial transport lines between industrial centers. Some of these lines can run from New York to San Francisco, from Washington to Chicago, from Minneapolis to New Orleans, from New Orleans to New York, from Seattle and Portland, Oregon, to San Francisco, Los Angeles and San Domingo, from Detroit to St. Paul, from Key West to Havana, from Portland, Maine, to Boston and New York. Scores of such aerial

The aerial limousine of the Dayton-Wright Company, making a week-end journey of 1,500 miles an event of luxury

transportation lines could be established and operated immediately, employing some of the thousands of idle Army and Navy aviators and mechanics, and they would solve the difficult national problems of transportation, solving the problem of utilizing the idle equipment and employing the idle aviators.

(4) All air traffic should be classed with interstate and international traffic, and the interstate traffic regulations should be extended to include air traffic.

(5) The Department of Commerce should be given charge of the registration and inspection of aircraft, creating in the Department of Commerce an Aircraft Inspection service similar to the present Steamboat Inspection Service.



"The subject is most extensive and it is therefore impossible to discuss in detail the regulations that have been proposed by the British Aerial Transport Commiittee. Mr. Henry Woodhouse has made a close study of the aerial regulations of different countries in the past ten years, and has pointed out by actual illustrations how some of the most difficult problems of enforcing the aerial regulations can be solved by using the wireless telephones developed by Colonel C. C. Culver."

Foodstuffs by Aeroplanes

The British Air Ministry have sanctioned the scheme to carry foodstuffs to Belgium by aeroplane. This is satisfactory news and marks the inception of the commercial traffic from this country, although those who are endeavoring to read the signs in the skies have noted with interest that a stipulation has been made by the authorities. In giving their approval to the scheme the Ministry have insisted, as in the case of the Paris Airbus, that service-pilots of the Royal Air Force, and not private aviators, shall make all the aerial journeys. This rather tends to strengthen the belief that the Air Ministry means, if possible, to retain the control of commercial aviation, although it may be that on the signing of Peace the ban will be lifted. We must wait and see. So far as the scheme is concerned, the Belgian authorities have been led to adopt it, as they find it impossible to ship the foodstuffs they have purchased in England for their people, owing to the congestion at all the docks in England. The flights are to take place from Hawking's Aerodrome to the Belgium Aerodrome outside Ghent, and the load carried will comprise about two tons of foodstuffs.

Popular Priced Trips in England

General Sir David Henderson, of the Royal Air Force, proposes before demobilization to organize flights of six or eight aerplanes around the principal cities and towns in Great Britain. The object of these visits would be to provide flights for the general public at a low fee, approximately three dollars, and to provide cross-country flights, exhibitions, and general instruction on aviation.

The Aeromarine Model 40 T Flying Boat is provided with a 100 horse-power Curtiss OX engine. This machine has been designed to answer requirements of the sportsman.

The Curtiss twin-motored Flying Boat, which will become popular with sportsmen with homes on the waterfront, accommodating, as it does, a dozen passengers

Flying-Boat Popularity

No small share of the coming developments lies with the flying-boat, which has been improved considerably since it was introduced to active service on behalf of the Allies. The sloppy machines of those days and the comfortable enclosed type which is now in view at the Aeronautic Exposition for civilian use present a great contrast, with all the advantage of experience and serviceability on the side of the later production. Some of the designs which have come under our notice recently combine boat excellence with biplane merits, every detail proving that the lessons enforced in the stern tests of warfare have been properly applied in planning the new craft. It would be idle to say that the flying-boat has fully qualified itself yet for the open sea, where rough water and rough weather have to be taken into account, but it is a progressible proposition and will go ahead in more senses than one.

Commercial Aeronautic Possibilities in South Africa

A London aeronautic publication has discussed the future of commercial aeronautics in South Africa in a recent issue which indicates the progressive attitude of the British industry.

Realizing that for the present the most important function that aeronautic transport can accomplish is the delivery of mails and passengers, in this respect, conditions in South Africa are especially conducive to aerial commerce. The population is small, but wealthy and active. Distance between cities is large and railroad communication poor. The railways follow the contour of the hills, having been built at so much per mile. The contractors therefore avoided bridges, tunnels and embankments. Grades of one in forty are numerous. The windings and contortions of the snake-like tracks make it seem quite possible in many places to shake hands with the engineer in the rear car. The ever-present sand and dust are especially disagreeable. These conditions, as compared with cool and speedy transportation by aeroplane, would make it difficult for railroads to compete with well-organized aerial passenger lines.

The stable weather conditions, absence of hurricanes and high winds, extreme clearness of the atmosphere, the definite rainy season on only one short fixed period of the year make conditions excellent for reliable air travel.

The natural wealth of the Union, not only in precious metals and minerals but in the whole range of natural resources, as well as its ability to supply many of the necessary materials for the maintenance of commercial aircraft, makes the prospects of an enterprising aircraft organization most excellent. Alcohol suitable for fuel is produced in considerable quantities and the climate in some parts is suitable for spruce growing. Land is available for aerodromes at low rates.

The details of various routes are outlined in the article. The first route is suggested from Cape Town to Kimberly, 525 miles air line. The train service between these important points consists of two trains each way daily, with a running time of thirty hours. The estimated time by air, allowing for stops, is eight hours.

A route from Kimberly to Johannesburg, requiring 45 hours by rail, could be covered by aeroplane in twelve hours. From Kimberly to Durban a saving of thirty-six hours could be made, the time by rail being forty-one hours and by plane five and a half hours.

The Dayton-Wright De Haviland 4, converted from a bombing machine into an enclosed passenger craft for two passengers and pilot

The ultimate expansion of an aerial transport system would result in a route from Cape Town to Cairo.

Australia Has Commercial Aeronautic Plans

Auckland, New Zealand.—The Minister of Posts and Telegraphs in New Zealand is supporting a movement for the establishment of aerial transport and aerial mail lines between various parts of New Zealand, extending from Auckand to Dunedin, a distance of 700 miles, and between New Zealand and Australia.

Mr. L. A. Walsh, the managing director of Walsh Brothers & Dexter, Ltd., aeronautical constructors and engineers, who was in charge of the training of military aviators during the war, has been one of the moving spirits in the development of these plans. Under his direction several types of single and twin-motored flying boats have been constructed, employing Hall-Scott motors for propulsion.

A large number of military fliers will be available for operating commercial aircraft.

A 3,000 H.P. British Machine

The latest British commercial aeroplane is the Tarrant triplane, a huge machine with a wing span of 150 feet and a length of 75 feet, being built by Mr. G. W. Tarrant, of Byfleet, Surrey. It will, when completed, have a six-engine power plant developing 3,000 H.P., and it is expected to travel at 80 to 100 miles an hour for 500 miles without refuelling. The machine, which is a development of a "bomber" about to be produced when the armistice was signed, is designed to accommodate passengers or cargo.

People seated in the body of the machine will be in an enclosed cabin provided with wlndows. As a cargo plane the machine will carry nearly six tons of goods. The whole of the interior of the body space will be available for the cargo or for passengers. By the sacrifice of cargo space and the substitution of petrol tanks, the range of the triplane could be greatly increased, a trip across the Atlantic being made a comparatively simple task.

Marconi Company to Supply Wireless Passenger and Mail Aeroplanes

Godfrey Isaacs announced December 18 that the Marconi Company would outfit aeroplanes employed in air passenger and mail service with wireless and would supply operators in the same way as it now serves ships. It also is intended to receive regular reports of air conditions in different localities and to circulate these for the information of the pilots. As every aeroplane will have either a name or distinguishing number, it will be possible to send telegrams from any part of the world or from any ship to an aeroplane. It is intended that this organization will be ready by the time the peace treaty is signed.

Arrangements recently have been made for the erection of wireless stations in the extreme parts of China, one on the frontier of Cashmere and another on the Chinese side of Siberia. Mr. Isaacs has arranged with Handley Page for the transport of the necessary machinery by one or more of his big machines. The journey inland will take two or three days in place of the same number of months.

A Free Hand for the Manufacturer

Now that we know how we stand about commercial aviation there is one matter upon which we must have a clear understanding. In common with others we are anxious to make certain that when the Government gets a firmer hold on aviation the tendency will not be to create or encourage monopolies and to freeze out the smaller firms. In this country we have no liking for the trust or anything resembling it. It is a bad old principle to allow any giant enterprise to get the control of anything, for the reason that not only does it lead to graft and other evils but it kills individuality. The latter quality has placed us where we are, not only in aviation but in all branches of the national work. At the beginning of the war, while some of the larger munition works were struggling to reorganize their methods, it was the small shop which came to the rescue and enabled us to meet the great demands made upon us. Similarly, some of the lesser aviation manufacturers, working at first without a great deal of assistance—and, if the truth be told, without any too much encouragement— have made good and contributed in no small measure to the supremacy we have won. We must continue to give these firms free facilities to develop the schemes which they have been formulating and which would havv been put into operation but for the fact that during the war they have been tied down to a particular line or policy. We want competition. Without it we shall be in danger of getting into a rut. The big firms have done well and, we doubt not, will do still better work in the future. But there are, doubtless, firms which, so far, we have heard little about, who may have inventions or plans which will place us head and shoulders above our rivals. Are they to have a free hand? There can be only one answer to the question.

The Curtiss triplane which will undoubtedly be heard from in the speed competitions which will be a feature of the Aeronautical Conveniton at Atlantic City in May

THE AERONAUTICAL EXPOSITION

LARGE crowds of interested spectators have daily visited the Aeronautical Exposition being held in Madison Square Garden and the 69th Regiment Armory, under the auspices of the Manufacturers Aircraft Association, the exhibits of which were completely described in last week's AERIAL AGE.

Various speakers of national prominence have visited the Exposition each day, and have delivered rousing messages on the role of aeronautics in war and commerce. We quote some of the more outstanding speeches.

Admiral Usher

Admiral N. R. Usher, Commander of the Third Naval District, told a large audience that America had advanced so far in aeronautics since its entrance into the war that it was only a question of a short time before the aeroplane will rival the railroad and automobile as a means of transportation in this country.

Vice-Admiral Albert Gleaves, formerly commandant of the New York Navy Yard, after viewing the exhibit, said:

"The part which has been played by the aerial arm of the United States Navy justifies me in saying that the possibilities open to this new means of transportation are almost unlimited. So much has been accomplished with the military machines that, as I look at these newer commercial types, I cannot visualize the future. It's a wonderful prospect for aviation."

Admiral N. R. Usher said:

"I come here this afternoon on the part of the Secretary of the Navy and at the request of the officers of the Aeronautical Exposition to say a word of the part the Navy played in the development of the navigation of the air. The exposition is staged and offered to the citizens of our country that they may become better acquainted with that new art which at this time is still in a state of progressiveness.

"Previous to the outbreak of this war, already our Navy had taken an interest in navigation and use of the air for the purpose of belligerent action aloft. By reason of various circumstances in our country, although the first fliers were our own—the Wright Brothers showed the way to others—the announcement of the war found us without that preliminary preparation to enable us to at once make the supremacy, but I am pleased to say that, due to American ingenuity and the devotion of our manufacturers—many of whom are represented here—at the termination of hostilities we were in a position to take complete charge aloft. Our men were able to dominate the air.

"In this immediate surrounding you will behold the exhibit sent here by the Secretary of the Navy, showing you the present as well as the former efforts made to provide efficient and sufficient fighting machines. The results of the American Liberty engine you all know, and I may say that at the time the armistice was signed. the American Navy had 17,000 men—fliers and non-fliers—abroad ready to take the Navy's part in the conflict. For the last eight months of the war we had been able to put abroad a sufficient number of planes to properly patrol the shores of the North Sea, the French coast and the Adriatic coast in the Mediterranean.

"From among other preparations which had to be made by us for actual entry into the war, we were ready at the time the Hun quit. But with that progress which you see in this Exposition, not only in the Armory, but in the Garden, you will see that our country is prepared to navigate the air with machines worthy of the confidence of all, and, without being a prophet, one may say that we are at the entrance of aerial navigation for carrying people, from one part of the country to another, which will presently be a strong competitor with the railway or automobile. I bespeak your careful attention and interested appreciation of what the Association has done to present this to your view. I speak not only for myself, but I have come here at the request of the Secretary of the Navy. I invite your attention to what has been done by our own flying people."

T. Kennard Thomson

Mr. T. Kennard Thomson, consulting engineer, said that how soon America will take to air flying of all kinds is up to Congress.

Quoting Assistant Secretary of War Crowell and Assistant Secretary of the Navy Franklin D. Roosevelt among big men in the service who declare New York City laggard in appreciating the present necessity for landing and getting off facilities for aircraft, Mr. Thomson outlined a project which he said he had presented to Congress and the President for extending the lower tip of Manhattan, off the battery, four miles into the bay, for use as a flying field.

Mr. Thomson mentioned more than a score of Army and Navy notables who had flown to New York's nearest landing place, Hazelhurst Field, Mineola, from Washington, D. C., during the past week, to discover that more time was required for the land transit into Manhattan from the Long Island hangar than was consumed in flying from the starting base.

In his chat, the speaker sketched the growth of the city from an Indian village to the present time. How many of the streets of the city got their names, the excitement that a viaduct across Broadway in 1829 created when it was built to prevent vehicle accidents, the alarm of the populace when the draft riots of the Civil War broke out, and other flashes of the Island's early history were included in the review.

Mr. Thomson's Battery hangar anticipates a coffer dam walling in the extension, providing work in its building for more than 50,000 men a year, and the hangar's completion within five years.

General Guy Livingston

Gen. Guy Livingston, director of the British Air Service before the formation of the Air Ministry, said:

"The most important thing to emphasize at this stage of aerial development is the necessity for cooperation between the great nations. Let us place all our cards on the table, so that we can benefit fully from all information that will help in the evolution of flying. America and Great Britain, more particularly, should get together.

"Personally, I don't think it matters a bit who first crosses the Atlantic—America, France, Italy or Great Britain.

"Very probably the Atlantic will be crossed this year; in fact, I think it will be accomplished within the next two or three months. It is precisely the same problem that confronted aviators some years ago in the crossing of the English Channel.

"Latham came within a few yards of the English coast before his engine failed him. Then a little later Bleriot, by a little luck, succeeded in making the crossing. After all, there is a good deal of luck in the matter of long distance flights, and the man who meets with favorable weather conditions will be the first man over.

"Great Britain has already established an Air Ministry that will cooperate with the manufacturers and coordinate all branches of aircraft development. At the present moment in this country you have the Army, Navy, the Marine Corps, and the Postal Service and the Interior Department all engaged in aviation development. In the natural evolution of things, I feel quite sure that within the next five years there will be an Air Department in America to do the same thing. It is only natural that the great business sense of Americans will quickly realize the necessity for that.

"The aviation industry will be retarded if irresponsible companies are formed, which make great and impossible promises and then sell stock to the public, giving a very small or no return.

"The story is so good that it seems a pity to overstate it and thereby lose the confidence of the public. I am quite convinced that if some-

The Gallaudet Aircraft Corporation's Exhibit—the small monoplane in contrast with the Model S Seaplane

A view of the accessory section, showing Standard Parts Co., Ajax Auto & Aero Sheet Metal Co. and Dayton Wire Wheel Co.

one told the public right now that it was possible to fly an aeroplane at five hundred miles an hour, the story would be generally believed. We may fly at five hundred miles an hour, but it will not be for many years.

"I think you will have a sound aircraft industry here in five years if the manufacturers do not tell the public they are going to fly to the moon in a few minutes.

"The main thing is not to promise anything that cannot be possibly accomplished. Don't let us tell the public that aeroplanes are going to supersede the Twentieth Century Limited, or the train from London to Manchester. The aeroplane is not going to supersede any form of transportation, but will be an adjunct to all of them."

Senator Key Pittman

Expressing astonishment that, after flying from Washington in a Glenn L. Martin bombing plane, the party could find no place in New York City to land, but was compelled to go down to Mineola, Senator Key Pittman of Nevada urged New York citizens to demand of their representatives in Congress legislation that would provide proper landing fields for commercial aeroplanes in every large city in the country.

The time is here, the Senator said, when the aeroplane as a commercial proposition is no longer a doubt but a certainty. Just how soon it reaches its full development in the commercial field, he added, would be up to the people.

Senator Pittman travelled from Washintgon to Mineola with Benedict Crowell, First Assistant Secretary of War, against a head wind in two and one-half hours. The pilot was Major Maurice Connolly, ex-representative from Iowa, who was accompanied by Captain Roy N. Francis, of the Army Aviation Service.

In introducing Senator Pittman, Assistant Secretary Crowell said every one agreed that the future of flying depended on the existence of the private manufacturer. He urged that the organizations which had been developed during the war by private aircraft manufacturers be perpetuated.

Senator Pittman caught the attention of the crowd at the outset by saying that after fifteen minutes in the air he felt just as safe as though on land.

"I want to say to you," the Senator continued, "that today for the first time in my life I rode from Washington to your city in front of a Glenn L. Martin bomber. There was no jar. There was no danger. It rode easier than any vehicle I ever entered in my life. In fifteen minutes I felt, as I know now, that it has come to stay. It has come to be a great public utility. It has come to give this country, with its genius and ingenuity, control and domination throughout the world to which it is entitled. It rests with the people of this country whether or not they are going to make it so.

"When you understand that the navigation of the air is as easy as the navigation of the water, when you understand that the aeroplane is just as practicable as the automobile, then you are going to support it.

"But first you are going to insist that there shall be established in your great city and other great cities places where these planes can land, instead of going to Long Island. Every city in the United States must have a place where these ships can land, prepare and repair, and it is 'up to you to go to your representatives in Congress and insist upon adequate laws to bring this about."

After viewing the exhibits, Senator Pittman reiterated that support should be given aerial navigation and that he would do his part toward passing any law that would aid the development of the aeroplane for commercial purposes.

Mr. Otto Praeger

A radio direction finder, which literally "calls to its home port" the mail carrying aeroplane, was described for the first time by Otto Praeger, Second Assistant Postmaster General, in a speech at the Aeronautical Exposition.

It was Aerial Mail Day, and Mr. Praeger, along with other aero mail officials, was the guest of honor.

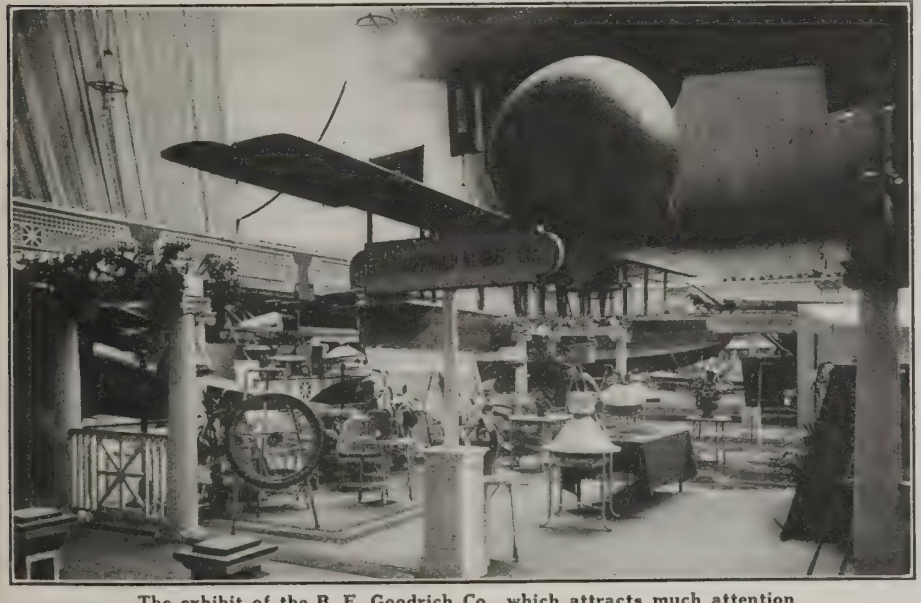
"A radio direction finder," said Mr. Praeger, "has been worked out so accurately for the Post Office Department that the aero mail testing plane has flown from Washington to Philadelphia by signals from the League Island Navy Yard with the pilot not a hair's breadth out of its course. The finishing touch to this radio direction giving is being put on the aeroplane mail planes by the Bureau of Standards in a device that will give the pilot the exact center of the air mail field and enable him to descend in the thickest fog in an intensely illuminated streak on the ground which he will be able to see sufficiently far to permit setting down his plane in any kind of weather."

This announcement was of particular significance because of Mr. Praeger's definite statement made earlier in the day that the New York-Chicago Aerial Mail Service would be in operation before the summer is over and that probably the service could be extended to St. Louis, Omaha, Minneapolis and St. Paul.

Mr. Praeger's plans call for the use of 18 special ships, which have been promised by the manufacturers by April 15. His schedule calls for night service of from eight to ten hours between New York and Chicago. Service between Cleveland and Chicago will begin first, Mr. Praeger indicated.

"We stand now at the threshhold of commercial aviation," Mr. Praeger said in his speech. "Only a short step needs to be taken to bridge the gap between military flying and commercial aviation. It is only a matter of readjusting to the needs of commerce the wonderful development achieved in military planes. It is this readjustment that the Aerial Mail is working out.

"What is required for a commercial aeroplane is dependability in operation, safety in operation, and economy in operation. To accomplish the first you must have a plane that will stay in the air. You already have the power that will drive an aeroplane at better than railway speed against the severest gales that it may encounter, and you are rapidly perfecting the instruments that will enable navigation of an aeroplane with the certainty of a ship at sea.



"A vessel in distress can ride on the waves in security until repairs are made. A railway train can stand on its tracks or limp into a siding for repairs, and a motor truck can halt on the pike pending the making of adjustments—but an aeroplane must come down to whatever berth it can find when its mechanism goes out of gear. A single motor plane will remain in the air only so long as its engine can turn up a certain number of revolutions a minute. A triple motor plane can lose one power plant entirely and reach its destination against a head wind, and a four or five motor plane can lose at least two of its engines and not only stay in the air, but proceed on its way while minor adjustments are being made in flight. How great is this prospect of certainty of operation in a multiple motor plane may be readily judged from the remarkable performance of the single motor planes that carry the mail daily between New York and Washington.

"Between May 15, 1918, and March 1, 1919, the Aerial Mail operations between New York and Washington covered 112,228 miles, or 1,536 hours in the air. In all this flying there were only 29 forced landings on account of mechanical trouble; that is, one forced landing to every 3,870 miles of flying. Seven of the forced landings were due to leaks in the oil system; 6 were due to leaks in the radiator and water lines; 6 were due to plugs fouling; 3 were due to magneto troubles; 2 were the results of valve failures and one forced landing each was chargeable to the generator, the distributor, the gas line, the carburetor and the breaking of the connecting rod. It may be interesting to note that on March 1 we have not had a forced landing due to spark plug fouling since December 24; we have had no forced landings due to carburetor trouble since August 27; we have had no forced landing due to gas line leak since July 23, 1918; no forced landing due to dirty distributor since June 3; no forced landing due to magneto trouble since December 11, 1918.

"Right here it might not be amiss to say a word as to the safety of pilots in flying the aerial mail. In the 112,228 miles flown between New York and Washington we have never had a plane to fall out of the sky. We have never killed or crippled a pilot on this mail route. There have been six cases of bruising in forced landings that, however, did not incapacitate any pilot for as much as one hour, and there has been but one serious injury to pilots on the New York-Washington route. One mechanic lost his life by coming in contact with a whirling

The SVA biplane constructed by Gio Ansaldo & Co.

The exhibit of the B. F. Goodrich Co., which attracts much attention

The Packard Biplane, with special 8 cylinder Packard aviation engine

propeller on the ground, and one applicant for a position as pilot lost his life in flying a De Haviland plane to demonstrate his ability. This is a record in daily cross-country flying, in all kinds of weather, with a parallel, and shows that commercial flying is not in the same dangerous class with stunt or military flying.

"There is one more problem—a most essential problem to successful commercial navigation. Aeroplane manufacturers must solve this. It is the problem of landing your plane on a small plot of ground. There is no use in arguing against this proposition. Aeronautical engineers must solve that problem to make the aeroplane a complete success. Until that problem is solved, forced landings or landings even on prepared fields will not be robbed of their terrior, of their danger to life, and their danger to property. The man who will show us how to flutter the aeroplane down as a bird lights will have done almost as much for aviation as Langley and Wright, who have shown us how to fly. When you solve that problem, everybody will fly and aeroplane factories will have to operate their shifts a day to supply the demand. If you do not solve this, the manufacturers will have trouble finding market enough to keep one shift going economically."

The Boeing Seaplane, described in detail elsewhere in this issue

The Goodyear Tire & Rubber Co. Exhibit

The Goodyear Exhibit

One of the most elaborate and interesting exhibits at the Aeronautical Exposition is that of the Goodyear Tire and Rubber Company of Akron, O. This exhibit contains a complete line of rubber aeronautical accessories, samples of balloon fabric and models of the different types of balloons. Suspended in the booth are three miniature balloons, a representative of each type, that has seen wide use in the war. These three types are the spherical or free balloon, the kite or captive balloon, and the non-rigid dirigible or blimp type of balloon. These balloons are built to scale and in every respect, except size, like the types of balloons that have been used by the Government in its air programme.

The exhibit also contains a model car for a big dirigible, the kind that Americans will soon be riding in during their transatlantic trips.

A very interesting feature of the exhibit is a balloon suspension patch, which shows the method of attaching to the balloon the ropes that hold the passenger carrying basket. A big balloon patch, shaped somewhat like a mammoth finger, is shown lifting a weight of 1,000 pounds, and as the entire balloon is usually required to sustain a load of little more than a ton, with upward of forty such balloon patches to help, the immense factor of safety in the suspension of the car is readily appreciated.

The big feature of the exhibit is a massive kite balloon of the type that was used on the battle fronts. This big bag is suspended from the roof and extends nearly across the width of the exposition hall. It is 90 feet long and 22 feet in diameter.

The Goodyear Tire & Rubber Co. began the manufacture of balloons and aeronautical supplies before the war, so that when our country entered the war, and an immediate need came up for balloons, this company was in position to commence prompt manufacture of the lighter-than-air craft equipment that the Government needed.

A big balloon pilot training school was established in which Goodyear men were trained as pilots and these pilots, in turn assisted in the training of the naval student officers, sent by the navy to receive instruction in the Goodyear school.

Since the cessation of hostilities the Government has taken over the Goodyear flying field and is now operating it as an experimental balloon station.

During the war this country made and delivered to the Government 900 balloons of the different types shown at their booth at the exhibition.

The Navy Dirigible

The most imposing exhibition at the Aeronautical Show is the big Navy coast patrol dirigible, which extends practically the entire length of the 69th Regiment Armory. This big balloon, the A-247, was built by the B. F. Goodrich Company in August, 1917, and is said to be the first dirigible accepted and used by the Government. It is 167 feet long, 33 feet in diameter and is driven by a 100-horsepower Curtiss engine. It has been in actual service over seventeen months, patrolling the coast, looking for submarines, &c., and has covered over 23,000 miles. It has never had an accident.

The activities of the B. F. Goodrich Company in aeronautics makes an interesting story. When the war broke out the Government wanted quick

action, and the Goodrich Company was one of the first to jump in. The big dirigible shown was the first one built, and it was accepted. When hostilities stopped the company was building one balloon a day, and had built up an enormous department of aeronautics, capable of great production and expansion.

Training Courses in Colleges

Anticipating the commercial development of aviation and at the same time assuring a ready air force for military exigencies which might arise in the future, the Division of Military Aeronautics is about to inaugurate a training course for college students. The course which has been designed, not to interfere with the prescribed studies, is expected to turn out in three years a finished aviator.

The plan, as outlined by Colonel B. F. Castle, a member of the Control Board of the Division of Military Aeronautics, provides for the absorbing by the college student while working for his degree of subjects included in the curricula of wartime ground school. This takes care of the necessary theoretical work in three months. The flying training under the Government's plan will be given during the Summer months at the various flying fields owned by the Government. The student aviator in order to win his coveted "wings" will be obliged to take this flying instruction three months annually for three years.

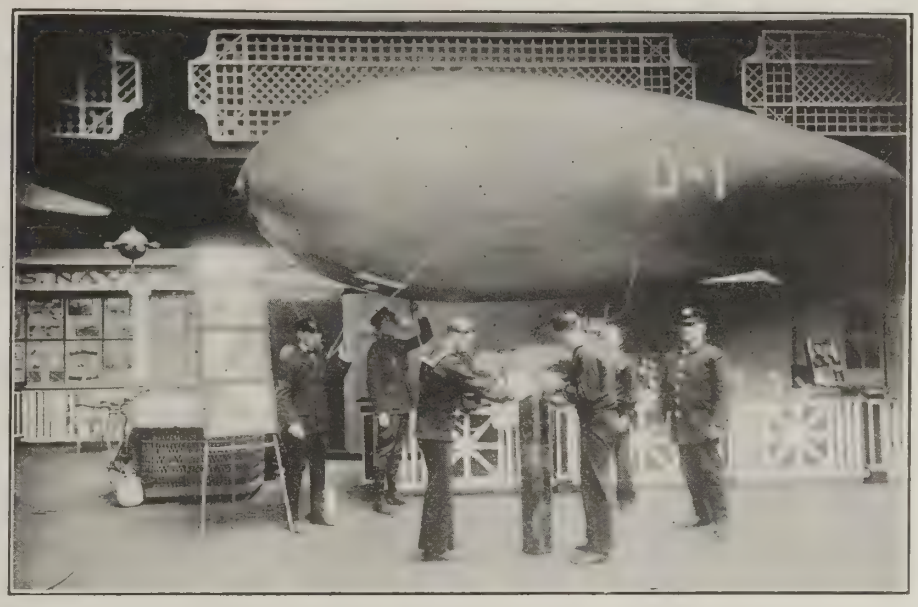
The Government plan, as explained by Colonel Castle in a statement, is as follows:

"As regards military aeronautics units of the Reserve Officers' Training Corps, we are proceeding on the assumption that aviators will become superannuated more rapidly than any other kind of officer, so that it is imperative that the supply of trained personnel be kept up. In view of the strength of the air service at the cessation of hostilities and in view of the depreciation among our reserve officers of not less than 10 per cent. a year, it is estimated that we must draw from some source about 1,000 pilots, 850 airplane and balloon observers, and 100 engineer officers every years. West Point, essentially military schools, and the ranks can be drawn upon only to fill up the regular establishment. The reserve then must be filled, as it was during the war, largely from the colleges and universities.

"In order not to take the better part of a year or a man's time to train him as a pilot or observer the machinery of the Reserve Officers' Training Corps, as established by General Order No. 49, 1916, (W. D.,) and now in process of modification, was chosen as most likely to bring about desired results.

"In outline the plan is to give the equivalent of the work formerly done in the ground schools, exclusive of military practice, that is, airplanes, engines, gunnery, navigation and maps, infantry and artillery co-operation, and signalling, at the colleges and universities duirng the college year and give flying and military training during the six weeks' Summer camps held at Northern flying fields. It is estimated that three Summer camps will be required to qualify a man for his wings.

Three Years of Study

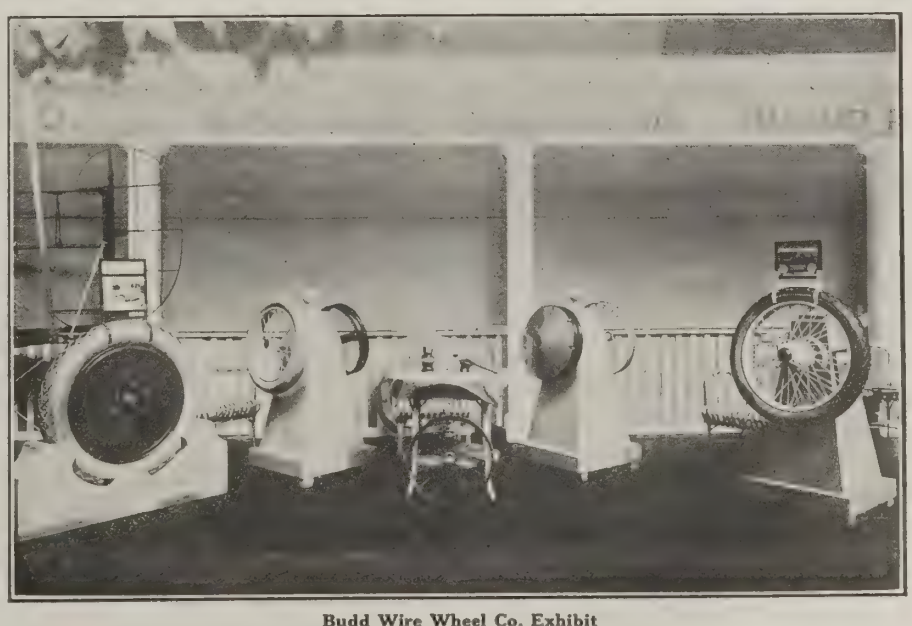


"The pilot at the first Summer camp is introduced to the army and to the air; the second turns him out a good straight flier; the third teaches him gunnery, bombing, and other specialties.

"The airplane observer at the first Summer camp will get much the same training as the pilot, but, at the second camp (spent at the Artillery School of Fire) he will learn the whole duty of an artillery observer, and at the third camp, serial gunnery, bombing, reconnoissance, and contact. The curriculum for balloon observers is not yet worked out in detail.

"The training for squadron engineer officers will involve courses at college in the scientific and engineering aspects of airplanes, airplane engines and accessories. The Summer camps will give the student practical insight into the problems of plans and engine repair and maintenance, and ship and hangar administration. The third Summer will be spent at an aviation experimental station learning the interior secrets of engine and plane design and testing.

"Apart from the college work, junior units will be established in mechanical training high schools, with the aim of training boys of a mechanical turn in the technical side of aviation, preparing them to be Air Service noncommissioned officers in time of war. One of the greatest difficulties of the situation just passed was the recruiting of the necessary trade specialists for our service, repair and construction squadrons. The Air Service needs trained chauffeurs, bricklayers, plumbers, carpenters, electricians, machinists, indeed, men of every craft in great numbers, and in another emergency must know exactly where to find them.



"Still another class of training is contemplated in the plan to co-operate with technical schools and engineering colleges in the training of aeronautical engineers who will be men highly trained as engineers and specialized particularly in the most far-reaching problems of aviation.'

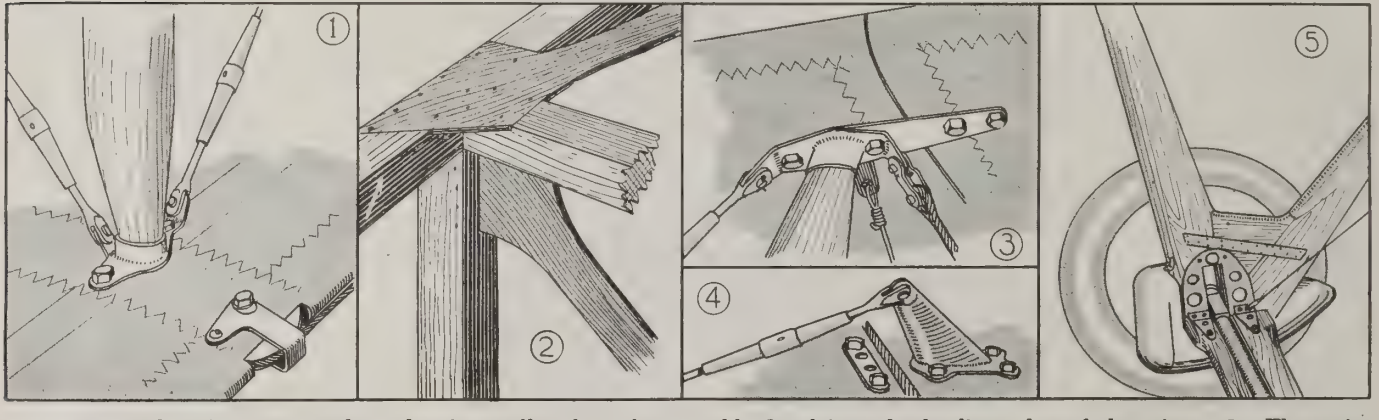
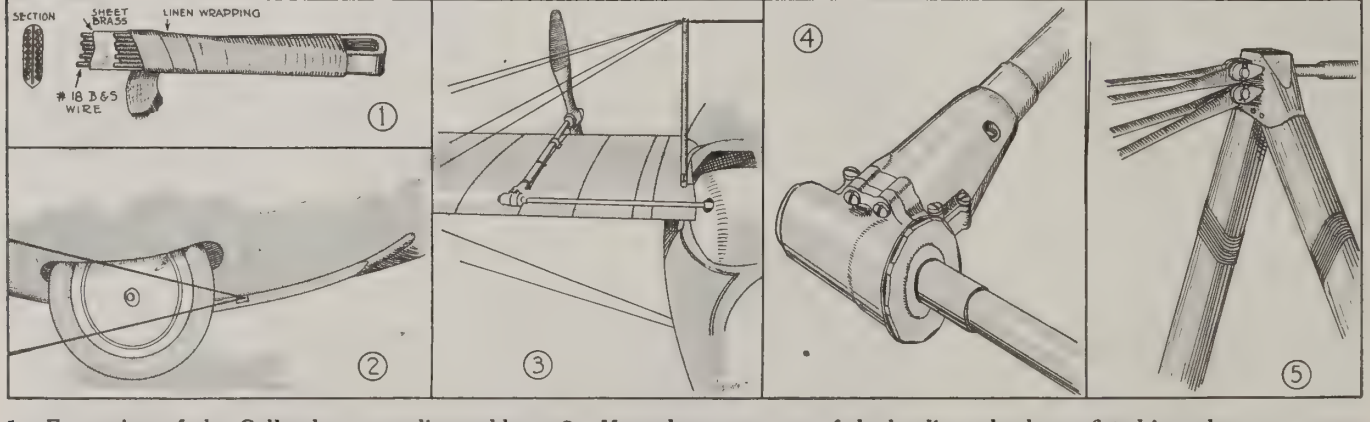
The Thomas Two-Seater Scout



Budd Wire Wheel Co. Exhibit

THE THOMAS-MORSE TYPE M-B-3, 300 H.P. HISPANO ENGINE FIGHTER



1—Streamline cap at wire crossing, middle interplane strut. 2—Left lower front strut socket. 3—Empennage, showing the unusual arrangement of the elevator lever which is run on the inside of the vertical fin. 4—Operating arm on top of upper aileron. At the right is shown a sketch of the unique junction for attaching streamline wires to flexible aileron control cable.

THE DAYTON-WRIGHT CO.'S "T-4 MESSENGER," LIGHT SINGLE SEATER

1—Lower right wing strut socket, showing pulley for aileron cable fitted into the leading edge of the wing. 2—The strip veneer used for cross bracing on the interior of the fuselage. 3—Attachment of upper wing section to the center section. 4—Elevator control lever. 5—Landing chassis fitting showing the streamline aluminum casing for the shock absorber cord.

THE GALLAUDET E-L-2 "CHUMMY FLYABOUT" MONOPLANE

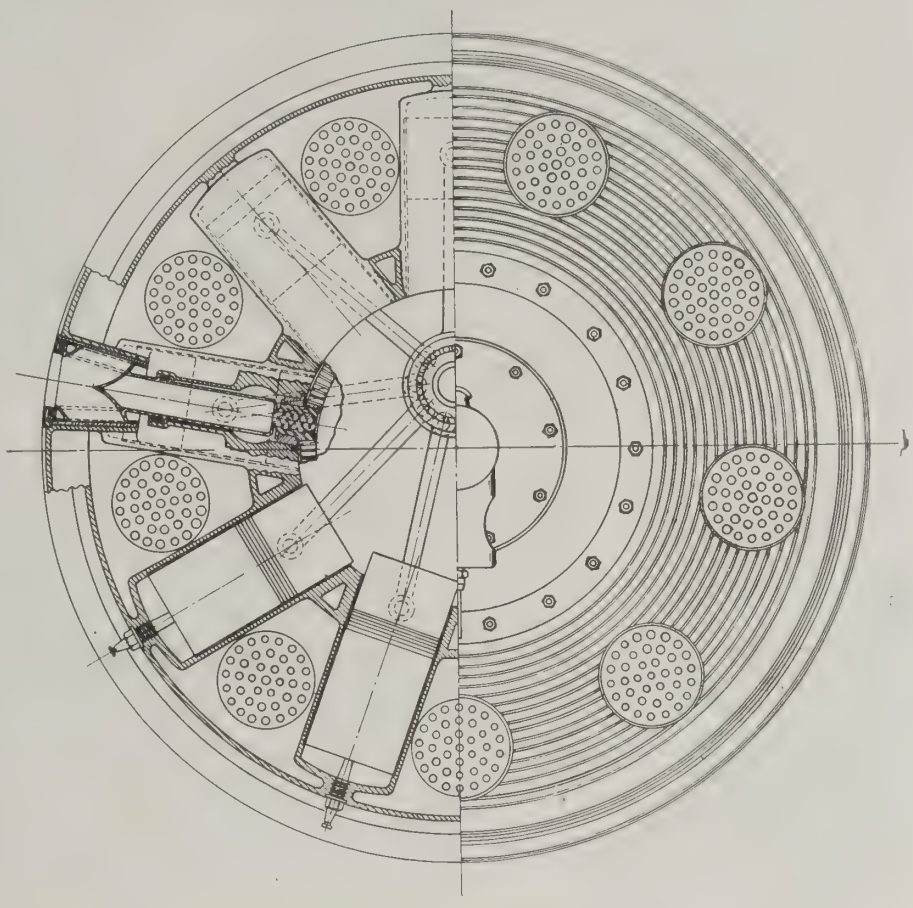
1—Formation of the Gallaudet streamline cables. 2—How the upper part of the landing wheels are fitted into the monocoque body. 3—Right hand shaft drive from the engines to the pusher screw. 4—Bevel gear housing, connecting transverse driving shaft with the longitudinal propeller shaft. 5—Attachment of bracing cables at the cabane

THE TIPS 480 H.P. AERO MOTOR

AIR cooling is provided by means of fins all around the main body of the engine, and nine tubular radiators built between the cylinders. Water circulation is provided around the entire body, cylinders, and inside of the sleeve valve. Water is circulated automatically by a slow rotation (60 revolutions per minute) of the main body, which body serves as a water jacket and radiator. This system eliminates all water hosing and connections.

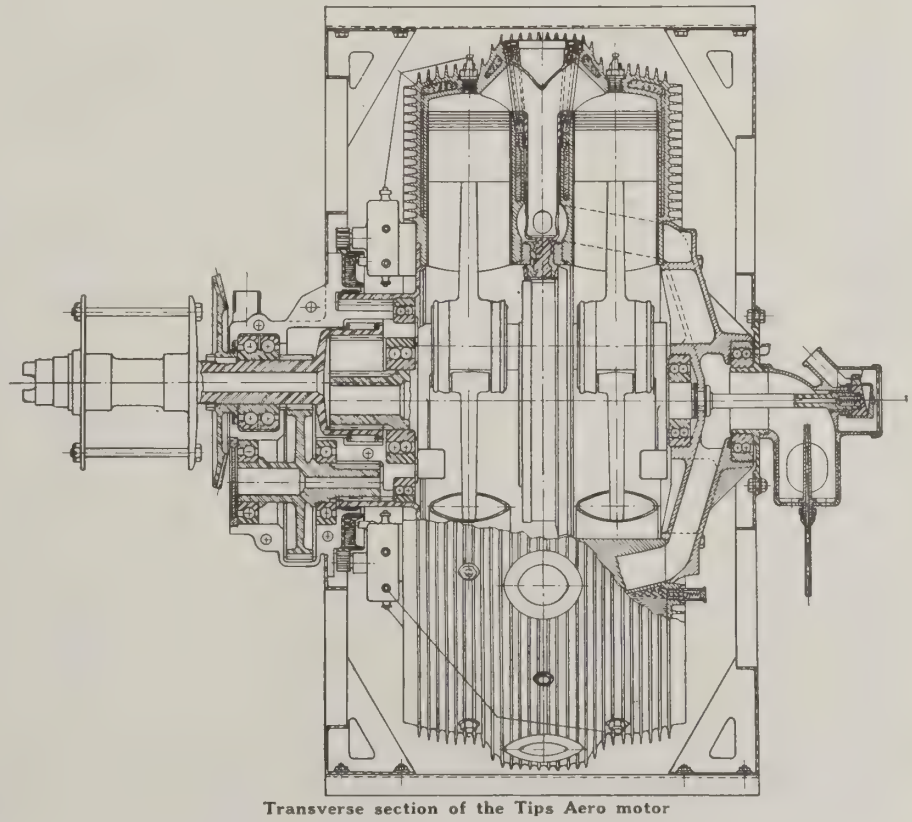
A decompression valve is also provided in the main body. A special gear arrangement permits to obtain the most efficient speed of crankshaft: 1,800 R.P.M., while the propeller revolves in the same direction at 1,080 R.P.M. The main body travels in an opposite direction at the rate of 60 R.P.M. This special disposition eliminates vibration and prevents gyroscopic action.

The arrangement of the planetary and eccentric gear mechanism provides an effective distribution of the rotary sleeve valves.



A tapered rotary sleeve valve, water cooled internally, is self-lubricating and automatically self-adjusting. This valve is spiral driven by the main planetary gear mechanism. Each sleeve operates a pair of cylinders for both inlet and outlet. The sleeve housing is of cast iron provided with graphite self-lubricating spots.

Oil for lubrication is forced under pump pressure through the crankshaft and bearings and splashed regularly by the slow rotation of the main body. The carburetor and oil pump body is made of one single aluminum casting.



A special design of obturators gives a maximum degree of safety of functionment in the cylinders, provides ideal lubrication and helps to obtain an efficient compression.

The general specifications of the Tips aero motor are as follows:

Number of cylinders.....eighteen
Bore.....4½ inches
Stroke.....6 inches
Max. B.H.P.....480
Weight complete including cooling system .....850 lbs.
R. P. M.....1,800 on crankshaft
R. P. M.....1,080 on propeller
R. P. M.....60 on main body
Consumption gas per hour.....22 gal.
Consumption oil per hour.....3 gal.
Water capacity, main body.....10 gal.
Ratio.....1.333 to 1
Compression ratio..... 1 to 5¼
Volume of one cylinder.....95.426 cu. in.
Total volume of cylinders..1,717.669 cu. in.
Area of one piston.....15.904 sq. in.
Piston speed per minute.....
.....1,799 ft. (30 ft. per sec.)
Vel. of gas on main inlet..141 ft. per sec.
No. of sleeves per pair of cylinders.....1
No. of obturators per piston....3 doubles

Half-section and rear view of the Tip Aero motor

Brigadier General Theodore C. Lyster and the group of aeronautic authorities who tendered him a luncheon at Aero Club of America

GENERAL LYSTER AWARDED DISTINGUISHED SERVICE MEDAL

BRIGADIER GENERAL THEODORE C. LYSTER, U. S. Air Medical Service, "The Man Who Saved the Lives of Hundreds of Aviators," who was awarded the Distinguished Service Medal by Secretary Baker for his valuable work in establishing the Air Medical Standards and organizing the Air Medical Service in this country and in France, was tendered an important reception at the Aero Club of America, which was attended by famous Allied aces.

General Lyster arrived in New York unexpectedly and went to the Aero Club, which is the headquarters and meeting place of Allied Aviators. The Club had been advised from Washington, that Secretary Baker had awarded General Lyster the D. S. M. in recognition of his valuable work as head of the Air Medical Service, and the Aces and other officers present were just preparing a resolution of appreciation for him when the General walked in the Club.

Those present at the luncheon were: Captain Augustine Lahoulle, the noted French Ace, who arrived in the United States a few days ago. Rear Admiral Bradley A. Fiske, Colonel James Prentice, U. S. Army Balloon Service; Mr. Alan R. Hawley, President of the Club; Henry A. Wise Wood; Captain Jacques Boyriven, the noted French Aviator who flew under all the New York Bridges a few months ago; A. Leo Stevens, Chief Inspector of the U. S. Army Balloon Section; Captain Granville A. Pollock, late of the Lafayette Esquadrille, who has just returned from France where he was in charge of the Orly Station where all aircraft intended for the American Forces were tested; Henry Woodhouse; Lieutenant de Limur, of the French Mission, who went in the war with Captain Lahoulee in 1914; Lieutenant Wainwright Abbott, late of the Lafayette Escadrille; Captain S. Herbert Mapes, U. S. A., the well-known sportsman of Tuxedo Park; Captain M. Idigords, of the Special Guatemala Mission; Augustus Post, Secretary of the Aerial League of America; W. W. Miller, John Hays Hammond, Jr.; G. Douglas Wardrop, Managing Editor of Aerial Age; Captain H. L. King, U. S. Air Medical Service; Captain Robert A. Bartlett, the noted explorer; Ensign Daniel E. Huger, U. S. N., late of the Lafayette Escadrille, who holds the French, Italian and American Military Aviator certificates; Lieut. Ray A. Barnes, U. S. Air Service; Ensign Frank I. Turner, U. S. Naval Aviator, who has just returned from overseas; Lieut. Gilbert M. Whitman, U. S. A.; Evan J. David, of Flying Magazine; Ensign A. A. Beckwith, H. B. Childs, Lieut. Morton B. Downs, U. S. N.; Mr. Walter Camp and others.

In congratulating General Lyster, Mr. Hawley stated that he had been told by Allied authorities that when General Lyster and Lieut. Colonel Isaac H. Jones, of the Air Medical Service, went to France, Italy and England in 1917 and 1918 and brought to the attention of the Allied Governments the U. S. Air Medical tests and system of testing men for the Air Service, those countries were perplexed with the serious problem of casualties in the Air Service due to accidents. General Lyster and Lieut. Colonel Jones proposed a system for testing aviators physically and keeping them in good physical condition, which solved the most difficult problems. It was the system originated by General Lyster and perfected by the U. S. Air Medical Service. Through the application of this system the percentage of casualties from accidents were cut down greatly.

SECOND PAN-AMERICAN AERONAUTIC CONVENTION AND EXHIBITION

To Be Held Under the Auspices of The Aero Club of America, The Aerial League of America and the Pan-American Aeronautic Federation.

From Thursday, May 1st, 1919,
to
June 1st, inclusive,
at
Atlantic City, N. J.

CONTESTS TO BE HELD EACH SATURDAY

(1) Seaplane Contests (general),
(2) Curtiss Marine Flying Trophy and Prizes,
(3) Intercollegiate Seaplane Contests,
(4) Land Aeroplane Contests,
(5) Dirigible Contests,
(6) Kite Balloon Speed in Ascending and Descending, and Maneuvering Contests,
(7) Parachute Competition,
(8) Aviette (bicycles and motorcycles with wings) Contests.

EVERY DAY ACTIVITIES

(1) Exhibits of Aeroplanes, Motors and Accessories on the Steel Pier,
(2) Demonstrations and tests of Seaplanes, Land Aeroplanes, Motors, Dirigibles, Kite Balloons, to prospective purchasers and representatives of different governments,
(3) Aerial Passenger Carrying by seaplanes and dirigibles, and kite balloon ascensions,
(4) Moving pictures and Addresses by leading authorities on most important phases of aeronautics.

The Governments and Aeronautic, Sporting, Scientific, Industrial and Civic organizations of the United States and all the countries in the world, excepting Germany and her allies, are invited to send representatives to attend this great aeronautic event. On arrival in the United States these representatives should call at the Headquarters of the Convention Committee at No. 297 Madison Avenue, New York City, to register and receive their official badges and the official program.

In the event that it is more convenient for them to go directly to Atlantic City they will register at the offices of the Convention located at the following Atlantic City hotels: Hotel Traymore, Hotel Chalfonte, The Breakers Hotel, Hotel St. Charles, Hotel Marlborough-Blenheim, Hotel Chelsea, Hotel Alamac, Hotel Dennis and Hotel Haddon Hall.

Representatives of the Convention Committee will be at the Bureaus of the Aeronautic Convention at the above-named hotels and will issue the official badges which admit the bearer to the Aeronautic Hall, as well as the Aero Exhibition on the Steel Pier, the judges' enclosure during contests, and to the Aerodrome and seaplane stations where the aircraft and motors will be demonstrated.

All communications until May 1st, should be addressed to Rear Admiral Peary, Chairman, Aeronautic Convention, Aero Club of America, 297 Madison Avenue, New York City.

DAILY PROGRAM FOR PAN-AMERICAN AERONAUTIC CONVENTION, EXHIBITION AND CONTESTS

THURSDAY, MAY 1ST

Opening of Convention and Exhibit.

AFTERNOON—Reception at Aeronautic Hall on the Steel Pier. Addresses by United States Government State and aeronautic authorities.

EVENING—Aero Show and addresses by officials.

FRIDAY, MAY 2ND

AFTERNOON—Aero Show. Preliminary tests of seaplanes, dirigibles and kite balloons.

EVENING—Moving pictures and address on flying for sport and pleasure.

SATURDAY, MAY 3RD

AFTERNOON—Seaplane and dirigible races, and kite balloon ascending and descending contest.

EVENING—Ball.

SUNDAY, MAY 4TH

MORNING—Memorial service by eminent Divine for the dead airmen.

AFTERNOON AND EVENING—Reception to allied aces and heroes of the air and their parents, and announcement of the award of the Aero Club of America Medal of Valor, and the Aerial League of America Diploma of Honor.

MONDAY, MAY 5TH

AFTERNOON—First parachute contest for $500 Bennett Prize.

EVENING—"The Large Dirigible and Its Value for Transportation." Representatives of railroads, express, steamship and other transportation organizations invited to attend.

TUESDAY, MAY 6TH

AFTERNOON—Illustrated addresses on "Aerial Forest Patrol." Forestry Department of every State invited.

EVENING—"Work of Aerial Police Squadrons, and Why Every City Should Have One."

WEDNESDAY, MAY 7TH

AFTERNOON AND EVENING—Aerial Mail Day. Illustrated address on, and consideration of, "Aerial Mail Planes." Chairman of Post Office and Post Roads Committees of House of Representatives and Senate, and Postmaster General Burleson invited to deliver addresses. (26,000 United States Postmasters, and Chambers of Commerce of 13,000 cities invited to attend.)

THURSDAY, MAY 8TH

AFTERNOON AND EVENING—Illustrated addresses on the "Need of Municipal Aerodromes, and the Part to be Played by Aircraft in City Planning." Chambers of Commerce and City Planning Commissions of 13,000 cities invited to attend.

FRIDAY, MAY 9TH

AFTERNOON—Arrival of seaplanes and army planes from Army and Navy Air Stations. Second parachute competition for the $500 Bennett Prize.

EVENING—Illustrated addresses on "Latest Developments in Aerial Warfare and Adventures in Aerial Warfare," told by famous aces.

SATURDAY, MAY 10TH

AFTERNOON—Army, Navy and Marine Corps Day. Aerial contests and tournament.

EVENING—United States Army and Navy Officers' Reception. Reception and addresses at Aeronautic Exhibition Hall on the Steel Pier.

SUNDAY, MAY 11TH

AFTERNOON AND EVENING—Presentation of the flags by each State of the United States to the Aero Squadrons representing the States. Each State will present a flag to each Aero Squadron, the members of which were overwhelmingly natives of that State. The presentation will be made by representatives from the State and the Aero Club and Aerial League branch of that State. All States and cities invited to send delegates, and Army, Navy and Marine Corps to send representatives.

MONDAY, MAY 12TH

AFTERNOON—Demonstrations and illustrated addresses on the "Value of Aircraft for Advertising by Day and by Night." All national advertisers and advertising agents invited to attend.

EVENING—"Pan-American Aerial Transport Over Land." Addresses by members of the commissions of the 20 Latin-American Republics.

TUESDAY, MAY 13TH

AFTERNOON AND EVENING—"Pan-American Aerial Transport Over Water." Addresses by members of the 20 Latin-American Republics' Commissions.

WEDNESDAY AND THURSDAY, MAY 14TH AND 15TH

AFTERNOONS AND EVENINGS—"The Airways and Aerial Transport in Europe, Canada, Africa, Australia and Asia."

FRIDAY, MAY 16TH

AFTERNOON AND EVENING—"Aerial Navigation Instruments for Flying Over Land and Water." Aviators, navigators, scientific instrument makers and aeronautic experts invited.

SATURDAY, MAY 17TH

AFTERNOON—Aerial races and contests. Illustrated addresses on Aerial Photography.

EVENING—Extensive exhibit of aerial photographs and photographic apparatus. All photographers, professional and amateur, and makers of photographic apparatus invited.

SUNDAY, MAY 18TH

AFTERNOON AND EVENING—Illustrated addresses on "Aerial Exploration and the Use of Aircraft for Coast and Geodetic Survey."

MONDAY, MAY 19TH

AFTERNOON—Addresses on "Need of Broader Attitude Regarding Insurance for Aircraft and Aviators."

EVENING—Illustrated address on "How Army Medical Standards and Inspection Lessen Accidents." Insurance companies and agents invited.

TUESDAY, MAY 20TH

AFTERNOON AND EVENING—Illustrated addresses showing different ways of crossing Atlantic by air and the problems to be solved to accomplish same successfully.

WEDNESDAY, MAY 21ST

AFTERNOON—Aero Safety Day. Discussion of aero safety provisions made; improvements in aeroplane construction; increased reliability of aero motors; devices which make for safety in flying.

EVENING—"Progress Made in the Art of Piloting Aeroplanes." Illustrated.

THURSDAY, MAY 22nd

AFTERNOON AND EVENING—Addresses and discussions of meteorology—"How the Weather Forecasts Can be Extended and Made More Efficient by the Use of Aircraft in Exploring the Upper Air," also "How the Weather Forecasts Help Aerial Navigation," and "Telegraphic and Climatic Factors in Relation to Aeronautics.

FRIDAY, MAY 23RD

AFTERNOON AND EVENING—Addresses on "Aerial Jurisprudence—Aerial Laws and Regulation of Air Traffic." (First day.) Lawyers, traffic commissioners and police authorities of different countries invited.

SATURDAY, MAY 24TH

AFTERNOON—Races and contests.

EVENING—Illustrated address on "Need of Establishing Altitude Levels for International, Interstate and Interurban Air Travel."

SUNDAY, MAY 25TH

AFTERNOON AND EVENING—Aeronautic Art Day. Address on "Aerial Painting and Sculpture of Different Countries, and Exhibition of Aerial Paintings," by Lieut. Farre, Lieut. Ruttan and others. All prominent artists, managers of art galleries and art patrons invited to attend.

ENGINEERING WEEK.

MONDAY, MAY 26TH

AFTERNOON—"Aeronautic Engineering Problems and Their Prospective Solution."

EVENING—Opening of contests for designs and ideas for large aeroplanes.

TUESDAY, MAY 27TH

AFTERNOON—"Factors That Increase the Efficiency for Large Dirigibles."

EVENING—"Advantages of Veneer and Plywood for Aircraft Construction."

WEDNESDAY, MAY 28TH

AFTERNOON—Address on "Problems of Flying at 35,000 Feet and Over, and Their Prospective Solution."

EVENING—"Present Day Aero Engines."

THURSDAY, MAY 29TH

AFTERNOON—"Flying Boats Versus Hydroaeroplanes for Sport and Transportation."

EVENING—Contest for designs and ideas for large aeroplanes.

FRIDAY, MAY 30TH (Memorial Day)

AFTERNOON—Dirigible races, kite balloon speed ascending contest; parachute contest.

EVENING—Reception at the Aeronautic Hall, Steel Pier.

SATURDAY, MAY 31ST

AFTERNOON—Seaplanes, land planes and dirigible contests. Aviette competition at which all cyclists and makers of bicycles and motorcycles will be invited.

EVENING—"International Medical Standards for Aviators in War and Peace." Reports from different countries illustrated with attractive films. 50,000 medical men invited.

SUNDAY, JUNE 1ST

AFTERNOON AND EVENING—Award of prizes and diplomas for all events.

PROGRAMME

Deuxième Convention et Exposition Aeronautique Pan-Américaine
Sous les auspices de l' "Aero Club of America," "The Aerial League of America," et la "Pan-American Aeronautic Federation."
Du Jeudi 1 Mai, 1919 au 1 Juin, inclus. à Atlantic City, N. J.

CONCOURS DEVANT ETRE TENUS CHAQUE SAMEDI.

1. **Concours d'hydravions.**
2. **Trophées et Prix Curtiss pour Aviation Navale.**
3. **Concours Intercollegiaux pour Hydravions.**
4. **Concours d'Avions.**
5. **Concours de Dirigeables.**
6. **Concours de rapidité d'ascension, de descente et de manoeuvre pour ballons captifs.**
7. **Concours de Parachutes.**
8. **Aviettes (bicyclettes et motocyclettes munies de voiles).**

EPREUVES QUOTIDIENNES.

1. **Exposition d'Avions, Moteurs et Accessoires sur la jetée d'acier.**
2. **Demonstration et essais d'hydravions, avions, moteurs, dirigeables, ballons captifs, aux acheteurs eventuels.**
3. **Transport de passagers par hydravions et dirigeables, et ascensions en ballons captifs.**
4. **Representations cinématographiques et conférences sur les phases les plus importantes de aéronautique suivant le programme ci-dessous:—**

JEUDI, LER JOUR
Ouverture de la Convention et Exposition.
Après-midi—Réception au Hall de l'Aéronautique sur la jetée d'acier. Discours par des autorités du Gouvernement.
Soir—Des Etats-Unis, et l'Etat et de l'Aeronautique Exposition aeronautique et discours par des personnages officiels.

VENDREDI, 2EME JOUR
Après-midi—Exposition aeronautique. Essais préliminaires. D'hydravions, dirigeables et ballons captifs.
Soir—Représentation cinématographique et conférences sur l'aviation en tant que sport, et agrément.

SAMEDI, 3IEME JOUR
Après-midi—Courses d'hydravions et dirigeables, et concours d'ascension et de descente pour ballons captifs.
Soir—Bal.

DIMANCHE, 4IEME JOUR
Matin—Service pour la mémoire des aviateurs morts.
Après-midi, et soirée—Réception des As Alliés et Héros de l'air et de leur familles. Remise de la Médaille de Valeur de l'Aero Club d'Amérique et du diplome d'Honneur de la Ligue Aérienne d'Amérique.

LUNDI, 5IEME JOUR
Après-midi—Premier concours de Parachutes pour le Prix Bennett de $500.00.
Soir—Le grand dirigeable et sa valeur au point de vue transport. Les représentants des Compagnies de chemin de fer, d'Express, de Navigation et autres organisations de transports, sont invités à y assister.

MARDI, 6IEME JOUR
Après-midi—Conférences, accompagnées de projections sur la surveillance aérienne des forets. (Les membres du département forestier de chaque Etat sont invités).
Soir—Le rôle des escadrilles de police aérienne, et pourquoi chaque ville devrait en posséder.

MERCREDI, 7IEME JOUR
Après-midi—Journée de la poste aérienne. Conférences avec projections; considérations sur les avions postaux. Le Président du Comité des bureaux de poste et des voies postales au Sénat et à la chambre, et le Directeur Général des Postes, Burleson, sont invités à prononcer des discours. (26000 Directeur des Postes des Etats-Unis et des représentants des Chambres de Commerce de 13,000 villes y sont invités.)

JEUDI, 8IEME JOUR
Après-midi et soir—Discours avec projections sur la nécessité d'Aerodromes municipaux, et la part qui sera joué par l'aviation dans le "City Planning". (Les chambres de commerce et les commissions de City-planning" de 13000 villes sont invités.)

VENDREDI, 9IEME JOUR
Après-midi—Arrivée d'avions et hydravions militaires de leurs différents centres. Deuxième concours de Parachutes pour le prix Bennett de 500 dollars.
Soir—Conférences avec projections par des As célèbres, sur les derniers développements de la guerre aérienne et sur leurs aventures personneles.

SAMEDI, 10IEME JOUR
Après-midi—Journée, de la Marine et des fusillers marins. Concours aériens.
Soir—Réception d'officiers de l'Armée et de la Marine Américaine. Réception et discours au hall de l'Exposition Aeronautique sur la Jetée d'Acier.

DIMANCHE, 11IEME JOUR
Après-midi et soir—Presentation de drapeaux par chaque Etat des Etats Unis au escadrilles représentant les Etats-Chaque Etat offrira un drapeau à chaque escadrille dont la majorité des membres sont originaires de cet Etat. La présentation sera faite par les représentants, de l'Etat, de l'Aero Club, et de la branche de la Ligue Aérienne de cet Etat. (Tous les Etats et villes sont invités à envoyer des délégués, et l'Armée et la Marine à envoyer des représentants.)

LUNDI, 12IEME JOUR
Après-midi—Démonstration et conférences avec projections sur la valeur de l'Avion pour la publicité diurne et nocturne (Tous les agents et sociétés de publicité sont invités).
Soir—Transport aérien continental, Pan-Américaine. Discours par des membres des commissions de 20 Républiques latines-Américaines.

MARDI, 13IEME JOUR
Après-midi et soir—Transport aérien intercontinental Pan-Américaine. Discours par des membres des commissions de 20 Républiques Latines-Américaines.

MERCREDI ET JEUDI, 14IEME ET 15IEME JOUR
Après-midi et soir—Les voies aériennes et le transport aérien en Europe au Canada en Afrique en Australie et en Asie.

VENDREDI, 16IEME JOUR
Après-midi et soir—Instruments de Navigation aérienne pour voler au-dessus de la terre ou de l'eau (aviateurs, navigateurs, fabricants, d'instruments scientifiques et experts en aeronautique invités).

SAMEDI, 17IEME JOUR
Après-midi—Courses et concours aériens. Conférences et projections sur la photographie aérienne.
Soir—Exposition de photographies aériennes et d'appareils photographiques (Les photographes, professionels, et amateurs, et les fabricants d'appareils photographiques sont invités).

DIMANCHE, 18IEME JOUR
Après-midi et soir—Conférences sur la nécessité d'une attitude pluslarge en regard de l'assurance pour l'avion et les aviateurs.
Soir—Conférences avec projections. Comme quoi les mesures médicales et les inspections en vigueur dans l'armée diminuent les accidents. (Agents et compagnies d'assurance, invités).

MARDI, 20IEME JOUR
Après-midi et soir—Conférences avec projections, montrant les différentes routes aériennes pour traverser l'Atlantique, et les problèmes à résoudre pour accomplir la chose.

MERCREDI, 21IEME JOUR
Après-midi—Journée de la sureté de l'aviation. Discussions des mesures prises pour la sureté de l'aviation. Améliorations dans la construction d'avions. Sureté augmentée dans les moteurs d'avions. Dispositifs pour la sureté en vol.
Soir—Progrès faits dans l'art du pilotage d'avions. (Projections).

JEUDI 22IEME JOUR
Après-midi et soir—Conférences et discussions sur la Meteorologie. Comme quoi les bulletins meteorologiques peuvent être étendues et rendus plus efficaces par l'emploi de l'avion pour explorer les plus hautes couches de l'atmosphère. Comme quoi ces bulletins météorologiques sont d'assistance à la navigation aérienne. Les facteurs climatérique et télégraphiques et leur relations à l'aeronautique.

VENDREDI, 23IEME JOUR
Après-midi et soir—Conférences sur la jurisprudence aérienne. Lois et reglements sur le trafic aérien (1er jour). Avocats, commissaires de trafic, autorités de police de différents pays, invités.)

SAMEDI, 24IEME JOUR
Après-midi et soir—Courses et concours. Conférences avec projections sur la necessité d'etablir un niveau d'altitude pour la circulation aérienne, internationale, interstate et interurbaine.

DIMANCHE, 25IEME JOUR
Après-midi et soir—Journée artistique de l'Aéronautique. Discours sur la peinture et la sculpture aérienne; et exposition de peintures par Lieut. Farré, Lt. Ruttan et autres. (Artistes, Directeurs de Galleries d'Art et amateurs d'oeuvres artistiques, invités.)

LUNDI, 26IEME JOUR
Après-midi et soir—Problèmems aéronautiques et leurs solutions probables Ouverture du concours pour les idées et projets de grands avions.

MARDI, 27IEME JOUR
Après-midi—Facteurs qui augmentent l'efficacité des grands dirigeables.
Soir—Les avantages du plaquage et contre-plaquage dans la construction d'avion.

MERCREDI, 28IEME JOUR
Après-midi—Conférences sur le problème du vol à une altitude de ou supérieure à 25000 pieds et leur solutions probables.
Soir—Les moteurs d'avions actuels.

JEUDI, 29IEME JOUR
Après-midi—Hydravions versus avions pour le sport et le transport.
Soir—Concours pour les idées et projets de grands avions.

VENDREDI, 30IEME JOUR—"Memorial Day".
Après-midi—Courses de dirigeables; concours de rapidité d'ascension pour ballons captifs; concours de parachutes.
Soir—Réception au Hall de l'Aeronautique. Jetée d'acier.

SAMEDI, 31IEME JOUR
Après-midi—Concours d'avions, d'hydravions et de dirigeables. Concours d'aviettes auquel les cyclistes et les fabricants de cycles et motorcyclettes seront invités.
Soir—Aptitudes médicales pour les aviateurs de paix et de guerre. Rapports de différents pays, illustrés par des films intéressants (50,000 autorités médicales invités.)

DIMANCHE, 32IEME JOUR
Après-midi et soir—Remise des prix et diplômes pour tous concours et courses.

Le Gouvernement Français, les organisations aéronautiques, sportives, scientifiques, industrielles, et civiques de France sont invités à envoyer des représentants pour assister à cette grande convention aéronautique. En arrivant aux Etats Unis, ces représentants sont invités à se présenter à l'Etat Major du Comité de la Convention, au numéro 297, Madison Avenue, à New York pour se faire inscrire et recevoir leur insigne et le programme officiel.

Au cas où il leur serait plus facile de se rendre directement à Atlantic City, ils pourront s'y faire inscrire aux bureaux de la Convention, situés à l'un des Hotels suivants: Hotel Traymore, Hotel Chalfonte, The Breakers Hotel, Hotel St. Charles, Hotel Marlborough-Blenheim, Hotel Chelsea, Hotel Alamac, Hotel Dennis, et l'Hotel Haddon Hall.

Des représentants du Comité de la Convention seront aux bureaux de la convention aux hotels ci-dessus et délivreront les insignes officiels qui admettront les porteurs au Hall de l'aéronautique, à l'exposition sur la jetée d'acier, au stand des juges, pendant les concours, et à l'aérodrome et au centre d'hydravion où moteurs et machines seront démontrés.

Toutes comunications jusqu'au ler mai, devront être adressées au: Rear Admiral Peary, Chairman, Aeronautic Convention, Aero Club of America, 297 Madison Avenue, New York City.

LA SEGUNDA CONVENCION Y EXPOSICION AERONAUTICA PAN-AMERICANA

Celebrada Bajo Los Auspicios del "Aero Club of America," "The Aerial League of America" y "The Pan-American Aeronautic Federation".

Desde el Jueves Primero de Mayo Hasta el Primero de Junio, Ambos Inclusives de 1919 En Atlantic City, Estado de New Jersey, Estados Unidos de America

PROGRAMA

Concursos Que se Verificaran Todos Los Sabados:

(1) **Concurso de Hidroaeroplanos (en general).**
(2) **Trofeo y Premios de Curtiss por Aviacion Maritima.**
(3) **Concurso de Hidroplanos Entre Universidades.**
(4) **Concurso de Aeroplanos Terrestres.**
(5) **Concurso de Globos Dirijibles.**
(6) **Concurso de Globos Sobre Velocidad en Ascender y Descender y sus Maniobras.**
(7) **Concurso de Paracaidas.**
(8) **Concurso de "Aviettes" (bicicletas y motocicletas con alas).**

Programa Diario

(1) **Exhibición de Aeroplanos, Motoras y sus Accesorias en el "Steel Pier."**
(2) **Demostracion y Ensayos de Hidroaeroplanos, Aeroplanos Terrestes, Motoras, Globos Dirijibles y Globos Cautivos, Para Compradores.**
(3) **Ascencion de Hidroplanos y Dirijibles con Pasajeros y Globos Cautivos.**
(4) **Vistas Cinematografas y Discursos Sobre Las Fases Mas Importantes de la Aeronautica, Como Siguen:**

JUEVES PRIMER DIA

Apertura de la Convencion y Exposicion

EN LA TARDE—Recepcion en el salon aeronautico en el "Steel Pier." Discursos de los funcionarios del gobierno de los estados Unidos de America, del estado y de las sociedades aeronauticas.

EN LA NOCHE—Exposicion aeronautica y discursos de funcionarios.

VIERNES SEGUNDA DIA

EN LA TARDE—Exposicion aeronautica, ensayos preliminares de hidroplanos y globos dirijibles y cautivos.

EN LA NOCHE—Vistas cinematografas y discursos sobre aviacion de sport y paseo.

SABADA TERCER DIA

EN LA TARDE—Carreras de hidroaeroplanos y globos dirijibles y concurso en ascender y descender de globos cautivos.

EN LA NOCHE—Gran baile.

DOMINGO CUARTO DIA

EN LA MANANA—Serivios conmemorativos en honor de los aviadores difuntos por un prelado distinguido.

EN LA TARDE Y NOCHE—Recepcion a los aviadores mas renombrados aliados y a sus familiares y entrega de la medalla de valor del "Aero Club de America" y del diploma de honor de la "Aerial League de America."

LUNES QUINTO DIA

EN LA TARDE—Primer concurso de paracaidas por el premio de quinientos dollars de bennett.

EN LA NOCHE—El gran globo dirijible y su valor en la transportacion. Representantes de las empresas de ferrocarril, expreso, vapores y demas de transportes quedan invitados para asistir.

MARTES SESTO DIA

EN LA TARDE—Discursos con ilustraciones, de patrulla aeria de montes. (El departamento de montes de cada estado queda invitado.)

EN LA NOCHE—Trabajo de vigilancia policiaca aeria y razones por las cuales toda ciudad debe tener esta clase de servicio.

MIERCOLES SEPTIMO DIA

EN LA TARDE Y NOCHE—Dia de correos aerios. Discursos con ilustraciones y estudio de aeroplanos para servicio de correos. El presidente de la comision de correos de la camara de representantes y el de igual comite del senado asi como el ministro de comunicaciones de los Estados Unidos Sr. Burleson. Quedan invitados para dirijir la palabra. (Veinte seis mil administradores de coreo de los Estados Unidos y las camaras de comercio de trece mil ciudades quedan invitados para asistir.)

JUEVES OCTAVO DIA

EN LA TARDE Y NOCHE—Discursos con ilustraciones sobre las necesidades de aerodromos municipales y de la parte que debe tomar la aeronautica en los proyectos de ciudades. (Las camaras de comercio y las comisiones de proyectos de ciudades de 13,000 ciudades quedan invitadas para asistir.)

VIERNES NOVENO DIA

EN LA TARDE—Llegada de hidroplanos y aeroplanos del ejercito y la Marina de sus respectivas estaciones. Segundo concurso de paracaidas por el premio de $500 de Bennett.

EN LA NOCHE—Discursos con ilustraciones de los mas recientes desarollos en la guerra aeria y hazañas relatadas por famosos aviadores.

SABADO DECIMO DIA

EN LA TARDE—Dia del Ejercito y Marina. Concurso aeronautico.

EN LA NOCHE—Recepción a los oficiales de la Marina y Ejercito de los Estados Unidos. Recepción y discursos en el Salón de Exhibición Aeronautica en el "Steel Pier."

DOMINGO ONDECIMO DIA

EN LA TARDE Y NOCHE—Presentación de banderas por cada uno de los Estados de los Estados Unidos de America a sus respectivos escuadrones aereos. Cada Estado presentará una bandera al escuadron aereo respectivo que contenga el mayor número de naturales de aquel estado. La presentación se hara por los representantes del estado y del Club Aereo y Liga Aeria de aquel Estado. (Todos los Estados y ciudades quedan invitados para enviar sus delegados y el ejercito y marina para enviar representantes.)

LUNES DUODECIMO

EN LA TARDE—Demostraciones y discursos con ilustraciones sobre el valor de la aeronautica para anuncios de dia y de noche. (Todas personas y agentes dedicados al negocio de anuncios quedan invitados para asistir.)

EN LA NOCHE—Transporte aereo terrestre Pan-Americano. Discursos por los miembros de las Comisiones de las veinte Republicas Pan-Americanas.

MARTES DECIMO-TERCERO

EN LA TARDE Y NOCHE—Transporte aereo maritimo Pan-Americano. Discursos por los miembros de las Comisiones de las veinte Republicas Pan-Americanas.

MIERCOLES Y JUEVES DIAS 14 Y 15

EN LA TARDE Y POR LA NOCHE—Dias y transportes aereos en Europa, Canada, Africa, Australia y Asia.

VIERNES DIA 16

EN LA TARDE Y POR LA NOCHE—Instrumentos para la aviación terestre y marítima. (Aviadores, navegadores, fabricantes de instrumentos cientificos y peritos en aeronautica quedan invitados.)

SABADO DIA 17

POR LA TARDE—Carreras y concursos aereos. Discursos con ilustraciones sobre la fotografia aerea.

POR LA NOCHE—Exhibición extensa de fotografias aereas y aparatos fotográficos. (Fotografos, tanto los profesionales como los afisionados y fabricantes de aparats fotograficos quedan invitados.)

DOMINGO DIA 18

EN LA TARDE Y POR LA NOCHE—Discursos con ilustraciones sobre la exploración aerea y el uso de la aereonave para estudios geodéticos y de costas.

LUNES DIA 19

EN LA TARDE Y POR LA NOCHE—Discursos sobre la necesidad de un concepto mas ámplio relativo al seguro de aereonaves y aviadores.

POR LA NOCHE—Discursos con ilustraciones sobre la manera en que los requisitos e inspección medico-militares disminuyen el número de accidentes. (Compañias de seguros y agentes quedan invitados.)

MARTES DIA 20

EN LA TARDE Y POR LA NOCHE—Discursos con ilustraciones mostrando diferentes modos de cruzar el Mar Atlantico por el aire y los problemas que deben resolverse para realizar dicho objeto.

MIERCOLES DIA 21

EN LA TRADE—Dia de Seguridad Aerea. Discusiones sobre las disposiciones hechas para la sceguridad aerea; mejoras en la construcción de aeroplanos; aumento de estabilidad en las motoras aereas; divisas para aumentar la seguridad aerea.

EN LA NOCHE—Progreso realizado en el manejo de los aeroplanos (con ilustraciones).

JUEVES DIA 22

EN LA TARDE Y NOCHE—Discursos y discusiones sobre metereología-manera de extender los informes metereologicos y hacerlos mas eficaces mediante el uso de aeronaves en la exploración de las altas regiones del aire así como la manera en que los pronosticos metereologicos pueden ser de auxilio en la navegación aerea; y factores telegraficos y climaticos en relación a la aeronautica.

VIERNES DIA 23

EN LA TARDE Y NOCHE—Discursos sobre la jurisprudencia aerea-leyes aereas y reglamentación del trafico aereo (primer dia). (Abogados Jefes de Trafico y Autoridades Policiacas de los distintos paises quedan invitados.)

SABADO DIA 24

EN LA TARDE—Carreras y concursos.

EN LA NOCHE—Discursos con ilustraciones sobre la necesidad de establecer lineas de altitud para viajes internacionales, entre los estados y entre las ciudades por medio del aire.

DOMINGO DIA 25

EN LA TARDE Y NOCHE—Da de Arte Aeronautica. Discurso sobre la pintura y escultura aeronautica de los distintos paises y exhibición de los cuadros aereos por el Teniente Farré, Teniente Ruttan y otros. (Artistas prominetes y directores de Salones de Artes y demás interesados quedan invitados.)

SEMANA DE INGENIERIA.

LUNES DIA 26

EN LA TARDE—Problemas de ingenieria aeronautica y su porspectiva solución.

EN LA NOCHE—Apertura del Concurso para diseños e ideas sobre grandes aeroplanos.

MARTES DIA 27

EN LA TARDE—Factores que contribuyen al aumento de la eficiencia de los grandes globos dirijibles.

EN LA NOCHE—Ventajas de enchapear y de la madera denominada "plywood" en la construcción de aereonaves.

MIERCOLES DIA 28

EN LA TARDE—Discursos sobre los problemas de volar a una altura de 25,000 pies y mas, y su solución prospectiva.

EN LA NOCHE—Máquinas aereas de la actualidad.

JUEVES DIA 29

EN LA TARDE—Tema: "Flying-boats" contra hidroplanos para sport y transporte.

EN LA NOCHE—Concurso sobre diseños e ideas para grandes aeroplanos.

VIERNES DIA 30

EN LA TARDE—Carreras entre globos dirijibles, concurso de velocidad de ascender y descender de globos cautivos; concurso de paracaidas.

EN LA NOCHE—Recepción en el Salón Aeronautico en el "Steel Pier."

SABADO DIA 31

EN LA TARDE—Concursos de hidroplanos, aeroplanos, y globos dirijibles. Concurso de "Aviettes" al cual serán invitados todos los biciclistas y fabricantes de bicicletas y motocicletas.

EN LA NOCHE—Requisitos medicos para aviadores en tiempo de guerra y de paz. Informes de distintos paises ilustrados con vistas cinematografas de atractivo. (50,000 medicos quedan invitados.)

DOMINGO DIA 32.

EN LA TARDE Y NOCHE—Presentación de premios y diplomas de todos los concursos.

Los Gobiernos de la Argentina, Brasil, Bolivia, Chile, Colombia, Costa Rica, Cuba, República Dominicana, Ecuador, Honduras, Haití, Panamá Guatemala, Paraguay, Perú, Portugal, El Salvador, Espaňna, Uruguay, Venezuela, Mejico, y Nicaragua, asi como las Sociedades Aeronaúticas, Deportivas, Cientificas, Industriales y Cívicas, de los mismos paises, por la presente quedan invitadas para enviar representantes a asistir a eete gran concurso aeronaútico. Dichos representantes a su llegada a los Estados Unidos deberán presentarse a la oficina principal del Comité encargado de la Convención, en el número 297 Avenida de Madison, en la ciudad de New York, para inscribirse y al proprio tiempo recibir sus credenciales y copia del programa oficial.

En el caso de que les sea mas conveniente a algunos de los representantes ir directamente a Atlantic City, dichos señores podrán inscribirse en las oficinas de la Convención que estarán constituidas en dicho lugar en los siguientes hoteles: "Traymore," "Chalfonte," "The Breakers," "St. Charles," "Marlborough-Blenheim," "Chelsea," "Alamac," "Dennis" y "Haddon Hall." En Comité de la Convención tendrá representantes en las oficinas de la Convención Aeronaútica en dichos hotelesquienes expedirán las credenciales o chapas oficiales de entrada al portador para el Salón Aeronaútico, la Exposi-ción Aeronaútica en el "Steel Pier," la sección apartada para los Jueces durante el concurso, y al "Aerodromo" yestaciones para hidroaeroplanos donde habrán exhibiciones de aeronaves y sus motoras.

Sírvase dirijir todas sus comunicaciones hasta el primero de Mayo Próximo venidero, al Sr. Contraalmirante Peary, en la forma siguiente: Rear Admiral Peary, Chairman, Aeronautic Convention, Aero Club of America, 297 Madison Avenue, New York City.

SECONDA CONVENZIONE ED ESPOSIZIONE AEREONAUTICA PAN-AMERICANA

Sotto gli Auspici dell'Aero Club of America, dell'Aerial League of America e della Federazione Aeronautica Pan-Americano

Dal Primo Maggio 1919, al Primo Giugno incluso,

ad

Atlantic City, N. J.

PROGRAMMA

GARE CHE AVRANNO LUOGO OGNISABATO

(1) Gare Idroplani (generale).
(2) Voli nautici apparecchio tipo Curtiss-Trofei e Premi.
(3) Gare Idroplani (Universita).
(4) Gare Aeroplani di terra.
(5) Gare Dirigibili.
(6) Gare Velocita ascesa e discesa, e manovre di Palloni frenati.
(7) Gare Paracadute.
(8) Aviette (Velocipedi e motocicli alati).

AVVENIMENTI QUOTIDIANI

(1) Esposizione di Aeroplani, Motori ed accessori sullo Steel Pier (Ponte d'Acciaio).

(2) Esercitazioni e prove idroplani, Aeroplani di terra, motori, Dirigibili, Palloni frenati.

(3) Trasporto Aereo passeggeri su Idroplani, e Dirigibili-Ascensioni Palloni frenati.

(4) Spettacolo cinematografico e discorsi sul elpiu importanti fasi dell'Aereonautica, nell'ordine seguente:

GIOVEDI, 1MO GIORNO

Apertura Convenzione ed Esposizione.

POMERIGGIO—Ricevimento nella Sala Aereonautica sullo Steel Pier. Conferenze Autorita Federali, Statali, ed Aereonautiche.

SERA—Esposizione Aereonautica e discorsi ufficiali.

VENERDI, 2DO GIORNO

POMERIGGIO—Esposizione Aereonautica—p r o v e preliminari, idroplani, Dirigibili, e Palloni Frenati.

SERA—Cinema e conferenza-soggetto "Aereonautica Sportiva."

SABATO, 3O GIORNO

POMERIGGIO—Corse Idroplani e dirigibili; gare di velocitá ascesa e discesa Palloni frenati.

SERA—Ballo.

DOMENICO, 4TO GIORNO

MATTINO—Un eminente Ecclesiastico commemorerá gli Aviatori defunti.

POMERIGGIO E SERA—Ricevimento "Assi" alleati ed eroi dell'Aria e loro parenti—Annunzio conferimento medaglia al valore dell'Aero Club of A. e diploma d'onore dell'Aerial League of America.

LUNEDI, 5TO GIORNO

POMERIGGIO—Prima Gara Paracadute. Premio Bennett $500.

SERA—Il Dirigibile di grosse dimensioni e la sua utilitá per trasporti. Sono invitati i Sigg. Rappresentanti delle ferrovie, dell Compagnie di Express, delle Compagnie di Navigazione e di altri servizi-trasporti.

MARTEDI, 6TO GIORNO

POMERIGGIO—Conferenze con proiezioni sulla "Guardia Forestale Aerea" (Sono invitati i rappresentanti dei Dipartimenti forestali di ogni Stato.)

SERA—Polizia aerea (squadre) e le ragioni per le quali ogni cittá dovrebbe averne una.

MERCOLEDI, 7MO GIORNO

POMERIGGIO E SERA—Giornata "Posta Aerea". Conferenza con proiezioni—Considerazioni su la "posta aerea". Sono invitati a parlare: il Capo del Comitato ufficio Posta e servizio Stradale della Camera di Deputati e del Senato e il Direttore Generale della Posta, Sig. Burleson (26,000 impigati postali ed i rappresentanti delle Camere di Commercio di 13,000 cittá).

GIOVEDI, 8VO GIORNO

POMERIGGIO E SERA—Conferenza con proiezioni sulla necessitá di costruire aerodromi municipali e sull agrande influenza che gli aeroplani avranno nella costruzione e nello svliuppo delle nuove cittá. (Sono invitati i Commissari delle Camere di Commercio e degli uffici Planimetrici municipali di 13,000 cittá.)

VENERDI, 9O GIORNO

POMERIGGIO—Arrivo di Odroplani e di aeroplani dell'esercito da stazioni aeree dell'esercito e della marina. Seconda gara paracadute premio Bennett $500.00.

SERA—Conferenza con proiezioni sui recentissimi progressi della lotta aerea narrate da famosi "Assi."

SABATO, 10MO GIORNO

POMERIGGIO—Giornata in onore dell'esercito e della Marina—Gare Aeree e tornei.

SERA—Ricevimenti Sigg. Ufficiali dell'Esercito e della S. U. Trattenimento e discorsi nella sala dell'-Esposizione Aereonautica sullo Steel Pier.

DOMENICA, 11MO GIORNO

POMERIGGIO E SERA—Presentazione delle bandiere da parte di ciascun Stato degli S. U. alle squadre aeree che li rappresentano. Ciascun Stato presentera una bandiera a ciascuna squadra aerea, i membri della quale saranno possibilmente tutti nativi dello Stato che rappresentano. I rappresentanti delle succursali in ogni Stato dell'-Aereo Club e dell'Aerial League faranno tale rappresentazione. (Ciasun Stato e ciascuna cittá saranno invitati a mandare delegati e l'Esercito e la Marina a mandare rappresentanti.)

LUNEDI, 12MO GIORNO

POMERIGGIO—Conferenze illustrate sul valore della macchine deree come mezzi di "reclame" di giorno e di notto. (Sono invitati tutte le compagnie di pubblicita nazionali ed estere.)

SERA—Trasporto Aereo Pan-Americano su terra. Conferenze di membri delle Commissioni delle venti repubbliche America-latine.

MARTEDI, 13MA GIORNATA

POMERIGGIO E SERA—Trasporto Aereo Pan-Americano sopra acqua. Conferenze di membri delle Commissioni delle venti repubbliche Americo-Latine.

MERCOLEDI, E GIOVEDI, 14MO E 15MO GIORNO

POMERIGGIO E SERA—Le Vie Aeree ed il Trasporto Aereo in Europa, Canada, Africa, Australia ed Asia.

VENERDI, 16MO GIORNO

POMERIGGIO E SERA—Istrumenti di navigazione Aerea per voli sopra terra e sopra mare. (Sono invitati aviatori, naviganti, fabbricanti strumenti scientifici a periti aereonautici.)

SABATO, 17MO GIORNO

POMERIGGIO—Corse e gare aerenautiche. Conferenze con proiezioni sul l'Arte Fotografica Aerea.

SERA—Esposizione su vasta scala di Fotografie Aeree e di apparati fotografici. (Sono invitati tutti i fotografi, professionisti e dilettanti, e fabbricanti di apparati fotografici.)

DOMENICA, 18MO GIORNO

POMERIGGIO E SERA—Conferenze Illustrate con proiezioni sull'Esplorazione Aerea e sull'uso di velivoli per le misurazioni costiere e geodetiche.

LUNEDI, 19MO GIORNO

POMERIGGIO—Conferenze sul bisogno di un miglior trattamente da parte delle Compagnie d'Assicurazione nelle condizioni di assicurazione delle macchine e degli aviatori.

SERA—Conferenze con proiezioni sull'influenza che i sistemi del Corpo Medico dell'Esercito hanno sulla diminuzione delle disgrazie. (Sono invitati tuttigli agenti delle Compagnie di Assicurazione.)

MARTEDI, 20MO GIORNO

POMERIGGIO E SERA—Conferenze Illustrate indicanti i vari modi gi studiati per attraversare l'Atlantico nell'Aria—ostacoli da vincere, problemi da risolvere per poter compiere felicemente il viaggio.

MERCOLEDI, 21MO GIORNO

POMERRIGIO—Giornata dedicata alla sicurezza Aerea—Discussioni su provvedimenti presi per la sicurezza Aerea—Perfezionamenti nella costruzione degli aereoplani; Aumentata sicurezza di motori aerei; congegni atti a migliorare la stabilitá dei voli.

SERA—Progressi fatti nell'arte dei piloti aviatori. (Illustrazioni.)

GIOVEDI, 22MO GIORNO

POMERIGGIO E SERA—Conferenze e discorsi di meteorologia; come possono essere fatte piu esattamente le previsioni meterorologiche esplorando l'aria con velivoli negli strati superiori, e come queste previsioni meteorologiche possono essere utili alla nagivazione aerea—Fattori telegrafici e climatici in relazione all'Aereonautica.

VENERDI, 23MO GIORNO

POMERIGGIO E SERA—Conferenze sulla giurisprudenza aerea; leggi e regolamenti per il traffico Aereo. (Avvocati, Commissario di traffico, Autorita di Polizia dei differenti paesi invitati.)

SABATO, 24MO GIORNO

POMERIGGIO E SERA—Corse e gare—Conferenze illustrate sul bisogno di stabilire un livello di altezza per il traffico aereo internazionale, interstatale, e interurbano.

DOMENICA, 25MO GIORNO

POMERIGGIO E SERA—Giornata d'Arta Aeronautica. Conferenze sulla Pittura e sulla Scultura di ogni paese su soggetti d'Aereonautica. Esposizione di quadri di soggetto dei tenenti Farre, Ruttan, e di altri. (Sono invitati tutti i piú Valenti artisti, i direttori di Gallerie d'Arte e gli amatori d'Arte.)

SETTIMANA DEDICATA ALLA "MECCANICA"

LUNEDI, 26MO GIORNO

POMERIGGIO—Problemi di meccanica aeronautica e la loro probabile soluzione.

SERA—Apertura di un concorso—disegni ed idee per la costruzione di grandi aeroplani.

MARTEDI, 27MO GIORNO

POMERIGGIO—Fattori che possono aumentare l'efficienza di grandi dirigibili.

SERA—Vantaggi del legno compensato per la costruzione di velivoli.

MERCOLEDI, 28MO GIORNO

POMERIGGIO—Conferenze sui problemi che si affacciano per voli a 25,000 piedi a piu e la loro probabile soluzione.

SERA—Macchine aere d'oggi.

GIOVEDI, 29MO GIORNO

POMERIGGIO—Battelli volanti contro Idroplani per Sport e per trasporti commerciali.

SERA—Gare—Disegni ed idee per aeroplani di grandi dimensioni.

VENERDI, 30MO GIORNO (Giorno Commemorativo)

POMERIGGIO—Corse Dirigibili—Gare di velocita d'ascensione tra palloni frenati—Gara paracadute.

SERA—Grande ricevimento nella Aereonautic Hall, Steel Pier.

SABATO, 31MO GIORNO

POMERIGGIO—Gare tra idroplani, aereoplani dirigibili—Gara Aviette alla quale interveranno tutti i ciclisti ed i fabbricanti di biciclette e di motociclette.

SERA—Sistemi e regolamentari medici internazionali per aviatori in guerro ed in pace. Relazioni sui sistemi adottati nei differenti paesi, illustrate da interessanti proiezioni. (Sono invitati 50,000 Sanitari.

DOMENICA, 32MO GIORNO

POMERIGGIO E SERA—Distribuzione generale dei diplomi.

Il Governo d'Italia e le organizzazioni italiane di Aeronautica di Sport e di Scienze sono invitati a mandare rappresentanti ad assistere a questo grande evento aereonautico. Arrivando negli Stati Uniti i Signori Rappresentanti dovranno presentarsi al Quartiere Generale del Somitato al N. 297 Madison Ave., N. Y., per registrarsi e ricevere la targhetta ufficiale, nonché il programma.

Nel caso fosse per loro piú conveniente recarsi direttamente ad Atlantic City, potranno registrarsi colá presso gli uffici situati nei seguenti alberghi: Hotel Traymore, Hotel Chalfonte, The Breakers Hotel, Hotel St. Charles, Hotel Marlborough-Blenheim, Hotel Chelsea, Hotel Alamac, Hotel Dennis and Hotel Haddon Hall.

I Rappresentanti del Comitato di Convenzione si troveranno negli uffici della Convenzione Aereonautica nei sunnominati Alberghi e distribuiranno i distintivi ufficiali che daranno al portatore il diritto di essere ammesso all'Aereonautic Hall, all'Esposizione sullo Steel Pier, nel recinto occupato dai giudiei durante la gara, all'Aerodromo, all stazione degli idroplani dove saranno esibiti i velivoli ed i motori.

Ogni comunicazione sino al primo Marzo dovrá essere indirizzata al Rear Admiral Peary, Chairman, Aeronautic Convention, Aero Club of America, N. 297 Madison Ave., New York.

THE LIBERTY MAGNETO

PRIOR to the entry of the United States into the War, comparatively little constructive work had really been accomplished in this country in developing a magneto suitable for the high speed, multi-cylinder engines required for aircraft service.

One of the first and most important problems confronting the designers of the "Liberty" engine was to provide a dependable and entirely satisfactory system of ignition. While practically all engineers were agreed that a suitable magneto afforded the most desirable source for the ideal ignition system, current history and the result of the tests of magnetos submitted clearly indicated that so far no magneto was available that could be readily mounted on and would successfully meet the exacting requirements of the twelve cylinder "Liberty" engine, therefore the battery-generator system of ignition was reluctantly adopted.

It remained for the engineers of the Berkshire Magneto Company to finally solve the problem with a very unique development of their high tension, inductor type magneto, so designed that it was mechanically interchangeable with the distributor heads of the original system.

The service tests to which these special magnetos have been subjected since last November prove that they not only function perfectly, but start the engine easier, appreciably increase the horse power and efficiency, reduce vibration and eliminate the many well recognized, inherent limitations of the generator-battery system.

In appearance the Liberty magneto more nearly resembles a small fractional horse power motor, as it is cylindrical in form, 6½" in diameter, 7¾" long and weighs less then seventeen pounds.

Briefly described, it consists of a cylindrical aluminum frame within which is mounted an aluminum field casting with four sets of laminated steel inserts for pole pieces.

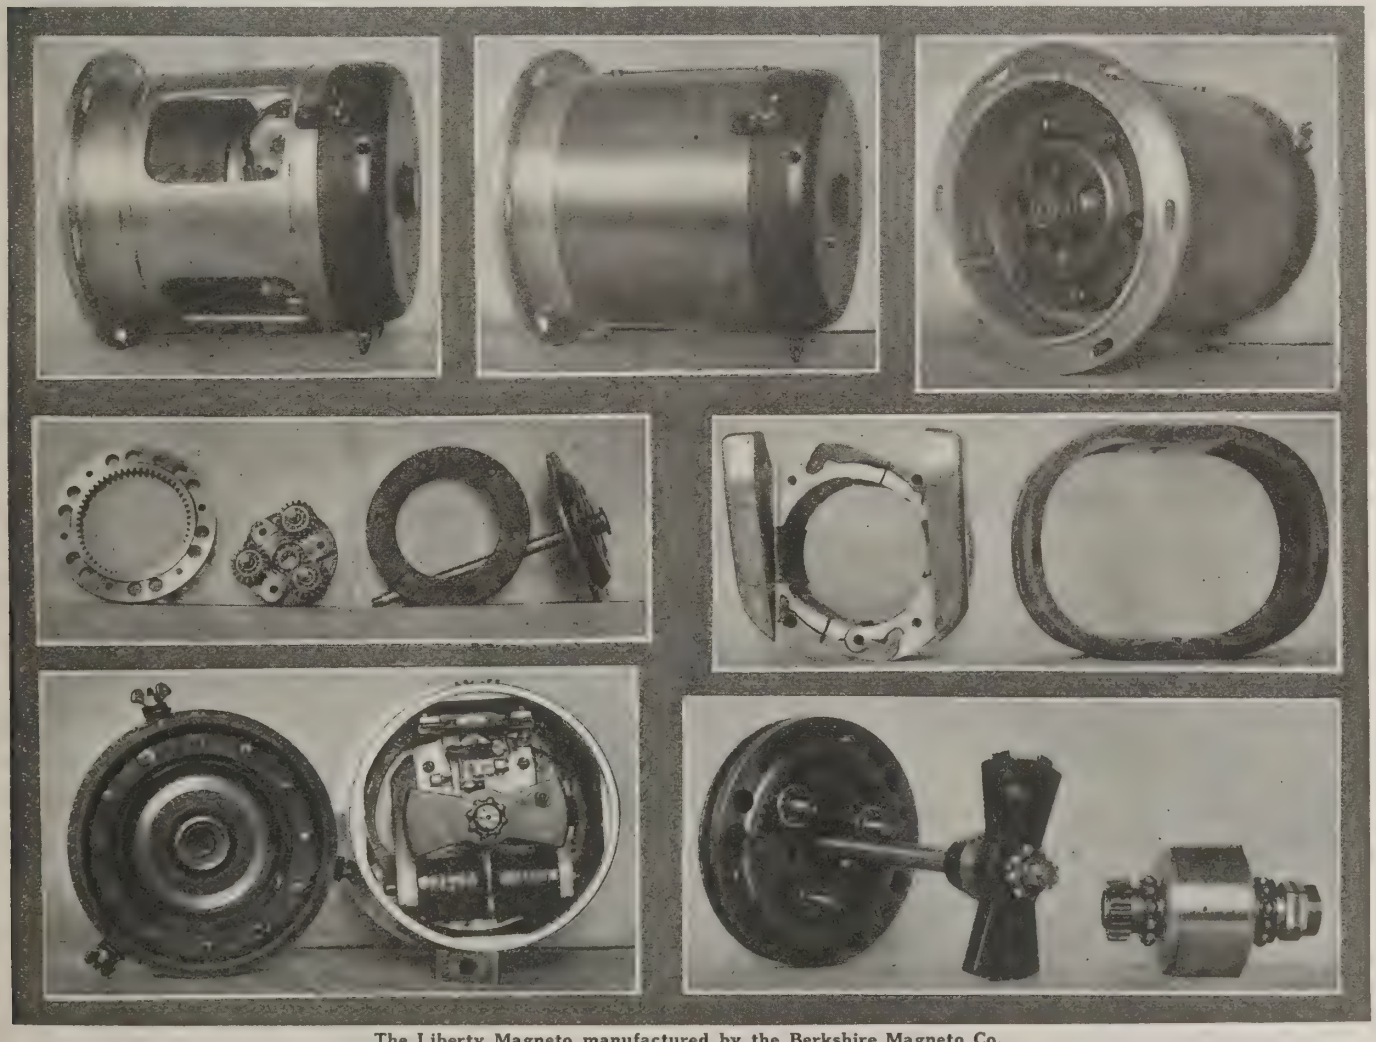
The four poles of the field are not conventionally arranged as in standard practice, but are located alternately 67½ and 112½ degrees from each other to coordinate with the angular spacing of the engine. This arrangement allocates each spark in the most efficient part of the generated wave.

Attached to and on opposite sides of the field casting are two nearly semicircular tungsten steel magnets, the ends of which abut each other in the center of one pair of pole shoes.

The stationary coil, which is supported by two projections from one set of field poles, is assembled on a laminated core on which the primary and secondary coils of enamel insulated wire are wound. The entire unit being thoroughly impregnated, after final assembly, with a special compound applied in a vacuum.

A two-pole armature, arranged for four sparks per revolution, built up of steel punchings and assembled on a hollow shaft, is carried on two very substantial ball bearings, one of which is rigidly attached to a flange on the inside of the main frame, while the other is pressed into an aluminum plate attached to the outer end of the field casting, which plate also serves to carry the interrupter and condenser.

A metal interrupter of simple design and extremely light in weight is operated by a self-lubricated metal cam provided with a special contour to correspond with the requirements of the angular spacing of the cylinders of the engine.



The distributor is of the jump spark type, made of special approved compound with metal inserts and socket type, radial receptacles for the leads from the spark plugs, the terminal binding screws being on the inside of the distributor. This distributor also serves as the end cover of the magneto, and when removed exposes the interrupter, condenser, coil and other vital parts which are thus easily accessible for inspection and repair.

The driving power from the cam shaft of the engine is transmitted to the armature through a flexibly mounted train of gears, consisting of a large bronze annular gear and three steel pinions, which latter engage with a hardened steel pinion on the armature shaft, rotating the armature at three time cam shaft speed.

A central shaft welded to the outer steel disc projects from the cam shaft of the engine, through the train of gears, through the hollow armature shaft, and carries at its outer end the collector ring and distributor rotor, which conducts the high tension current to the proper terminals inside the distributor.

A cover of sheet brass encloses the sides of the frame, and with the distributor on the end form a water and dust proof protection for the working parts of the magneto.

It is expected that magnetos of the Liberty design will soon be available for other aviation and automobile engines of the "V" type, and since they provide not only a duplicate source of ignition, but simplify the problem of driving connections, as they will be available in both the horizontal and vertical type, should strongly commend themselves to the engine builders, who have been searching for a dependable magneto with these characteristics.

The Liberty Magneto manufactured by the Berkshire Magneto Co.

THE O. E. C. TYPE B SINGLE SEATER

ALTHOUGH the Model "B" and "C" Machines were the first single seater types produced by the Ordnance Engineering Corporation of Baldwin, L. I., and the Model "B" the first single seater to be actually built in the United States and fitted with a 160 H.P. Gnome, it is gratifying to learn that at its first trial it not only equalled but surpassed the performances of the best of the then existing foreign planes. The Model "B" is a single seater fighter designed to carry a full battery of Revelli guns, mounted on the wings or one synchronized machine gun, fixed and firing through the propeller.

After the cancellation of the order for 160 H.P. Gnome engines in this country, the Model "B" machines were modified to take the 80 H.P. Le Rhone motors, and it is interesting to note from the official records made in the trials at Dayton, Ohio, that this machine with one half the horse power it was originally designed for not only equalled but surpassed the performances of other designs equipped with a like motor.

In addition to the splendid flight performances put up by both types, an equally fine record was made with sand tests at Dayton, Ohio. The wings went to a factor of safety of 8½, showing one of the strongest wing trusses ever tested at that plant, weight and size considered. The elevators and tail parts failed under a load of 67 lbs. per square foot. Specifications called for a breaking load of 35 lbs. per square foot.

During a test at the company's experimental shop a total load of 8,400 lbs. was applied to the wings and left on the wings for sixteen hours.

As stated before, the type "C" is an adaptation of the Model "B" fighter, and with the exception that the staggers differ in the two types and the tanks and weight distributions are different, the general dimensions of the two types remain the same.

Main Planes

Aspect ratio of upper wings, 6.5; lower wing, 6.14.

Safety factor of wing truss at high speed, 6; at low speed, 7. Wings have no sweepback nor dihedral. Decalage, 1 degree. Angle of upper wing to propeller axis, 1.5°; lower wing, 0.5°.

Gap to chord ratio, 0.947.

Wing section, R. A. F. Number 15.

Clear vision is obtained forward through an angle of 45 degrees between wings. The only blind spots are through an angle of 8 degrees for the top wing and 33 degrees for bottom wing.

Ailerons are 6′ 9″ long and 1′ 7″ deep. Center of pressure, 9′ 6¾″ to longitudinal axis.

Tail Group

Stabilizer span, 7′ 6″; depth, 1′ 10″. Center of pressure to center of gravity of machine, 11′ 10″.

Elevators are 8′ 2″ in span; depth, 2′ 0″. Center of pressure to center of gravity of machine, 13′ 4″.

Rudder, 3′ 4″ high and 2′ 0″ deep. Center of pressure to center of gravity of machine, 13′ 4″.

Fin, 1′ 8″ high, 2′ 10″ deep. Center of pressure to center of gravity of machine, 11′ 9″.

Landing Chassis

Wheels have a track of 5′ 0″. Angle of center of gravity ground point and vertical 13½ degrees.

Chassis designed to stand up when fully loaded machine is dropped from a height of 10 inches.

Fuselage

Length of fuselage, 15′ 11″. Maximum section, 3′ 5″ by 3′ 5″.

Fuselage designed to stand a load of 30 pounds per sq. ft. on horizontal tail surface and dynamic loading of 5. Engine section has a safety factor of 10.

The instruments on the dashboard are as follows: Dixie Magneto switch; Phinney-Walker rim wind clock; longitudinal inclinometer; horizontal inclinometer; Altimeter (20,000 ft.); Tachometer, Signal Corps, type B; and a Sperry Air Speed Indicator. The clock, Altimeter, Tachometer, and Air Speed Indicator have Radiolite dials.

A Pyrene fire extinguisher is conveniently mounted at the left of the seat, connected so as to be pumped directly into carburetor, or it may be used separately.

Power Plant

(*LE RHONE*)

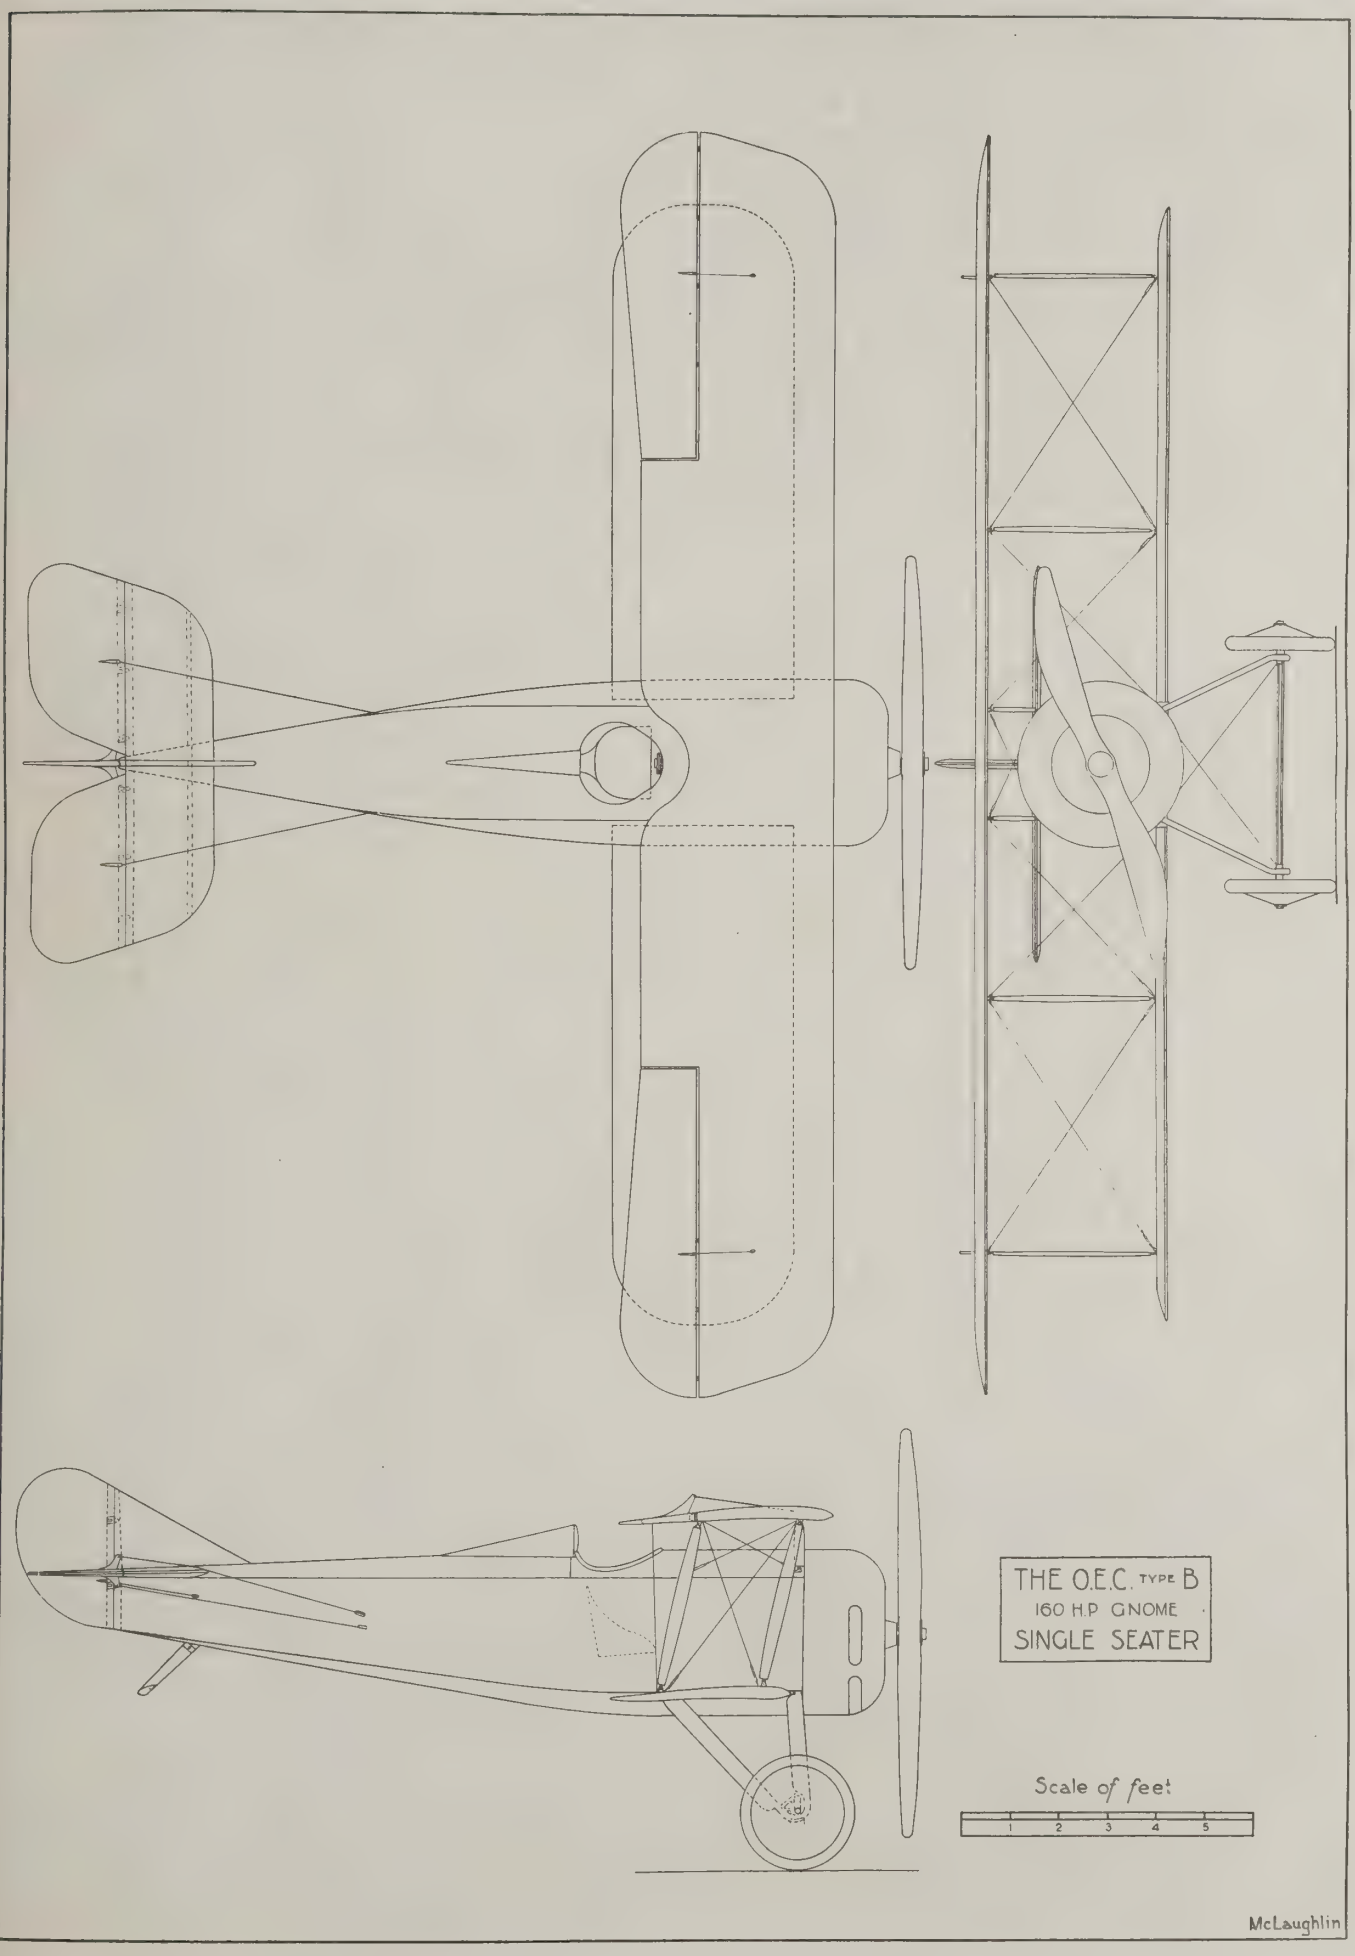
The 80 H.P. Le Rhone engine develops its rated H.P. at 1,200 r.p.m. Fuel tanks are mounted between the engine and the pilot, over the center of gravity.

Capacity of gasoline tank, 18 gallons, Oil, 4 gallons. Weight of gasoline, 110 lbs., sufficient for 2¼ hours. Weight of oil, 28 lbs., sufficient for 2¾ hours. Gasoline consumption, 0.60 pounds per B.H.P. hour. Oil, 0.13 pounds.

Propeller, 8′ 4½″ diameter and 7′ 6½″ in pitch.

Height of propeller axis above ground with machine in flying position, 4′ 11″; with machine at rest, 5′ 6″.

Power Plant



(*GNOME*)

The Gnome engine is of French manufacture. At 1,200 r.p.m. it is rated at 160 H.P.

Gasoline consumption, .85 pounds per H.P. per hour; Oil, 16 pounds per H.P. per hour; Gasoline capacity, 35 gallons; weight 210 pounds. Oil capacity, 4 gallons; weight, 28 pounds.

THE LAWRANCE 60 H.P. AIR COOLED ENGINE

THE Lawrance Model L-1 is a three-cylinder Y-type air-cooled engine rated at 60 h.p. at 1,900 r.p.m. The accompanying graph shows that the engine delivers 30 h.p. at 800 r.p.m. and 63 h.p. at 2,100 r.p.m.

Bore, 4.25 inches; stroke, 5.25 inches. Cylinder displacement, 225 cubic inches. The weight complete with propeller hub, 130 pounds. This weight includes everything necessary for running, with the exception of the oil tank and mounting plates for which an additional weight of nine pounds is allowed. Starting handle is supplied when desired. Exhaust pipes made to individual requirements.

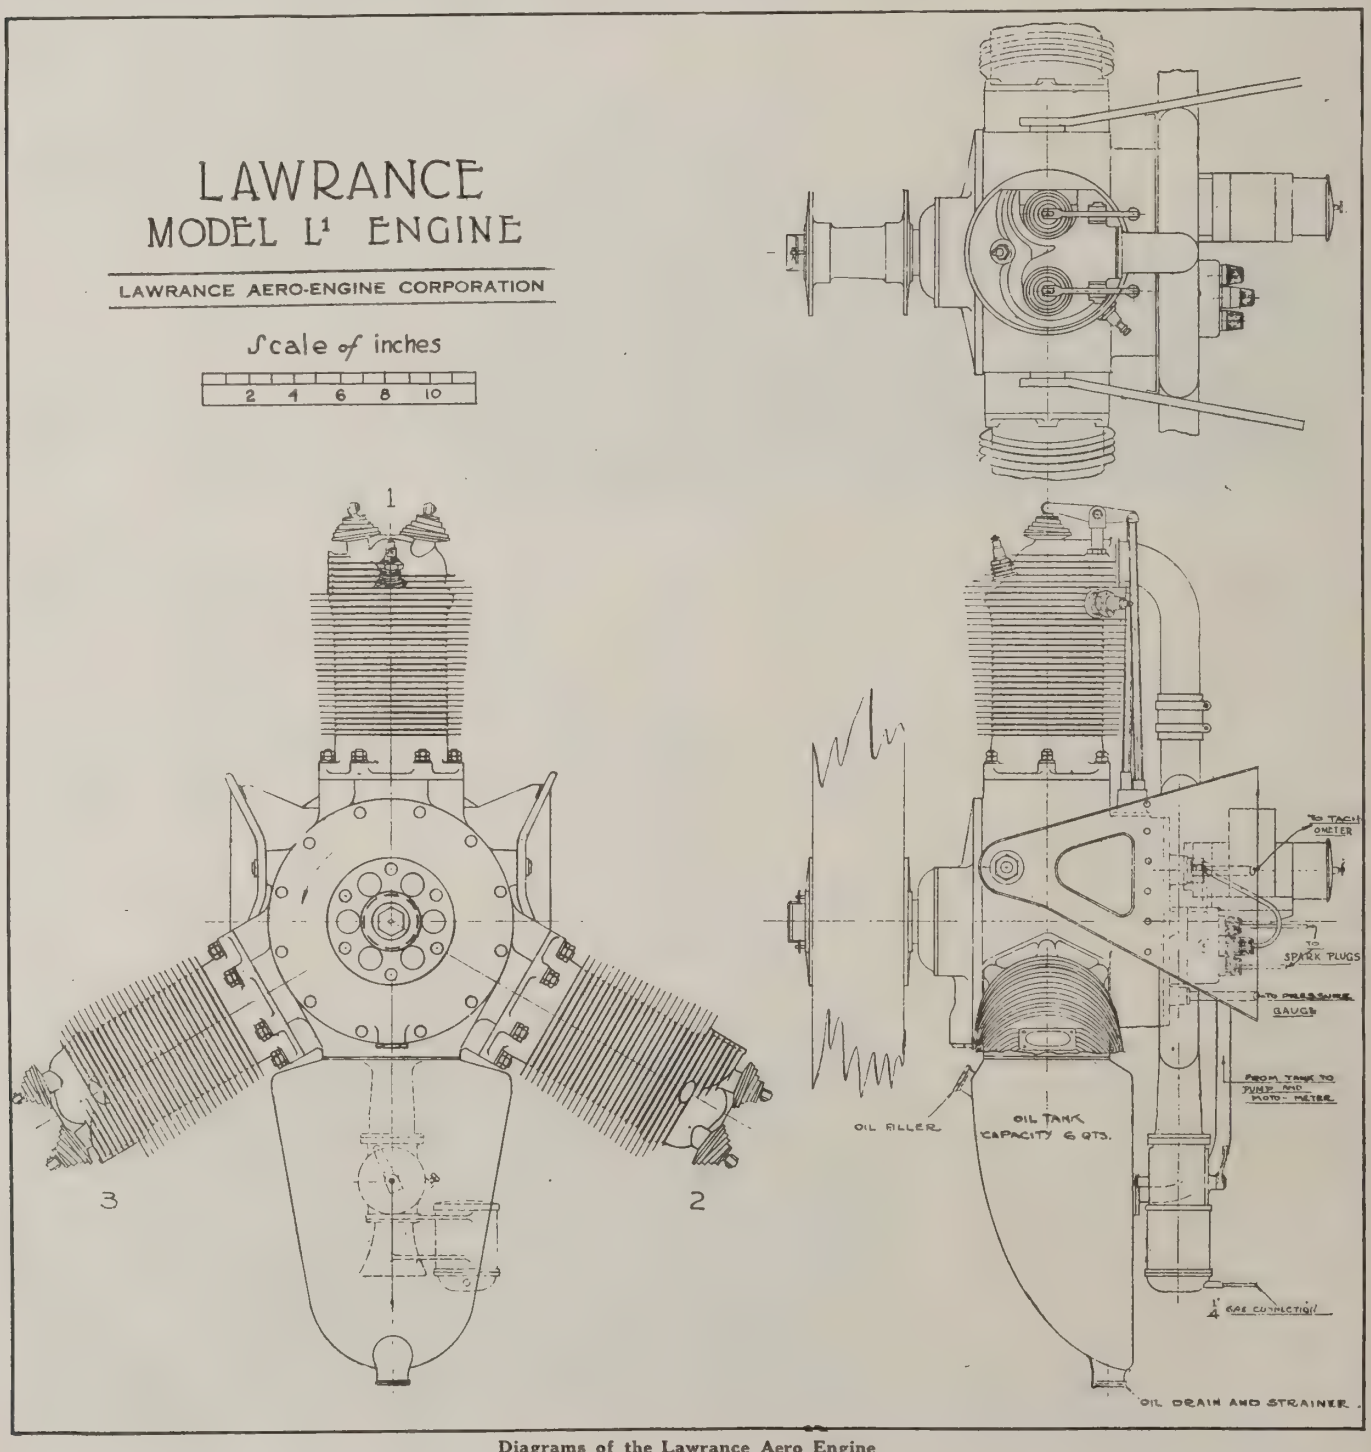
Cylinders

The cylinders are of cast aluminum with cooling fins machined. Shelby steel liners with walls 1/16 inch thick are cylinder and the crankcase. Liners are case-hardened and ground, which gives them a very fine wearing surface.

Each cylinder is attached to the crankcase by means of six studs.

Pistons

Pistons are of cast aluminium alloy. Crowns are flat. Each piston has four concentric cast iron rings and one wiper ring on skirt.



Crankcase

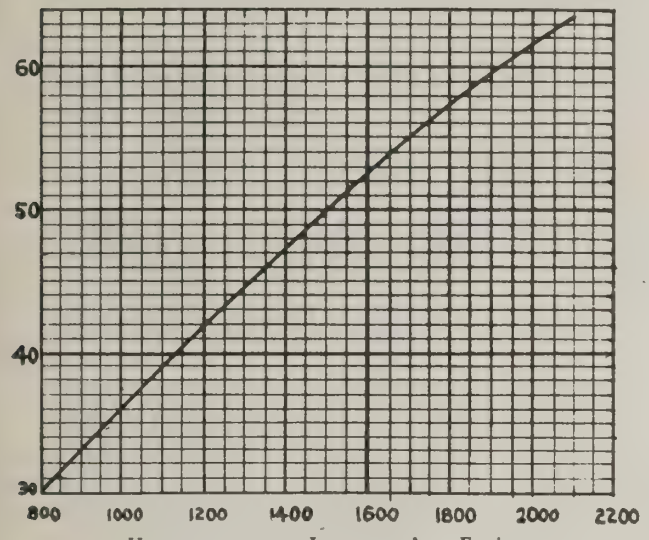
Crankshaft is of chrome nickel-steel. It has a single throw and is counterbalanced. The shaft is hollow for lubrication.

Front end of shaft is tapered to receive the propeller hub which is drawn tight by means of a differential thread nut. The shaft is sturdy and of large dimensions throughout.

Connecting Rods

Connecting rods are of chrome nickel-steel. They are round, of constant section and hollowed for lightness. They are machined all over. Each of the three rods has a seg-

Diagrams of the Lawrance Aero Engine



mental shoe which floats in two grooves in the big end bearing.

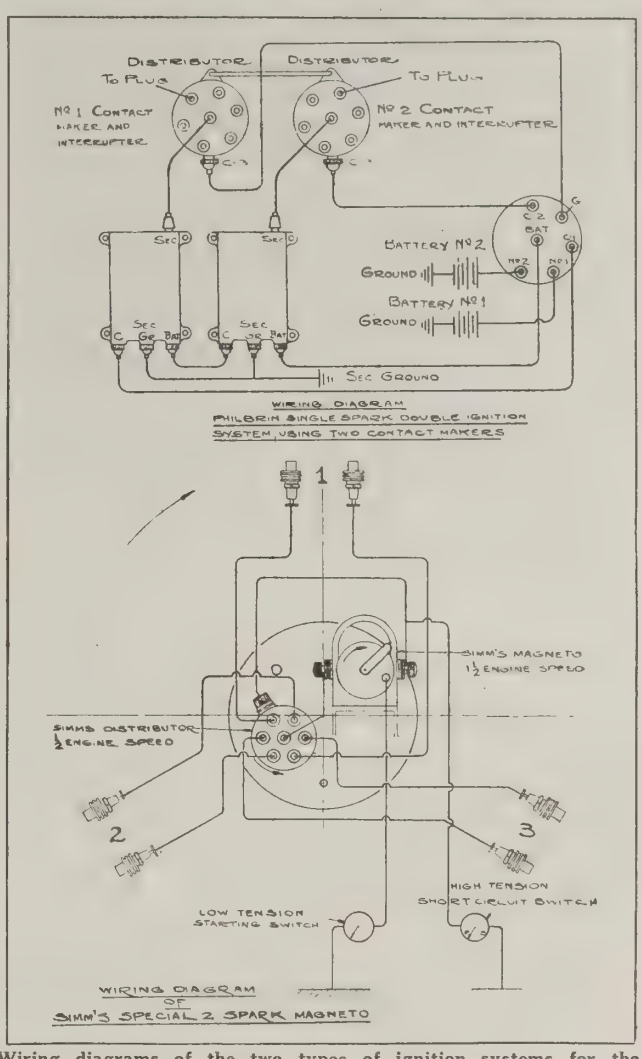
Bearings are of cast bronze with Babbitt lining.

Wrist pins of nickel-steel float in both the rods and pistons. Bronze buttons on the ends of wrist pins keep them from working out sidewise.

Valve Gear

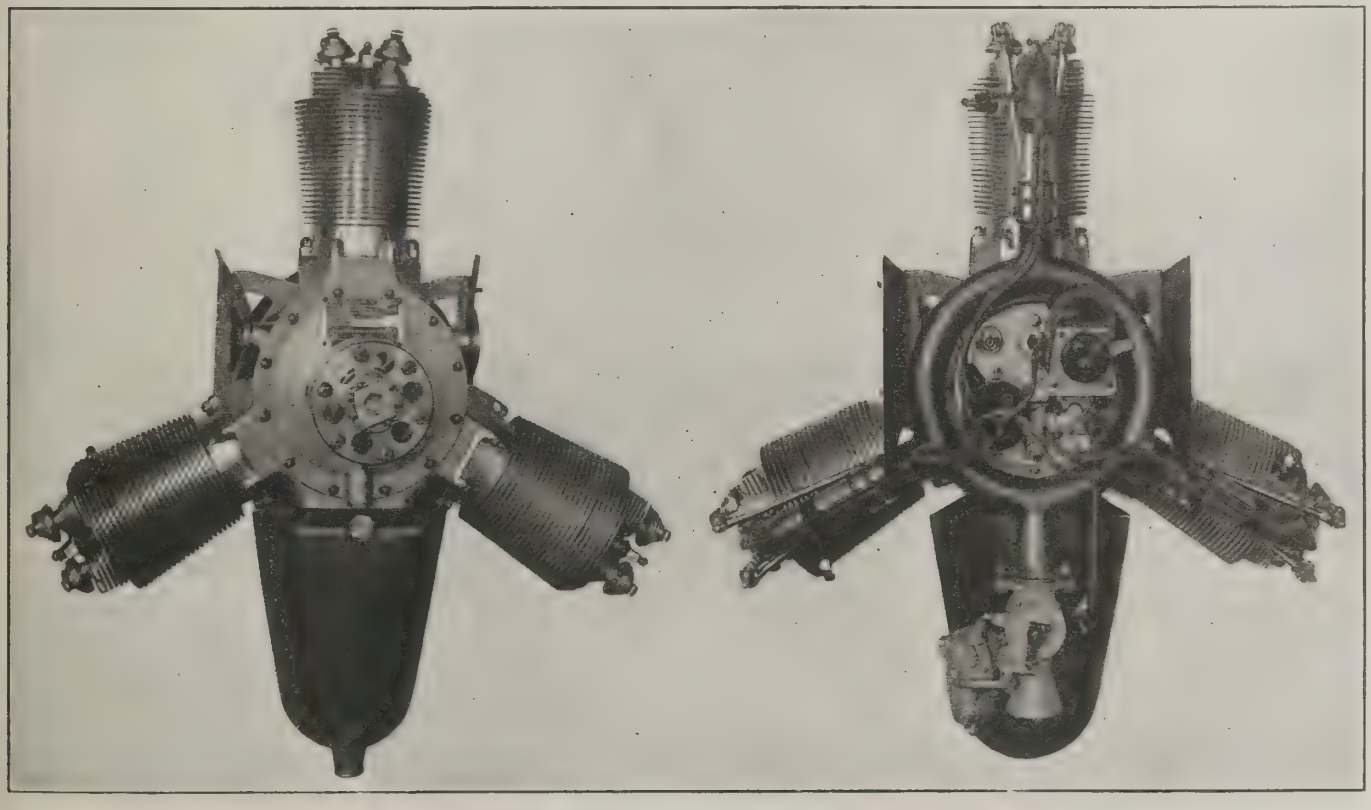
Valve gear consists of three individual camshafts, each with two cams. The push rods are adjustable.

Horsepower curve, Lawrance Aero Engine



Rocker arms are provided with rollers where they come in contact with the valves so that all side thrust on the valve guides is eliminated.

Valves are of Tungsten steel, 2 1/16 inches in diameter.



Exhause valves are mercury treated so as to more readily conduct the heat from the head of valve to the stem.

Guides and valve seats are also of cast bronze, set into heads of the aluminium cylinders.

Springs are of a new type. They are conical in shape,

Wiring diagrams of the two types of ignition systems for the Lawrance Model L-1 Aero Engine

The Lawrance 60 H.P. air cooled aero engine

wound of flat steel placed edgewise and tapered so that the greater width is in the large coils and lesser width in smaller coils. This permits of a shorter spring than would be possible with the usual helical coil spring.

Ignition

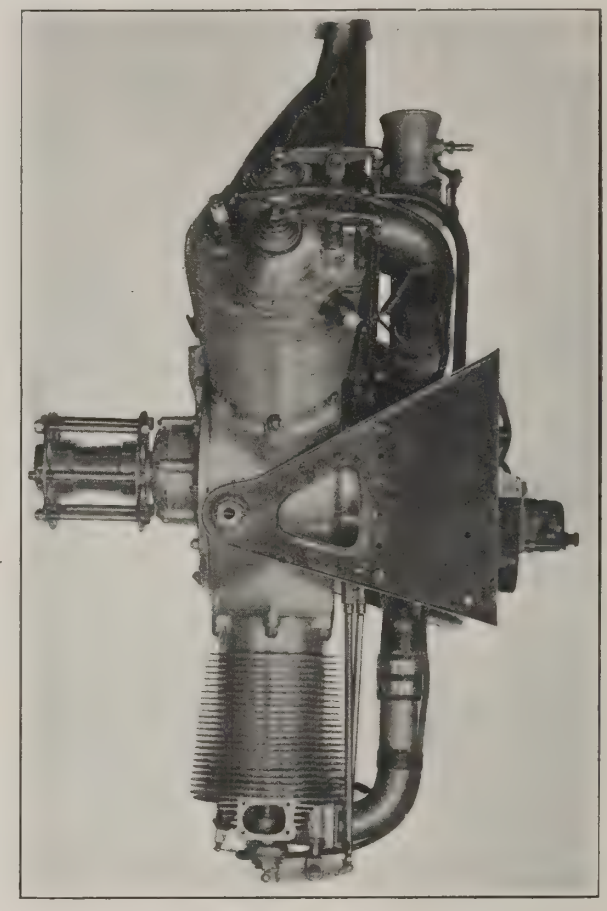
Two kinds of ignition are supplied. One type is a magneto designed by Mr. Kilsrath of the Simms Magneto Company which has a single breaker and one primary winding but two high tension windings, giving two absolutely synchronized sparks.

Magneto is run at 1½ times engine speed. The high tension distributor is separate and driven off one of the crankshafts.

The other ignition system is the "Philbrin," designed by the Philips-Brints Ignition Company. This system has a dual spark with two breakers; either one is used to fire the entire system; allowing perfect synchronization.

One of the accompanying illustrations shows the magneto in place.

Carburetor



A Miller Carburetor is used. It has a throat 1¾ inches in diameter.

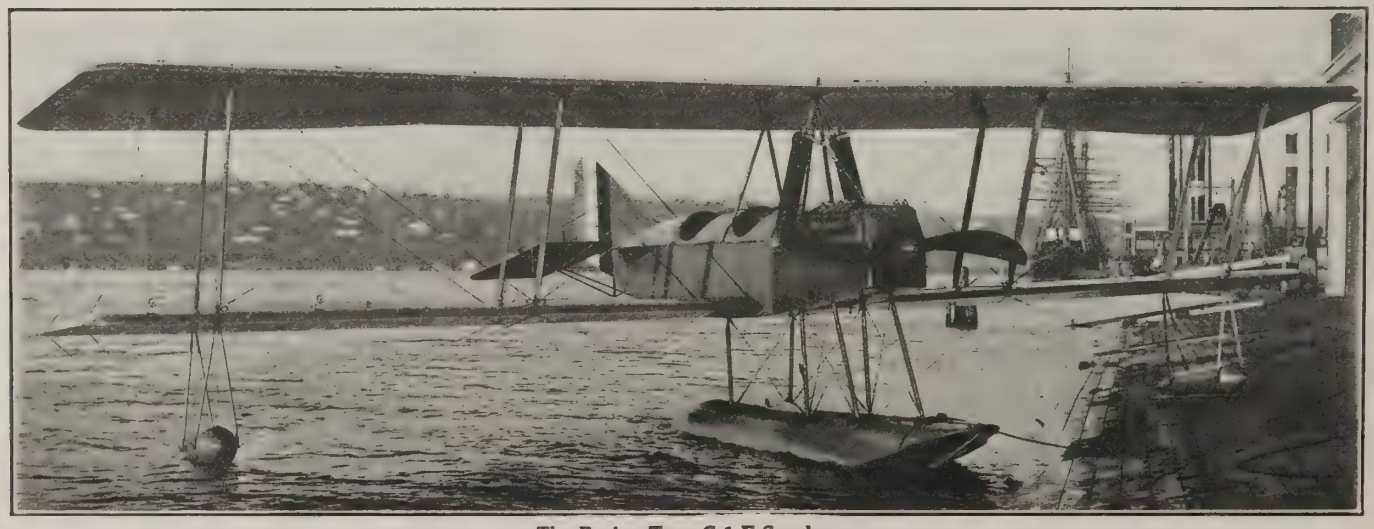
Lubrication

Lubrication is by means of pressure supplied by a gear pump. Pressure is maintained at 25 pounds per square inch.

The oil is fed through the rear of crankshaft to the front cover where it runs to a check valve which maintains the necessary pressure. From this valve the oil drains back to the tank immediately below it. On the front cover plate, the by-pass valve operates at a pressure of 50 pounds. It might seem that the two lower cylinders would obtain most of the oil but as a matter of fact it has been proven that the oil is evenly distributed to the 3 cylinders.

Oil is consumed at the rate of .07 lbs. per h.p. per hour.

BOEING SEAPLANE—TYPE C-1-F



THE model C-1-F is an advanced modification of the Boeing type "C" seaplane used by the Navy Department for training purposes during the war. This machine embodies the use of the single float and the Curtiss OXX-2 eight-cylinder motor. A further modification from the "C" type lies in the use of one degree of dihedral rather than 2¾ degrees as used on the older machine.

Wing Structure

The wing structure follows the model "C" in that a 50 per cent. stagger and 2½ degree declage is used. This combination assures the inherent longitudinal stability which has been characteristic of previous Boeing designs. The center cabane struts are made of seamless steel tubing with special steel terminals, giving a simple, efficient and sturdy center section construction. The forward construction of the cabane eliminates fore and aft stays and furnishes substantial means of bracing the side radiators. The interplane spruce struts are of straight streamline form, tapered at the ends to accommodate strut sockets, while the internal drift struts are made from web sections, of box form. The wing fittings are of special design, giving a minimum of head resistance, while providing for maximum strength necessary. The wing tip floats are provided, these being of conventional form and securely braced to the lower wings.

Tail Unit

The design of this unit is characterized by extreme simplicity as well as maximum strength. Balanced elevators are used, giving automatic adjustment for differences in loading. This

The Boeing Type C-1-F Seaplane

feature is particularly notable to pilots in that maximum and minimum conditions in the distribution of the useful load are unnoticed in flight. The elevators are fixed to steel shaft, having center and two end bearings for supports. Fin and tail posts are of steel, making a thoroughly satisfactory mounting for bracing and tubes.

Landing Gear

The landing gear is of conventional single float type. The underwater lines of this float are such as to assure quick getaway and easy landing without undesirable spray and water disturbances. The stability of this machine has frequently been demonstrated while taking off, landing and taxying in rough seas and while drifting in as high as 30-mile winds. The float is of two-ply laminated construction and with cotton and marine glue between the laminations. The external float fittings are such as to facilitate rapid assembly as well as to transmit all stresses to the center longitudinal bulkhead, which is the main strength member of the float. The landing struts are of streamline steel tubing.

Body

The body is of the conventional longeron truss type with metal frames for engine bearers and metal carry through struts for lower wings. The seats are made from a series of ash slats conforming to the attitude of the occupant and covered with detachable upholstery. The cushions are stuffed with Kapoc and are readily detachable for use as life preservers in emergency. The instrument board is equipped with all instruments necessary to indicate the operation of the machine. The surface control is Dual Deperdussen, featuring an adjustable rudder and adjustable rudder compensator for distance service. The engine throttle is mounted at the right of both cockpits, and the ignition retard is at the left of the pilot's cockpit. The Curtiss OXX-2 100 H.P. motor has proven extremely satisfactory. It is light, powerful, economical and free from undesirable vibration in the range of flying operation. A hand starting lever is provided immediately behind the motor and has given satisfactory service. As mentioned before, the cooling system is mounted to the rear and above the motor. This mounting is exceptionally effective and has performed satisfactorily in service. The gasoline tank is immediately behind the motor and supplies gasoline under atmospheric pressure to the carburetor. The carburetor lead is supplied with a shut-off valve operated from either cockpit as well as a convenient drain beneath the body.

The Boeing Type C-1-F. Seaplane with Curtiss OXX-2 motor

THE CAPRONI BOMBING TRIPLANE TYPE CA-4—1915

THE Caproni triplane, which was on exhibition at the Aeronautical Exposition at the Sixty-ninth Regiment Armory, represents a type designed and built by the famous Italian constructor since 1915. This machine was created at that time for the night bombing of important military and naval bases, railroad stations and war plants.

As for the preceding types of machines by the same constructor which have attained fame for the brilliant services rendered to the Allies the type Ca.4 triplane has for its distinctive characteristic the number and arrangement of the motors, firstly adopted by the renowned Italian constructor. There are three motors, distributed on the two fuselages and on the central nacelle. The central motor is for a pusher propeller, while the two lateral motors have each a tractor. Both tractors turn in the same direction.

Fuselages and nacelle are attached to the spars of the middle wing. The center wing section, lower plane, holds the bomb rack. This bomb-dropping apparatus, also devised by Engineer Caproni, represents the simplest, most reliable and the lightest in weight of all the devices brought forth for bombing purposes during the war.

Normally the crew of the machine is constituted by two pilots, seated side by side, as it is usual with the Caproni bombing planes, a gunner in the front nacelle cock-pit, who operates a 1½-inch gun and two Fiat machine guns, coupled on the same mount. The front gunner also operates a searchlight of the Sautter-Harlé type. The rear defence is enthusted to two gunners, each of whom is seated in one of the fuselages; they also handle Fiat machine guns coupled on the same mount.

Each of the five men is afforded the possibility of commodiously transferring himself from one part of the machine to another. Between the central nacelle and the fuselages on the middle wing a passage covered with veneer wood is installed for this purpose.

The bomb sight and the five handles controlling the bomb rack are operated by the pilot on the right-hand seat.

The Ca.4 triplane has been successively equipped with three different types of motors. At first three Isotta-Fraschini 8-cylinder (vertical) 240/250 H.P. engines were used; it was later equipped with three Fiat A/12-Bis 6-cylinder (vertical) engines, and finally three Liberty-12 engines, Navy type (low compression) were adopted.

With an aggregated useful military load of 6,600 lbs. the performance of this triplane, equipped with Liberty engines, have been, especially in climbing, considerably better than those obtained with the other two types of motors. In the official tests, at full load and fully armed, a speed of 98 M.P.H., registered at 6,560 feet, was reached. The average rates of climbing attained with Liberty motors at full military loads were:

3,280 feet in 6 minutes
6,560 feet in 14 minutes
10,000 feet in 25 minutes

The ceiling is at about 16,000 feet.

The total weight of the machine, empty, is 11,100 lbs. With full military load the machine weighs 17,700 lbs.

With a complete fuel load of 550 gallons, the bomb rack is supposed to be loaded with 2,500 lbs. of bombs, but practically in almost all bombing raids the load of bombs exceeded 3,000 lbs.

The following is a table of the general specifications.

General Dimensions

Overall wing span (at trailing edge)	96′ 6″
Overall height to top of aileron, lever in normal position	20′ 8″

Angles

Lower wing chord	8° 50′
Stabilizer chord—minimum	3°
Stabilizer chord—maximum	8°
Motor inclination	2°
Stagger	0°
Sweepback	0°
Dihedral	0°

Main Planes

Each of the three planes is built up in seven wing sections. The corresponding sections in upper, middle and lower wings are equal in length. The wing spars are of box beam section. The ribs, double ribs and box ribs are in whitewood and ash (cap-strip). Between rib and rib the wing spars are wrapped with strong linen. The connection between the two subsequent sections is obtained with the male and female box-fitting system.

The chord is, for the entire length of the wings, 6′ 11¾″. The covering is of linen, nailed on the rib cap-strips and on the leading and trailing edges. On the linen, above and below the wing, maple batten strips are screwed in correspondence to the ribs.

For the interplane struts, ash, spruce and seamless steel tubes are used. Some of the struts have adjustable ends. The bracing is, as usual, with steel cables and wires.

Gasoline System

The gasoline is supplied by three tanks disposed; two, one in each of the fuselages and one in the nacelle. Three wind-driven centrifugal pumps pump the gasoline from the tanks to a central distributor, and from this to the carburetors of the three motors. The pilots have close at hand the devices necessary for the regulation of the gasoline pressure. For the testing of the motors on the ground two small gravity tanks are provided; these are excluded from the circuit while the machine is in flight. Each of the three tanks is divided in three compartments, and at the bottom of each of said compartments a check valve is applied, this valve working so as to avoid that in the event one of the compart-

The Type CA-4 Caproni Bombing Triplane, capable of carrying a useful load of 6,600 lbs.

ments is shelled the gasoline in the undamaged compartments should leak through the hole bored in the damaged one.

Chassis

The landing gear is of a special Caproni design and very robust. The two M-struts are of laminated ash and spruce, wrapped with strong canvas fabric. The chassis carries on each side one front and one rear axle; these axles are attached to the chassis by means of shock absorber rubber cord and rods fastened at the other end in a universal joint, so as to absorb whatever oscillation the machine may make in taxing or landing. Each of the front axles carries two double wheels, one on each side of the M-strut. The chassis is braced in the usual manner with double steel cables.

Nacelle

The nacelle is perfectly streamlined (dirigible form). Two main longerons with compression steel tube struts between them and diagonal steel brace wire and cables form the frame on which a set of ribs of appropriate design are fastened. The outer edge of the ribs determine the shape of the nacelle. Birch veneer and walnut are employed in the construction of these ribs, said construction being of a somewhat likewise manner to that employed for similar elements of flying-boats. The front of the nacelle, upper part, is formed by a cowling made of plywood with interposed layers of fabric.

The two pilots are seated back of the front gunner. Behind they have a gasoline tank, and before them a large dashboard for the instruments, while between them they have a board for the controls (gas, spark and altitude adjustage) for the three engines. The gasoline system is controlled by various cocks and a special distributor, all disposed in such a manner as to render them easily accessible to either of pilots. In the rear of the gas tank, which is of the same circular section that the nacelle has in that tract, there is a short path that allows the motorist to freely accede to the rear motor. The engine bed is conveniently braced with adjustable steel tubes and steel braces. The rear part of the nacelle around the engine is also cowled. For the remaining parts linen and veneer are used.

Fuselages

The fuselages are flat-sided and of the usual construction with four ash longerons, and between them compression struts, steel cables and wire bracing. All the fittings, to which the diagonals are fastened, can be manufactured with the one and the same set of dies. They are of a model, extremely simple and light in weight, without welding or bracing, and applies so as to avoid the longerons' being bored by bolts or screws. The front end of the fuselage around the motor is aluminum cowled. A gas tank is placed in the rear of the motor, and an oil tank under it. At a short distance from the trailing edge of the middle wing a seat for the rear gunner, with the usual arrangement for machine guns and ammunition, is installed. From the height of the gunner seat to the rear end the fuselages are linen covered. A Pensuti tail skid with shock absorber is at the end of each fuselage.

Control Surfaces

As on all Caproni bombing planes, the stabilizer, elevator, rudders and ailerons are of steel tubes. The tail surfaces are very ample, as can be observed from the dimension chart heretofore given. The stabilizer is solidly braced to the fuselage by means of cables and steel tube struts. It bears the three characteristic vertical rudders. The ailerons are six in number, one at each of the ends of the three wings.

As also on the other Caproni bombers, dual control is fitted so that the plane can be controlled by either pilot at will. The control system for ailerons and elevator is a combination of the wheel and stick method; the vertical rudders are controlled by a foot bar of the usual type.

For the sake of emergency, the pilot on the left also disposes of a hand pump, sufficient to feed the three motors by pumping from the central tank. Each motor has its own oil tank and a small radiator for the cooling of the oil.

The lateral motors have a nose water radiator, fastened on the same beams forming the engine bed. The central motor has two radiators, high, narrow and streamlined, each placed at the two rear interplane struts between the center wing sections, middle and upper plane. All the radiators are of the honeycomb type, and equipped with shuuters.

Lighting and Heating

The lighting system for navigation, signalling and landing, and the heating system for the crew are few by a wind-driven generator of one kilowatt, combined with a large storage battery.

Instruments

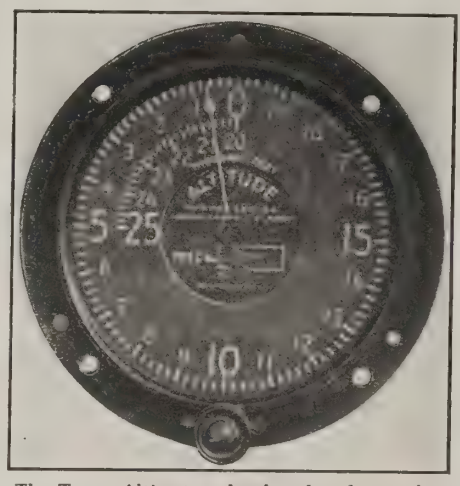
The instruments are all set in a large dashboard before the pilots. Besides the usual standard instruments for navigation, motor and radiator control, each pilot has a Pensuti Air Speed Indicator. Some machines are also equipped with an Absolute Speed Indicator.

Group of Italian, British and American authorities standing in front of a huge Caproni triplane of the type that would make mail carrying from New York to San Francisco possible. Third from left, Lieutenant C. Leopoldo Belloni, R. I. F. C., with a British general at his side. The two civilians in the center are Gionni Caproni, in front, and Dr. Frederico Caproni. Next to them is Captain Guido Laureati, the famous Italian aviator who flew from Turin to London, and from Turin to Naples and back. (Italian Official Photo.) Twelve Capronis of this type have made a long non-stop flight of 1000 miles

THE DEVELOPMENT OF THE TYCOS ALTIMETER

Written Especially for Aerial Age by P. R. JAMESON, F. R. Met. Soc., F. R. G. S.

AT the outbreak of hostilities in Europe in August 1914, the United States was in a most peculiar and difficult position in regard to the procurement of certain articles obtained abroad, as the majority of the European governments had prohibited the exportation of all material which would be of assistance to them in the successful prosecution of the war.



Among these articles were numbered instruments. Certain types were obtainable only in Europe for the English and French manufacturers had supplied the wants of practically the whole world.

The Altimeter was an instrument essential to nearly every aeroplane and where to obtain them became the question of the moment. Early in 1915 the Taylor Instrument Companies were aproached by a certain aircraft manufacturer and were impressed with the necessity of "getting busy" and looking to the requirements of the ever growing industry.

The altimeter mechanism is the same in general construction as the ordinary weather barometer, but the altimeter is so much more carefully made and constructed that the comparison is as sawdust is to gold.

Having operated a factory in England for the manufacture of barometric instruments of highest grade, for a number of years, we were rather reluctant to start in this country. The construction and adjustment is individual, in fact, each part is made and adjusted for each individual instrument. No parts (except the dials and hands) are interchangeable, and the instrument did not seem to fit into regular manufacturing methods in this country. Again, the work called for expert workmen in this particular line, and there were a few only in the entire country since there were no aneroid barometer factories.

We had a fair number of specialists in our Rochester plant and immediately spread a net over the country to gather in all others that we could find. Workmen were advertised for through the representative papers of the principal cities.

The Tycos Altimeter, developed and manufactured by the Taylor Instrument Companies

As the weeks and months progressed, contracts were placed by foreign governments for altimeters, as inspection of our samples proved they were satisfactory and that they passed all tests.

By the time the United States entered the war our altimeter output was a considerable item. The type instrument adopted by both the U. S. Army and Navy was patterned after the one specially designed by our English factory and supplied exclusively to the British Government by them. We were, not unnaturally, approached by the Government for supplies and immediately set about enlarging our plant with the idea of furthering our output which would in future be diverted to home channels.

Some idea of what was accomplished can be gained from the fact that previous to the Declaration of War by the United States, our factory floor space occupied 120,000 square feet. The day the Armistice was signed we covered 244,000 square feet.

Altimeter testing and adjusting department

The floor space devoted to the adjustment of altimeters alone covered 9,712 square feet and production reached the very satisfactory total of over two thousand completed and accepted altimeters a week. All of these instruments went through the required government test and each passed the individual test by government inspectors.

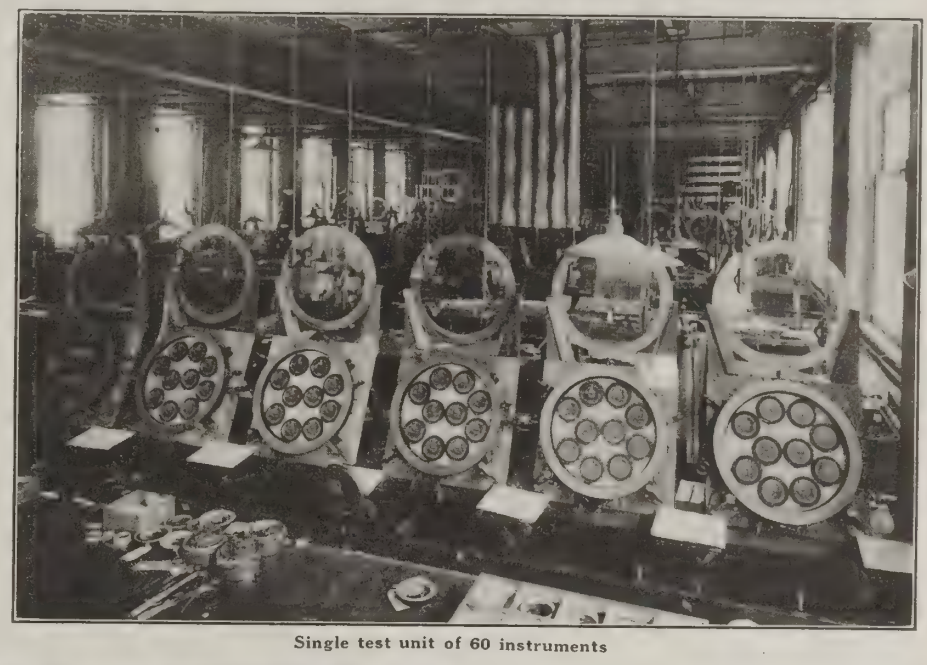
In order to reach this output testing apparatus numbering 152 sets were installed. Each set is capable of containing 10 instruments. Twenty-five standard mercury barometers used for purposes of comparison were also installed, each of these being standardized by mercury instruments, adjusted and rated by the Bureau of Standards, Washington.

For the manufacture of the altimeter, special metals as regards composition has to be made, rolled and properly prepared before being made into diaphragms. It is most necessary that this part of the instrument be perfect, for it is the heart of the altimeter, and a large percentage of trouble in imperfect instruments can be directly traced to the diaphragm. The thickness of this metal is approximately 0.006 inches, so it can easily be seen that great care and skill is necessary in making and treating it.

A perfect spring opens and closes this diaphragm, dependent on the different pressure changes. It must be perfectly tempered to ensure the diaphragm opening and closing accurately and without any lagging or stiction. The spring, when fitted properly to the diaphragm becomes the main working part of the instrument, since its movement is transmitted to the dial by a series of levers which are very accurately set and which magnify the slightest change enormously until the final movement is seen by the changing of the position of the hand on the dial.

To offset the effect of temperature changes, a compensation became essential. All altimeters pass through temperature ranges of from minus 10 to plus 40 degrees Centigrade, remaining for a series of hours until they become "saturated." The average instrument goes through nine complete temperature tests before compensation is accurately effected, each test consuming approximately six hours.

After compensating for temperature, the mechanisms are placed in their permanent mounting cases, and the adjustment of the movement started so that the dial indications will be correct. This calls for highly trained and skilled mechanical knowledge of the construction and pecularities of each instrument. A test is started by exhausting the air from a large glass covered bowl in which ten instruments are placed. The exhaust takes place at the rate of four minutes for each thousand feet. The readings are noted in comparison with the standard mercurial barometer and corrections tabulated on an individual test sheet. Another "thousand feet" of air is exhausted and the dial readings noted and corrections are tabulated again, and so the test is continued throughout the scale which occupies on the average one and three-quarters hours.



No instruments are correct on the first test for it is conducted solely to see their behavior and to note their errors. After each test a rest of half a day for each instrument is necessary in order to allow its parts to become normally readjusted.

Mechanical changes are then made and another test conducted and errors noted. Our records show that the average instrument is tested twelve times before being finally passed, total test occupying on the average 21 hours with a total rest period of a working week. This is exclusive of the time consumed in compensation.

Friction is a great source of error and as a consequence all bearing have to be very finely polished. Attention has to be given to the correct adjustment and perfect centering of all parts.

At one time it appeared as if production would stop entirely on account of the lack of the very small chains used to transmit the movement to the hand. These chains are all of European manufacture and great difficulty was being encountered in getting sufficient for our needs from our London factory. After considerable experimenting we succeeded in producing some ourselves in small quantities, but the day was saved when our foreign representative successfully procured enough for a further ninety thousand instruments.

Besides being used on altimeters these chains perform the same vital service on the barometers we were making at the rate of twelve hundred weekly for the U. S. Navy and the U. S. Shipping Board. A successful attempt was made by us to supply similar instruments for the war needs of some Allied countries. Each instrument necessitated the use of a chain.

Single test unit of 60 instruments

All completed altimeters were given to government inspectors to enable them to conduct separate tests and select those instruments which came up to specifications in every way. The instruments selected were then stored for a period of three weeks and at the end of that time another and final test was conducted by the government to ascertain if any changes had taken place due to settlement of parts, corrosion by moisture, porosity of diaphragms, etc. Accepted instruments were then ready for shipments to the various depots and plane manufacturers.

We may well feel proud of our attainments for the almost impossible has been successfully accomplished and except for a very negligible quantity the Tycos altimeter has been fitted to every U. S. machine, both for Army and Navy.

Flying high above the clouds, the Tycos altimeter has helped by doing its bit to make the world a better place to live in.

High temperature test for compensation

The French Aerial Post

There were two reasons why the French authorized the inauguration, during war time, of an aerial post from St. Nazaire-Paris—the first, necessity, due to the inefficiency and slow transport of mail on the Western Line, the second, to obtain data upon which to make a report on the subject of aerial postal connection generally. This report has been made to the Minister of Commerce, and is now receiving his attention.

The report states that military aviation can help greatly and immediately by lending or giving aeroplanes, engines, spare parts, hangars and national factories as repair shops to the postal department; the Department of Posts and Telegraphs will recruit their own personnel. The report says that immediately the service is a working proposition 500 pilots will be employed; these aviators must be selected for their intelligence, integrity and soundness. They will be able to earn 20,000 francs ($4,000) a year, counting the bonuses they are to receive over a thousand kilometres. Ten years is reckoned to be the longest period over which an aviator can continue to render useful service to the postal authorities.

The report further points out that if he is not extravagant the aviator will be able to retire with 100,000 francs ($20,000) capital and that if he possesses the necessary qualities he may be made a director of one of the lines and so augment his income.

L'Auto has some very interesting suggestions. One, a means of employing wireless telegraphy as well as an aeroplane to deliver a communication, and this is how it will be done. Letters will be sent in duplicate in a specially made envelope, one portion of which will contain the actual letter and in another portion a resumé of the letter in clear or in code. If owing to bad weather or fog the mail does not leave, the two portions will be dispatched, the resumé sent by wireless, the other following by ordinary mail; thus will the destinataire receive the confirmation of the wireless message.

If the mail-carrying aeroplane has an accident en route it will be known immediately, because according to the *Auto* the pilot will be required to send his code number to earth every five minutes. When the allotted time has passed and no message is received from the pilot the operator will report a breakdown and will proceed to send the mail by wireless. This does not seem a very workable plan, the author of the articles does not say whether each machine is to be equipped with two wireless sets in case one refuses to work, because it is conceivable that the wireless might be out of order though the aeroplane reaches its destination safely in accordance with schedule, in which case it would be unnecessary to send the mail by wireless.

As to the financial profit of an aerial mail there would seem to be no doubt. Assuming that a rapid machine carries 100 kilogrammes of postal matter on a distance of 500 kilometers, it has been calculated, proved and verified that the expenses are covered by 20 kilogrammes of postal matter; the 80 per cent. will remain as profit, and can be utilized either as letters or small registered packets.

The French authorities calculated that on letters weighing under 20 grammes the following charge will be necessary:

500 kilometers ..... 0 franc 75 cents.
500-800 kilometers ..... 1 franc
Above 800 kilometers... 1 franc 50 cents.

and will increase in direct ratio to weight and distance.

LUBRICATING OIL INVESTIGATION

MR. S. W. STRATTON, the Director of the Bureau of Standards, has requested AERIAL AGE to present to its readers a program which has been prepared as a guide to the prosecution of a research on lubricating oils, particularly for internal combustion engines.

Study should reveal what the present qualities of lubricating oils made crude petroleum of different bases now are, and if a difference is found to determine why it exists. Whether, on the one hand, it is caused by the presence of undesirable compounds left in by manufacturing processes, or whether these differences are caused by inherent characteristics of certain groups of chemical compounds peculiar to petroleums of different bases.

It is self evident that any study in the hydrocarbon field is confronted with many complications and difficulties. Valuable information is usually not easily or quickly obtained. Such recognized difficulties, however, should not discourage investigation for the reason that the fertility of the field is extremely inviting from the angle of conservation of national resources and that of the possibility of finding results of great commercial importance, to automotive and petroleum industries.

The most careful consideration of it is invited, and constructive criticisms and suggestions are desired from all interested parties. They should be sent to the Director, Bureau of Standards, Washington, D. C.

Following is the program:

General Purpose

The general purpose of this investigation is to collect as much information as possible pertaining to the many problems involved in the lubrication of internal combustion engines. The majority of these problems have been well recognized in the past, but the real importance and the necessity for their solution have been further emphasized during the war, especially in aircraft engine and farm tractor engine operation.

The secondary purpose of the investigation is to determine the real value and importance of laboratory methods now used in oil testing and of the significance of the results as an indication of the value of oils in practical service. It is hoped that new tests of value may be developed to supplement those now in use.

It is the earnest desire of the Bureau to secure the whole-hearted cooperation of oil refiners, large and small oil users and other interested parties in this investigation. All suggestions for the improvement of the program and constructive criticisms of same from all sources will be heartily appreciated.

General Statement

So far as present knowledge goes the ideal lubricating oil should possess the followign characteristics:

(a) Maximum reduction of friction.
(b) Minimum amount of wear of rubbing surfaces.
(c) Maximum length of time that oil can be used in service.
(d) Minimum rate and minimum amount of decrease in lubricating efficiency.
(e) Minimum carbonization in combustion chambers.
(f) The greater security against seizure consistent with maximum lubricating efficiency.

It is proposed to determine what oil or oils most nearly approach this ideal.

Some Specific Problem

(1) To determine the cause of reduction of lubricating efficiency, i.e., whether it is due to change in viscosity alone or to the presence of decomposition products in the used oil or to both of these factors.

(2) Does the lubricating efficiency of an oil depend upon any other characteristics than those usually recorded in specifications, such characteristics as, for instance, adhesion, specific heat, thermal-conductivity, "body," etc.?

(3) What relationship exists between the flash and fire points of an oil and its boiling point range?

(4) What predictions may be made of the specific consumption of oil in an engine from the values of the flash, fire and boiling point range? Should the entire boiling point range or any part of the boiling point range of an oil be limited?

(5) What are the relative values of the Conradson carbon residue test and the Waters or other oxidation oven tests as means of predicting the decomposition which will occur in any lubricating oil in service?

(6) Does the presence of emulsifying products in an oil effect its lubricating efficiency in service? What disadvantage in reclamation processes are caused by the use of emulsifiable oils?

(7) Does the presence of colloidal matter such as deflocculated graphite, carbon or carbonaceous matter effect the lubricating efficiencies of oils? What is the relative value of settled unfiltered cylinder stock (which contains colloidal matter as well as solid or semi-solid matter in suspension) compared to the same cylinder stock in the filtered condition when these oils are used for blending with light hydro-carbon oils?

(8) What are suitable oils for use in Gnome or other similar types of rotary engines—castor, mineral blended with castor (using oleic acid as a binder) or mineral blended with other fatty oils?

(9) Is it desirable to blend fatty oils (high or low acidity) with mineral oils and what effect does the presence of fatty oils have upon the decomposition of mineral oils of paraffin and naphthene bases?

(10) To what extent do lubricating oils of paraffin and naphthene base, blended with fatty oils, absorb fuel vapors?

(11) How may it be judged when an oil has reached such a condition that it should be discarded or reclaimed?

(12) How may the appropriate viscosity or other characteristics of an oil for any given engine be determined, giving due consideration to seasonal changes in temperature, wear of engine parts, peculiarities of lubricating systems, etc.?

(13) What are the relative merits in service of lubricating oils manufactured from paraffin and naphthene petroleums?

(14) To what extent does the character of bearing metals in contact and the condition of their surfaces influence lubrication?

Engines and Engine Test Methods

It is proposed to make tests of oils in the following aviation engines:

(1) Liberty Twelve Cylinder.
(2) Liberty Six Cylinder.
(3) Hispano-Suiza 150 Horsepower.
(4) Gnome Rotary.

Mechanical Conditions

Record peculiarities of engine lubricating systems, bearing clearances, specific bearing pressures, compression ratio, type pistons and rings, piston clearance and all other mechanical features of importance. The large bores in the crank shaft should be plugged with aluminum to facilitate removal of oil from system without taking down between test if desired.

Rate of Oil Flow

The oil flow from the pump to bearings will be measured by a venturi. If possible the actual rate of oil flow through all bearings should be determined at the normal R.P.M. of engine by direct measurement.

Running Records

Barometer, Temperature, Inlet Air, Humidity.

Constant	*Variable*
(1) R.P.M. of Engine	(1) Horsepower
(2) Fuel Consumption	(2) Oil Consumption (a) Burned (b) Leakage (c) From breathers (vapor)
(3) Jacket Water Inlet Temp.	(3) Oil Temp. outlet to cooler
(4) Oil, inlet to pump temperature	(4) Oil temp. from crank pin cheeks
(5) Oil pressure.	(5) Water Temp. outlet
	(6) Condensate from breathers (a) Oil (b) Volatile (c) Gas.

Test Periods

It will be necessary to determine whether the same amount of decomposition can be obtained in 1 hour runs as in 5 hour or longer periods. A standard test period will be chosen for all tests.

Special Tests

(1) *Fuel Absorption.* Runs should be made with paraffin base and naphthene base lubricating oils using as fuels (a) dry gasoline vapor, (b) aviation gasoline and (c) average auto gasoline with each oil for the purpose of determining the relative amount of fuel absorbed by each and the character of the compounds absorbed.

(2) *Carbon Deposits.* Runs should be made with (a) paraffin, (b) intermediate and (c) naphthene base lubricating oils and a record made by photographing the piston heads and noting the amount and character of the carbon deposits on the remainder of the explosion chambers.

Standardized Test Fuel

A sufficient quantity of aviation gasoline made from the same refinery distillate should be provided for the completion of all engine tests. Whenever any change is made in fuel, then a standardized lubricating oil should be used to determine whatever variation may occur because of the change in fuel.

Standardized Lubricating Oil

It is highly advisable to standardize some lubricating oil for use during all engine tests to check any variation other than that caused by lubricating oil. A sufficient quantity of this oil should be provided to meet the requirements of all check tests.

Theory of Lubrication

Adhesion

(1) Determination of method or methods of measuring adhesion on the following groups of oils:

(a) Hydro-carbon oils of different bases, and each of different viscosities and volatilities.
(b) Fatty oils—prime lard, "acidless tallow, castor and sperm, also same with different proportions of oleic acid, cotton-seed, etc., also cutting oils.
(c) Blends of hydro-carbon oils and fatty oils, also hydro-carbon and castor blends with oleic acid as a binder.

Study of cutting oils, and the bearing cutting oil properties have on lubrication. Power consumption for cutting operations with and without cutting oils.

Study of Oil Films

1. Behavior of films at constant temperature on plates also on plate with temperature gradient, to determine drainage and rate of spread.

2. Behavior of films on different metals with localized heating.

3. Behavior of films on water, as a possible means of throwing additional light on the present knowledge of oil films as applied to lubrication.

Thermal Properties

Specific Heat, Heat Conductivity and Thermal Expansion on same groups, of oils as given under Adhesion.

Friction Machines

The practical usefulness of friction machines in general has been widely commented upon and questioned in the past. In order to definitely settle the real value of friction machines, the following program of investigation is proposed:

(1) Study of present stage of the art.

(2) The analysis of all existing machines comprising the following general items:

(a) Information is desired as to whether a reading can be made of the critical point of film breakdown, i.e., incipient seizure of bearing at different loads, speeds, and viscosities at the temperature of oil film in the bearings, also when using different bearing metals.

(b) Method of applying lubricant to rubbing surfaces.

(c) Method of regulating all operating conditions.

(d) Recording devices, automatic or otherwise.

In the preparation of the above analysis it is desirable to draft a chart in which as much information as possible may be given in tabular form for direct comparison.

With all the above data at hand, then complete detail specifications should be prepared of an Ideal Friction Machine on which all determinations desirable could be made.

Division VIII, Metallurgy and the Division studying lubricants will fully cooperate with reference to bearing metals and tests.

Routine Tests
Fresh and Used Samples

1. *Gravity.*
2. *Flash.*
3. *Fire.*
4. *Viscosity.* (Saybolt Universal) at 100°, 150°, 212° Fahr.
5. *Color.* 1. Fresh
   2. After Heat Test
   3. Used Oil from Engine.
6. *Emulsion.* Shaker—(Coles).

Demulsibility. Herschel—Stirrer.

Note: Oils more viscous than 50 sec./212° will be blended 50/50 with standardized petroleum ether for shaker emulsion tests.

7. *Cold Test.* A. S. T. M. Method.

Special Laboratory Examinations

Carbon Residue

Carbon residue values will be determined by means of the Conradson Carbon Residue apparatus as described in the A. S. T. M. proceedings. All outside oil samples and special engine test oil samples will be subjected to the Conradson test.

Oxidation Oven

All oil samples both outside and those used in special engine tests will be subjected to tests in both the Waters and Stratford oxidation ovens for the following determinations: (a) evaporation loss, (b) petroleum ether insolubles, (c) "varnish"—resins.

In making a general study of the susceptibility to oxidation of engine oils. full consideration should be given to constitution and methods of manufacture of anhydrous switch and transformer oils. The same remark applies to viscous "water-white" oils, such as Squibbs or Nujol medicinal oils.

Standardized Petroleum Ether

In making petroleum ether insoluble determinations it is imperative that the same standardized petroleum ether be used throughout all tests. Specifications for standardized petroleum ether are as follows:

Gravity, Baumé 77 to 80 (incidental).
Initial Boiling Point. 110° to 120° Fahr.
Final Boiling Point. 220° to 245° Fahr. Unsaturated content not over four per cent (Bureau of Mines Method).

Note: Above distillation range determined by Saybolt distillation method.

Volatility

It is desirable to investigate by distillation the volatility of the different compounds contained in lubricating oils. In order to properly make this investigation, it may be necessary to determine a part of the boiling point range or the whole of that range.

There are four general distillation methods applicable:

(a) Destructive distillation under atmospheric pressure.
(b) Dry distillation under high vacuum (40 to 50 millimeters Hg.).
(c) Distillation under high vacuum (40 to 50 millimeters Hg.) with the introduction of super-heated steam.
(d) Distillation under atmospheric pressure with the introduction of super-heated steam.

It is proposed to determine by experimentation which of the above four methods is most applicable to the study of the constituency of lubricating oils with least decomposition of oil and with the most concordant results.

Other Determinations

(a) Sulphur content, (b) ash, (c) fatty oils, (d) acidity, (e) alkalinity, (f) tarry or suspended matter, (g) moisture, and (h) odor.

List of Oil Samples for Examination

Commercial Oils

A two gallons sample of all available American hydrocarbon oils, intended for the lubrication of internal combustion engines, will be examined for their physical and chemical characteristics. This list of oils will comprise all of those now sold in sealed containers and having reasonable distribution and volume of sales. These oils will not at present be run in the engine tests. It is proposed to purchase these samples at regular intervals, say, quarterly, and to retain a four-ounce sample for reference from each of the samples purchased.

Special Oils

The following Liberty Aero Engine Oil Types will be procured and subjected to a complete examination, including engine tests. Specifications for these oils will correspond to the limits prescribed by Signal Corps Specification Number 3501.

Paraffin Base

(1) Lubricating oil made from paraffin base crude petroleum (Penna.) of high boiling point range.
(2) Lubricating oil made from paraffin base petroleum (Penna) with low boiling point range.

Naphthene Base

(1) Lubricating oil made from naphthene base crude petroleum (Gulf Coast) of high boiling point range.
(2) Lubricating oil made from naphthene base petroleum (Gulf Coast) with low boiling point range.

Fatty Oil Blends

Fatty oil (prime lard) blends will be made with each of the two oils given above under the heading of Paraffin and Naphthene Bases. The physical properties of these blends will be made to correspond to Signal Corps, Liberty Aero Oil Specification, Number 3501.

The above oils have been selected to determine the difference if any in their lubricating efficiencies in service; such differences may occur because of different chemical structure or peculiarities of refining processes applied in their manufacture.

If the data from the tests on this list of oils show marked tendencies it may then also be advisable to carefully investigate lubricating oils made from natural mixtures of paraffin and naphthene base crudes (Mid-Continent) or same made from blends of the lubricating distillates from these two crudes at some stage in their manufacture.

Miscellaneous Oils

Various special oils will be used in the study of the effect of processing methods, i.e., acid treatment, sulpho-compounds, etc. Also the effect of filtration to different colors.

(a) Prime lard, (b) sperm, (c) castor oil—cold pressed, (d) rape seed oil, (e) rape seed oil, blown, (f) cylinder stock—low cold test highly filtered, (g) cylinder stock—strained low cold test unfiltered, (h) "paraffin" and (i) acid treated oils.

Regeneration of Used Oils

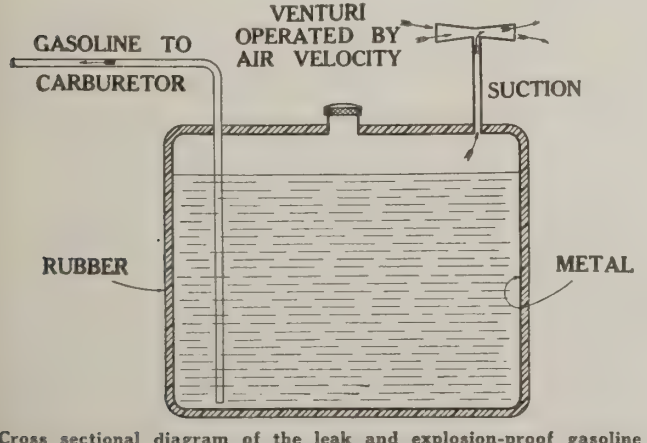
It is proposed to make a study of commercial processes applied to the regeneration of used oils and to determine what is the best and cheapest means of converting used oils into good lubricants. Also to determine the relative lubricating efficiency of regenerated oils as compared to that of the same oil in its fresh, unused condition.

Problems Involved

1. Removal of solids in suspension.
2. Separation (distillation) of very volatile products.
3. Separation (distillation) of light oils.
4. Removal of heavy oxidized compounds by treating with soda ash and blowing with steam.
5. Removal of moisture.
6. Filtration—Fullers earth.
7. Blending filtered oil to required viscosity if necessary.

Proposed Samples for Regeneration

1. Used oils made from paraffin crudes—Penna.
2. Used oils made from intermediate crudes—Mid-Continent.
3. Used oils made from naphthene crudes—Texas.
4. Used oils made from California crudes.
5. Used oils made from blends of hydro-carbon and fatty oils.
5. Slop oils consisting of a mixture of oils and greases.



LEAK AND EXPLOSION-PROOF TANKS

THE aeroplane for warfare has been generally thought of as a reconnaissance machine, but the first few weeks of the war demonstrated that it was also of great military value for both offensive and defensive purposes. Machine guns were immediately installed, and aerial warfare became a reality. The combatants quickly realized that the vital spot to be aimed at was not so much the pilot as the gasoline tank, which offered a much larger and easier target to hit. The loss of fuel either forced an untimely and sometimes disastrous landing or the leaking gasoline when mixed with the current of air from the propeller formed a veritable explosive mixture which, when ignited by the engine, set fire to the machine and burned its occupants in midair.

To counteract this, the Germans, having comparatively heavier planes and higher powered engines, soon resorted to armor plating their tanks, while the ingenious French engineers devised compartment fuel tanks, in which one compartment could be pierced and emptied without affecting the others, and the supply to the engine was thus mainained. But war is a game of wits and no sooner had the enemy discovered the French methods than he created and employed incendiary bullets. These bullets owe their inflammability to the presence of phosphorus, which when mixed with the oxygen of the air will ignite any explosive mixture with which it comes in contact.

These bullets were fired within a fraction of a second alternatively with armor piercing and tracer bullets, the order and number of each depending upon the kind of attack that was to be made; but for example we may consider the following order. The tracer bullet, leaving a fine trail of smoke, guided the gunner's aim. The armor piercing bullet put a hole in the gasoline tank, causing the fuel to be spilled and to be ignited by the incendiary projectile which followed. This method of attack was very effective, and the allied casualties increased alarmingly. The compartment tank used by the French airmen was now of no avail, because if one compartment was set on fire the others soon exploded, due to the heat. In the meantime the British had availed themselves of another French invention which consisted in enveloping the gasoline tank with some elastic material. This minimized the tear caused by a striking bullet, but proved only small protection against the incendiary projecile. To get an idea of the vicious character of these bullets, cases have been known where some of the phosphorus became imbedded under the gasoline in the tank, and hours afterward, when the fuel ran low and the phosphorus became exposed to the air, an explosion took place.

This was the state of affairs when the United States entered the war, and the problems were immediately taken up by the Bureau of Standards at Washington. The Bureau in turn took the matter up with a Detroit automobile engineer, Fred Weinberg, who had invented the new leak and explosion proof tank; and it was demonstrated to the Washington authorities in August, 1917, one week after the request was made. The value of the invention was immediately recognized by the Bureau as well as by the Advisory Committee on Aeronautics, who in turn recommended it to the Army and Navy. Through the co-operation of the Bureau of Standards and the Science and Research Division of the War Department the invention was soon brought to a state of high perfection.

Cross sectional diagram of the leak and explosion-proof gasoline tank

The construction of the Weinberg tank is clearly illustrated in the diagram. Primarily it is an ordinary metal tank of any size or shape, having two connections and its filler cap. The suction connection is to provide a partial vacuum above the liquid sufficient to prevent its escape against the pressure of atmosphere on the exterior. This can be accomplished in a number of ways, but the simplest method is undoubtedly by means of a venturi in the draft of air while the aeroplane is in flight. The fuel reaches the carburetor through the second connection by overcoming the vacuum created through the former. This may be accomplished by maintaining greater suction or by positive feed pumps, preferably gear or vane type, mounted on the interior of the tank. To insure proper functioning at all times the tank is enveloped in some elastic material, preferably rubber, which covers any ragged holes in the metal that a bullet might make upon entering. This covering, due to its elasticity, returns practically to its former state after being pierced and leaves a hole so small that it can hardly be detected. The tank may be literally made a sieve by bullet holes and still function properly.

The principle of operation is quite analogous to a very simple example. Almost everybody is familiar with the fact water will not pour out of the neck of a bottle if the latter is turned upside down quickly. This is due to the partial vacuum above the fluid which will hold the liquid in the bottle until the vacuum is destroyed by the entrance of air. The simplest way to do this is to pour the liquid out with the bottle in a horizontal position or to provide a second opening such as we are accustomed to make before we pour milk out of a can. The air entering one hole allows the fluid to flow out of the other. It follows that if we desire to keep the fluid in the can all we have to do is to maintain sufficient partial vacuum above the liquid regardless of how many holes the can may have. This is what Weinberg did, and he produced a vacuum in a very simple way by the speed of the aeroplane itself.

The application of this principle not only makes a tank leak proof but makes it explosion proof as well, to cause an explosion there must be a combustible mixture of air and fuel, but in the Weinberg tank no such condition exists on account of the rarefied air. The flames starting on the outside of the tank from an incendiary bullet are immediately drawn into the tank through the bullet opening and are extinct below the fuel. Any bullet striking above the fuel cannot cause ignition by reason of the vacuum existing there. In fact the inventor in testing his tank originally had no incendiary bullets at his disposal so after shooting holes into the tank he directed a torch against the openings made by the bullets.

It has been discovered that a bullet rarely goes completely through a tank. In most cases it will penetrate one side and will lose its energy so completely while passing through the liquid that it will drop into the tank. It may be paradoxicaly but truly asserted that the fuel tank which formerly possessed the greatest danger to the pilot has now become his best bullet proof protection. A tank which eliminates the danger of fire and leaks should be of value on aeroplanes during peace times as well. Leaking tanks have been the cause of many fires in midair, which invariably have burned the pilots before they could reach the ground and escape.

The final tests were made at the aviation experimental station, McCook Field, Dayton, Ohio, in the following manner. Two identical tanks, one made according to Weinberg invention, the other covered with elastic materials prepared by the Science and Research Division of the War Department, were shot at side by side with armor piercing and incendiary bullets. The latter tank caught fire after the third shot, while the Weinberg tank was penetrated by fifteen armor piercing bullets, which were followed by seven incendiary bullets, and neither leak nor explosion occurred.

NOTES ON GERMAN DESIGN AND CONSTRUCTION*

By E. BOUDOT, Aeronautical Engineer

THE following notes are intended to give a succinct but precise and—as far as possible—complete idea of the methods of design and construction adopted in Germany. Many ways of reaching that object may be found. The one we propose to follow is to confine our analysis to only one machine at a time, to give all available information about the general and detail design, and illustrate it by dimensioned drawings, for which we are greatly indebted to our contemporary *l'Aerophile* and to the authorities of this country, who have opened a most interesting exhibition of German aeroplanes and engines.

The Albatros Aeroplanes

The most pre-eminent and probably the best designed German aeroplanes are those produced by the Albatros Flugzeugwerke Gesellschaft, of Johannistal.

The Albatros aeroplanes may be ranged into two classes:

1. The single-seater fighting biplanes, used only for fighting purposes. They carry two guns firing through the propeller disc and a variable load of ammunition. Their identification mark is D, which letter is followed by a number, giving the number of the design. Thus the single-seaters are marked D I, D II, D III.

2. The two-seater biplanes, "reconnaissance" type, used principally for reconnaissance work, artillery spotting, and photographic work. They carry two guns, one fixed, firing through the propeller disc and used by the pilot, who sits in front; the other one, reserved to the observer, is mounted on the usual circular gun-mounting. They are identified by the letter C. Thus we find C I, C II, C III.

In most cases the difference between two consecutive designs of the same type is very slight, consisting in many instances of shortening or lengthening the span by a foot or so, or by changing the position or the form of the radiators. To follow those modifications or alterations carefully would unnecessarily intricate the description. We will choose one particular design number, and will mention the alterations or modifications found in previous or subsequent designs.

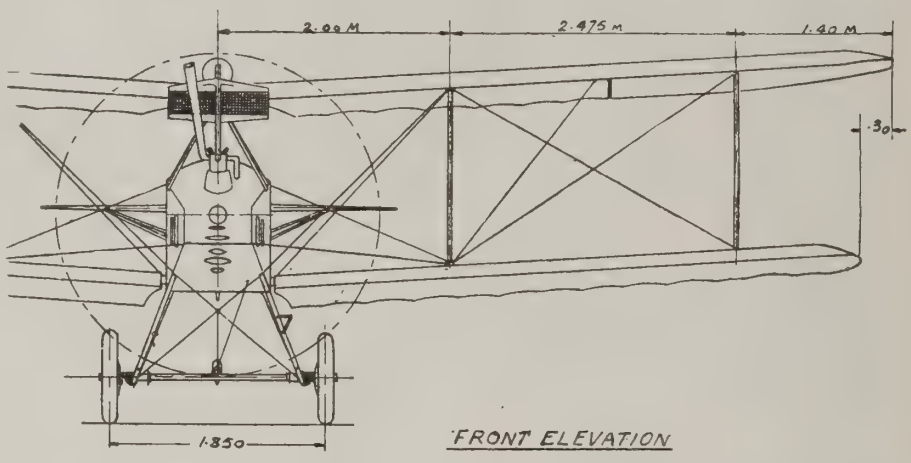
Albatross C III

General Characteristics — "General purpose" aeroplane. Two-seater, pilot in front, observer at the rear.

Six-cylinder vertical engine, 170 h.p. Mercedes (water-cooled).

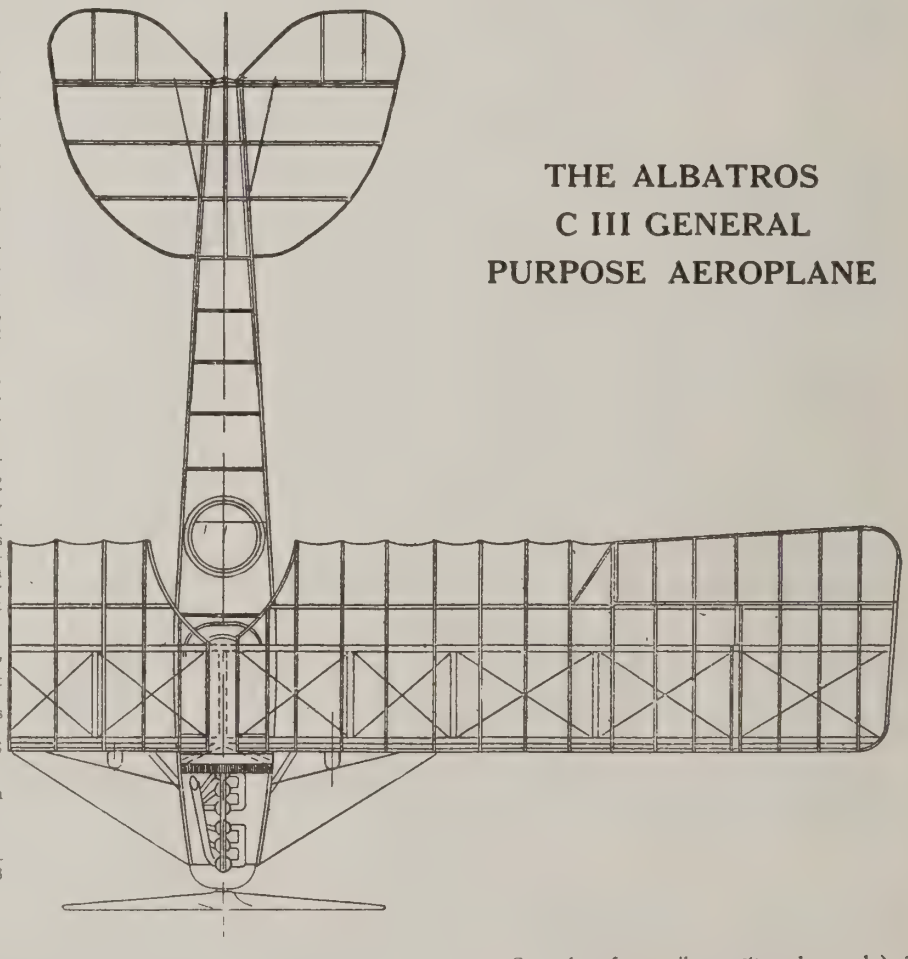
Overall span: top plane, 11.75 m. = 38.8 ft.; bottom plane, 11.15 m. = 36.7 ft.

Overall length: 7.90 m. = 26.0 ft.



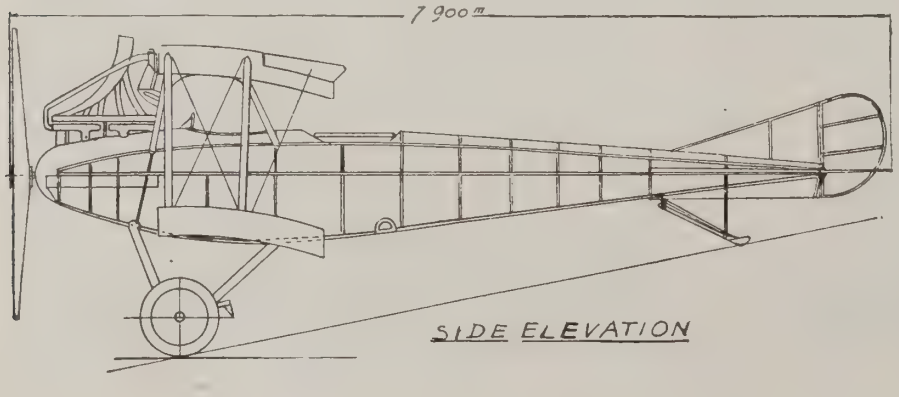
Chord: top plane, 1.800 m. = 5.93 ft.; bottom plane, 1.700 m. = 5.6 ft.

Gap: 1.55 m. = 5.1 ft.



Dihedral: 2°.

Wing area: top, 19.75 sq. m. (including ailerons) = 214 sq. ft.; bottom, 17.75 sq. m. = 193 sq. ft.



Total wing area: 37.50 sq. m. = 407 sq. ft.

FRONT ELEVATION

THE ALBATROS C III GENERAL PURPOSE AEROPLANE

SIDE ELEVATION

Control surfaces: ailerons (top plane only), 3.0 sq. m. = 32.5 sq. ft.; elevators, 1.3 sq. m. = 14.1 sq. ft.; rudder, .6 sq. m. = 6.5 sq. ft.

Stabilizing surfaces: fixed tail plane, 3.0 sq. m. = 32.5 sq. ft.; fin, .5 sq. m. = 5.4 sq. ft.

Weight (empty): 830 kg. = 1,830 lbs.

Useful load: 435 kg. = 960 lbs.

Total weight: 1,265 kg. = 2,790 lbs.

Wing loading: 33.7 kg. per sq. m. = 6.9 lbs. per sq. ft.

Power loading: 7.45 kg. per h.p. = 16.4 lbs. per h.p.

Aerodynamic Qualities

Probably the most characteristic feature of this machine is the wing section used. Instead of using a low cambered section usually found on modern machines and very efficient, the Albatros designer has used a form of aerofoil very similar to Eiffel No. 14.

The reason for this choice must be found in the rather high wing loading for this type of machine. High wing loading as compared with low wing loading means:

* Courtesy of *Aeronautics*.

AIRCRAFT WIRES AND CONNECTIONS

By SIDNEY CAMM

IN all aeroplanes the question of wires and the terminal connections associated therewith is a matter of some importance, and there is little doubt that the efficiency of modern wiring systems is largely responsible for the structural efficiency of the aeroplane as a whole.

Aeroplane construction consists almost exclusively of a framework of wood braced by wires, a condition of things which has obtained since the inception of flight, as may be judged by the various engravings of Henson's projected monoplane of 1842. This machine incorporated an arrangement of king-posts and wires, approximating very closely to modern practice, and the natural sequence of improvements have tended towards the gradual elimination of exposed wiring.

The various wires used in construction may be classified into four distinct types; the solid wire stay, the straining cord or cable used for stay wires, the extra flexible cable for controls, and the swaged tie-rods in plain or streamline form. The earliest form of bracing was of the solid piano-wire variety, this having been used on most aeroplanes from the days of the Wrights onwards. From the viewpoint of the early pioneers, this wire was eminently satisfactory, being cheap (a vital consideration) and simple to attach and replace. Although the tensile strength of this wire cannot probably be excelled, its hardness renders somewhat difficult the forming of the end loop without fracture of the wire.

For this reason piano-wire gradually gave place to a softer grade of wire which, while being strong, was tough and ductile, enabling bends to be made with a lessened danger of fracture. The original connection used for the piano-wire stay is shown by Fig. 1, this consisting of a loop or eye, the free end being turned round a ferrule of soft copper tube, this being sometimes varied by the use of a flat strip of tinned iron, wrapped round and soldered. While this was fairly satisfactory for short stays, it was hardly suitable for the main lift wires of the inter-plane bracing, owing to the comparative ease with which, under load, the free end pulled or cut through the ferrule, so that after a while the oval spring-wire ferrule, Fig. 2, came into use. This is made of the same gauge wire as the stay, and is from seven to nine convolutions in length. The eye should be formed as an easy bend, and not kinked, the ferrule being pushed tight against the shoulders, and the free end turned back.

Tests undertaken at the instance of the American Advisory Committee for Aeronautics showed that 80 per cent. of the wires tested failed by the free end pulling through the ferrule, the remaining 20 per cent. failing by fracture, the stays possessing an average efficiency of 68 per cent. of the maximum strength of the wire. Although various modifications, such as tying the free end to the ferrule with fine wire, as in Fig. 3, resulted in an increase in total efficiency, average European practice consists of that shown by Fig. 2. At the present time the solid-wire stay of the form dealt with is used mainly for the bracing of the fuselage frame, and the internal wiring of tail planes.

The gradual increase in engine power and total weight of aeroplanes, led to the adoption of stranded cable for all important loaded wires, this being made in two distinct ways.

The cable employed for inter-plane bracing is composed of a number of fine wires, varying from nineteen to thirty-seven, according to the different diameters, the end section being indicated by Fig. 4.

Where extra flexibility is required, such as for control wires running round pulleys, the cable is composed of a number of strands, generally seven, which in turn consist of a number of fine wires, usually nineteen, the end section being shown by Fig. 5.

English practice designates this form of cable as extra flexible, and the single rope of nineteen wires as straining cord.

American classification is practically the reverse, in that the single rope is known as stranded cable, and the multi-strand as cord. Although the factor of strength is an important one, it does not entirely govern the selection of a wire, as other considerations, such as flexibility and fatigue strain, influence greatly the efficiency of a stay under active service conditions. Under test the solid wire possesses the greatest ultimate breaking weight, the next best being the single rope. It must be understood that in flight a wire is subjected to constant and intensive vibration, which must have a deleterious effect on the material, and for this reason a flaw or slight fracture in a solid wire may escape notice until complete failure in the air, whereas the cable, by the unstranding of the damaged wires, would give warning of wear.

Chiefly owing to the difficulty of forming a satisfactory splice in the single-strand cable, modern practice inclines toward the use of the multi-strand cable for all purposes, as the construction of this wire lends itself to the forming of a successful splice.

The earliest form of terminal connection for stranded cable consisted of a loop, the free end being bound to the main part of the wire and soldered. With the addition of a serving or binding of wire round the loop to prevent injury, due to contact with the wiring lug or strainer eye, this wire, in a recent test, gave an efficiency of 100 per cent. for all diameters up to one-quarter inch.

This result, considering the elementary nature of the joint, is surprising. Unfortunately, the effect of corrosion due to acid and solder is a somewhat doubtful quantity; moreover, the appearance of the joint is far from neat. An attachment, which at one time achieved some popularity, is shown by Fig. 6, and is especially suitable for the single-strand wire. This consists of a cone-shaped forked end, with a taper hole, into which the cable is inserted, the free end being unstranded, spread out and soldered. This attachment has been used on what was at one time one of our best products. The efficiency obtained with this fitting is in the neighborhood of 100 per cent.

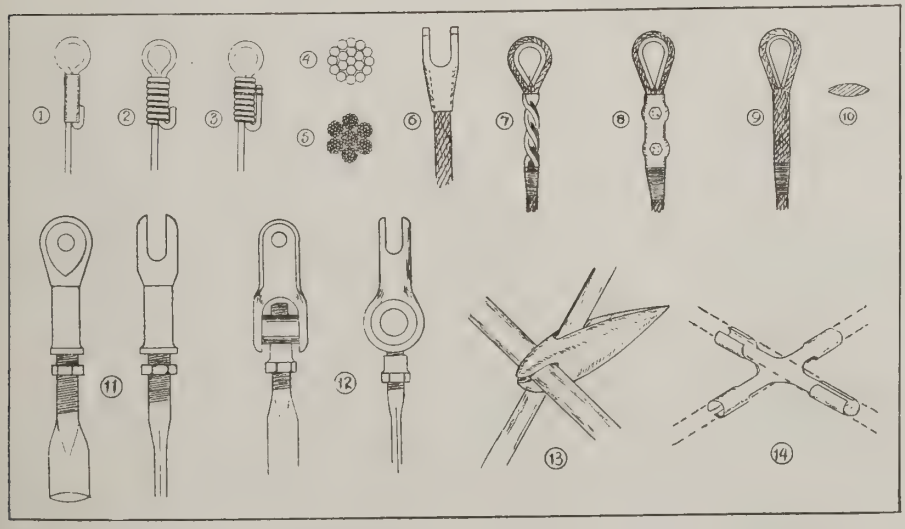
In the method indicated by Fig. 7 a piece of flat copper tube is passed over the wire, the free end of the latter being bent round a brass thimble, and then passed through the copper tube, in a similar manner to the connection for the solid wire in Fig. 1. The tube is then given several turns, and the complete joint well soldered. This system is reliable, and has given good results.

A distinctive terminal is indicated by Fig. 8, consisting of a brass ferrule, just sufficiently wide to accommodate the two thicknesses of wire. The bolts are of the counter-sunk head variety, so that the operation of screwing a bolt home also forces the wires into the protuberances in the sides of the ferrule. Although the foregoing methods have all been extensively used, they have now given place to the thimble splice, Fig. 9, which, as a general proposition, is undoubtedly the better terminal connection. The brass thimble protects the strands from the wearing effect produced by contact with the turnbuckle or wiring lug. It is the usual practice to wrap the splice with a binding or serving of fine copper wire, or waxed twine. The efficiency of this joint with a properly made splice may be safely taken as 85 per cent. of the total strength of the wire. With this joint the point of failure, as evidenced by numerous tests, always occurs at, or near, the last tuck in the splice, at which point the extra thickness of the splice is just merging into the normal thickness of the wire. The disadvantage with all terminal connections which necessitate the use of solder is the impossibility of determining just how much the heating operation affects the strength of the wire, and also the effects of corrosion, set up by the various species of flux used in the process of soldering. For a given diameter the solid-wire stay possesses the greatest strength, the next best being the single-strand cable, as the following comparison of stay strength, taken from the report of the National Advisory Committee for Aeronautics, 1915, of America, will show:

Material	Diameter	Strength of Material	Strength of Stay
Wire, solid.....	3/16"	5,500 lbs.	5,100 lbs.
Strand, single.....	3/16"	4,600 lbs.	4,100 lbs.
7x19 multistrand..	3/16"	4,200 lbs.	3,500 lbs

Although in the quest for increased speed the number of exposed wires were reduced to a minimum, the aggregate resistance still remained considerable, this leading to the development of the swaged streamline wire, the introduction of which is generally ascribed to the Royal Aircraft Factory, and these wires are now generally used for all exposed wiring. The points in favor of them are that, properly fitted, a considerable reduction of resistance is obtained, there is a lessened liability to slacken after some use, this rendering rigging a more certain operation, and the nature of its connection obviates the use of turnbuckles.

They have been variously criticized as being expensive to produce, that the resistance may be increased if improperly aligned in the machine, and also that any fracture or flaw is less liable to be detected before complete failure during flight. In manufacture the solid rod is rolled to the section shown by Fig. 10, a certain length each end being left for the right- and left-hand thread. Two of the connections mostly used are shown by Figs. 11 and 12. To prevent wear at the points of intersection, it is usual to fit acorns of fibre or aluminum, a popular form being shown by Fig. 13. Some designers still prefer to use the wire cable for inter-plane bracing, a fairing of wood being bound to the cables by tape at intervals, this also preventing excessive vibration.



Some years ago various attempts were made, mostly on French monoplanes, to utilize flat steel ribbon for exposed wiring, but, owing to the difficulty of successfully forming a terminal, its use never became extensive, although it may possibly be regarded as the precursor of the modern streamline wire.

It is notable that, so far, the wiring of all German aeroplanes is effected by cable, so that apparently the merits of the streamline wire are not recognized. It is also surprising that no attempt has been made to streamline the cable. A device for tying the wires and preventing the friction at the point of intersection found on nearly all enemy aeroplanes is indicated by Fig. 14, and there are also instances of quick-release devices, these being popular in England about 1912.

Although determined attempts have been made of late to entirely eliminate exposed wiring, examples of this occurring in the recent German Fokker triplane, it appears that the various alterations engendered by this procedure in the structure of the machine more than counteract the saving in head resistance.

Moreover, with modern methods of construction, the ultimate strength of a wireless wing structure leaves considerable room for improvement, and the price paid for the saving is too great.

The arrival of the all-steel aeroplane would entirely alter the condition of things, as with this construction much better chances exist for the production of a reasonably strong wing structure, without exposed wire bracing.

318 Consecutive Loops Made By Lieut. Maynard In France

According to official information received by AERIAL AGE WEEKLY, on Lincoln's Birthday a new world's looping record was established at Romorantin, France, when Lieut. Belvin W. Maynard, U. S. Air Service, made 318 consecutive loops in 67 minutes, thus breaking the record made about two weeks before at Issoudun by Lieut. T. N. Joyce, who looped 300 times in 66 minutes. As in the case of Lieutenant Joyce, Lieutenant Maynard looped until his gasoline gave out and landed with a dead stick.

The machine used was a Sopwith-Camel with a 150 h.p. Monosoupape Gnome motor. The unusual strain apparently did not injure the plane in any way, as a thorough inspection showed it to be in perfect condition after the flight.

Lieutenant Maynard has the distinction of being one of the few real "sky pilots" in our army, as he was a student at the Wake Forest, N. C., Theological Seminary up to a short time before the United States entered the war. His home is at Mt. Olive, N. C. He enlisted in the Air Service in August, 1917, and received his ground school training at Ohio State University. Upon completing the course in ground work he was sent to France for flying instruction and was graduated from the American schools at Tours and Issoudun. From Issoudun he went to Romorantin, the assembly depot for the Liberty-motored DeHaviland-4's, where he was one of the first American pilots to fly that machine in France. When the armistice was signed he was acting as a test-pilot at Romorantin.

To Return Soon

The following organizations have been assigned to early convoy: 157th, 370th and 639th Aero Squadron.

A cabled correction reads:

On the transport *Plattsburg*, which sailed from Brest February 26 and is due to arrive at New York March 6:

"37th Aero Squadron, 9 officers, 168 men"

should read "49th Aero Squadron, 9 officers, 168 men."

The transport *Patria* sailed from Marseilles March 2 and is due to arrive at New York about March 14, with 34 casual officers of the Air Service on board.

Over 4,800 Liberty-12 Engines Shipped to Storehouses Since Armistice

The Statistics Branch of the General Staff, War Department, has made up the following table, which shows the number of planes and engines shipped by the Bureau of Aircraft Production to depots and storehouses from the date of the armistice to February 14:

Liberty 12 service engines	4,806
OX-5 elementary training engines	1,261
Le Rhone advanced training engines	994
De Haviland-4 observation planes	524
Hispano 180 advanced training engines	343
Hispano 150 advanced training engines	254
JN6-H advanced training planes	174
JN4-D elementary training planes	131

War Risk Insurance—Applications for Insurance Must Be In Writing

Circular No. 103, W. D., February 26, 1919, Y 824, D. M. A., quotes the following decision of the Bureau of War Risk Insurance:

"In this case ————, Battery ————, Battalion ————, enlisted on June 30, 1918. He did not make out an application for insurance. On October 7, 1918, after being taken to the base hospital at his camp, he expressed a desire to make application for insurance. His commanding officer prepared an application and took it to the base hospital to obtain the soldier's signature, but, being unable to find the soldier, mailed the application to him. This application was not received by the soldier before his death, October 16, 1918.

"The question is then presented as to whether the soldier's oral expression of a desire to make application for insurance constitutes an application for insurance.

"In this case no valid application for insurance has been made for the reason that application for insurance must be made in writing."

Honorably Discharged

The following officers of the Air Service have been honorably discharged:

Lieutenant-Colonel Robert Glendinning.

Majors Charles H. Hammond and Frank H. Maguire.

Captains Leonard C. Hammond, Claude O. Van Valer, Charles M. Fleischmann, Henry I. Brock, Charles L. Heater, Roscoe G. Kincaid, Walter L. Saunders, John S. M. Eley and Harford W. H. Powel, Jr.

First Lieutenants Harry J. Kennedy, John K. Willcox, Tom S. Patterson, Robert L. McClure, Paul P. Immel, Leo M. Harlow and Walter A. McDonald.

Second Lieutenants Robert G. Elbert, Robert H. Doutt, James A. Johnston, Jr., George D. Kingsland, Louis A. Giroux, Edward L. Bullock, Jr., Herbert J. Stack, James C. Hayes, Efford A Beverly, Anthony E. Nommensen, James W. Huntley and Norman C. Granniss.

New R. M. A.'s

The following officers have been rated as Reserve Military Aviators from the dates set after their respective names:

Major Ora M. Baldinger, A.S.A., January 30, 1919.

Captain Gordon Baker, A.S.A., January 30, 1919.

First Lieutenant William D. Prindle, Infantry, February 12, 1919.

First Lieutenant William M. Bailey, A.S.A., February 12, 1919.

First Lieutenant James Wade Jenkins, A.S.A., January 30, 1919.

First Lieutenant Fielding B. Cochran, A.S.A., January 30, 1919.

First Lieutenant Donald G. Duke, A.S.A., January 30, 1919.

First Lieutenant Raymond C. Brown, A.S.A., January 30, 1919.

First Lieutenant William B. Remington, A.S.A., January 30, 1919.

First Lieutenant Charles M. Leonard, A.S.A., February 11, 1919.

First Lieutenant Earl D. Stearns, A.S.A., January 27, 1919.

First Lieutenant Sam George Epstein, A.S.A., January 27, 1919.

First Lieutenant Joe Thurmond, A.S.A., February 14, 1919.

First Lieutenant George V. Bonhag, A.S.A., February 11, 1919.

Second Lieutenant John L. Salway, A.S.A., January 30, 1919.

Second Lieutenant Stanley Clarke, A.S.A., February 10, 1919.

Second Lieutenant Milton Barratt, A.S.A., February 11, 1919.

Second Lieutenant Ralph A. Gibson, A.S.A., February 11, 1919.

Second Lieutenant Alfred D. Karr, A.S.A., February 11, 1919.

Second Lieutenant Granville C. Johnston, A.S.A., January 27, 1919.

Second Lieutenant George K. Pond, A.S.A., January 27, 1919.

Second Lieutenant Arnold M. Kent, A.S.A., February 12, 1919.

Senator New Objects to Sale of Army Aircraft Equipment at Fraction of Cost

Members of the United States Senate Committee on Military Affairs have revealed to the New York *Sun* an intention by the Secretary of War, Newton D. Baker, to wreck and dismantle the nation's air service, to hand over to a few shrewd dealers in the good graces of the Administration equipment at less than junk prices and to make no provision whatever for such commercial aircraft service as Great Britain and other nations are now working night and day to develop.

The facts are so astounding as to be incredible were they not supported by the evidence in the possession of Senators whose statements are not open to doubt—Harry S. New of Indiana, James A. Reed of Missouri and others. As members of the sub-committee on aviation of the Military Affairs Committee these Senators have gathered official information (some of it confidential) which exposes the almost unbelievable design on the part of the Secretary of War to junk the whole aircraft service of the United States with hardly any return to the Treasury, yet with immense profit to the lucky "buyers"; to give away virtually property which cost the taxpayers in a year and a half more money than it required to run the whole Government before the war, and all with absolute blindness to the needs of the future.

On the authority of Senator New of Indiana, probably the best informed man in the country regarding the past, present and future of aircraft, the New York *Sun* states that the Administration purposes these destructive aims, in flat rejection of the will of Congress:

1. To reduce the air service from 30,000 aviators, costing $10,000 a man to develop, and 30,000 skilled mechanics and assistants, to 3,000 pilots and 3,000 mechanics.

2. To sell at private bidding, on such terms as would virtually be giving away Government property, the greater part of 7,580 training aeroplanes in this country and 6,334 service and training planes in France.

3. To sell at private bidding the greater part of 20,000 Liberty motors, on terms that conscientious manufacturers denounce as ridiculous, even scandalous.

4. To sell at private bidding 30,000,000 feet of selected spruce, costing $800,000,000, at a price which would yield but a small percentage of the original cost.

5. To sell at private bidding 7,000,000 yards of aeroplane linen at terms equally disastrous to the Government, however favorable to the bidders.

6. To abandon 30 aerodromes and balloon depots at an immense sacrifice and without the slightest provision for the future of commercial aeronautics.

7. To kill at a blow an industry (the manufacture of aeroplane motors and aeroplanes and spare parts) which under any encouragement might be expected to grow into one of the substantial industries of the country, and which certainly would be indispensable if the United States is to keep pace with Great Britain.

8. To deprive many thousands of skilled laborers, urgently needed for years to come, of work and to throw them into other occupations, thus contributing to labor unrest and materially increasing the problem of reconstruction.

9. To destroy the splendid morale of the air service by robbing the service of identity and requiring that officers of the service may only be obtained by temporary detail from among officers of corresponding grades in other branches, thus serving notice on young officers of demonstrated efficiency during the war that they cannot hope for many years to exercise positions of command and responsibility in any way equal to the positions they earned by the intelligence, devotion and courage of their war service.

10. To deny to the inventive genius of America and the manufacturing intelligence and energy of America the opportunity, even the right, to carry the country forward to the first place in commercial and military aeronautics, or at least to a place equal to that which Great Britain now seeks.

Anti-Freezing Mixtures for Radiators

The Motor Transport Branch, Supply Section, O.D.M.A., is in receipt of latest reports on anti-freezing mixtures for radiators from the U. S. Bureau of Standards. This information is on file in this branch and is available to anyone interested.

General Mitchell Says Planes Would Have Been Used to Transport Troops to German Rear in Spring

New York, N. Y.—Brig. General William Mitchell, who served two years with the air service of the A. E. F. abroad, told the meeting of the Society of Automotive Engineers held in the Engineering Societies Building, 29 West Thirty-ninth Street, on March 7, that in the last two months of the war the American aviators were so successful that the Germans seldom dared attack them.

If the war had lasted until spring, he said, the aviation service had planned to co-operate with the infantry very extensively by dropping men with machine guns in parachutes behind the German lines, thus providing a way to attack the Germans from the rear, simultaneously with a frontal onset.

Speaking of the aerial combats at St. Mihiel and illustrating his talk with stereopticon views, General Mitchell instanced the work of the first pursuit group under Colonel Hartley. These enterprising young men, he said, shot down 110 German planes and lost only ten machines.

Air Service Units Returning

The battleship *Louisiana* sailed from Brest on March 5 and is due to arrive at Newport News on March 17, bearing, among other units, Balloon Wing Companies D, E and F.

The battleship *South Carolina*, due to arrive at the same place and date, is returning with the 5 officers and 164 men of the 5th Air Park.

Clothes for ex-Soldiers Needed

The reclamation shop of the National League for Woman's Service, 21 West Forty-sixth Street, is urging contributions of men's wearing apparel of all kinds for discharged soldiers, stating that civilian clothes are necessary for them to obtain work. Clothes that cannot be delivered will be called for.

Admiral Sims Congratulates Naval Airmen Through Aero Club of America

President Alan R. Hawley of the Aero Club of America received the following wireless message on March 5 from Vice-Admiral William S. Sims, commanding the Unitel States Navy in British waters:

"Please express to the naval aviators of America my most sincere appreciation of their courageous and loyal performance of duty at home and abroad throughout the war. Their brilliant exploits, their determination to win, will ever remain one of the highest tributes to American manhood. The performance of duty of these young naval aviators under my command has not only been in keeping with the very best traditions, but won for America the enthusiastic praise of her allies."

Aeroplanes and Engines Shipped to Storehouses Since Date of Armistice

The following statement was prepared by the Statistics Branch, General Staff, War Department:

The following table shows the number of planes and engines shipped by the Bureau of Aircraft Production to depots and storehouses from the date of the armistice to February 14:

Liberty 12-service engines	4,806
OX-5 elementary training engines	1,261
Le Rhone advanced training engines	994
De Haviland 4 observation planes	524
Hispano 180 advanced training engines	343
Hispano 150 advanced training engines	254
JN6-H advanced training planes	174
JN4 D elementary training planes	131

Prisoner Taken Via Air, Indiana to Ohio

Dayton, Ohio.—The Police Department of Dayton on February 26 set an unusual precedent in the transfer of prisoners from one city to another when a prisoner was driven by aeroplane from Indianapolis to Dayton.

Safety Director James, in charge of the delivery of the prisoner to Dayton, said at the end of the trip that he believes the aeroplane will prove valuable to the Police Dpartmnt the country over in the safe delivery of prisoners for whose release there has been public agitation or against whom public feeling runs high.

New Board of Contract Review

Lieut. Col. Jacob E. Fickel, Capts. George W. Price and Louis Montford have been appointed members of the Board of Contract Review of the Division of Military Aeronautics, vice Col. Harold Bennington and Capts. Otis S. Van de Mark and Lewis B. Ticknor, relieved.

Royal Air Force Mail Service Speedy

London.—A fine letter-carrying feat was carried out by the Royal Air Force recently. The Air Ministry received a document at 12.35 p.m., at 1 p.m. a special aeroplane left Hendon, and the letter was delivered by the airmen in Cologne before dusk. The 300 miles was flown with one stop near the French coast.

FOREIGN NEWS

Albert Visits Army by Aeroplane

Brussels, March 4.—King Albert of Belgium went to Aix-la-Chapelle on Sunday by aeroplane, visited the headquarters of the Belgian Army of occupation and flew back to Brussels. The trip was made in about 50 minutes each way. The King took care not to fly over Dutch territory.

Caproni Aerobus on Trial Flight

The Caproni aerobus squadron, intended for the proposed passenger service between Naples and Rome, left Cento Celle at 11 o'clock several days ago and arrived at Naples at 12.10. The return flight started from Naples at 2 P. M. and was completed at 3.10.

Royal Air Force to Have 6,500 Officers and 75,000 Men as Peace Standard

London.—Announcement has been made regarding the peace standard for the year 1919 for the Royal Air Force. When hostilities ceased, the force consisted of 30,000 officers and 265,000 men. On January 24 1,724 officers and 51,727 men had been discharged. This process of demobilization will continue until the force is reduced to 6,500 officers and 75,000 men. Officers and airmen will be retained who were not enlisted and posted before January 1, 1916, have not attained their thirty-seventh birthday, or are not entitled to three or more wounded stripes.

A weekly bonus has been added to the pay of all ranks, ranging from 10 shillings weekly for second class mechanics to over 2 pounds for officers ranking above Lieutenant-Colonel.

British Radiophone Progress

London.—An eminent engineer of the Western Electric Company, who was concerned in the development of American aircraft radio telephone sets, who is testing British Royal Air Radio equipment in competition with American sets, is quoted in the British press as stating that after numerous test flights he has concluded that British wireless telephones are far superior to American phones. Standard British equipment permits of conversation between pilot and ground or other planes as far as fifteen miles, while airship sets are standardized for communicating fifty miles.

The Peace Conference aerial ferry planes for service between Paris and London are equipped with radio telphons.

British Metereological Department Operating Fifty Stations

London.—It was recently announced that the British Government, in order to foster commercial aeronautics, was planning to establish meteorological stations for the assistance of airmen. A dispatch to the *New York Sun* announces that already almost fifty such stations are in operation under supervision of general commercial air boards. The energy with which the plans for aerial commerce are being pursued, the correspondent writes, indicates Great Britain's intention to attain aerial supremacy as well as naval supremacy.

Progress of Australia-London Air Route

The syndicate of Australian business men which organized for the purpose of establishing an Australian-London air service, have decided on the establishment of landing places approximately 300 miles apart.

The route is to be from Sydney or Melbourne direct to Port Darwin, in the northern territory of Australia, from which point there will be a 300-mile sea trip across to the Island of Timor in the Dutch East Indies, thence from island to island through Java and Sumatra to Singapore and Calcutta, across India to Karachi, thence to Bagdad and Port Said, from which latter point the choice of several developed aerial routes to London are available.

Next month Mr. Lloyd will lead a surveying party from Australia through the Dutch East Indies, the Malay States, India and Mesopotamia, to locate landing sites and to arrange for their lease or purchase. The organization of the present company is merely to provide for the expenses of this routing party. After the completion of this survey it is proposed to finance a company in London to operate the aerial service to Australia.

Chinese Government Buying Aero-Radio Apparatus

London.—The British Marconi Company is manufacturing two hundred aircraft radio sets for the Chinese Government, according to a statement by Mr. Godfrey Isaacs, managing director of the company.

Porte Flying Boat to Attempt Transatlantic Flight

London.—In addition to the dirigible and Handley Page transatlantic plane, the British Government, according to information recently received, will try a Porte flying boat for the projected flight.

British Surplus Government Property Disposal Board Appointed

London.—In connection with the disposal of surplus State property, an Advisory Council, of which Lord Salisbury is chairman, has been appointed to advise the Minister of Munitions on such questions as may be referred to them. The organization consists of a board, directly responsible to the Minister, to be called the Surplus Government Property Disposal Board, of which Mr. F. G. Kellaway, M. P., Deputy Minister, is chairman, and Major F. C. T. Tudsbery, O. B. E., secretary. The departmental organization is divided into seventeen sections to deal with the different classes of property, one of which will deal with aircraft equipment. Communications should be addressed to the secretary, Disposal Board, Armament Place, Whitehall Building, London, S. W. 1.

Will Try to Fly to Brazil

Paris.—Captain Coli, who recently crossed the Mediterranean and made the return trip within twenty-four hours, will soon make a flight by way of Madrid to Fez and Agadir, Morocco.

He will make an especial study of conditions over the sea in view of his intention to make a flight from Dakar, at the extreme point of Cape Verde, to Pernambuso, Brazil, within the next two months. On this flight he will operate a special machine which is equipped with a fuselage which will keep afloat for ten hours and which will permit the aviator to wait for assistance in case of a breakdown while over the sea.

Handley Page Passenger Ship Exhibited

London, March 4.—Handley Page, the aeroplane builder, has on exhibition the fuselage of an ordinary two-engine machine, formerly used as a bomber over the Rhine. It has the new well-appointed passenger saloon extending full width and about one-third of the length. The fuselage is six and one-half feet high and has armchairs for seventeen passengers, all facing forward, besides windows with a gangway between the seats. There are lamps and mirrors.

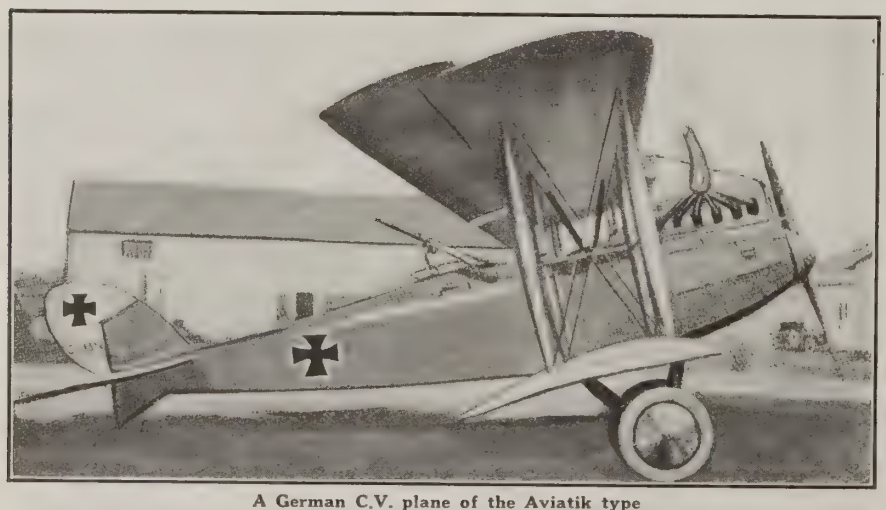
This plane is only half the size of the giant Handley Pages, but it makes more than 100 miles an hour. With two 350-horsepower engines, the Handley Page carried 700 passengers to France last month.

British Transatlantic Dirigible Tested

London, March 6.—Great Britain's largest airship, the R-33, which is to attempt a transatlantic flight, made a trial to-day and covered 30 miles in half an hour, landing successfully, in spite of unfavorable weather.

The airship is of the rigid type of dirigibles, 670 feet long, and during her flight preserved a perfectly even keel.

Archies Downed Many Enemy Aircraft



London.—Official figures have recently been issued indicating the effectiveness of anti-aircraft guns and searchlights against the enemy in France. The total bag of the A. A. artillery from January 1, 1918, up to November 11 consisted of 171 planes that were definitely "crashed" or forced to land in British lines and 73 sent down out of control. In addition, machine guns equipped with special sights attached to the infantry accounted for 27 more enemy aircraft, making a grand total of 271 victims of anti-aircraft artillery.

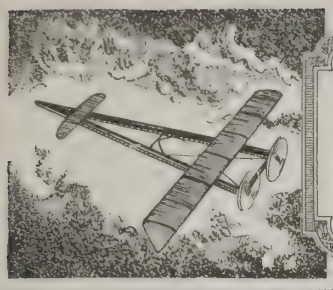
The extensive searchlight service in operation during the last few months greatly increased the hazard to enemy bombing planes. It was a frequent occurrence for enemy planes to be picked up in the beam of one searchlight and passed on to the next, until downed. Devices to detect the location of planes in flight by direction of sound greatly increased the effectiveness of the searchlight service. At least 25 large enemy bombing planes were destroyed as a result of the improved searchlight installation.

Chinese Government to Establish Regular Transport Service

Pekin.—The Chinese Government is preparing to begin an aerial transport and mail service, and has appointed General Tinge, the director of th Pekin-Suiyuan Railway, to be director of the Chinese aerial service. Aeroplanes will be used in connecting Kalgan, an important caravan center, with Siberia, and also in transversing the Gobi Desert.

The success of the British with aeroplane transport in India is believed to have inspired the Chinese Government to make plans for this form of transport. It is understood that an order for aeroplanes has been placed with Japanese manufacturers.

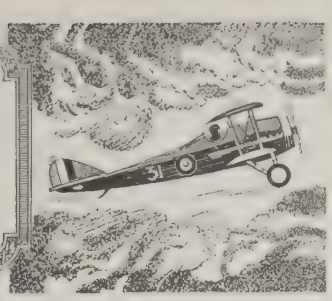
A German C.V. plane of the Aviatik type



Aerial Transport for Spain

Madrid.—Major Emilio Herrera of the Spanish army, who is planning for a line of aerial transports from Corunna to New York, has obtained the co-operation of a powerful transatlantic steamship company, which has accepted his plans and appointed a commission consisting of Major Herrera, the director of the Madrid meteorological observatory and Lieut. Col. Calbis of the General Staff, who are leaving for Paris, London and Scotland to study the construction of and to acquire large dirigibles.

Aerial service between Toulouse and Morocco via Barcelona was inaugurated recently. The London-Madrid service is about to be started.



Gas Station for Aeroplane at Panama

The Governor of the Province of San Blas, Republic of Panama, has offered the U. S. Government the use of a portion of Capital Island, Porvenir, for aviation purposes, and he has offered to build a gasoline station there. Co-operating with Navy aviation officers, the commanding officer of France Field, Cristobal, Canal Zone, plans to visit Porvenir in a Navy submarine chaser, and complete arrangements for the establishment of this gasoline station. The importance of such a station is apparent when it is learned from Navy sources that six Curtiss NC-1 flying boats are capable of landing 200 soldiers and equipment at a point along a 700-mile coast in three hours' time.

Model Aeroplane Building as a Step to Aeronautical Engineering

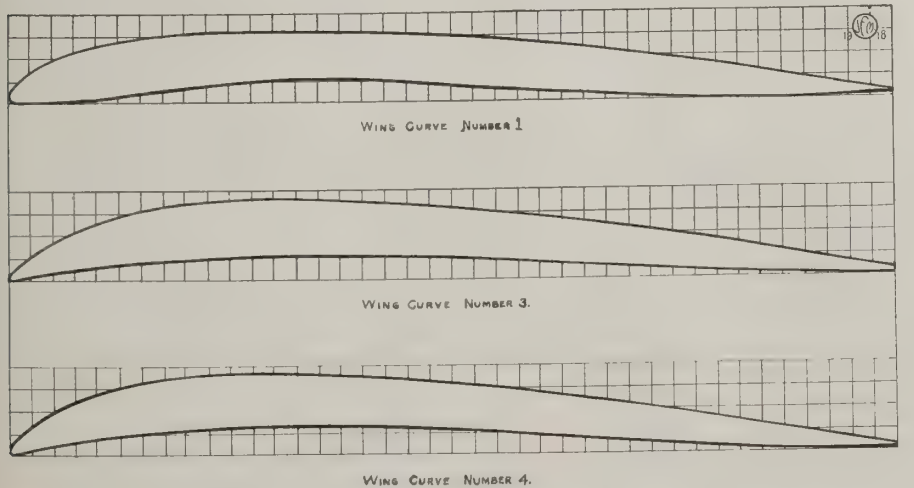
THE writer has received many letters since starting the light aeroplane articles asking different questions as to why I don't make a monoplane instead of a biplane.

The first question is answered by reason of the necessity of combining the most efficient aerodynamical wing section with the strongest construction. In the Ford motored machine I found the R. A. F. 6-wing section best for the machine because of the husky spars that this section allows. This construction gives a factor of safety of 9 in the wings. I had intentions of using the R. A. F. 3 in my new machine but while at the Aeronautical Show, I found in the government book of research that the U. S. A. curves had been retested and showed up better than the first reports had led to believe. Of course these new figures are not to be had as yet, but they will be distributed by the end of May.

From what I heard the U. S. A. curves will be used extensively as the distance of the top camber from the bottom camber is pretty liberal in all the sections, which allows deep wing spars.

I am seriously considering using the U. S. A. No. 1 section in preference to the R. A. F. No. 3 as the L/O is much higher and the Ky as well. This curve will allow great speed with little Horsepower.

That the light weight aeroplane has come to stay can be seen by any one who visited the show. The Gallaudet Company exhibited a small two-seater monoplane of unique design powered with two Indian motorcycle engines of approximately 18 H.P. each or a total of 36 H.P. The propellers, two in number, mounted at the trailing edge of each wing just far enough apart to clear the body when rotating, were driven by a cleverly worked out shaft transmission. A clutch was also in use to allow one engine to keep working if the other failed.



Another interesting machine was exhibited by the Dayton Wright Company. This little "ship" took the eye of every young aviator at the show, the most interested being the Army and Navy pilots. This little machine was in direct contrast to the big ones around it. Somebody remarked that the big Handley-Page would eat it, and it would not be noticed by anybody. The spread of this little machine was 18 feet. Top and bottom wings being the same spread. The weight was something like 450 lbs. Wing section looked like U. S. A. No. 1. The engine in this machine was interesting, a four cylinder two-cycle motor of very light weight, air cooled. The speed of this machine is about 80 miles an hour. These two machines are fully described in another part of the magazine.

Model of the Continental KB-3T described below

As the engine I am about to describe will develop about 27 horsepower, we cannot expect as much as the machines mentioned above, but, we will be well satisfied to get a speed of 60 or 70 M. P. H.

I am negotiating with a machine shop at the present time in regard to making the special crankcases to use with the motorcycle cylinder, and when everything is in working order I will help the readers who have written or applied to me in person in regard to purchasing one of these crankcases. To build an engine of this kind is instructive as well as profitable. In our next article we will consider the possibilities of our machine.

Three U. S. A. Curves the data of which was given some time ago. The first, No. 1, we will use for our machine

Continental K-B-3T Model

The model shown in the accompanying photograph is the work of a mechanical engineer of Omaha, Nebraska, Mr. A. H. Fetters, and if he should enter it in the coming contest it would have an excellent chance of winning the flying model prize for construction. The model follows its big prototype in every detail. The accompanying photograph shows clearly the structural work. The ribs are of standard built-up construction of U. S. A. No. 5 section, weight 1/5 oz. each and are built up of seventeen separate pieces of wood. The wing spars are channelled out to an "I" beam section and the gas tank is carried in top section of wing over body, front section of fuselage is covered with aluminum principally. The spread of the wings is 9 feet. This model would be interesting as a non-flying model, but when one considers the fine workmanship put into it coupled with the fact that it has a power plant and will fly, it increases the interest in this model considerable. Mr. Fetters is to be complimented and we would like to see more of this kind of model construction.

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

The Rookie Speaks

Sitting at mess the other evening down at the Air Service Mechanics' School, one of the Fly-chasers happened among several newly arrived rookies.

"Well," said one, "I do say that a ship can't come down tail first." There was quite a bit of argument about this, but the matter was finally ended by one declaring with great gravity and portentous show of knowledge: "It's like this, fellers. You say a ship can't come down tail first. Well, how about the tail spin? That's one of the most difficult stunts a flyer has to do—bring his ship down tail first and spinning on the tail."

And since no one apparently knew more about the subject, they let it go at that.

No Empty Chair

When Kaiser Bill wearily sits down in St. Helena or somewhere, and gathers his family around him and begins to figure out all he's lost, he'll have one consolation—he can gather all his family around him.

In Other Words—Good Old George Robey

They are silvery in color and in figure,
  They are streamline as regards the head and tail,
And in size they are considerably bigger
  Than a microbe, tho' they're smaller than a whale.
They control themselves a great deal by their tailfins,
  If they try to they can move like many beans,
You will find them in great numbers packed in oil tins;
  In other words—Sardines.

They are frequently in use in aviation,
  And are used by many members of that race,
They are really quite important to the nation,
  And they travel through the air at breathless pace.
They provide us with good optical protection,
  And are guaranteed to be without defects,
Thus permitting clear unlimited inspection;
  In other words—*Eyetects.*

The adventures of "Cyril" in the aviation world. He tests an engine

From *Flight*

Volplanetor

Insoluble
In high air's
Quiescency,
My plane, on earth
A sophist, naively
Reconoitres promiscuously.
Sinuously, nose retrousse,
It spans thinning stratums
Of atmosphere, and volplaning
Deems itself a static medium.
How it routes
Pusillanimous planets
From its path at night,
Dazzling them
Pyrotechnically
With sovereign spectrums
Belched forth sporadically.
My purposelessness
Prognosticates
The heterogeneity
Of world events.
Nevertheless
The sky's oscularity
Propitiates
My primal impulses
And tedium is thwarted.

—Robert M. McAlmon.

That's It!

I quit Elsie!
T'other day
She wrote me.
A fren of mine asked:
"Hoosit from?"
I seys:
"Mos' wonderful gurl livin'."
"Why, she's writin' me, too."
He seys:
Such fickleness.
I quit Elsie!

WE find that no one really questions the superiority of AC Spark Plugs. In the automotive field, AC is the standard equipment of practically all the leading manufacturers with whom lower price is less significant than quality. When the United States Government needed spark plugs for aircraft service, army engineers investigated all makes of spark plugs, then adopted AC as standard equipment for all Liberty and Hispano-Suiza airplane motors.

VOL. IX NEW YORK, MARCH 24, 1919 NO. 2

INTERCOLLEGIATE AERIAL TOURNAMENT AT ATLANTIC CITY TO LAST THROUGHOUT THE SUMMER

TO enable the hundreds of thousands of college men who were in the Army and Navy and Marine Corps Air Service but have left the service, to continue their training in aeronautics, both as a measure of national preparedness and as a means of facilitating their remaining in the aeronautic movement, the Aero Club of America and the Aerial League of America have arranged to hold a series of intercollegiate tournaments at Atlantic City during the coming summer.

The first of these intercollegiate contests, which are to be held in May, are as follows:

Intercollegiate Seaplane Speed Race

Over a five mile course, for the $2,000 Intercollegiate Trophy. This event is open to graduates and under-graduates whether in military or civilian life.

Dirigible Speed Contest (With Handicap) For the Aerial League of America Silver Trophy

This contest is open to Army, Navy, aero clubs, colleges and aeronautic organizations. It will be held on the afternoon of Saturday, May 3; Saturday, May 10; Saturday, May 17; Saturday, May 24; Friday, May 30, and Saturday, May 31.

Each member of the winning crew of each race will receive a silver plaque of the trophy.

The names of the members of the winning crew of each race will be inscribed on the trophy, which is to be competed for annually.

The race will be for the best speed (under the conditions of the handicap) made at each race.

After these events are over a few weeks will be allowed for preparation and then the following contests will be held:

Three Months Intercollegiate Seaplane Tournament

This will be an intercollegiate seaplane tournament to last three months. The contests will be held every Saturday, and the college holding the largest number of points at the end of the month, each month, will be considered the winner for that month. The second best the second; the third best the third.

But the final winner will be the college which has the largest number of points at the end of the three months.

Each college will be permitted to have three entries. The pilots may be changed weekly, the change being left entirely to the discretion of the college which has made the entry. This plan will permit the testing of a number of collegiate aviators and finding the best. It will also give an opportunity to a college which may have had a very low number of points during the first and second months to catch up with the leader during the last month.

Three Months Intercollegiate Aeroplane Tournament

There will also be held a three Months Land Aeroplane Race, to be governed by the same rules as stated above.

Three Months Intercollegiate Dirigible Tournament

To provide for practice with dirigibles and give opportunities to college men to participate in the development of this wonderful and most progressive branch of aeronautics, there will also be held a Three Months Intercollegiate Dirigible Tournament, to be governed by the same rules as stated above.

The Aero Club of America and Aerial League of America authorities have been assured that the Army and Navy will be glad to co-operate and permit Army and Navy officers who are dirigible balloon pilots to represent their respective colleges in the dirigible balloon tournament.

Three Months Intercollegiate Spherical or Kite Balloon Operating Tournament

In view of the fact that, owing to the nearness to the Atlantic, it would be impossible to hold free balloon races from Atlantic City, plans have been made for holding the Intercollegiate Free Balloon Races elsewhere in the latter part of the Summer. To afford training to college men in the operation of balloons, there will be held a Three Months Intercollegiate Balloon Operating Contest, to be governed by rules similar to the rules for the seaplane tournament.

The contest will consist of the important work of lay out the balloon, inflating, and send it up, with two or more men on board, who will take observations and communicate with the people on the ground by telephone.

The trophy will be awarded for the speed and efficiency in laying out, inflating, and sending up the balloon, as well as for the work of the men on board.

Provision is being made at the Atlantic City Aviation Field for housing the land planes and balloons. Arrangements are also being made for housing and taking care of the seaplanes. Provision will be made for experts to look after the aircraft used for the intercollegiate races, and every facility will be given so that undergraduates, as well as graduates, can compete in the May contests with a minimum loss of expenditure of time.

Great enthusiasm has been aroused in intercollegiate circles by the announcement of these intercollegiate aerial contests, and it is expected that the entries will be numerous and the events will be of great value to the nation, and will be a means of keeping up the development of American aeronautics as well as giving an opportunity to college men to participate in the program of aeronautics.

United States Army, Navy and Marine Corps aviators and balloon observers, in the Service or out of the Service, who wish to compete with the teams of their colleges or to start teams, should apply to Mr. Alan R. Hawley, chairman, Contest Committee, Aero Club of America, 297 Madison Avenue, New York City.

ATLANTIC CITY CONFERENCE AND EXPOSITION COVERS ALL PHASES OF AERONAUTICS

WITH the success of the Aeronautical Exposition which has just closed in Madison Square, blazing a new era in the science of aviation, air pilots, engineers and manufacturers are looking forward with eager interest to the first big outdoor aviation event held in the world since 1914, the second Pan-American Aeronautic Convention and Exposition to be opened during the month of May at Atlantic City.

Reading the war news has made many persons conversant with the theory of flying; the indoor exposition at the Garden has given thousands a practical idea of the construction of aircraft; now those back of the Atlantic City affair believe that open air demonstration where attention will be paid to the commercial end of aviation, will show the business world that flying is a fact and not a fad. The Exposition is to be held under the auspices of the Aero Club of America, the Aerial League, and the Pan-American Aeronautic Federation.

The idea governing the various contests at the Exposition will be in the main to prove that both the heavier-than-air and the lighter-than-air airship can be used to a good purpose in the world of business and the world of pleasure. There will also be lectures by experts on every phase of aviation with pictures and models. The aerial contests will be sanctioned under the rules of the International Aeronautic Federation, which governs all aerial contests.

There will be an efficiency marine flying contests, the awards made under the terms of the will of the late Samuel H. Valentine, being four prizes of $1,000, $500, $250 and $100. The flight will be over a sixty-mile course with the Steel Pier, Atlantic City as a starting point, and the Cape May Naval Air Station as a turning point. The winner will be the pilot who covers the greatest umber of laps on this course flying during the five Saturdays of the Exposition.

Glenn H. Curtiss has offered a prize of $1,000 to the first entrant for the Curtiss Marine Flying trophy who covers the distance of 1,000 miles without stopping. There will also be an open seaplane speed contest for three prizes, $1,000, $500 and $250. Two contests, open to graduates or undergraduates of American colleges, will be the intercollegiate seaplane race and the intercollegiate land aeroplane race. A prize of $2,000 is offered the winner in each of these contests.

There will be Army, Navy and Marine Corps contests in bomb dropping on floating targets. Also there will be the handicap dirigible race for the Aerial League of America's silver trophy. Aerial commuting will be another of the novel contests. To win the several prizes offered to aerial commuters, it will be necessary to have either covered the greatest distance commuting to the Exposition by aeroplane or to have made the most commuting trips, or to have made the longest non-stop commuting trip.

The Aeronautic Convention, which is to be another phase of the Exposition will be the largest event of its kind that the world has ever seen. The program includes an actual demonstration of aeroplanes, seaplanes, dirigibles and kite balloons. The Governments of all the allied and Latin American countries and their aeronautic, sporting, scientific, industrial and educational organizations have been invited to participate.

In order to afford a thorough discussion of the various lines along which aviation and aircraft have been developing, thousands of experts in different lines of endeavor related to aeronautics have been invited to attend. For instance, representatives of railroads, express, steamship and other transportation organizations will be invited to attend the discussion of 'The Large Dirigible and Its Value for Transportation" and the Forestry Department of every State and every nation will send representatives to the illustrated addresses on the "Aerial Forest Patrol.'

Other interesting discussions will be on the "Work of Aerial Police Squadrons and Why Every City Should Have One," "Aerial Mail Plans," "Aerial Exploration and the Use of Aircraft for Coast and Geodetic Survey," "Aerial Jurisprudence," and "Aerial Navigation Instruments for Flying Over Land and Water."

The following men compose the contest committee for the Aero Club of America, which will have charge of the various contests and the awarding of the prizes: Alan R. Hawley, Lieut. Com. P. L. N. Bellinger, U. S. N.; Col. G. C. Brant, U. S. A.; W. Redmond Cross, Lieutenant Godfrey L. Cabot, U. S. N.; Walter Camp, Col. Milton F. Davis, Col. C. D. F. Chandler, U. S. A.; Major A. B. Lambert, U. S. A.; Major William McElvin, U. S. M. C.; Colonel James Prentice U. S. A.; Major J. C. McCoy, U. S. A.; Commander H. C. Hustin, U. S. N.; Lieut. Com. John H. Towers, U. S. N.; Henry A. Wise Wood and Henry Woodhouse.

AMERICAN ACES AWARDED DIPLOMAS OF MERIT

AT the meeting of the Board of Directors of the Aerial League of America which has its headquarters at No. 297 Madison Avenue, it was resolved to award the League's Diploma of Honor and Merit to the sixty-three American aces.

Diplomas are also to be awarded to the military balloon observers who distinguished themselves and whose services were meritorious.

With the Diploma there will be presented to each ace a fellow membership in the League. In the case where the aces have lost their lives, the Diploma and the membership will be presented to the mothers or parents.

The aces and their parents will be invited to the Aeronautic Convention to be held at Atlantic City from May 1 to June 1, where the presentation of the Diplomas will be made.

The aces to whom the League's Diploma and fellow membership were awarded today are as follows:

Captain E. V. Rickenbacker, of Columbus, Ohio; Lieut. Frank Luke, Jr., of Phoenix, Ariz.; Major Victor Raoul Lufbery, of Wallingford, Conn.; Major Reed G. Landis of Chicago, Ill.; Lieut. David E. Putnam, of Brookline, Mass.; Lieut. Fields Kinley, of Gravette, Ark.; Lieut. G. A. Vaughn, Jr.; Lieut.J. M. Swaab, of Philadelphia, Penna.; Lieut. Thomas G. Cassady; Lieut. C. E. Wright, of Cambridge, Mass.; Lieut. W. P. Erwin, of Chicago, Ill.; Captain E. W. Springs, of Lancaster, Penna.; Lieut. H. R. Clay, Jr., of Fort Worth, Texas; Major James A. Meissner, of Brooklyn, N. Y.; Captain Hamilton Coolidge, of Boston Mass.; Captain G. F. Larner, of Washington, D. C.; Lieut. P. F. Baer, of Fort Wayne, Ind.; Lieut. F. O. D. Hunter, of Savannah, Ga.; Lieut. W. W. White, of New York, N. Y.; Lieut. C. Jones of San Francisco, Cal.; Captain R. M. Chambers of Memphis, Tenn.; Lieut. Harvey Cook, of Toledo, Ohio; Lieut. Lansing C. Holden, of New York, N. Y.; Lieut. K. H. J. Schoen, of Indianapolis, Ind.; Lieut. W. A. Robertson, of Fort Smith, Ark.; Lieut. Leslie J. Rummell, of Newark N. J.; Lieut. L. A. Hamilton, of Burlington, Vt.; Lieut. J. O. Creech, of Washington, D. C.; Lieut. Howard Burdick, of Brooklyn, N. Y.; Lieut. C. L. Bissel, of Kane, Penna.; Major Harold E. Hartney, of Saskatoon, Canada; Captain Douglas Campbell, of Mount Hamilton, Cal.; Captain J. C. Vasconcelles, Denver, Colo.; Captain Edgar Tobin, San Antonio, Texas; Lieut. E. P. Curtis, Rochester, N. Y.; Lieut. Sumner Sewell; Lieut. R. A. O'Neill, Nogales Ariz.; Lieut. Donald Hudson, of Kansas City, Mo.; Lieut. M. K. Guthrie, of Mobile, Alabama; Lieut. W. H. Stovall, Stovall, Miss.; Lieut. J. D. Deane, Concord, Mass.; Lieut. A. R. Brooks, Framingham, Mass.; Lieut. R. O. Lindsay Madison, N. C.; Lieut. M. Stenseth, of Twin Valley, Minn.; Lieut F. K. Hays, Chicago, Ill.; Lieut. H. C. Klotts; Lieut. Colonel William Thaw, of Pittsburgh, Penna.; Major D. M. Peterson, of Honesdale, Penna.; Captain H. R. Buckley, Agawam, Mass.; Major C. J. Biddle, Philadelphia, Penna.; Lieut. J. Knowles, Cambridge, Mass.; Lieut. J. A. Healey, Jersey City, N. J.; Lieut. Innis Potter; Lieut. F. M. Symonds, of New York, N. Y.; Lieut. G. W. Furlow, of Manchester, Minn.; Lieut. A. E. Eusterbrook, Fort Flagler, Wash.; Lieut. B. Baucom, Milford, Texas; Lieut. Harold McArthur; Lieut. J. S. Owens, Baltimore, Md.; Lieut. J. E. Wehner, New York, N. Y.; Lieut. J. J. Scenley, Chicago, Ill.; Lieut. E. M. Haight, Astoria, N. Y.; Lieut. H. H. George, Niagara Falls, N. Y.; Lieut. J. O. Donaldson.

THE NEWS OF THE WEEK

Banker Uses Aeroplane

New York, March 14.—The first aerial banking transaction was consummated when Ralph H. Mann, president of the Park Trust Company, of Worcester, Mass., flew from that city to New York in a Curtiss biplane, piloted by Lieutenant Charles S. Jones.

Stops were made at Springfield and New Haven to transact business. Mr. Mann claims to be the first financier to carry on his banking business by aeroplane.

Daniels Says Navy Must Lead Way in Aircraft Development

New York, March 15.—In an interview just prior to his departure for his visit to European capitals Mr. Josephus Daniels, Secretary of the Navy, predicted that our Navy would lead the world in aeronautic development.

"It is our purpose in the Navy to keep not only abreast of aviation in the future, but to lead the way in the development of this new art," said Mr. Daniels. "Under the whip and spur of conditions much was accomplished here. The Liberty motor is the most striking instance. It is still unrivalled in its own field—that of a high power aircraft motor suitable for rapid production in quantity. That was our war problem—production—and we solved it.

"Now, however, with the stress of war behind us, our problem is to advance the science of air navigation, to explore every avenue of possible development, to build better, faster, safer aircraft from year to year, as we build better ships for the Navy. For that purpose we must devote ourselves to orderly experiment in peace times. We must keep in touch constantly with what other nations are doing, profiting by their experience and sharing with them the benefit of our own.

"Admiral Mayo, who is the Navy's representative on the Aircraft Production Board, is already widely experienced in the designing and production of aircraft for our own fleet. He will organize and direct the expanded campaign of aviation experiment on which the Navy is embarking. Abroad Admirals Griffin, Taylor and Earle will have the aid of Captain Craven, fresh from intensive wartime experience with aircraft."

Admiral Taylor Says Navy Will Make Trans-Atlantic Flight Within Month

New York, March 15.—The United States Navy will be ready within a month to commission an aeroplane which, naval experts think, will be able to cross the Atlantic, according to a statement made by Rear Admiral David W. Taylor, in charge of the naval air program. Admiral Taylor also said the Navy Department would not be surprised if a transatlantic flight by dirigible should be attempted before the end of the present week.

"America," Admiral Taylor said, "will be ready in a month to fly across the Atlantic. I do not believe that Great Britain will beat us across; that is, if the attempt is made with heavier-than-air craft. We are under the impression, however, that a dirigible trip will be undertaken, possibly within the coming week.

"The Navy has four boats of the N. C-1 (Naval Curtiss) type and work on these craft, I understand, has been almost completed. It has not yet been decided whether all four will be sent over at the same time, but I believe that when the time comes more than one will start. This will be an insurance against entire failure in the event one or two of the machines break down."

Asked whether the entire flight from Long Island to Ireland would be attempted without a stop, Admiral Taylor said he was not sure. "We may break it into two hops," he said. "This will entail the use of vessels equipped with gasoline, oil and food. Through their wireless mother ships can keep in touch with the flying boats. Although the flying boat may alight only once at sea, it is possible that more than one mother ship could be used."

Aircraft Exhibits to Be Flown Back to Factories

Two Thomas-Morse planes which have been shown here will fly to their home, Ithaca, this week, both carrying newspaper reporters and trying for speed records.

Four Naval Planes Here for Flight Across Ocean

Philadelphia, March 17.—Wings for two of the four seaplanes from the Navy Department will make selection for a flight from America to Europe have been completed and tested at the League Island Navy Yard, and now are being fitted to the airboats for which they were designed.

The seaplanes, which are of gigantic size and the N. C. 1 Naval Curtiss type, are at present at Far Rockaway, New York, and it is expected the Navy Department will announce within a week the date for the proposed flight. That it will be within a month is the declaration of Rear Admiral W. Taylor, in charge of the naval air programme.

The Dayton-Wright De Haviland 4 which has been in the Garden will be installed as a Government exhibit at the Smithsonian Institution. It is the first De Haviland battle plane built in this country and has been flown for 1,000 hours on the front in France.

General Menoher Announces Air Service Plans

New York, March 15.—Major General Charles T. Menoher, newly appointed Director of Air Service, U. S. Army, outlined in a newspaper interview the immediate problems facing the War Department in the development of aviation.

"First of all," he declared, "we shall co-operate to every possible extent in development of commercial aviation. Our future in military aeronautics is intimately bound up with commercial aerial development."

The problems now confronting the War Department, as outlined by the general, are as follows:

1. Establishment of an Academy of Aviation similar to West Point or Annapolis.
2. Placing the air service on a peace footing of about 24,000 men all ranks, with about sixteen flying fields.
3. The question of turning over to the National Guard of the various states surplus aviation material to assist in training pilots, observers and mechanics.
4. Completion of an aerial photographic survey of the United States, and from this the compilation of an aviation blue book similar to the automobile blue book.
5. Formation of aerial traffic rules and regulations.

Regarding the first of these the general said:

"It has not yet been definitely decided whether to establish an academy similar to West Point or to open a school of application for technical students. The department is now studying out a plan of co-operation with universities and colleges to train reserve officer pilots.

"Nothing definite has been decided about the peace footing of the air service, but I think it will be in the neighborhood of 24,000 of all ranks. We shall retain a sufficient number of 'planes adequately to take care of the needs of this force.

"If the legal status allows it, we may turn over to the National Guard units of the various states most of the surplus aeroplanes and other equipment. This could then be used for training military pilots who could be transferred to the army in case of war.

"The present plan is to maintain in the peace time units skeleton squadrons. Certain of them will be more or less complete for tactical purposes, but the others will form a nucleus to be filled in with reserve men in case of war.

"The air service has been engaged in mapping the United States by means of photographical survey. When completed the data obtained will be placed at the disposal of commercial aerial transportation companies. In like manner the army aviation fields will be open to their use wherever it does not interfere with purely military work.

"Commercial aviation is going to come, but perhaps a little more slowly than most enthusiasts think. There is so much to do in providing proper landing fields, licensing pilots and making rules for navigation of the air."

World's Altitude Record Held By United States

New York, N. Y.—According to information received here on March 10, Major R. W. Schroeder of the American Air Service is still holder of the world's altitude record of 28,900. An official test of the altimeter employed by Captain Lang of the Royal Air Force on the recent flight, for which an altitude record of 30,500 feet was claimed, lead to the conclusion that Captain Lang attained an altitude of only 27,000 feet.

Major Schroeder made his flight at Dayton, Ohio, on September 18, 1918.

Record New York to Hampton Roads Flight Made

Three hundred miles in 270 minutes was the record of two navy flying boats that made the trip on March 12 between Hampton Roads, Va., and the Naval Air Station at Rockaway Point. The figures set a new non-stop record for this type of flying boat.

The machines left Hampton Roads at 10 A. M. They passed over Atlantic City at 12:30 and landed at Rockaway Point at 2:30 P. M.

Ensign Southers, pilot of the first seaplane, carried Lieutenant Richardson, who took pictures on the flight, and four passengers. Ensign Irvine, in the second flyer, also had five men with him.

The flight was made to test the long distance carrying capacity of this type of craft. If naval officers consider it successful, it is possible that one of the design will be groomed for the Atlantic trip.

A model of the F-5-L type, to which the new record makers belong, is on exhibition at the Aeronautical Exposition. It has a wing span of 103 feet and is driven by two twelve-cylinder Liberty engines. Its total weight is 13,000 pounds with full military load and full gasoline tanks. It carries fuel for eight hours' flying.

Department Store Uses Aerial Delivery

New York, N. Y.—Aeroplane delivery of merchandise was introduced to New York on March 12, when a consignment of goods by the Lord & Taylor Company was sent from the store's substation at Garden City to the home of C. R. Shipley, of Mount Vernon, N. Y., in less than an hour. The load carried weighed 250 pounds.

The merchandise was carried in a Curtiss biplane, J. N. 4, with a K-6 motor. Roland Rohlfs, experimental pilot for the Curtiss company, operated it. He left Garden City at twenty-five minutes after ten o'clock in the morning and landed at the golf course at Pelham Bay thirty-five minutes later.

The load included a bungalow bed, large rug, floor lamp, carpet sweeper, a tabouret, percolator, three pillows, fireless cooker, curtains and draperies, two dozen napkins, tablecloths and towels.

The K-6 motor and a duplicate set of the merchandise purchased by Mr. Shipley are on exhibition in a show window of Lord & Taylor's, Fifth Avenue and Thirty-eighth Street.

Loading the Curtiss Biplane, which transported household utensils from Lord & Taylor's Department Store in New York City to Mount Vernon, N. Y.

Aerostatic Investigators Return

P. W. Litchfield, vice president and factory manager of the Goodyear Tire and Rubber Company, of Akron, Ohio, has returned from Europe after having spent two months abroad.

Mr. Litchfield, together with Ralph Upson, the famous Goodyear balloon expert, and Clifford Slusser, the efficiency manager of the Goodyear factories at Akron, formed the civilian part of a military committee sent to Europe by the Navy Department to study airship conditions in the allied countries at the time of the signing of the armistice.

This duty took the Goodyear officials to England, France and Italy, where they visited and inspected every construction plant, balloon factory and flying field in those countries, and gathered an extensive amount of data which has been incorporated into a report that has just been submitted to the Navy Department, together with various recommendations and observations on the future of the government's airship policy.

During his visit abroad Mr. Litchfield was authorized by the War Industries Board at Washington to make a study of the performance, operation and repair work on automobile tires in the foreign countries visited. The report which the official submitted on these subjects will be used by the Government in analyzing tire conditions as related to the military service.

Spokane Establishing Free Aerial Landing Place

Spokane, Wash.—As a result of the work of the Aero Club of the Northwest, there is being established an aerial landing field, consisting of 400 acres of park land, for the free use of passenger, mail and express planes. An aeroplane repair shop and flying school will be conducted at the field.

The Yakima Commercial Club of Yakima, Washington, has selected two landing places which require little expense to make first-class aerodromes.

The Centralia Chamber of Commerce, Centralia, Washington, has designated a site, which has been pronounced by aviators as superior to some of the government training fields, as an aerial landing place.

Airline to Catalina Island

Los Angeles.—On his return from a recent trip of inspection to Catalina Island, his new purchase, William Wrigley, Jr., stated that an aerial line of transportation for passengers between the island and the mainland is one of the plans under consideration by the new officials of the Santa Catalina Island Company.

Mr. Wrigley stated that he had already been approached by two aeroplane companies for the rights to establish an airline between Los Angeles and Catalina Island.

Naval Aerial Ambulance Demonstrated

New York, March 11.—In order to demonstrate the practicability of the aerial ambulance a naval flying boat was used to carry Lieutenant David Gray, U. S. N., from Rockaway, New York, to St. Luke's Hospital in New York City. Lieutenant Gray, wounded in both legs and one arm, was in the charge of Major Helen Bastedo of the Motor Corps of America, and the journey, including transfer by dory from the Hudson River at 96th Street to an ambulance on shore, and thence to the hospital at 113th Street, required only 48½ minutes.

Bureau of Mines Announced New Aircraft Fuel

Washington, D. C., March 12.—Development, too late for use in the war, of a motor fuel which adds ten miles an hour to the speed of aeroplanes and has possibilities for use in automobile racing was announced to-day by the Bureau of Mines. The liquid, a combination of benzol and cyclohexane, called hectar, costs about $1 a gallon, so while of military value it is not regarded as practical for commercial purposes at present.

Another combination developed by the bureau, consisting of benzol and gasoline, which has been found to be more powerful than gasoline alone, is expected to prove of value in industry.

Aeronautics as Part of College Courses

The Division of Military Aeronautics, in cooperation with the Committee on Education and Special Training of the General Staff, has arranged a training program for college students which will not interfere with their prescribed college courses, but which will, at the end of three years, turn out men prepared for commercial or for military aviation.

In view of the depreciation among our reserve officers of not less than ten per cent. a year, it is estimated that the Air Service must draw from some source about 1,000 pilots, 650 aeroplane and balloon observers, and 100 engineer officers every year. West Point, essentially military schools, and the ranks can be drawn upon only to fill up the regular establishment. Therefore the machinery of the Reserve Officers' Training Corps, as established by General Order No. 49, 1916 (W. D.), and now in process of modification, was chosen as most likely to bring about desired results.

"In outline the plan is to give the equivalent of the work formerly done in the ground schools exclusive of military practice—that is, aeroplanes, engines, gunnery, navigation and maps, infantry and artillery co-operation, and signaling—at the colleges and universities during the college year and give flying and military training during the six weeks summer camps held at northern flying fields. It is estimated that three summer camps will be required to qualify for pilot."

"Aerial Taxis"

The first aerial taxi depot in the world will be established within the next two months at Garden City, Long Island, according to Glenn H. Curtiss at the Aero Show.

Mr. Curtiss said: "We shall have a taxi depot which will furnish small machines for short inter-city travel, anything less than 200 miles, on order. Experienced pilots will be available to drive these aeroplanes, and the total cost will be surprisingly reasonable. It certainly will not exceed that of many an automobile trip, for we save on the pilot's and the ship's time, even if we may have a larger running cost to meet."

War Risk Insurance—Non-Delivery of Insurance Certificates

The Bureau of War Risk Insurance announces that a large number of insurance certificates remain undelivered. This is due to insufficient or no address having been given in some cases, while in many others the address of the beneficiary has changed and the certificate has been returned.

All officers and enlisted men whose insurance certificates have not been received either by themselves or by their beneficiaries should write to the Insurance Division, Bureau of War Risk Insurance, Treasury Department, Washington, D. C., stating the following:

a. Full name.
b. Rank and organization at the time of application for insurance.
c. Army serial number.
d. Present address.
e. Name and address of the beneficiary, if it is desired that the certificate be sent to the beneficiary.
f. If it is not desired that the certificate be sent to the beneficiary, instructions will be given as to what disposition is to be made of it.

Certificates will in no case be sent for file to the Adjutant General of the Army.

Permanent Exhibit of Aircraft

It was announced at the Aeronautical Exposition that a number of the exhibits now on display there will be sent to Washington after the close of the show to become the nucleus of a permanent exposition at the United States National Museum.

Under direction of Dr. Charles D. Walcott, Secretary of the Smithsonian Institution, plans for a permanent War Exposition in Washington have been under way for some time, and are now definitely arranged. Dr. Walcott, a member of the National Advisory Committee for Aeronautics, is particularly interested in aviation and has been since the days of Langley, who was himself at one time Secretary of the Smithsonian. Consequently a large part of the War Exhibition will be the development of the science of aeronautics and include many American and European examples of aeroplanes and accessories.

The Bristol All Metal Machine, manufactured by the Bristol Aeroplane Co. of England. It is equipped with a Hispano-Suiza engine

Navy Department Issues Statement on Helium Development

Washington, D. C., March 20.—The Navy Department issued a statement relative to the development of helium gas, charging the Bureau of Mines with abandoning this work before the solution of the problem.

The Navy Department statement says:

"During the experimental period of this work the Bureau of Mines, assuming that the plants designed by the organization would be in successful operation, advised that the experimental work on the two commercial plants should be stopped. The War and Navy Departments and particularly the Navay Bureau of Steam Engineering, which was concerned with the production of helium, insisted on the contrary upon a continuation of the experimentation of these plants. Their judgment was vindicated within a few weeks when it as shown that helium could be produced in quantity at a reasonable price at both these plants."

To this statement, Director Van H. Manning, of the Bureau of Mines, replied that the Navy Department was attempting to obtain credit for developing helium. The discovery of helium in Kansas, Oklahoma and Texas is said to be due to the work of the Bureau of Mines, acting on the suggestion of officials of the British Government. Two large plants are located in Texas producing the gas in quantities.

The process is roughly as follows:

Natural gas is collected and compressed and cooled down in the same kind of apparatus used to liquify air. As the cooling process continues, everything is liquified out long before the helium. The regular hydrocarbon series making up approximately 70 per cent of the natural gas liquefies first and then the nitrogen, constituting about 30 per cent, is condensed at a temperature of 195 degrees C below zero. It requires 268 degrees C below ordinary zero to liquify helium, so this gas remains to be collected when other elements have been liquified.

Assistant Secretary of the Navy Franklin D. Roosevelt stated that the only means of bringing down a helium filled dirigible would be for an aeroplane to crash its way bodily through it. He further stated that:

"If the war had lasted until next spring the British and American Governments would have sent helium filled airships over strategic points in Germany, each capable of dropping a total of ten tons or more of high explosives either in a single tremendous discharge or in a number of smaller ones during its passage over a fortress or city. These airships would have carried batteries amply sufficient to repel aeroplane attack."

Elaborate Decorations at the Aircraft Show

New York.—A feature of the Aeronautical Exposition held at Madison Square Garden and the 69th Regiment Armory from March 1 to 15 were the unique and elaborate decorations, which were carried out in accordance with the suggestions of Mr. Fay L. Faurote, of the Aircraft Manufacturers' Association, by artists Gates and Morange, famous scenery painters.

The plan was to convert the entire walls and ceiling of the Garden into a vast outdoor panorama. At the western end of the building rose a mountain lodge, and before it stretched a vista of valley, peak and ocean. A continuous effect of landscape and sky was achieved from the floor to the ceiling, and the ceiling itself, covered with a mesh of blue gauze, completed the illusion of space which the canvasses covering the walls had begun.

This permitted the aeroplanes and balloons to repose on a landing field represented by the Garden floor. The accessories were placed on the balcony, but the scenic walls consisted of foreground and background, and the foreground, cliffs or rolling hills, rose in front of the balcony and above it, hiding the exhibits there and blending with the sky or peaks which lay beyond, running from the balcony to the arch of the ceiling. Four stairways at different parts of the hall led to the accessory exhibits.

The Alpine lodge at the western end of the Garden fronted a view of the Atlantic at the eastern end. On the surface of the ocean lay the transports which carried the American doughboys to France and their guardians, the American battleships.

On the northern wall Alaskan peaks lay in the background, and in the foreground shone the red, orange and white of Colorado canyon cliffs. On the opposite side rolling hills and nestling valleys represented farmland and grazing country.

To Maintain 22 Fields for Aircraft

Washington, March 13.—The War Department has arranged to maintain twelve temporary flying fields, which will be used for storage purposes, four permanent balloon fields and four permanent training fields, and at least two experimental fields.

The first intention to retain only two training fields was abandoned when this number was found insufficeient, and in consequence Arlington Field, Houston, Tex.; Post Field, Ft. Sill, Okla.; Kelly Field, San Antonio; Rockwell Field, San Diego, Cal., have been chosen as the permanent training fields.

The twelve fields to be maintained for storage purposes have not yet been definitely named. The War Department believes it can store its hundreds of elementary and advanced training planes for a period of years without deterioration. Langley Field will be retained as one of the experimental fields; McCook Field will be given up, as the city of Dayton wants this property back. Wilbur Wright Field, which has been suggested as an experimental field, will not be used, because of the possibility of floods.

The Air Service would like to purchase the Dayton-Wright plant and use it for its main experimental depot. The Dayton-Wright equipment includes an excellent experimental field and a number of structures, including buildings as large as 1,000 x 300 ft., and is considered by the Air Service as especially suitable for experimental work. If this plant can be purchased, the Air Service will move its present repairship from Indianapolis to Dayton. The Government already has a large financial interest in Dayton-Wright, due to war financing, and the balance of the purchase price would consequently be insignificant. In the event that the purchase of the Dayton-Wright plant cannot be consummated, some other site in the Middle West close to the aeroplane and engine factories will be selected.

Brooklyn Building to Have Landing Place On Roof

Brooklyn, N. Y., March 17.—The Gibbons Company, builders, have announced that the new building for which they are just breaking the ground will have an aerial landing place on its top. It is to be five stories high and will have a frontage of 175 feet. Tenants of the building will have extended to them the privilege of using the landing place for commercial aerial delivery.

Aviation to Come to Its Own as International Sport

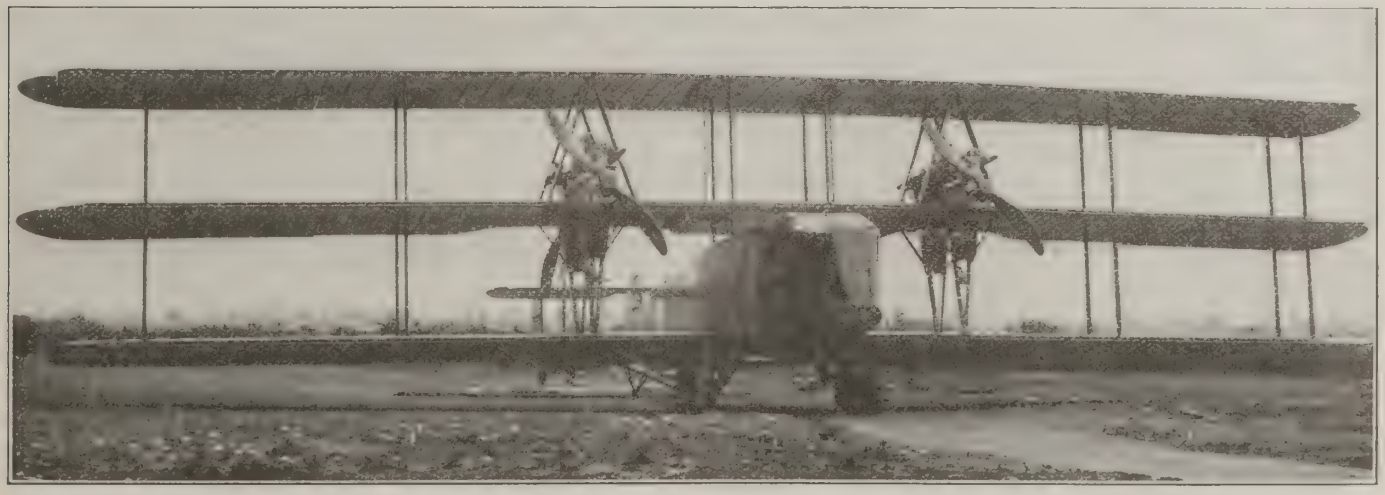
New York, March 17.—Lieutenant J. O. Donaldson, a flying officer with eight German machines to his credit, who was captured but escaped to Holland, in an interview upon his return from overseas, predicted that interest in international aviation meets would exceed that of any other international sport. Automobiles, motorboats and yacht races will make way in the popular interest for the international aviation meets, with its seaplane and aeroplane races and thrilling acrobatics. The recent speed and looping records, which have each been broken several times in the past few weeks, foreshadow the great interest which will be centered about aeronautic achievements.

New York Aerial Police Field Selected

New York, March 17.—Inspector John F. Dwyer, of the New York Police Department, announced that the old reservoir in Central Park will be drained to provide a landing place for the use of the New York Police Force. The Inspector is quoted as stating that fifteen fliers have already been enlisted in the Aeronautic Branch of the Police Department. Filled-in ground along the Hudson River near west Eighty-sixth Street will be used for hangars.

Daniels Talks by Radio with Seaplane 150 Miles Away

Seated at his desk in his office in the State, War and Navy Building, Secretary Daniels this morning talked by radio 'phone to the pilot of a seaplane in flight approximately a hundred and fifty miles from Washington. The Secretary asked questions and received replies from Ensign Harry Sadenwater, who was piloting the seaplane, the last remark "caught" by the Secretary being the Ensign's statement that he was then about a hundred and fifty miles away. The test was made with a seaplane on a flight from the capital to Hampton Roads.



This is believed to be the first time that telephonic communication with aeroplanes at such long range has been accomplished, although communication at short distances and in formation has been carried on in the past.

A further interesting detail in connection with this communication is that any commercial telephone may be used, not only for transmission, but also for reception from the seaplane. Heretofore it has usually been necessary for officials who desired to communicate with aeroplanes in flight to be with the apparatus at the radio station itself, and this is the realization of the commanding officers being personally in touch with seaplanes on long distance patrol at sea.

The apparatus used was the Secretary's commercial desk telephone connected through the Navy Department central and the Navy Yard exchange in the usual manner and a standard air station telephone transmitter located in the Navy Yard. The apparatus at the Navy Yard was designed by the General Electric Company under the direction of the Bureau of Steam Engineering, from which was radiated 10 amperes in the antenna. This is the largest tube transmitter which has been designed for commercial use in the United States.

The apparatus on the seaplane is the largest telephone transmitter in use in any aviation service and is at light in weight as many other designs of much smaller power. The receiving apparatus used in the plane and in the receiving station at the yard was designed and manufactured at the Navy Yard under the direction of the Bureau.

The personnel of the General Electric Company included E. P. Edwards and E. M. Kinney. The personnel of the Navy Department involved in the design and use of this method of communication was Admiral Griffin, Chief of the Bureau of Steam Engineering, and Commander S. C. Hooper, head of the Radio Division, and assisted by Lieutenant Commander R. A. Lavender and T. Johnson, Jr., expert radio aide.

The Bristol Type Braemar Triplane Bomber with 4 Puma Engines

The AIRCRAFT TRADE REVIEW

Aeromarine on Pre-War Basis

Keyport, N.J.—The Aeromarine Plane and Motor Company has got back into production on a pre-war basis and has reduced its working force. The construction of the 1-story building, 60 x 100 ft., for the New Jersey Motor Sales Company, which builds engines used by the Aeromarine company, has been resumed.

Small Curtiss Training Plane Makes Long Flight

New York, March 14.—Flying a small Curtiss JN training plane which has had more than three thousand hours in the air, Carl Batts made a 350 mile flight from Newport News to New York in a flying time of five hours and fifty minutes. This machine has been serving as a training plane since April, 1917.

In order to save time, it was necessary to fly straight over Chesapeake Bay, a distance of twenty miles. The Curtiss JN machine, not being a seaplane, is not intended for over-water flying, but it successfully negotiated this jump and another one of similar length over Delaware Bay. Two landings were made, one at Pocomoke, Md., and another near Atlantic City, N. J. A severe storm was encountered in flying over New York Harbor, and upon examining the fuel supply after landing, Mr. Batts found that not a drop of gasoline remained in the tank.

In view of the long service which the particular plane used has seen and the fact that no special preparations were made for the flight, it serves as an example of the reliability and endurance of modern aircraft.

Personal Pars

A. Ludlow Clayden has resigned as consulting engineer for the Wright-Martin Company. He will establish a consulting engineering business in London and will specialize on the investigation of European propositions for American manufacturers. Mr. Clayden spent most of 1918 in Europe, studying methods of manufacture of the Hispano-Suiza motors.

Neil MacCoull, contributing technical editor to Aerial Age, has returned from duty in France with the Naval Air Forces, and is now connected with the Texas Company as Automotive Engineer in the Sales Department with headquarters in New York. Prior to enlistment, he was a mechanical engineer in the machine works of the Westinghouse Electric and Manufacturing Company, of Pittsburgh, Pa.

Officials Undecided About Status of Self-Imported Aeroplane

Washington.—Customs authorities have encountered the first case of an aeroplane imported into the United States under its own motive power. An American bought a Canadian plane, and it was flown across the border near Detroit.

The question then arose as to whether it was dutiable, since aeroplanes are not mentioned in any tariff acts. Customs officials finally decided that if it remains permanently in the United States it should be taxed as a "manufactured article" at the rate of 20 per cent, but if it flies out of the country again within six months it will be regarded as "on a tour" and will not be taxed.

3,018 American Aeroplanes In Europe On November 11

The A. E. F. had 3,018 planes equipped with Liberty motors at the front when the armistice was signed, according to Major R. J. Bates, Signal Corps, who arrived recently from France.

Major Bates, who flew the first American aeroplane at the front, said Liberty motors were being assembled, tested and turned over for action at the rate of forty a day on November 11.

Fishermen to Use Aeroplanes

Hugh M. Smith, of Washington, D. C., Commissioner for the Bureau of Fisheries, has indorsed the plan presented by the Gloucester Board of Trade of Massachusetts to have several seaplanes as scouts to accompany the fishing fleet of 35 to 40 mackerel boats that starts for the fishing grounds about the middle of April.

It was pointed out that the scouting experiment should be under the direction of a practical purse-seiner fisherman of experience who is versed in identifying fish schools and estimating their size.

Julius M. Meirick

Julius M. Meirick, Superintendent of Publicity, Standard Aircraft Corporation, Elizabeth, N. J., has been one of the "strong men" of that organization. Of tireless energy and forceful demeanor, he made an important impression on the company's activities.

In addition to his being in charge of a large photographic department, which throughout the war turned out hundreds of thousands of pictures, showing every phase of Standard's activities, Mr. Meirick, in his publicity work, unquestionably made Standard one of the best known corporations in America. It has been said that he obtained more free space for his company than has been obtained by any institution anywhere, except the United States Government in its various campaigns.

The publicity accorded the Standard Corporation on Langley Day, Saturday, July 6, 1918, has set the pace for work of this kind. Practically every newspaper in the country carried front-page messages about that event and for months after it was still going the rounds of the various magazines not only in English but in all the foreign languages published in America. Foreign publications also devoted considerable space to this and other Standard activities.

Throughout 1918 Mr. Meirick handled the various Liberty Loan and similar campaigns in the various Standard plants and achieved a phenomenal result in every campaign. Not only was the 100 per cent. flag secured in every case but the per capita record of individual subscriptions is the greatest of any industrial corporation in the country.

His previous training of twenty-five years at the head of his own organization has certainly been a great factor in his new field of endeavor and unquestionably he has given a wonderful account of himself.

Mr. Meirick is recognized as a versatile writer and lecturer, a man of broad vision, and he has an abiding faith in the future of aeronautics. In a recent interview he stated: "So sure am I of the successful future of aviation that I am perfectly willing to devote my entire future towards its upbuilding and growth. Now that man has attained supremacy in the third element of possible transportation, there can be no going backward. Onward, upward and forward must be the 'obiter dictum' and aeroplane makers of broad vision, backed by substantial organizations, must achieve financial gain, glory and fame."

In 1898 Mr. Meirick gave up his business to enlist in the Spanish-American War, being one of the first to volunteer, on April 29. He was mustered out with his regiment in December of that year.

He was for twenty years proprietor of the Commercial Photo Company of Newark, N. J., with branches through the country. This organization achieved great distinction as catalog builders, publicity promoters and sales engineers. He was also interested in many other commercial and civic ventures.

He is a member of the Aero Club of America, City Club of New York, Kiwanis Club of Newark, N. J., and other organizations.

He is now forty-two years old.

Personal Pars

Charles Freosch has resigned as aeronautical mechanical engineer for the Government and is now designing engineer for the Fergus Motors of America, Newark, N. J.

Aero Club of Pennsylvania Urges Municipal Aerodrome

The Aero Club of Pennsylvania will go before Councils to urge a municipal aerodrome for this city. The decision was taken last night at the monthly meeting of the organization in the Bellevue-Stratford.

Lieutenant Ralph T. Folwell, of the naval aviation corps, read a report on available landing fields in and near Philadelphia. He mentioned one near the Sixty-ninth Street elevated railroad station, measuring 145 acres, and for which the owner, P. G. Lawler, of Bala, asks $145,000. The second is at Van Kirk street and the Second street pike, embracing 5,000 acres, for which no price has as yet been set. The third is a fifty-seven-acre tract of land near the Sixty-ninth street elevated station, owned by George A. Drovan, and valued at $164,000. It was also suggested that the city might give the field from Thirty-third street to the Schuylkill River and from the East Park river drive to the river for the purpose.

The reason for the move, Lieutenant Folwell explained, is that it is estimated 100,000 aviators will return to this country who will desire to remain in flying activities.

To Store Unused Army Planes

Washington, D. C., March 12.—Acting Secretary of War Crowell announced the decision of the War Department on March 12 to store for possible future use the hundreds of elementary and advanced training planes used during the war at the sixteen flying fields and three balloon fields, which are to remain in the hands of the War Department as inactive and reserve aviation fields.

Fields to be retained and now leased will be purchased by the Government. Actual instruction in flying will be conducted at only two fields. The fields to be retained have not yet been decided, but the Secretary said that two would be near Newport News, three on the Pacific Coast, one near New York, three in Texas, two in Florida, one in Mississippi, one on the Great Lakes, and one each in Georgia and Oklahoma.

The War Department, however, is planning an advertising campaign to dispose of material, finished parts and special tools designed for the aircraft program. It is understood that no complete Liberty motors or planes are to be sold under this plan. Detailed announcement regarding the disposal of parts and materials is expected at an early date.

Zenith Equipment on Record Packard

V. R. Heftler, president of the Zenith Carburetor Company, in speaking of the performance of the Zenith carburetor on the aeroplane-motored Packard in which Ralph De Palma made his mile in 24.04 seconds and smashed all other official speed records at Daytona Beach, said: "The carburetor used by Ralph De Palma was one of our regular commercial duplex models and was supplied from stock. No one realizes better than De Palma the absolute necessity for dependable carburetion and he has used the Zenith exclusively on his racing cars for the past three years. The exhaustive tests made by the Liberty aircraft designers before they adopted the Zenith for the Liberty aircraft engine had also placed the stamp of official approval on the soundness of the compound nozzle principle which makes the Zenith automatic in action and eliminates adjustments. Speed contests, as well as the exacting requirements of aviation, are sure to reveal any weaknesses as well as demonstrate the real merit of any essential part of the racing machine or aeroplane."

Aeroplanes to Make Victory Loan Flights

Washington, March 15.—Three flying "circuses" of aviators will tour the United States giving sham battles in the air and performing acrobatics over the principal cities as a feature of the Victory Loan campaign, which opens on April 21.

This announcement was authorized by the Treasury Department. The tour is intended to present the "greatest flying program" ever offered in the United States. The three "circuses" will be composed of American, French and British aviators. They will fly American planes and captured German Fokkers. Frank R. Wilson, Director of Publicity for the loan, will have charge of the aerial tours. The actual flights will be under the direction of the Military Aeronautic Branch of the War Department, with Captain Leon Richardson in charge.

Fourteen German Fokker planes, captured by General Pershing's men, were landed at Newport News, and will be shipped at once to Washington and turned over to the Treasury Department for the loan campaign. All are in flying condition, and will be used in all of the loan demonstrations. The best types of American planes developed during the war will be used to show what has been achieved in American aircraft development.

The country has been divided into three sections for the Victory Loan flights. Eastern, Middle Western, and Western. A squadron made up of American, French and British flyers will tour each of these three districts, beginning April 10. The Eastern tour will begin at Mineola, L. I. The Middle-Western tour will begin at New Orleans, and the far Western tour at San Diego. Each squadron will be carried in a special train of eleven cars, traveling at night. Nine end-door baggage cars will be required to carry the seventeen aeroplanes in each squadron. Each train will be preceded by an officer, who will select landing fields and make arrangements with local Liberty Loan committees for the entertainment of the flyers.

The names of the six British flyers are not known. However, the Government has been informed by Great Britain that six of the best British flyers will be here in time for the tours. Eight French flyers have already left France for the United States. One of the French flyers has a record of forty-three victories over German adversaries. Another made 170 bombing trips over German lines.

Photographers of the Signal Corps will accompany each squadron. They will take photographs of each of the American cities visited, the plates will be dropped from aeroplanes by parachute, and hurried reproductions made for the benefit of the residents of all cities visited.

The general program to be followed in each city visited will be as follows: Two American scout planes will rise to drop Victory Loan literature over the city. Four of the captured German planes will then attack these two American planes. Four American planes will drive off the German planes, and the flyers will give demonstrations of aerial acrobatics. Parades will precede the flights. Citizens will be able to see the planes unloaded and set up in the morning and knocked down again for shipment after the flights.

The schedule follows:

Eastern Squadron—New York, Philadelphia, Washington, D. C.; Richmond, Charleston, Savannah, Jacksonville, Atlanta, Birmingham, Nashville, Louisville, Lexington, Cincinnati, Indianapolis, Toledo, Detroit, Cleveland, Pittsburgh, Buffalo, Rochester, Syracuse and Boston.

Mid-Western Squadron—New Orleans, Jackson, Memphis, Little Rock, St. Louis, Peoria, Chicago, Milwaukee, Duluth, Minneapolis, St. Paul, Sioux City, Omaha, Des Moines, Kansas City, Wichita, Muskogee, Oklahoma City, Dallas.

Western Squadron—Los Angeles, Fresno, San Francisco, Sacramento, Reno, Salt Lake City, Boise, Walla Walla, Portland, Seattle, Yakima, Spokane, Missoula, Butte, Sheridan, Denver, El Paso, Phoenix.

If weather conditions permit and the train reaches Denver on scheduled time, the cities mentioned below may be visited: Pueblo, Trinidad, Santa Fe, and Albuquerque, N. M.

OTTO PRAEGER, Second Assistant Postmaster General.

THE "NC-1" NAVAL FLYING BOAT

THE N C-1 Naval Flying Boat, built by the Curtiss Engineering Corporation at Garden City, L. I., was designed by the Bureau of Construction and Repair, under the direction of Naval Constructors Hunsacker, Richardson and Westervelt. It is one of the largest boats ever built and on November 8, 1918, flew with fifteen people from Long Island to Washington, D. C., and thence to Hampton Roads, Va. A world's record for passenger carrying was established when a flight was made on November 27 with 51 people aboard. On these flights the boat was flown by Lieutenant David H. McCullough, U. S. N.

The usual crew is composed of five officers and two enlisted men. Two pilots sit side by side in the central nacelle aft of the engine. Dual controls are installed. A machine gunner is placed at the bow of the hull and another gunner in a turret built into the top wing, and reached by way of a ladder which runs up through the pilot's nacelle from the boat hull.

The fuel tanks contain 300 gallons of gasoline, sufficient for a flight lasting about 13 hours.

General Dimensions

Span, upper plane	126′ 0″
Span, lower plane	96′ 0″
Chord, both planes	12′ 0″
Gap between planes	12′ 0″
Overall length	70′ 0″
Overall height	25′ 0″

Weights

Net weight	13,000 lbs.
Gross weight (fully loaded)	22,000 lbs.
Useful load	4½ tons

Performances

Maximum speed	80 M.P.H.
Climb in ten minutes	2,000 feet
Maximum range of endurance	13 hours

Main Planes

Incidence angle of both planes.....3°

Main planes are in 7 sections. Upper plane in 3 sections. Center section 25′ 4″ in span. Outer sections 44′ 4″.

Lower plane in 4 sections; extensions from either side of the hull are 10′ 8″ in span; outer sections 35′ 4″.

There is a clearance of ¼″ between all plane sections.

Outer lower sections have a 3-degree dihedral. All other plane sections are in a flat span.

Interplane struts above the hull are spaced 50¾″ apart. Between these struts at a height of 6′ 10 3/16″ from the lower front wing beam is the center nacelle which carries the engine and the pilot's compartment. Outer motor nacelles are centered 11′ from the center of the machine. The interplane struts carrying them are spaced 3′ 31¼″ apart.

Center sections of the main plane terminate 4⅛″ beyond the outer nacelle carrying struts. Another set of interplane struts are located 26′ 11″ from the center line of machine. From these the outer struts are centered 14′ 7″, leaving an overhang on the upper plane of 15′ 6″ and of 6′ 6″ on the lower plane.

Ailerons attached to the upper plane are 36′ 6½″ long and have a chord of 43″; ends are balanced. At the balanced portion the chord is 6′ 1⅜″ and the balanced portion extends 6′ beyond the end of rear main wing beam. There is a clearance of ¾″ between inner ends of ailerons and the main plane.

The main planes have a chord of 12′. Forward main wing beam centered 16½″ from leading edge; beams centered 84″ apart; trailing edge 43½″ from center line of rear beam.

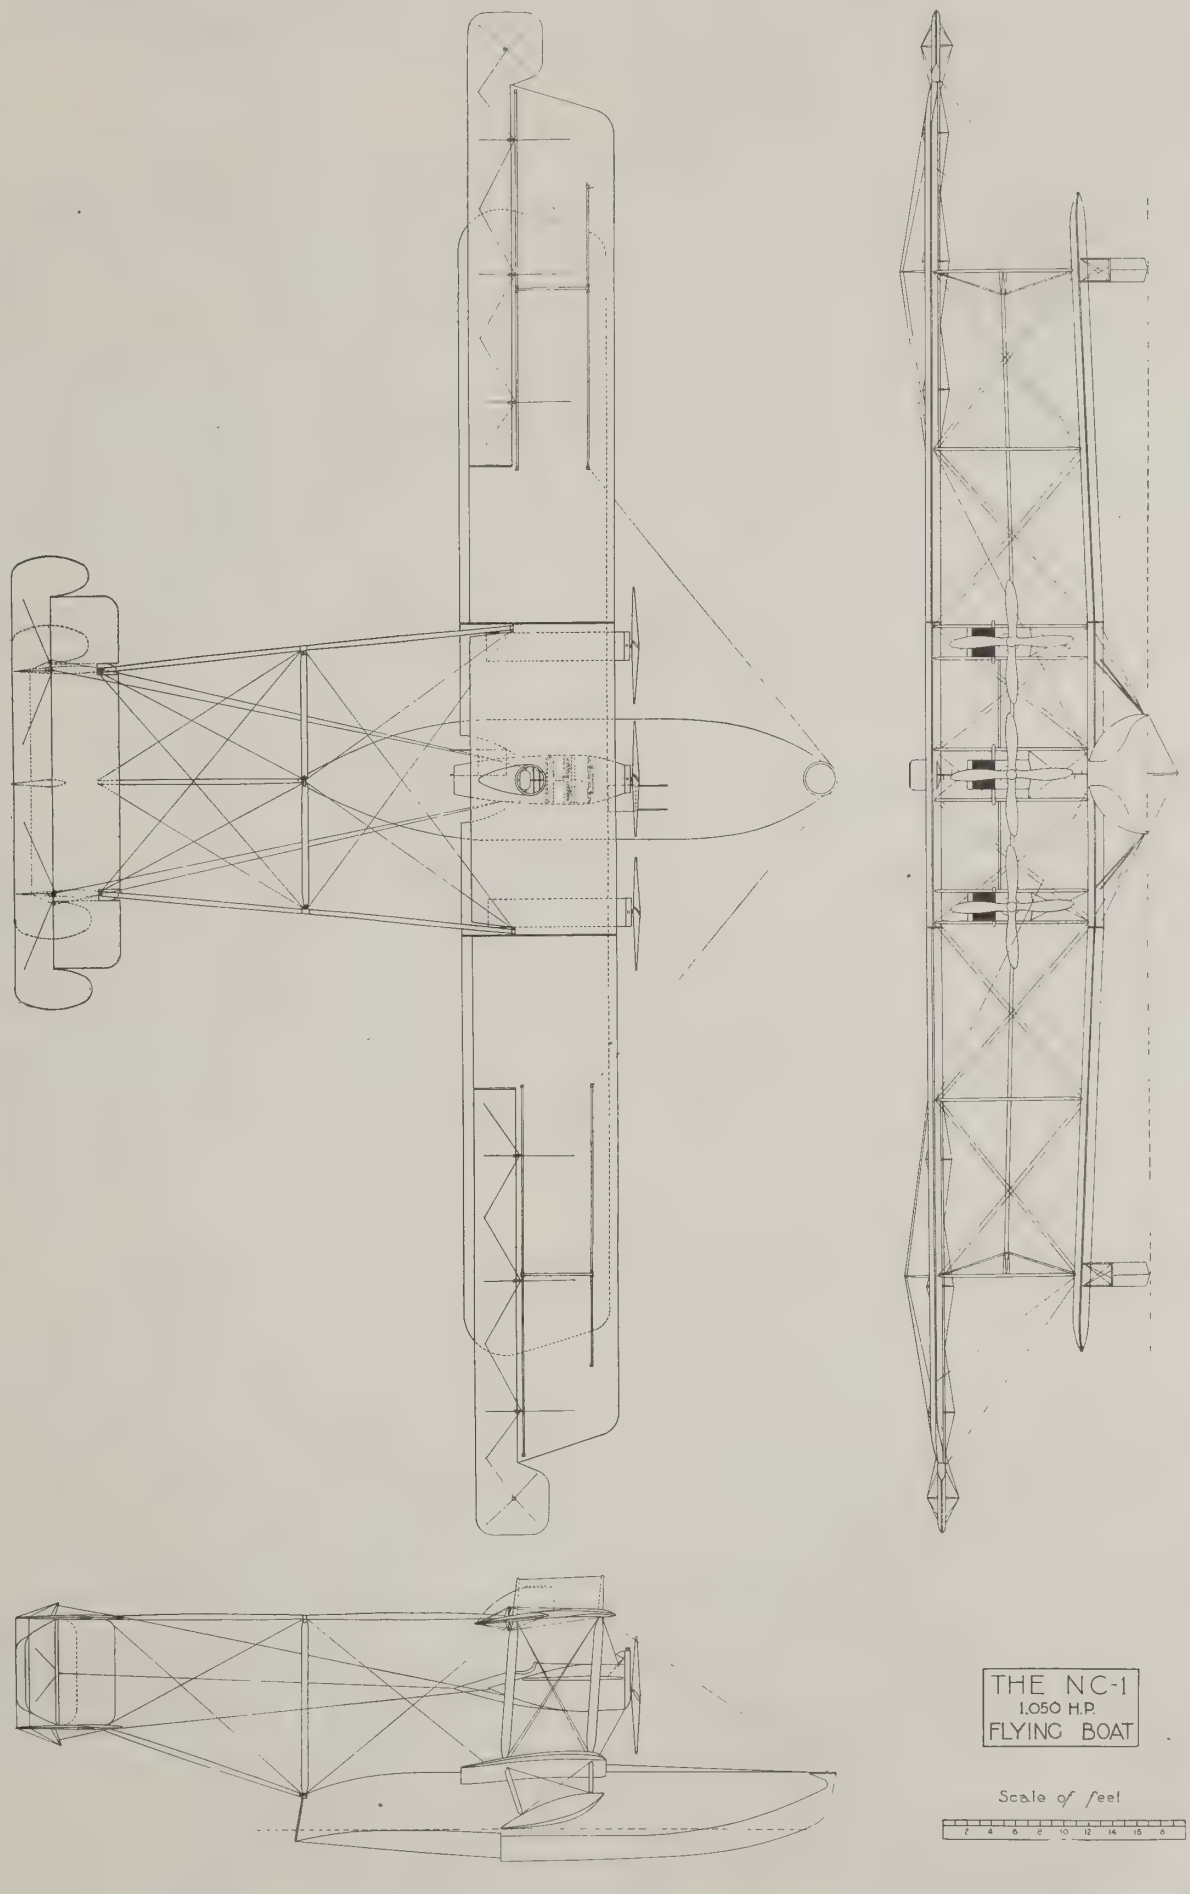
Gap between planes, 13′ 6⅛″. Because of the dihedral of the lower plane, the gap decreases to 12′ at the outer strut. Lower wing beam is centered 5⅛″ below top deck of the hull.

Hull

The overall length of the hull is 44′ 8¾″. The step is located 27′ 8¾″ from the nose. Maximum width of hull is 10′; maximum depth, 7′ 5⅝″. Leading edge of upper main plane located 18′ 2″ from nose.

Tail Group

The tail is of the biplane type. It is carried on three hollow spruce outriggers. Elevator hinges are located 34′ 8 3/16″ from the trailing edge of the upper main plane. Gap between tail planes, 9′ 3″. The lower tail plane is located 10′ 11″ above lowest point of the hull. Span of the upper tail plane is 47′ 11″, including ailerons. The ailerons extend 41″ beyond ends of the planes. The span of the lower stabilizer plane is 26′ at the ailerons. Balanced portion of ailerons extends 37″ beyond ends of lower stabilizer plane. The chord of the balanced portion of both ailerons is 55″.



There are three rudders and two fins. The center rudder is balanced and the outer rudders are hinged to the vertical fins.

Engine Group

Three Liberty engines are carried in nacelles between the planes. The engines, low compression Navy type, each develop about 350 H.P. Four-bladed tractor propellers are used, 10′ 10″ in diameter. A clearance of 12″ is allowed between tips of central propeller and tips of adjacent propellers.

The NC-1 Flying Boat, which will probably attempt the Trans-Atlantic flight

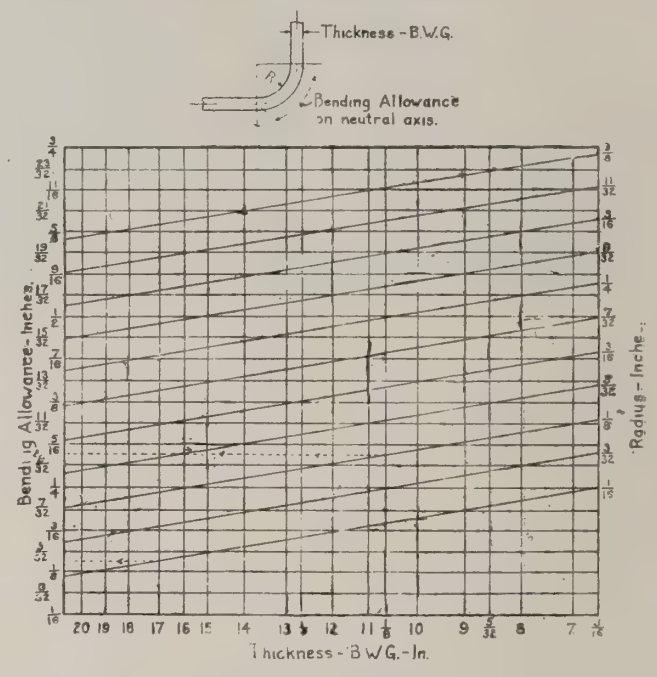
A SIMPLE BENDING ALLOWANCE CHART FOR SHEET METAL

By E. S. Bradfield, Formerly of the Engineering Department of the Naval Aircraft Factory

ONE of the commonest errors on aeroplane fitting drawings are the bending allowances on flat patterns. In most cases the bends are 90 degrees, and the bending allowance is the distance on the neutral axis of the metal, beginning at the point of bend and measured to the end of the bend.

At the bottom of the chart are the thickness of the metal, both in B. W. G. and fractions of an inch. On the right-hand side is the inside radius around which the bend is made, in fractions of an inch. On the left side is the bending allowance in fractions of an inch. It is usual practice to give all measurements on flat patterns in fractions, and down to a sixty-fourth of an inch.



If, for instance, it is desired to find the bending allowance for 17 B. W. G. metal around a sixteenth of an inch radius, with a ninety-degree bend, we go up the line from 17 until it intersects the 1/16" radius line, and from that point draw a line to the right side of the chart, where we find it is midway between 1/8" and 5/32" or 9/64" is the bending allowance.

The formulæ on which this chart is based is that,

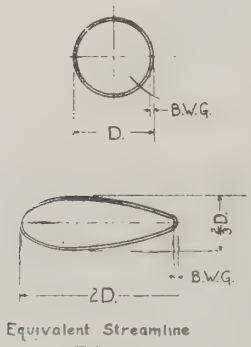
$$B.A. = \frac{pi}{2}(R + \frac{t}{2})$$

$$= \frac{pi}{2}R + \frac{pi}{2} \times \frac{t}{2}$$

From which it will be seen that for a given radius, B. A. is equal to a constant plus a variable which varies directly with t. And by calculating this for different radius and thickness, and plotting same, this chart was obtained.

BENDING ALLOWANCE CHART.

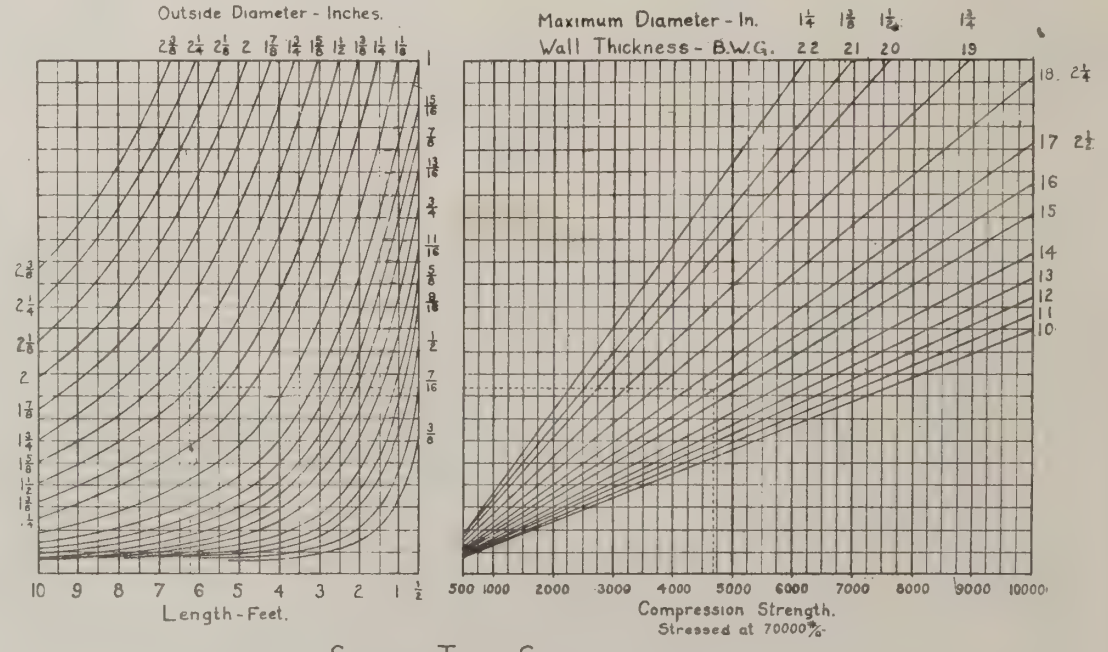
DIMENSIONS OF STEEL TUBE STRUTS



By E. S. Bradfield, Formerly of the Engineering Department of the Naval Aircraft Factory

THIS chart was prepared from a similar chart that appeared in the trade papers several months ago, but is given in the units used in our practice, that is, inches and B. W. G. Also the ultimate strength is given, for mild steel tubes, which have an ultimate strength of 70,000 lb. per sq. in.

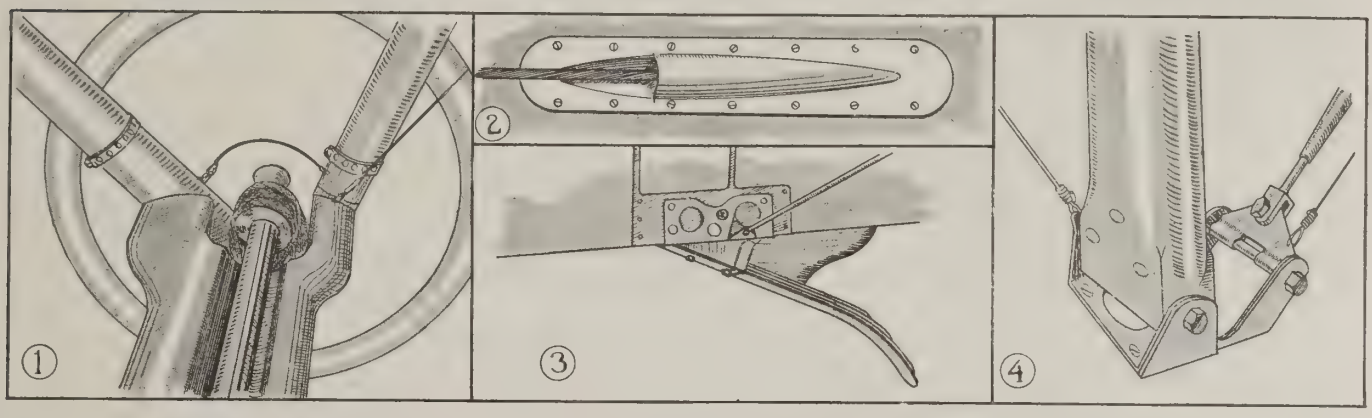
After preparing this chart a series of 25 tests were run to verify the same and the results of these tests agreed with those indicated by the chart. While certain advantages would result from the use of alloy steel tubes of greater strength, it is usual practice to use mild carbon steel tubes, as they are easily obtained and readily worked.



The figures at the bottom of the left graph are the length in feet, those at the top and sides are the outside diameters in inches. The figures at the top and sides of the right graph are the wall thickness in B. W. G., and above them is the maximum diameter of tube that can be used with that wall thickness, on account of crumpling. The figures at the bottom are the ultimate strengths in pounds. The figure at the left is that of a stream-line tube of equal strength to a circular one. Immediately below are the best wall thicknesses for weight and resistance for different speeds.

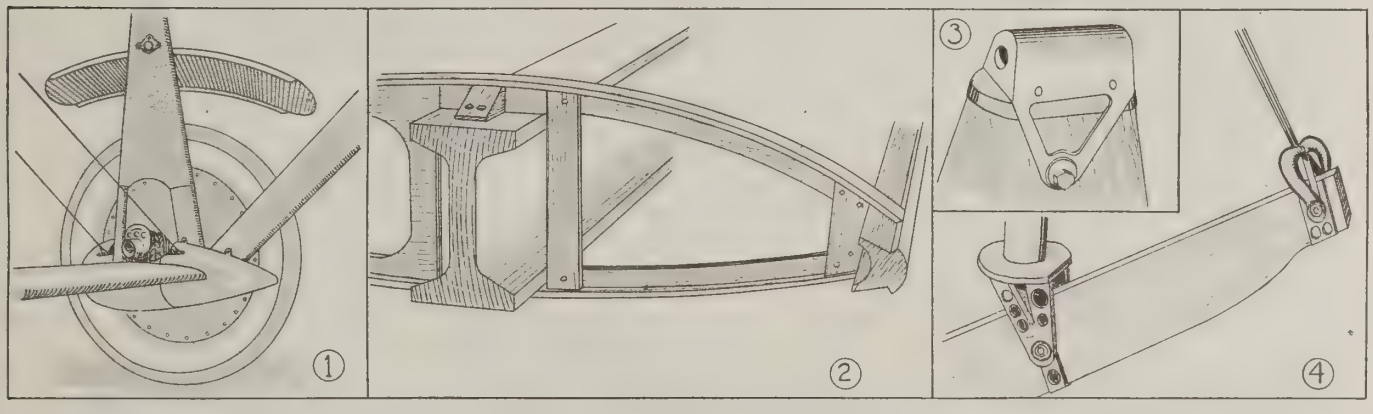
To find strength of tube 6¼ feet long, 1½ inches diameter and 16 B. W. G., go up vertically from 6¼ on the length in feet until intersection with the curve for diameter of 1½; from this point project horizontally over until intersection with line for 16 B. W. G, and then going vertically down we read the ultimate strength of 4700 pounds, and dividing this by the factor of safety the permissible load is obtained.

Equivalent Streamline Tube.



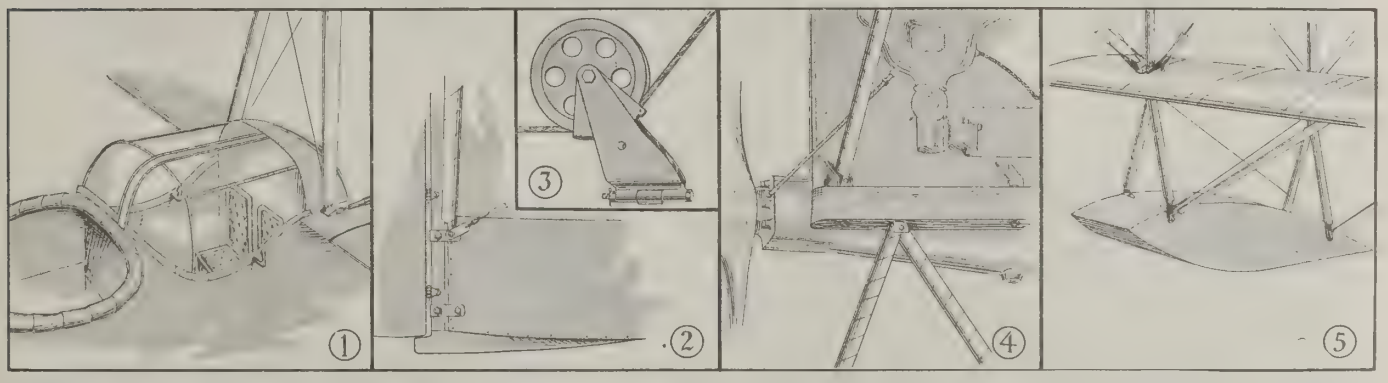
Streamline Tube.	
M.P.H.	B.W.G.
75-100	20-14
100-125	17-13
125-150	14-10

STEEL TUBE CHART.



SOME DETAILS OF MODERN AEROPLANES

THE ITALIAN ANSALDO "A-1" 220 H.P. SINGLE SEATER



1—Landing Chassis detail, showing axle recessed into streamline sheet steel strut separating V landing gear members. 2—Aluminum friction plate outlet for rudder control cables on sides of fuselage. 3—Leafspring tail skid and attachment of the steel rod stabilizer brace. 4—Rear left lower wing strut fitting. Struts are of streamline steel tube with squared ends

THE GLENN L. MARTIN TWIN LIBERTY MOTORED BOMBER

1—One of the four landing wheels showing the streamline shock absorber casing and the wheel guard to protect the propeller from stones and mud. 2—One of the main ribs, showing sections through wing beam and leading edge. 3—Fitting at ends of wing struts. 4—Tail skid unit, with shock-absorber elastic removed

THE AEROMARINE "T-50" THREE SEATER FLYING BOAT

1—Seating arrangement, showing the open cockpit for the pilot and the two rear passengers' seats enclosed in a transparent cover, which protects the occupants from the wind and spray. The casing is divided and hinged at the middle, permitting access from either side. 2—Stern post, rudder hinges and hull skid. 3—Aileron pulley attached to the lower left plane. 4—Engine bed, and attachment of middle struts. 5—Right wing float, built up of mahogany veneer with an ash frame. The bracing is of steel tube, faired to a streamline form

A METHOD OF APPROXIMATING THE STATIC THRUST AND BRAKE HORSE-POWER OF AIR PROPELLERS*

By W. BERNARD MURPHY

SINCE data as to methods of approximating static thrust of propellers are very meagre and as many people seem content with results that may be 20 per cent from the actual figures, also ignoring the variable element of blade widths, a very important factor, a more suitable method is obviously necessary. Therefore, I wish to call your readers' attention to the Laws of Airscrews discovered by W. R. Turnbull, A.F.Ae.S.

From these laws the Static Thrust and the Brake Horse-Power (on the ground) of any propeller can easily be determined within 5 per cent of the actual values.

These laws were first published in the "Aeronautical Journal" of October, 1910, and were confirmed later by Riabouchinsky, Eiffel and others. They must not be confused with "Two Fundamental Laws of Aerodynamics," also discovered by Turnbull and published in the same journal in January, 1912.

Briefly stated, Turnbull's laws of airscrews are represented by the two formulæ:

$$T = U R^2 D^4.$$

and

$$P = Q R^3 D^5.$$

**in which T = Static Thrust in lbs.
P = B.H.P. (Absorbed by propeller revolving with no forward motion).
R = Revolutions per minute.
D = Diameter of the screw in feet.
p = Pitch of the screw in feet.

The co-efficients U and Q are variable, depending on the units employed and the relation of the Pitch (p) to the Diameter (D).

Bu using Turnbull's curves and substituting for the known quantities it is possible to determine quite accurately both the Static Thrust and the Horse-power absorbed. I reproduce the curves herewith so as to show how they may be applied to concrete cases.

It is assumed that the Brake Horse-power and the Maximum Revolutions per minute obtained in the air are known. Also, that the diameter, maximum blade-width and the ratio of the pitch to the diameter of the airscrew have been chosen. As the revolutions on the ground are always less than those obtained in the air by about 12 per cent the necessary deduction must be made to obtain accurate results.

To take an actual example, let us assume that the engine to be used give 100 B.H.P. at 1,250 revolutions per minute in the air. A maximum velocity of 100 m.p.h. is to be obtained and the diameter of the airscrew is to be 9 feet.

With the use of the curves, Figs. 1 and 2, and the above-mentioned formulæ, the Static Thrust, and Maximum blade-width are first determined in the following manner:

Maximum revolutions less 12 per cent = 1,100 revs. per min. on ground.

From the B.H.P. curves supplied by the engine makers the brake horse-power delivered at 1,100 revs. per min. is obtained, we will assume it to be 93 B.H.P.

Substituitng for the formula:—

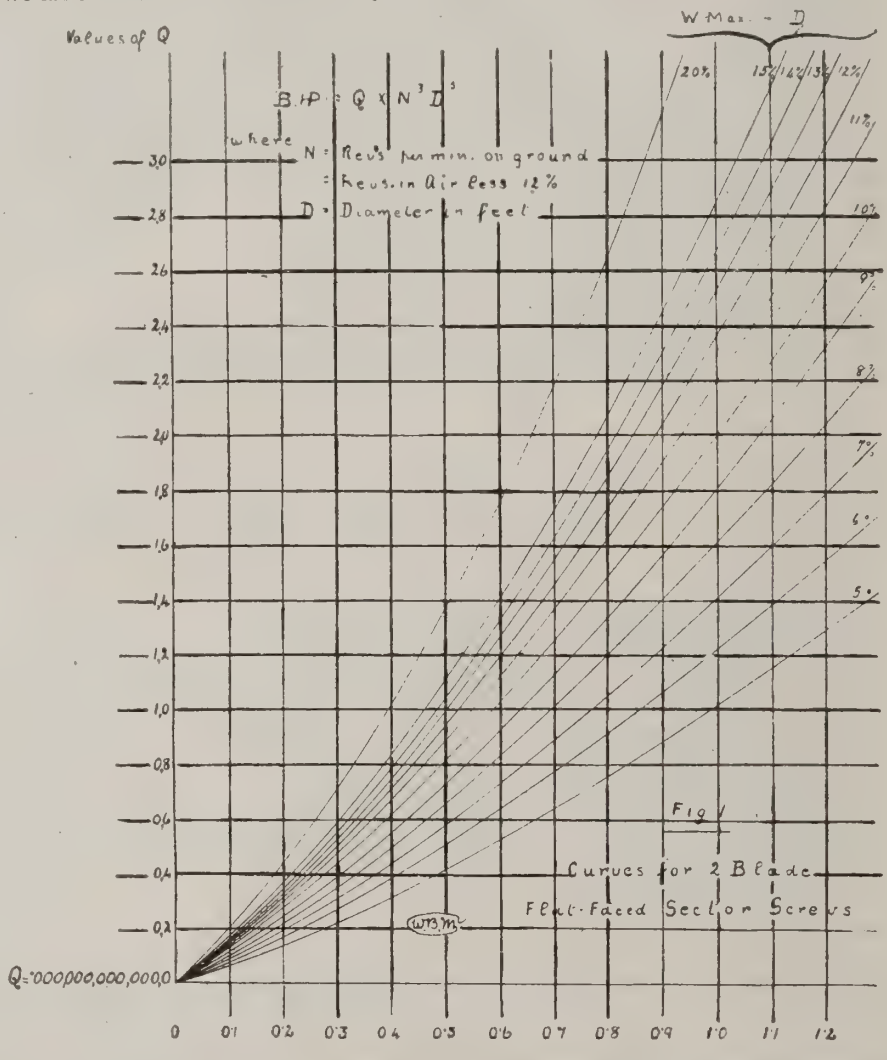
$$P = Q \times 1100^3 \times 9^5$$

we obtain

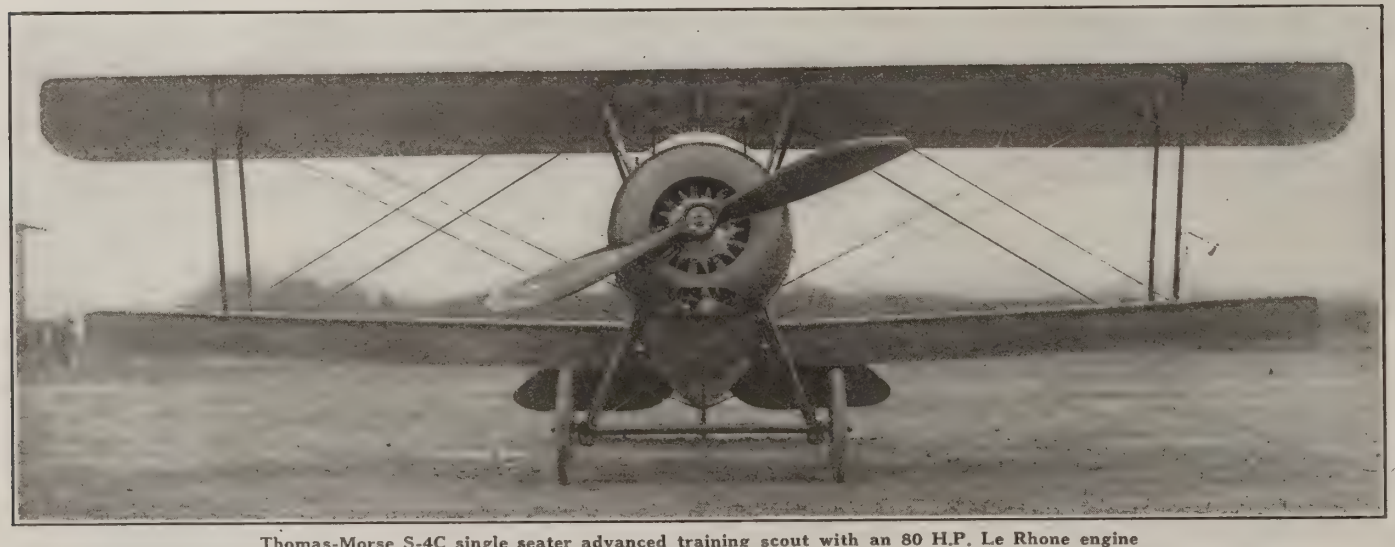
$$93 = Q \times 1100^3 \times 9^5$$

from which

$$Q = 0.000,000,000,001,184.$$



We must now determine the ratio of p/D from the air-speed of the machine assumed in this case to be V = 100 m.p.h.



We can obtain this from the formula for pitch, viz.:—

$$p = \frac{88\,V}{R}$$

or in the case assumed $p = \frac{88 \times 100}{1250} = 7.05$ ft.†

$$\therefore p/D = \frac{7.05}{9} = 0.783.$$

Thomas-Morse S-4C single seater advanced training scout with an 80 H.P. Le Rhone engine

*Courtesy of *The Aeroplane*.

** These laws can be used with any units of time, weight, power, etc., not necessarily the English Units.

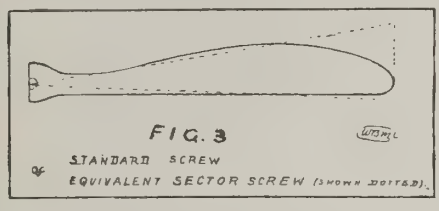
† This is the effective pitch, and for a strict consideration of the case the pitch due to the angle of attack must be added, but this is not necessary for approximate results.

We now have the ratio p/D and a value for Q, and if we enter the curves, Fig. 1, we find the maximum width (W. Max.) of a sector-screw to be 8.1 per cent of the diameter, or 8.1 per cent of 9 feet = 0.728 feet = 8.75 inches.

Having now determined our W. Max. for the conditions assumed, we can now turn to the curves on Fig. 2, and with this value and the value of p/D already found, find the corresponding value of U to be 0.000,000,059,5.

We may now by direct substitution in Formula 1 obtain the Static Thrust as follows:—

T in lbs. = $U \times R^2 \times D^4$



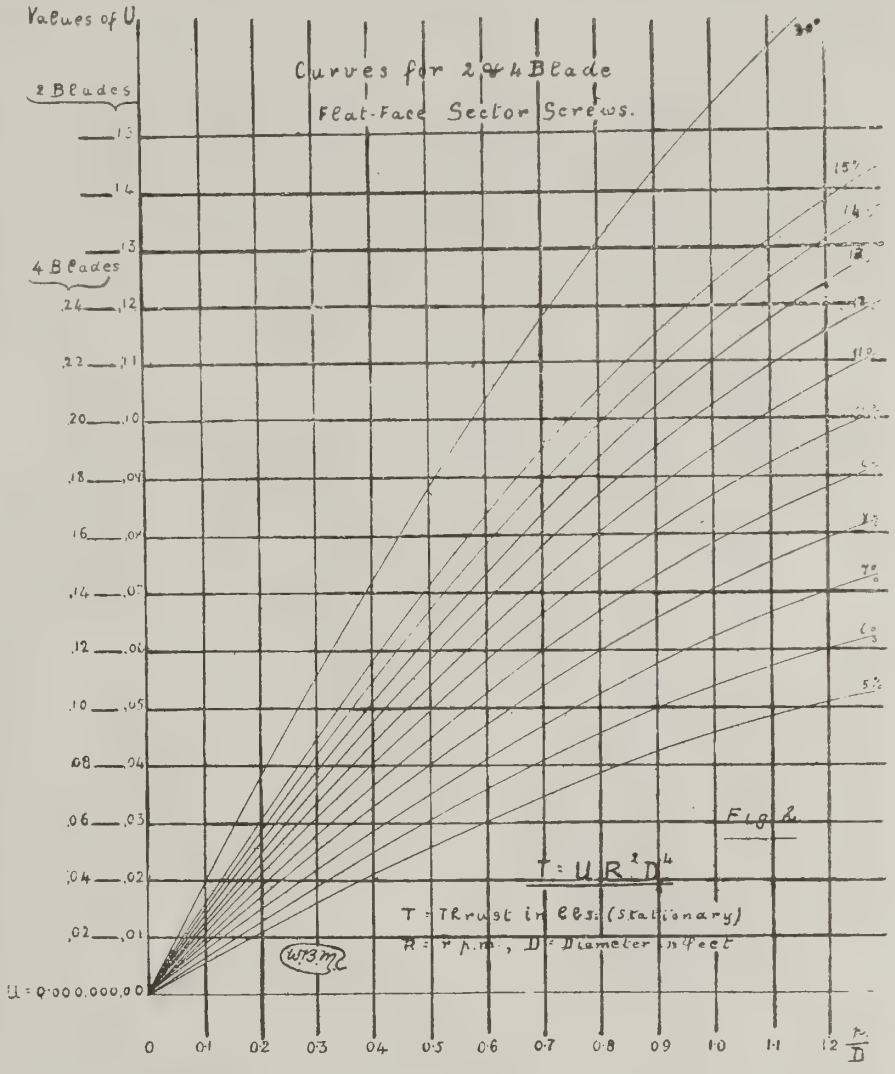
$= 0.000,000,059,5 \times 1100^2 \times 9^4$

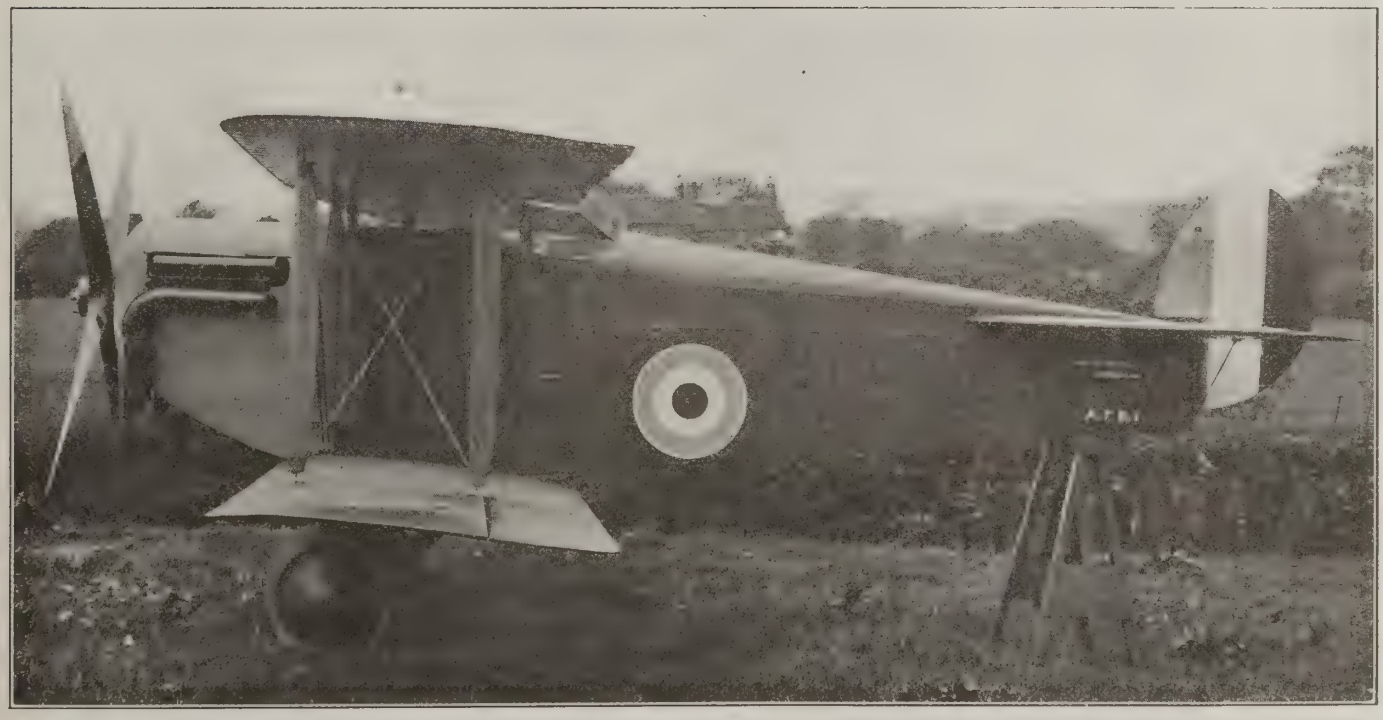
= 472 lbs.

This gives a close approximation for 2-bladed airscrews of sector shape having a flat face, but if it is desired to obtain a similar result for the more modern shaped screws, say, having a curved leading edge and a straight trailing edge, with the maximum blade width at about ⅔ radius of the screw, it is necessary to introduce some modifications as found by Turnbull from large-sized screws of this type.

For approximate results all that is necessary is to multiply the value of the maximum width (Sector Screw values) by 1.135.

In Fig. 3 is shown the difference between Sector Screws and Standard Screws. It will be noticed that the maximum width of the former





is at the blade tips, while of the latter is at ¾ of the radius. Insufficient attention has been paid to the fact that where a large horse-power has to be obsorbed by an air-screw of restricted diameter the Sector Screw is the more useful. But where the diameter is not restricted the Standard Screw is more efficient, owing to the diminution of the blade-tip losses.

I have to thank Mr. Turnbull, the discoverer of these laws, for his kind permission to publish them. Unfortunately, many of the more modern designers, having at hand the latest aerofoil data and the results of numerous actual experiments, evolve their propellers by empirical formulæ which, in some cases, show little knowledge of the actual aerodynamics concerned.

It is to be regretted that the originator of these and the other laws mentioned does not republish his old works with the addition of his more modern data in a suitable volume, which would be of immense value to the many aeronautical engineers at present trying to obtain knowledge.

It will, of course, be remembered that the recent world's height record for seaplanes was established by the aid of a Turnbull propeller.

SECOND PAN-AMERICAN AERONAUTIC CONVENTION AND EXHIBITION

To Be Held Under the Auspices of The Aero Club of America, The Aerial League of America and the Pan-American Aeronautic Federation.

From Thursday, May 1st, 1919,
to
June 1st, inclusive,
at
Atlantic City, N. J.

CONTESTS TO BE HELD EACH SATURDAY

(1) Seaplane Contests (general),
(2) Curtiss Marine Flying Trophy and Prizes,
(3) Intercollegiate Seaplane Contests,
(4) Land Aeroplane Contests,
(5) Dirigible Contests,
(6) Kite Balloon Speed in Ascending and Descending, and Maneuvering Contests,
(7) Parachute Competition,
(8) Aviette (bicycles and motorcycles with wings) Contests.

EVERY DAY ACTIVITIES

(1) Exhibits of Aeroplanes, Motors and Accessories on the Steel Pier,
(2) Demonstrations and tests of Seaplanes, Land Aeroplanes, Motors, Dirigibles, Kite Balloons, to prospective purchasers and representatives of different governments,
(3) Aerial Passenger Carrying by seaplanes and dirigibles, and kite balloon ascensions,
(4) Moving pictures and Addresses by leading authorities on most important phases of aeronautics.

The Governments and Aeronautic, Sporting, Scientific, Industrial and Civic organizations of the United States and all the countries in the world, excepting Germany and her allies, are invited to send representatives to attend this great aeronautic event. On arrival in the United States these representatives should call at the Headquarters of the Convention Committee at No. 297 Madison Avenue, New York City, to register and receive their official badges and the official program.

In the event that it is more convenient for them to go directly to Atlantic City they will register at the offices of the Convention located at the following Atlantic City hotels: Hotel Traymore, Hotel Chalfonte, The Breakers Hotel, Hotel St. Charles, Hotel Marlborough-Blenheim, Hotel Chelsea, Hotel Alamac, Hotel Dennis and Hotel Haddon Hall.

Representatives of the Convention Committee will be at the Bureaus of the Aeronautic Convention at the above-named hotels and will issue the official badges which admit the bearer to the Aeronautic Hall, as well as the Aero Exhibition on the Steel Pier, the judges' enclosure during contests, and to the Aerodrome and seaplane stations where the aircraft and motors will be demonstrated.

All communications until May 1st, should be addressed to Rear Admiral Peary, Chairman, Aeronautic Convention, Aero Club of America, 297 Madison Avenue, New York City.

DAILY PROGRAM FOR PAN-AMERICAN AERONAUTIC CONVENTION, EXHIBITION AND CONTESTS

THURSDAY, MAY 1ST

Opening of Convention and Exhibit.

AFTERNOON—Reception at Aeronautic Hall on the Steel Pier. Addresses by United States Government State and aeronautic authorities.

EVENING—Aero Show and addresses by officials.

FRIDAY, MAY 2ND

AFTERNOON—Aero Show. Preliminary tests of seaplanes, dirigibles and kite balloons.

EVENING—Moving pictures and address on flying for sport and pleasure.

SATURDAY, MAY 3RD

AFTERNOON—Seaplane and dirigible races, and kite balloon ascending and descending contest.

EVENING—Ball.

SUNDAY, MAY 4TH

MORNING—Memorial service by eminent Divine for the dead airmen.

AFTERNOON AND EVENING—Reception to allied aces and heroes of the air and their parents, and announcement of the award of the Aero Club of America Medal of Valor, and the Aerial League of America Diploma of Honor.

MONDAY, MAY 5TH

AFTERNOON—First parachute contest for $500 Bennett Prize.

EVENING—"The Large Dirigible and Its Value for Transportation." Representatives of railroads, express, steamship and other transportation organizations invited to attend.

TUESDAY, MAY 6TH

AFTERNOON—Illustrated addresses on "Aerial Forest Patrol." Forestry Department of every State invited.

EVENING—"Work of Aerial Police Squadrons, and Why Every City Should Have One."

WEDNESDAY, MAY 7TH

AFTERNOON AND EVENING—Aerial Mail Day. Illustrated address on, and consideration of, "Aerial Mail Planes." Chairman of Post Office and Post Roads Committees of House of Representatives and Senate, and Postmaster General Burleson invited to deliver addresses. (26,000 United States Postmasters, and Chambers of Commerce of 13,000 cities invited to attend.)

THURSDAY, MAY 8TH

AFTERNOON AND EVENING—Illustrated addresses on the "Need of Municipal Aerodromes, and the Part to be Played by Aircraft in City Planning." Chambers of Commerce and City Planning Commissions of 13,000 cities invited to attend.

FRIDAY, MAY 9TH

AFTERNOON—Arrival of seaplanes and army planes from Army and Navy Air Stations. Second parachute competition for the $500 Bennett Prize.

EVENING—Illustrated addresses on "Latest Developments in Aerial Warfare and Adventures in Aerial Warfare," told by famous aces.

SATURDAY, MAY 10TH

AFTERNOON—Army, Navy and Marine Corps Day. Aerial contests and tournament.

EVENING—United States Army and Navy Officers' Reception. Reception and addresses at Aeronautic Exhibition Hall on the Steel Pier.

SUNDAY, MAY 11TH

AFTERNOON AND EVENING—Presentation of the flags by each State of the United States to the Aero Squadrons representing the States. Each State will present a flag to each Aero Squadron, the members of which were overwhelmingly natives of that State. The presentation will be made by representatives from the State and the Aero Club and Aerial League branch of that State. All States and cities invited to send delegates, and Army, Navy and Marine Corps to send representatives.

MONDAY, MAY 12TH

AFTERNOON—Demonstrations and illustrated addresses on the "Value of Aircraft for Advertising by Day and by Night." All national advertisers and advertising agents invited to attend.

EVENING—"Pan-American Aerial Transport Over Land." Addresses by members of the commissions of the 20 Latin-American Republics.

TUESDAY, MAY 13TH

AFTERNOON AND EVENING—"Pan-American Aerial Transport Over Water." Addresses by members of the 20 Latin-American Republics' Commissions.

WEDNESDAY AND THURSDAY, MAY 14TH AND 15TH

AFTERNOONS AND EVENINGS—"The Airways and Aerial Transport in Europe, Canada, Africa, Australia and Asia."

FRIDAY, MAY 16TH

AFTERNOON AND EVENING—"Aerial Navigation Instruments for Flying Over Land and Water." Aviators, navigators, scientific instrument makers and aeronautic experts invited.

SATURDAY, MAY 17TH

AFTERNOON—Aerial races and contests. Illustrated addresses on Aerial Photography.

EVENING—Extensive exhibit of aerial photographs and photographic apparatus. All photographers, professional and amateur, and makers of photographic apparatus invited.

SUNDAY, MAY 18TH

AFTERNOON AND EVENING—Illustrated addresses on "Aerial Exploration and the Use of Aircraft for Coast and Geodetic Survey."

MONDAY, MAY 19TH

AFTERNOON—Addresses on "Need of Broader Attitude Regarding Insurance for Aircraft and Aviators."

EVENING—Illustrated address on "How Army Medical Standards and Inspection Lessen Accidents." Insurance companies and agents invited.

TUESDAY, MAY 20TH

AFTERNOON AND EVENING—Illustrated addresses showing different ways of crossing Atlantic by air and the problems to be solved to accomplish same successfully.

WEDNESDAY, MAY 21ST

AFTERNOON—Aero Safety Day. Discussion of aero safety provisions made; improvements in aeroplane construction; increased reliability of aero motors; devices which make for safety in flying.

EVENING—"Progress Made in the Art of Piloting Aeroplanes." Illustrated.

THURSDAY, MAY 22nd

AFTERNOON AND EVENING—Addresses and discussions of meteorology—"How the Weather Forecasts Can be Extended and Made More Efficient by the Use of Aircraft in Exploring the Upper Air," also "How the Weather Forecasts Help Aerial Navigation," and "Telegraphic and Climatic Factors in Relation to Aeronautics.

FRIDAY, MAY 23RD

AFTERNOON AND EVENING—Addresses on "Aerial Jurisprudence—Aerial Laws and Regulation of Air Traffic." (First day.) Lawyers, traffic commissioners and police authorities of different countries invited.

SATURDAY, MAY 24TH

AFTERNOON—Races and contests.

EVENING—Illustrated address on "Need of Establishing Altitude Levels for International, Interstate and Interurban Air Travel."

SUNDAY, MAY 25TH

AFTERNOON AND EVENING—Aeronautic Art Day. Address on "Aerial Painting and Sculpture of Different Countries, and Exhibition of Aerial Paintings," by Lieut. Farre, Lieut. Ruttan and others. All prominent artists, managers of art galleries and art patrons invited to attend.

ENGINEERING WEEK.

MONDAY, MAY 26TH

AFTERNOON—"Aeronautic Engineering Problems and Their Prospective Solution."

EVENING—Opening of contests for designs and ideas for large aeroplanes.

TUESDAY, MAY 27TH

AFTERNOON—"Factors That Increase the Efficiency for Large Dirigibles."

EVENING—"Advantages of Veneer and Plywood for Aircraft Construction."

WEDNESDAY, MAY 28TH

AFTERNOON—Address on "Problems of Flying at 35,000 Feet and Over, and Their Prospective Solution."

EVENING—"Present Day Aero Engines."

THURSDAY, MAY 29TH

AFTERNOON—"Flying Boats Versus Hydroaeroplanes for Sport and Transportation."

EVENING—Contest for designs and ideas for large aeroplanes.

FRIDAY, MAY 30TH (Memorial Day)

AFTERNOON—Dirigible races, kite balloon speed ascending contest; parachute contest.

EVENING—Reception at the Aeronautic Hall, Steel Pier.

SATURDAY, MAY 31ST

AFTERNOON—Seaplanes, land planes and dirigible contests. Aviette competition at which all cyclists and makers of bicycles and motorcycles will be invited.

EVENING—"International Medical Standards for Aviators in War and Peace." Reports from different countries illustrated with attractive films. 50,000 medical men invited.

SUNDAY, JUNE 1ST

AFTERNOON AND EVENING—Award of prizes and diplomas for all events.

Aircraft Advertising Agency, Inc.

280 Madison Avenue

New York

Telephone 1556 Vanderbilt
Cable Address: "Aero-Ads"

Western Office:
Reed G. Landis,
623 So. Wabash St.,
Chicago, Ill.

"AERO-ADS"

by

"AERO EXPERTS"

The Aircraft Advertising Agency aims to cover the whole advertising field for aeronautics, including:

The advertising of Aircraft and Accessories in periodicals and elsewhere.

Display advertising on *Dirigible Balloons,* and *Kite Balloons, Aeroplanes,* and *Streamers* from Aircraft, and by the dropping of Souvenirs and handbills from the air.

Rates on application.

The members of the Aircraft Advertising Agency are all ex-officers of the United States Air Service, with both theoretical and practical knowledge in the Aeronautic Field, assuring expert service for clients.

Granville A. Pollock, President of the Aircraft Advertising Agency, Inc., previous to his release from the Army with the rank of Captain, served in the war from its beginning and was a member of the famous "Lafayette Escadrille." In addition to this practical war service, Captain Pollock is by profession an aeronautical engineer.

S. Herbert Mapes, 1st Vice-President of the Aircraft Advertising Agency, is another Air Service Captain who has recently laid aside his uniform after having served in important capacities at various aviation training fields in this country. He is well known as an automobile racer, an exhibitor of saddle horses and a winner of Horse Show Blue ribbons, as well as being a member of many prominent clubs.

Reed Gresham Landis, of Chicago, 2nd Vice-President of the Aircraft Advertising Agency, and lately a Major in the American Air Service, has the added distinction of being the second ranking American "Ace" with 12 Air Victories to his credit. Major Landis is the Western Representative of the Aircraft Advertising Agency, to whom prospective clients in that territory may apply for information regarding service and rates.

William Menkel, Secretary of the Aircraft Advertising Agency, also served as a Captain in the Air Service, holding various positions at Washington and in the field. He was for five months, and until the end of hostilities, Commanding Officer of the efficient Aviation Repair Depot at the Speedway, Indianapolis, Ind. Previously to entering the service, Captain Menkel was for more than 15 years associated with the American Review of Reviews.

The Aircraft Advertising Company is now booking the space for exhibitors at the Second Pan-American Aeronautic Convention and Exposition at Atlantic City, N. J., May 1 to June, 1919, and also has charge of the preparation of the elaborate souvenir Program, advertising rates for which may be had on application.

SYSTEM OF TESTING FUEL JETS IN ZENITH CARBURETORS

THE manufacture of Zenith carburetors presents many interesting features. Extreme accuracy of workmanship is essential and many operations on the various parts may be compared in their delicacy and skill to the manufacture of fine watches. The inspection of finished parts is particularly thorough, and instruments for measuring and gauging are used that easily detect faults not visible to the eye. Many girls and women are employed, and their keenness of perception, interest in the work and natural aptitude are conducive to successful results.

One of the most interesting, as well as important, operations is that of testing the fuel jets. The measuring orifice of a jet is so small and its flow is dependent upon so many factors that it must be tested by actual flow of a liquid. The accompanying view of the jet testing machine shows the apparatus used for this purpose. It is described as follows:

All the Zenith jets are tested by the flow method. This consists in measuring how much water will flow through the jet in one minute when the water is maintained at a given height above the jet. It would readily be seen that this is the nearest possible approximation to the conditions to which the jet will be subjected into the carburetor.

In order to make these tests in the quantities that are required by the output, we have been led to build special machinery. One of these machines is shown in Fig. 1. It consists of a large tank in which a float controls the inlet of the water in such a manner that level of the water is maintained at a given point (a). From this tank four pipes extend downwards and terminate in a special valve (b) under which the jet under-test may be clamped. When the valve is opened, the water flows through the jet into a special glass graduate (c), which can be quickly emptied by turning a valve (b_1) at the lower end of the graduate.

RATE OF FLOW UNDER 1M. HEAD								
JET	NO.	COMP	JET	NO.	COMP.	JET	NO.	COMP.
35	**50**	42	243	**120**	265	653	**190**	714
42	**55**	52	266	**125**	288	695	**195**	754

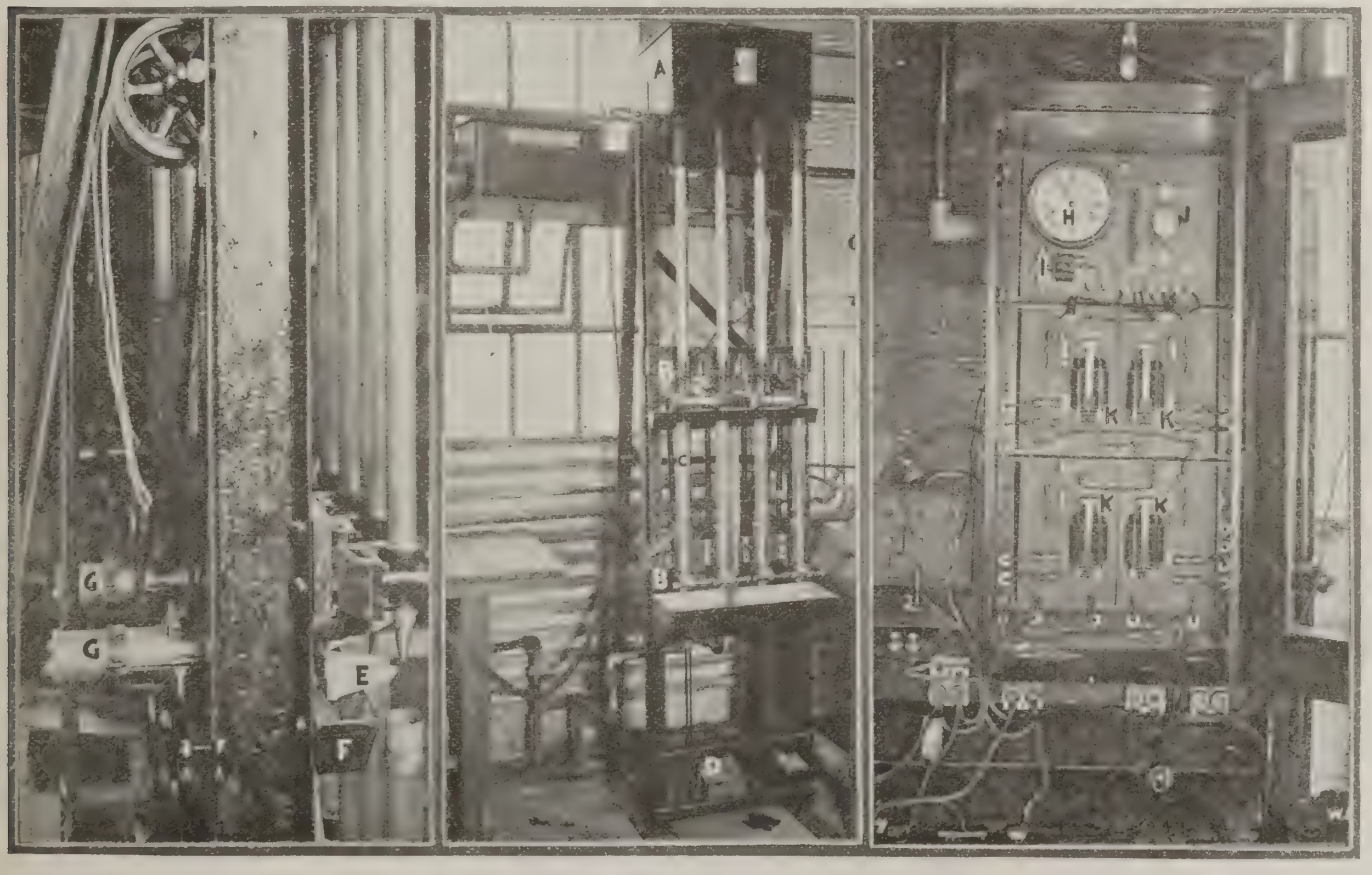
60	**65**	72	312	**135**	338	775	**205**	825
72	**70**	83	335	**140**	368	815	**210**	870
85	**75**	95	360	**145**	397	845	**215**	915
100	**80**	109	387	**150**	425	870	**220**	960
115	**85**	121	416	**155**	455	910	**225**	1010
132	**90**	140	445	**160**	483	940	**230**	1060
149	**95**	158	475	**165**	514	970	**235**	1110
166	**100**	176	510	**170**	550	1000	**240**	
184	**105**	195	545	**175**	596		**245**	
202	**110**	215	583	**180**	634		**250**	
220	**115**	240	613	**185**	675		**255**	



The clamping of the jet is done by a lever, and a spring at the rear of the machine presses each lever into the valve, thus clamping the jet. A pedal (b) is provided for releasing and opening these clamps.

In order to measure with accuracy the time during which the flow is taken into the graduate, a small sheet-brass box (see Fig. 2-E) is used, which can be swung under the jet and diverts the flow from the jet into a waste pan (f). When this box is swung under the jet the water flows to waste, then this box is withdrawn for one minute, during which the water flows into the graduate. The movement of the box is obtained electrically by means of an armored solenoid (see Fig. 2-G). Two boxes are connected together and actuated by the same solenoids; one solenoid for pushing the box under the jet and one for withdrawing the box.

To control the time, the electrical apparatus shown in Fig. 3-H is used. On the upper panel may be seen the master clock (h), which makes a contact every half second. Below the clock is a telegraph relay (i), which receives these impulses and transmits them to an electric clock movement (j) on the right side of the upper panel. This secondary clock movement is arranged to make contacts at a proper interval of time and distribute them to the large relay (k) shown on the second and third panel. These relays, in turn, actuate the four solenoids of each machine.

On each machine the flow is sent to the graduate for one minute and diverted for one-half minute, thus making a cycle of 90 seconds. One-half of the machine is made to lag behind the other half by 45 seconds in convenience in operation.

One operator can, with this machine, test four jets in one and one-half minutes, or 160 jets an hour.

Special machinery in Zenith Laboratory for testing of fuel jets

Brigadier-General William Mitchell, Director of Military Aeronautics

General Mitchell, who was awarded the Distinguished Service Cross on July 9, 1918, was then Chief of the Air Service, 1st Army, A.E.F. He enlisted as a private in May, 1898, and served throughout the Spanish War. He was appointed first lieutenant in the Signal Corps, Regular Army, in February, 1901, was promoted to captain in March, 1903; lieutenant colonel in May, 1917. During his service overseas he was cited repeatedly for acts of extraordinary heroism in action at Noyon, March 26, 1918, and near the Marne river in July, 1918. He "displayed bravery far beyond that required by his position as Chief of the Air Service, 1st Army, setting a personal example to United States aviators by piloting his aeroplane over the battle lines." Among the instances of his service for which he was specially mentioned was a flight in a monoplane over the battlefield of Noyon and the back areas, seeing and reporting the actions of both air and ground groups, and which led to a change of the tactical methods of United States aviators; and a flight in a monoplane over the bridges the Germans had erected over the Marne, in July, 1918, which gave the first definite reports of the location of these bridges and led to the subsequent attack upon the German troops by United States air forces. In daily reconnaissances over the lines during the battle of St. Mihiel, September 12-16, he gathered valuable information of the movement of troops which led to a victorious action by the Allied airmen and other arms of the Service.

Kenly Now Colonel; Air Service Cut to Two Fields

Washington, D. C., March 11.—William L. Kenly, formerly chief of the air service, with the rank of Major General, has been given back his regular army commission as Colonel of the Field Artillery. Brigadier General William Mitchell is Director of Military Aeronautics.

Major General Charles T. Menoher has issued orders reducing the number of active fields to be used by the Air Service to two. All possible personnel will be discharged from the service, it being desired to have only those desiring regular army service on active duty.

Reorganization of the Air Service

Washington, D. C.—A detailed statement regarding the reorganization of the Air Service followed the announcement that Major General Wm. L. Kenly has been relieved of his rank as Major General in the National Army and of his assignment as Director of Military Aeronautics. General Kenly reverts to his rank as Colonel in the Field Artillery and has reported for duty to the Chief of Field Artillery. Brigadier General Wm. Mitchell, who was Assistant Chief of the Air Service, A.E.F., and later Chief of the Air Service, 3d Army of the Army of Occupation,

has succeeded General Kenly as Director of Military Aeronautics.

Major General Charles P. Menoher, Director of Air Service, has selected and announced orders in his staff. They are as follows:

Executive Staff: Executive Officer, Colonel Milton F. Davis, A. S. A.; First Asisstant Executive, Colonel William E. Gillmore, A. S., A.; Second Assistant Executive, Major Horace M. Hickam, A. S., A.; Third Assistant Executive, Brigadier General William Mitchell, U. S. A.; Fourth Assistant Executive, Lt. Colonel William F. Pearson, A. S., A.

Technical Advisory Staff: Supply—Chief, Air Service Property, Lt. Col. Augustine W. Robins, A. S., A.; Chief, Air Service Procurement, Col. Chalmers G. Hall, A. S., A.; Chief, Air Service Materials Inspection, Lt. Col. George W. Mixter, A. S., A. P.; Chief, Air Service Finance, Lt. Col. Alex. C. Downey, A. S., A. P.; Chief, Air Service Aeronautical Engineering, Col. Thurman H. Bane, A. S., A.

Training and Operations—Chief, Air Service Training, (detail to be announced later); Chief, Air Service Operations, Lt. Col. Lewis H. Brereton, A. S., A.; Chief, Air Service Gunnery, Lt. Col. Harold E. Hartney, A. S., A.; Chief, Air Service Communications, Col. Clarence C. Culver, A. S., A.; Chief, Air Service Balloons and Airships, Col. Charles DeF. Chandler, A. S., A.

Administrative Staff: Chief, Air Service Personnel, Lt. Col. Rush B. Lincoln, A. S., A.; Chief, Air Service Inspector, Lt. Col. Frank M. Andrews, A. S., A.; Chief Surgeon, Air Service, Col. Albert E. Truby, M. C.

The following-named officers have been designated as an Advisory Board, Air Service: Colonel Walter G. Kilner, M. A., A. S. A.; Colonel Arthur L. Fuller, A. S. A.; Colonel Henry C. Pratt, A. S. A.; Lt. Colonel George B. Hunter, A. S. A.; Lt. Colonel Henry W. Harms, J. M. A., A. S. A.; Major Charles R. Cameron, A. S. A., Secretary.

The following named detailed for duty in the Office of the Director of Air Service, as indicated: Assistant to Executive Officer, Lt. Col. Oscar Westover, A. S., A. P.; Assistant to Second Assistant Executive, Major John B. Reynolds, A. S. A.; Assistant to Third Assistant Executive, Col. Thomas DeWitt Milling, M. A., A. S. A.; Assistant to Fourth Assistant Executive, Major Walter H. Frank, J. M. A., A. S. A.; Assistant to Fourth Assistant Executive, Major Raycroft Walsh, J. M. A., A. S. A.; Assistant to Chief, Air Service Materials Inspection, Lt. Col. John D. Reardon, A. S., A. P.; Assistant to Chief, Air Service Finance, Lt. Col. Jacob E. Fickel, J. M. A., A. S. A.; Assistant to Chief, Air Service Finance, Lt. Col. William C. McChord, J. M. A., A. S. A.; Assistant to Chief, Air Service Aeronautical Engineering, Lt. Col. Byron Q. Jones, M. A., A. S. A.; Assistant to Chief, Air Service Training, Lt. Col. Herbert A. Dargue, M. A., A. S. A.; Assistant to Chief, Air Service Personnel, Lt. Col. Hollis C. Clerk, A. S.; A. P.; Legal Advisor to Director of Air Service, Major J. Gowan Roper, J. A.

Officers Named Reserve Military Aviators

The following-named officers have been rated as Reserve Military Aviators: First Lieutenant Donovan R. Phillips, A. S. A.; First Lieutenant Joseph T. Higgins, A. S. A.

Officers Recently Dicharged

The following officers have recently been honorably discharged from the Air Service: 1st Lieut. John H. McCann, 1st Lieut. Morris E. Brown, 2nd Lieut. James A. McKnight, 2nd Lieut. William D. Baker, Major Ira B. Joralemon, 2nd Lieut. Harold Bottomley, 2nd Lieut. John H. Christman, Lieutenant Colonel Hiram Bingham, Captain Thomas A. Box, 1st Lieut. Duerson Knight, 2nd Lieut. Clifford T. Wetherell, Captain Garland W. Powell, 2nd Lieut. George W. Sutton, Jr., 1st Lieut. John B. Shober.

Lieut. Belvin W. Maynard, who is credited with the world's looping record, having made 318 consecutive loops in 67 minutes

First Lieut. Arthur E. Easterbrook, Infantry (observer). For the following acts of extraordinary heroism in action near Exermont and Varennes, France, October 8, 1918, a bar, to be worn with the distinguished-service cross awarded him on October 3, 1918, is awarded. On October 8 Lieut. Easterbrook, with Lieut. Erwin, pilot, successfully carried out a mission of locating our infantry, despite five encounters with enemy planes. During these encounters he broke up a formation of three planes, sending one down out of control; killed or wounded an observer in an encounter with another formation, and sent a biplane crashing to the ground, besides driving away a formation of two planes and several single machines. Home address, Maj. E. P. Easterbrook, father, Fort Flagler, Wash.

Capt. Elmer R. Haslett, Air Service. For extraordinary heroism in action near Montfaucon, France, September 28, 1918. While on an artillery surveillance mission Capt. Haslett engaged four enemy planes which were about to attack the American balloon line. He succeeded in diverting them from the balloons, but in the combat his machine guns became jammed. Driving off his nearest adversary by firing a Very pistol at him, he succeeded in clearing the jam and, returning to the fight, he destroyed one hostile plane and dispersed the remainder of the group. Home address, Mrs. J. F. Haslett, mother, Cartersville, Mo.

Method fo Paying $60 Army Bonus

The War Department authorizes the following statement from the Director of Finance:

"Section 1406 of the Revenue Act, approved February 24, 1919, authorizes the payment of a bonus of $60 to officers, soldiers, field clerks and nurses of the Army upon honorable separation from active service by discharge, resignation or otherwise. This bonus is not payable to the heirs or representatives of any deceased soldier.

"Those who are discharged hereafter will receive this bonus on the same roll or voucher upon which they are paid their final pay. Those who have been discharged and have received their final pay without the $60 bonus should write a letter to the Zone Finance Officer, Lemon Building, Washington, D. C., stating their service since April 6, 1917, the date of last discharge and their present address to which they desire their bonus checks to be sent and enclosing with this letter their discharge certificate or military order for discharge or both, if both are issued. Upon the receipt by the Zone Finance Officer, Washington, D. C., of this information and the soldier's discharge certificate, this officer will cause checks to be drawn and mailed to the claimants in the order in which their claims were received by him. The discharge certificate will be returned to the soldier with the check.

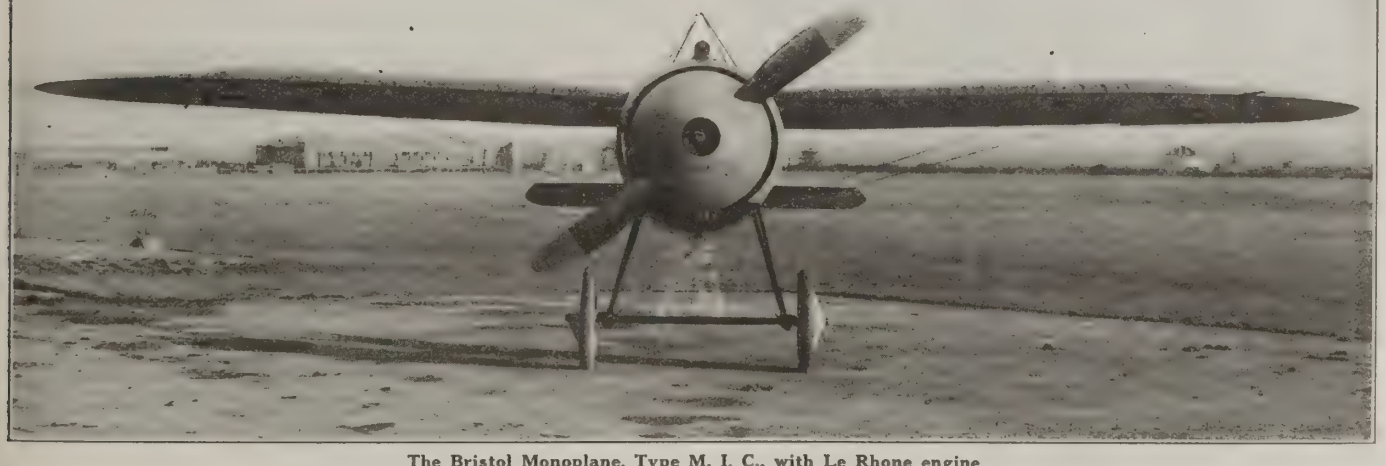
It is estimated that at least 1,250,000 persons have been discharged from the Service who are entitled to the benefits of this act, and while payments will be made as expeditiously as practicable it will manifestly take considerable time to write and mail this many checks."

Air Medical Service Determines Airmen's Special Fitness

Washington.—Of each 100 flyers accepted by the medical service of the Aviation Corps, 61 are capable of flying in altitudes over 28,000 feet, 25 are capable of flying in altitudes up to 15,000 feet and 14 are capable of flying at 8,000 feet or less. Consequently, 61 are fitted for any air work, 25 may perform such work as bombing and 14 are limited to night bombing. These figures are the results of numerous tests made by the Air Medical Service, following the acceptance of candidates for flying duties.

The tests for altitude are made on the ground by means of a device called the "Flack-bag," which reduces the oxygen the aviator breathes so that within 25 minutes there is but 8 per cent. of oxygen in the tank, creating an atmosphere equal to 28,000 feet. The weaker flyers taking this test quickly react to the limited supply of oxygen.

Othere tests are also made for vision and balancing, both of which are affected by altitude. Low oxygen affects the vision. The tests given are also used to determine which men have better "night sight" for night bombing work.



Performance of stunts and low oxygen affect the internal ear, and cause the flier to lose his balance. Consequently, examinations were made of the internal ear to determine whether or not fliers are capable of withstanding low oxygen and whether they are able to perform stunts without losing their sense of balance.

All fliers are frequently examined by a rebreathing test, as it has been found that in many instances men who are capable of standing 25,000 feet altitude at one time are not equal to it at other periods.

In making the tests for examination of stunting ability, fliers are placed in a machine called the "Ruggles Orientator." This machine allows the cadet to acquire flying experience without leaving the ground.

It is a modification of the old-fashioned universal joint, composed of three concentric rings so pivoted together as to permit the fuselage, which is pivoted within the innermost ring through every possible evolution to be experienced in actual flying. It is practically an aeroplane in every respect. The cadet sits in the fuselage and by means of control stick and rud-

FOREIGN NEWS

Medical Aid to Aviation

Rome, March 11.—The first interallied medical aeronautical congress opened in Rome, its object being to promote the study of medical problems arising from aviation.

Resolutions dealing with physical and psychological tests applicable to candidates for pilots' licenses, the control of flights to high altitudes and the use of oxygen by aviators were presented.

It was decided to form a permanent committee to present the views of the medical profession in matters pertaining to aviation.

The United States was represented by Dr. L. G. Rowntree of Minneapolis.

$332,500,000 Requested By British Air Service

London, March 13.—During the war 8,000 enemy aeroplanes were shot down by the British air forces, while 2,800 British machines were missing, Brigadier General J. E. B. Seeley announced in the House of Commons to-day in introducing the army's air estimates of £66,500,000. General Seeley said that if the war had continued the estimate would have been £200,000,000.

When the armistice was signed, he added, England was turning out 4,000 aeroplanes a month and had 20 squadrons in commission, compared to six at the beginning of the war.

A White Paper issued to-day on the air estimates vote says the British air force of 150,000 is being reduced to 79,570 for the period of occupation. This includes the Rhine, France and Belgium, 17,420; Middle East, 3,180; home and colonial establishments, including Russia and men with the Grand Fleet, 58,970.

The vote on account requires £20,000,000 for the first five months of the fiscal year 1919-20.

No Military Aircraft for Germany

Paris, March 13 (Associated Press).—The aerial terms of German disarmament, as adopted by the Supreme War Council, provide that aeroplanes and dirigibles shall no longer be used for military purposes. The only exception is that Germany is permitted to use until October 1 100 seaplanes and 1,000 men to gather mines in the North Sea.

Germany must deliver all her aeroplanes to the Allies, and must prohibit the construction of other aeroplanes until the conclusion of peace. The terms do not decide the future fate of the aeroplanes, which may be destroyed or divided among the Allies.

First Duel in the Air is Arranged in Paris

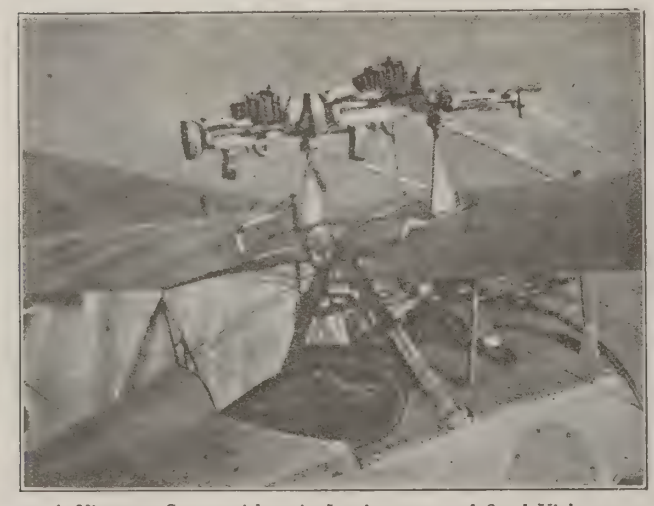
Paris, March 12.—The first aerial duel in history was arranged to-day. Captain Schreiber and Captain Vaudeorane, the principals, will use Nieuport single-seat machines equipped with machine guns.

Their seconds, Captain Wadon and Pilot Babo, will take the air at the same time.

What caused the duel is not made public. The precise date of the encounter has not been given out, but it is expected to take place soon.

Paris, March 14.—The Paris police have taken a hand in the proposed aerial duel between Leon Vaudecrane and Robert Schreeber, former army aviators. The police give two reasons why the duel should not be held, namely, that duelling is forbidden and that people below would be endangered.

It is suggested, however, that the aviators might hold their duel over the seas.



British Authorities Are Making Secret Experiments With the Helicopter

London, March 13 (Special Cable Despatch to The World).—It is understood that experiments with an apparatus destined to be embodied in a helicopter aeroplane are being conducted secretly by authorities near this city.

General Seeley, on behalf of the Air Ministry, told the House of Commons that speed far beyond any yet obtained by aircraft is claimed by sponsors for a new type which is being investigated.

Huge 1,000 Horse Power Air Ambulance Tested

Paris.—A thousand horsepower aeroplane was tested recently as an ambulance, conveying surgeons, hospital equipment and wounded.

A Nieuport Scout with twin Lewis guns and fixed Vickers gun

Bolsheviki Bomb American Lines

Archangel, March 7 (by the Associated Press).—The Bolsheviki took advantage yesterday of the first clear day, with the thermometer above freezing point, by attempting to bomb the American positions on the Vaga from an aeroplane. The machine was the first one observed to bear the new Red army identification mark, a six-pointed red star. The bombs fell without causing any damage.

Since the beginning of the campaign last summer there has been much confusion on both sides of the line because the Bolshevist aeroplanes bore the old Russian marking, a red, white and blue circle. This was so similar to the marking on the allied planes that it was hardly possible to distinguish the one from the other, and the enemy machines were sometimes able from this cause to fly within revolver range of the allied troops, gunboats and armored trains, while the allied planes were similarly able thus to approach the Bolsheviki.

French Aviator Flies 1,180 Miles in 11 Hours

Toulose, March 11 (French Wireless Service).—Lieutenant Lemaitre, a leading French aviator during the war, has completed a flight from Toulose to Casablanca, on the western coast of Morocco, a distance of 1,900 kilometres (approximately 1,180 miles), in eleven hours actual flying time.

The Lieutenant and a passenger left Toulose at noon March 8 and landed at Casablanca at 5 o'clock on March 9. The whole voyage, which lasted twenty-nine hours, was made in two stages, the first from Toulose to Alicante, Spain, and the second from Alicante to Casablanca. The voyage from Toulose to Casablanca by ordinary means consumes ten days.

New Air Record for South America

Buenos Ayres, March 10.—A new altitude record for South America was made on March 8 by Lieutenant Pardoi, an Argentine army aviator. Flying at the Palomar military aviation field, Pardoi ascended to a height of 6,480 meters (about 21,600 feet), beating the record made in 1915 by Lieutenant Zanni by nearly 300 feet.

German Sell Planes to Bolsheviki

London, March 11.—Lieutenant Porten, formerly an officer in the German aviation service, has been tried by court-martial, according to Berlin advices received in Copenhagen and forwarded by the Central News Agency, on a charge of having sold an entire park of aeroplanes at Vilna to the Bolsheviki for $500,000.

The aeroplanes were valued at $2,500,000.

Porten then fled to Koenigsberg and headed a conspiracy in the local workmen's council against the commander of the German garrison at Kovno.

The plot was discovered and Porten was arrested.

British Trans-Atlantic Flight Arrangements Maturing

London.—The first flight across the Atlantic will be attempted as soon as favorable weather appears by the Naval Branch of the Royal Air Force. This statement is made by the Sunbeam Motor Company, which is completing the mechanical equipment for a Tyne built airship.

A landing site has been selected at Newfoundland, to which the ship will fly from Ireland. It is expected that the attempt will be made before the end of this month or in the early part of April.

The Vickers, Ltd., plant at Barrow is completing designs for a giant airship said to be capable of carrying 100 passengers to the United States is a hundred hours.

Germans Bomb Berlin

Berlin, March 10.—Huge Gotha bombing planes were employed by the Government forces in subduing the Spartacists' revolution in Berlin, to clear out machine gun nests on housetops and to establish gun positions. A battery, well concealed and delivering effective fire against Government troops, was only destroyed after the air forces were employed.

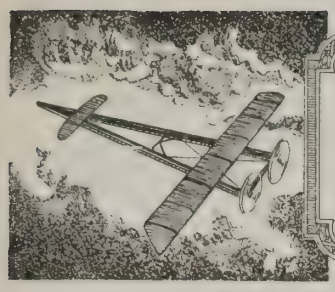
Colonel Bristow Says 90 Passenger Plane is Under Construction

In a speech before the Aldwych Club of London Colonel Bristow, R. A. F., stated that he had recently been sitting in an aeroplane under construction which was designed to carry ninety-one passengers in armchairs in rows of four. According to the Colonel's statements, this giant passenger aeroplane should be completed by this time.

British Aviators' Registry

British flying men now have a labor exchange exclusively for pilots. According to the secretary of the British Aviators' Registry, Upper Baker Street London, there are dozens of big firms on the books anxious to secure efficient pilots as soon as flying restrictions are raised. One firm wants thirty pilots alone, while numerous other firms are in the market for smaller numbers.

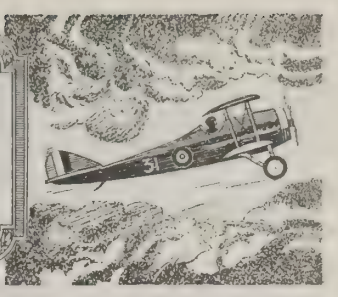
Dirigible Makes Endurance Flight



The British airship N. S. 11 succeeded in remaining four days four hours and fifty minutes in the air under the severe atmospheric conditions encountered off the coast of Scotland between Moray Firth and Aberdeen. The vessel carried a crew of ten officers and men, who were able to sleep in comfort and who cooked their meals on board. Great interest in the flight was evidenced by aircraft promotors as a forecast to extended commercial flight.

Aero Transport for International Football Contestants

Paris, March 8.—Four aeroplanes, piloted by Aviators Frantz, Gardey, Delauny and Delmas, left Villacoublay, Seine-et-Oise, at 1:20 P. M. on March 8 and arrived safely in Brussels at 3:40 o'clock. They carried passengers who will see the international football game between Belgium and France to-morrow. The French team will return to France in the aeroplanes.



Society of British Aircraft Constructors a Permanent Organization

London.—The Society of British Aircraft Constructors, born of war necessity, is to be a permanent organization. Every maker of aircraft in Great Britain is a member of this society. There are two grades of membership: poll members, made up of manufacturers of planes and engines; and associate members, representing makers of parts, materials, etc. Steel and aluminum makers also have membership in the society. The membership of the society is divided into sections, according to manufacturing interests.

ELEMENTARY AERONAUTICS *and* MODEL NOTES

By John F. McMahon

The Motorcycle Driven Machine

THE construction of the body is much the same as the body of the Ford Motored Aeroplane. The longerons from the nose to a point half way back are of selected ash wood 7/8" square, from this point to the tail end are of spruce or fir also 7/8" square. They are then tapered at the ends for a length of 18 inches. The fir piece and the ash are then fastened together by hot glue and wrapped with silk ribbon two plies.

The body struts are of spruce or fir in the rear of the pilot's seat and ash in front of the cockpit. All are 7/8" square except those under the centre panel wing struts, the engine struts and the compression struts to which the bottom wings butt against. These are 2 x 1" and are diamond shape in cross section. That is the square edges are cut out to lighten without decreasing the strength to any great extent.

The body fittings that were in use on the other machine described can be used for this machine, as well as all the other fittings.

The landing chassis is built up of ash straight grained 3 x 1" and stream lined except at the ends which are left square.

The wings are built up in the same fashion as the previous machine, but there is one thing that the reader must remember, and that is to make the ribs light. The webs should not be over 3/16" thick, in fact it is better to have them nearer 1/8", but a fair compromise would be 5/32". The battens or straps along the top of the ribs must also be light. The dimensions for these should be 1/2" scant by 5/32". Webs and battens should be made of clear spruce, but fir can be used for the webs if necessary. The weight of a finished full rib should be four ounces. I have received letters from readers who are building the Ford Motored Machine and some of them tell me that their ribs weigh as much as six ounces. This is too much; the weight of the Ford rib must not go over five ounces at the most.

The principal thing to remember when making this machine is to keep all parts within the limit that I specify to insure the minimum weight being realized, which is necessary for successful flight.

The little half ribs should have only a batten and a former to hold it in shape along the top only. This half rib should extend to the front wing spar only, and is fastened to it by a little glue and a brass brad.

Ailerons are constructed the same as for the other machine. The aileron control arm is made of tubing also but it should only be five inches between the centre of the hole at the top to where the flattened part begins. When the Aileron is covered a piece of wood streamlined and cut to a sort of a triangle shape is placed behind the tubing and fastened to it neatly with a piece of silk covering the tubing and the wood former. The wood former is then fastened to rib to keep it from turning. A little dope should then be applied and then a coat of varnish or if the builder so desires a little paint.

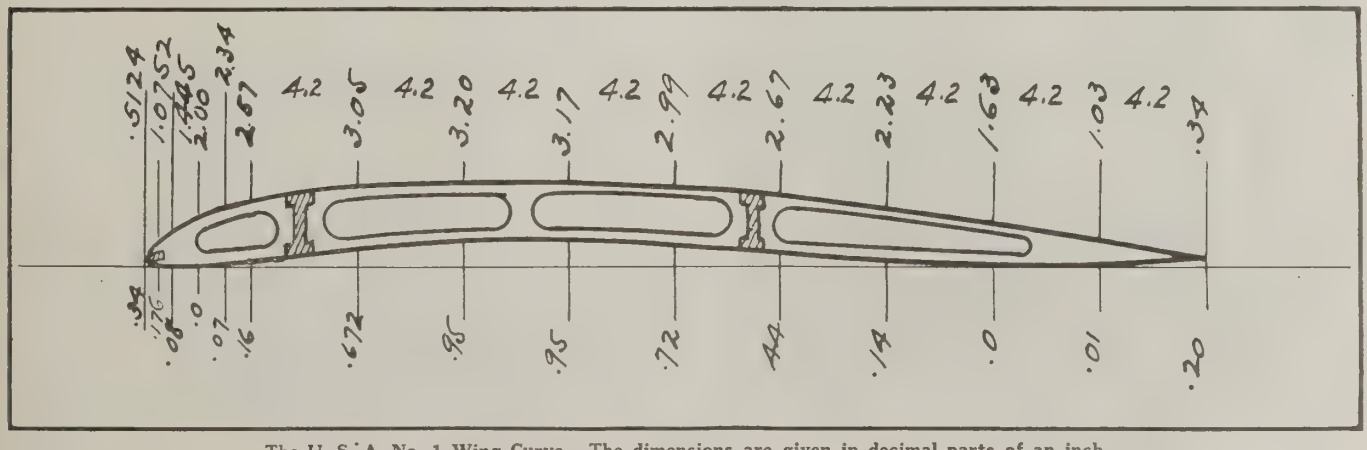
When the wings and ailerons are completed they are covered with a cotton cloth or unbleached muslin which is fastened to the inside ribs first with tacks and cotton tape to keep the cloth from pulling over the tacks, then pulled tightly and fastened to the last rib from the outside tip of the wing. The cloth is then tacked along the entering edge. When this is finished the top and bottom coverings are folded over the steel wire edge at the rear and sewed close to the trailing edge.

Dope should then be applied. (Regarding "DOPE." Many inquiries have been received asking what dope is and why it is used. The term "DOPE" is applied to the fluid which is applied to the covering on aeroplane wings to fill the pores of the cloth which would otherwise allow the air to leak through as it were and of course the machine could not fly, and also to cause the covering to shrink, making it drum tight, which is desirable to enable the wing to pass through the air cleanly. A good dope can be made by boiling glue, 1 pound, alum, 2 ounces, glicerine 6 ounces in a quart of water. This of course will not give the best results, but it was used in the old days in place of something better. Today many good dopes are on the market and I would refer the readers to the advertising columns, as many firms are advertising good dopes and aeroplane varnishes at reasonable prices, almost as cheap as the reader could make it up himself and many hundred per cent better.)

As I started to say, the wings should be given two coats of dope, sand papering or rubbing with steel wool after the first coat. When the two coats of dope are applied the varnish or a color should be applied.

The body is also covered with muslin, but not until all the controls are fitted and in working order. Instead of making the control stick pivoting on a rocking bar, we will have it attached at the botton end and free to move in any direction. The control cables will be attached at a point 6" from the bottom end. The Elevator cable passes around a pulley in front and then under the pilot's seat to the rear where it attaches to the elevator control arms.

(To be continued)



Wading River Manufacturing Company

The Wading River Manufacturing Company announces their new catalog, containing many new up-to-date models built to scale and driven by rubber bands. The models are sold in knock-down form and can be assembled by the average schoolboy by the help of a blue print simply gotten up, which helps in the construction of the model.

The list of models contains the Curtiss JN-4B, Sopwith Triplane, Spad, Nieuport, Caproni, Biplane, Handley-Page, The De Haviland 4, that every American boy loves to hear mentioned on account of its help in ending the war, and racing models for those who prefer this type of machine.

The Wading River Company announces that they intend giving a prize in conjunction with the coming contests to the boys or men who purchase their parts from them.

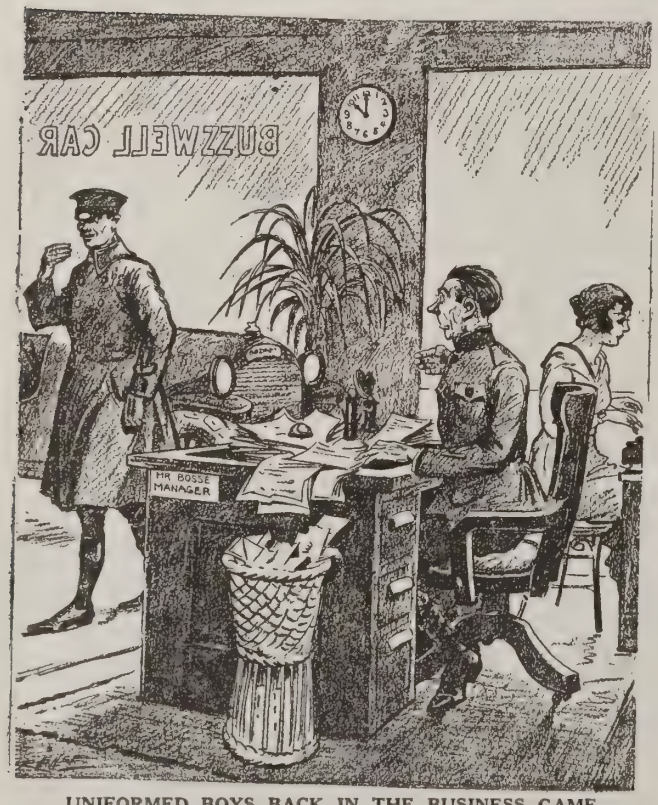
It would be worth the reader's trouble to get one of these new catalogs. The address of the Wading River Company is listed in the classified columns of this paper.

The U. S. A. No. 1 Wing Curve. The dimensions are given in decimal parts of an inch

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

John Peel Up to Date

(Airmen in their machines saw the sport from the sky, but though they 'viewed' the fox, the noise of the engines drowned their 'holloas'."—*Daily Mail.*)



D'ye ken the lads of the Velvoir hunt,
Have you heard the tale of their latest stunt:
How they brought their 'planes from the battle front
And they flew with the hounds in the morning?

They were sportsmen all, they were blithe and gay,
As they rose with the lark at the break of day;
And they flew o'er the hills and far away
With the Velvoir pack in the morning.

Oh, the wind was keen, and the engines sang,
And the hill and dale to their shouting rang
As their faces felt the joyous twang
Of the frosty air of the morning.

D'ye ken the boys of the Belvoir pack?
Old Reynard hopes they will not come back:
For he quite forgot to double his track
At their "view-hallo" in the morning.

AUBREY ENGLAND in *Aircraft* (London).

UNIFORMED BOYS BACK IN THE BUSINESS GAME

Private Bosse salutes Capt. Salesman, who gets down in the morning a trifle late

(From the *N. Y. World*)

There was a young fellow named Payze,
Who thought out the means and the wayze,
In manner romantic,
To fly the Atlantic,
And his name on the walls of Time blayze.

From *Aircraft.*

Sam: Look at that chap in that aeroplane. Shouldn't like to be up there in it.
Mike: I shouldn't like to be up there without it.

"Daddy, why do they call that airship a Blimp?"
"Because it looks like one."
"What is a Blimp, daddy?"
"Oh, eat your d——d bun and shut up."

First Hun: "How did der story of der Crown Prince's death get aboud?"
Second Hun: "Because we a story circulated to throw dust in der eyes of hated England dot he in an aeroplane had escaped."
First Hun: "But there was no story circulated dot the 'plane had been lost?"
Second Hun: "No, but everybody who knew der Crown Prince thought dot if he in an aeroplane went up, he must haf died of fright."

A Scot persuaded a friend to take him up for a flip. In looping the loop he dropped a coin out of his trouser pocket.
Later, while the two were flying over an ornamental pond, the Scot tapped the airman on the shoulder and shouted:
"Let's awa' doon, mon; I can see ma saxpence."

The Village Blacksmith

(Revised R.A.F. Version)

Under the spreading hangar roof
The sergeant-major stands;
A fierce, imposing monster he;
All quake at his commands.
And the thunder of his booming voice
Is worse than German bands!

His hair is cropped beyond recall,
His face is like a boot;
His brow is wet with thoughts of debt
Incurred when a recruit.
He looks nobody in the face
(If so, they'd have to scoot!)

He goes at midday to the mess
And sits among the swells;
Then drags defaulters by the neck
And dumps them in the cells.
While his massive fists are tightly clenched
Like those of Billy Wells!

Week in, week out, from morn till night,
You can hear him curse the day
When he started on his maiden flight
And a beastly strut gave way,
When (according to his own account)
He was foremost in the fray!

Strafing, abusing, bellowing,
Onward through life he goes,
Each morning he contrives to add
To many an A/M's woes.
Something attempted, someone "run,"
Will earn him a damaged nose!

Land Machines—Seaplanes—Flying Boats

Steele's Adv. Service

(*Continued from page* 123)

der puts himself through all the evolutions he is later to experience in the air. These evolutions stimulate the internal ear, which send the nerve impulses to the brain. Consequently, after flying day after day in this apparatus the cadet is entirely familiar with the sensations he will experience in an air flight. He is thus prepared to realize and cope with the peculiar conditions incidental to aviation.

The Air Medical Service divides its system of operation in three ways: Selection, classification and maintenance. Tests for selection are standardized. Examiners making the tests are also standardized.

A late innovation in the Air Medical Service includes what is known as the Flight Surgeon, who examines intimately the conditions in aviation accidents, and makes recommendations accordingly. For example: He finds that the cowl of an aeroplane provides too little play for the head, and that fliers cut their heads in crashes as a result. He recommends more room. Such recommendations have been shown to result in 10 to 30 per cent. less accidents. Another recommendation instituted the use of a rubber shock absorber, used to attach the safety belt to the machine. This lessened the number of broken ribs.

An Aeroplane Life Saving Safety Appliance

With the wonderful progress and development in aircraft in general and the application of scientific study and inventive genius to perfect reliable power engines, necessary control instruments and safer wing structure under stimulus of war needs, there is now an increasing demand for consideration of a reliable, practical life-saving method in case of accident to aeroplanes in flight.

This problem begins and ends with man-carrying parachutes which have now been developed to a degree of reliability, but a parachute carried on an aeroplane in flight is of no use whatever unless means are provided to successfully launch it instantly when needed and in such manner that parachute and its suspension ropes cannot be fouled by the aeroplane and prevented from successfully launching with its passenger. No method of launching a parachute from a container by the jumping out of the passenger from an aeroplane falling out of control will be dependable, for reason that the aeroplane would be falling as fast or faster than the passenger after jumping out, and as the parachute and suspension ropes is fully 70 feet in strung-out length, there is small chance of parachute not being fouled, especially as when opening, the parachute and passenger attached must slow up in rate of descent and when fully opened out the parachute is fully 35 feet in diameter, thus making an object of such size as to be unlikely to escape being fouled by the falling aeroplane. These facts are evident and require that some means be provided to launch the parachute by pulling it out of the container instantly by an applied force other than gravity of falling passenger. A recent invention of Henry M. Crowther, M.E., of Arizona, provides a system of instantly launching, automatically, a parachute from a carrying case mounted permanently within the fuselage space and accomplishes the rapid launching of parachute by the firing of a light shell from a gun loaded with a light charge of powder and to the shell or projectile is attached a short tow line, the opposite end of which being previously attached to the top of the parachute, and the tow line is provided with a shock absorber in form of a number of elastic rubber ribbons of several feet in length, and arranged parallel, to absorb the shock of inertia of rapidly launching the parachute from its case. This shock absorber section of the tow line is fastened to the top of the parachute. There is also provided means of cutting the tow line and its attached shell or projectile free from the parachute as soon as the parachute and its suspension ropes are fully launched in suspended, fully strung out, collapsed condition above the aeroplane, ready to open out.

The cutting loose device consists of a small triangular knife that severs the tow line anchorage rope automatically at proper moment when parachute is fully drawn out of its case and in the air ready to open out. The aviator wears a shoulder harness and the end of the parachute suspension ropes is attached to the aviator's harness, by snap hook, before beginning flight. The parachute is launched in fully strung out and collapsed condition by the tow line drawn by the fired shell, pulling parachute out of its case, top end first, and fully launched in such condition the tow line and attached shell automatically frees itself from parachute, and the aeroplane and passenger with parachute previously attached, continuing to fall, will presently cause the parachute to open out in usual manner and lift passenger free from the aeroplane to descend safely.

The aviator has only to pull trigger, thus firing the gun and discharging the shell with its tow line previously attached, and wait for the parachute to launch and open and lift him free from falling plane. The whole apparatus being mounted and carried in place ready for instant use. The tow line and parachute are carried in separate containers having covers which automatically open by movement of the tow line. The shell or projectile may be fired by use of a coil spring powered gun or by compressed air gun, as well as by explosive powder charged cartridge. It is estimated that the entire apparatus, including parachute, will not exceed 80 pounds in weight, and being all contained within the skin of fuselage will not offer any wind resistance during flight of aeroplane.

The parachute should be fully launched and have lifted the passenger free within less than three seconds after discharge of shell.

The system is adaptable for several passengers by providing a life-saving unit for each person. The particular merits of each type of launching gun and style of shell or projectile carrying tow line that launches the parachute, and the most suitable length and elastic resistance of shock absorber elastic ribbons, will be determined by experiment on the ground, and with these details perfected the apparatus is ready to try out with 150-pound sandbag dummy during flight.

It is, however, more difficult for an aeroplane in control to be manipulated most favorably for launching this apparatus, since method will operate more perfectly if aeroplane is actually falling while out of control, and this fact is an important distinction to consider, as several other methods proposed to accomplish this service will only operate with certainty with aeroplane in control or especially maneuvered favorably to launching of a parachute. There is a psychological consideration in the fact that it may be assumed that every aeroplane passenger would have nerve enough to pull a trigger and await action of an automatic life-saving device, whereas it would be a person of exceptional bravery who would jump overboard in case of accident, especially soon enough, even though he had a favorable chance to do so, as would be required in use of any non-automatic system for this purpose.

$30,000 CASH PRIZES AND TROPHIES FOR ATLANTIC CITY AERIAL CONTESTS

COLONEL BISHOP OFFERS "ACE OF ACES" TROPHY

THIRTY thousand dollars in cash prizes and trophies has already been offered for the Atlantic City aerial contests which are to begin on Saturday, May 3rd.

Harvard Has Made Two Entrees Yale University to Compete

The Harvard Aeronautical Society has notified the Aero Club of America that it will enter for both the seaplane and landplane intercollegiate contests. Yale University is to compete and is developing plans to that effect. Other universities are summoning their aviators and balloonists and half a dozen entries may be expected within a week.

Colonel Bishop Offers "Ace of Aces" Trophy

To encourage the development of aerial navigation and to stimulate aerial sport between Canada, his native country, and the United States, Colonel William A. Bishop, British Ace of Aces, has offered, through the Aero Club of America, an international trophy for annual competition.

The trophy presented by Colonel Bishop is to be known as the "Ace of Aces Trophy" and is to be awarded in 1919 to the aviator who makes the greatest speed in a contest from Toronto to Atlantic City, to be held in May during the Second Pan-American Aeronautic Federation, which is to be held at Atlantic City from May 1st to May 31st, 1919.

Colonel Bishop is the winner of 72 official battles in the air in which he brought down his German opponent, and he has an unofficial record of over 100 enemy machines.

He is now the Honorable Aide de Camp to the Governor General of Canada, and has been decorated with the Victoria Cross, Distinguished Service Medal, Military Cross and Distinguished Flying Cross; also with the special War Medal of the Aero Club of America.

He had in his squadron three Americans, of whom he says "they did themselves proud I can tell you." They were Spriggs of New York, who got fifteen machines; Grider, who was killed; and Callahan of Chicago, who downed ten Huns.

Colonel Bishop is particularly interested in developing speed contests and bringing closer relations between Canada and the United States.

Atlantic City Aero Club Offers $10,000 for First Trans-Atlantic Flight

The Atlantic City Aero Club has offered a cash prize of $10,000 to be awarded to the pilot of the first aircraft to fly over the Atlantic, which starts from or terminates at Atlantic City during the month of May. The general conditions of this competition are approximately the conditions of the Daily Mail $50,000 prize. Entry blanks can be obtained from the Secretary of the Aero Club of America, 297 Madison Avenue, New York, or from President Albert T. Bell, of the Aero Club of Atlantic City, Atlantic City, New Jersey.

Contests for $5,000 Additional Prizes to be Announced

A contest for $5,000 additional cash prize is to be announced within a few days. The details are being worked out as AERIAL AGE goes to press. The prize will be for land aeroplanes.

The contests, which are sanctioned by the Contest Committee of the Aero Club of America, under the rules of the International Aeronautic Federation, which govern all aerial contests, are as follows:

The Valentine Weekly Efficiency Marine Flying Contest

The prizes (awarded under the terms of the Samuel H. Valentine will) are to be awarded for the greatest number of laps covered in flying over a 60 mile course with the Steel Pier, Atlantic City, as starting point and Cape May Naval Air Station as turning point, during the five Saturdays of the Convention:

First Prize	$1,000
Second Prize	500
Third Prize	250
Fourth Prize	100

The race is to start at 10 A. M. and last until 5 P. M., each of the five Saturdays in the month of May.

The laps start and end at the Steel Pier. Only complete laps count.

Curtiss 1,000 Miles Non-Stop Seaplane Contest

Mr. Glenn H. Curtiss has offered a prize of $1,000 to go to the first entrant for the Curtiss Marine Flying Trophy who covers the distance of 1,000 miles without stopping. The contest for this prize will open on May 1 and continue until it has been accomplished.

The entrants who wish to compete for this prize during the Convention can fly over the 60 miles course between the Steel Pier and Cape May Air Station, and can compete for the Valentine Efficiency Marine Flying Prizes at the same time.

The entrant's record will be counted as a flight for the Curtiss Marine Flying Trophy under the rules for the 1919 competition for this trophy.

Open Seaplane Speed Contest (with handicap)

for 42 laps of 5 miles each. To be held on Decoration Day, May 30.

First Prize	$1,000
Second Prize	500
Third Prize	250

Aerial Commuting Prizes

(1) To be awarded to entrants who cover the greatest total distance in commuting by air from anywhere to Atlantic City during the period of the Convention.

First Prize.....Gold Medal
Second Prize.....Silver Medal
Third Prize.....Bronze Medal
(Distance to be measured in straight line.)

(2) To be awarded to entrants who make the greatest number of trips in commuting by air from anywhere to Atlantic City during the period of the Convention.

First Prize.....Gold Medal
Second Prize.....Silver Medal
Third Prize.....Bronze Medal

(3) To be awarded to entrants who make the longest flight in commuting from anywhere to Atlantic City during the period of the Convention. (Drstance to be measured in straight line.)

First Prize.....Gold Medal
Second Prize.....Silver Medal
Third Prize.....Bronze Medal

Army, Navy and Marine Corps Contest for Accuracy in Bomb Dropping on a Floating Target

This contest is to be held every Saturday during the Convention and on Decoration Day.

Both land machines and seaplanes are permitted to compete, but slow machines must fly higher than fast machines, to equalize the chances of hitting the target.

First Prize.....Gold Medal
Second Prize.....Silver Medal
Third Prize.....Bronze Medal

To enable the hundreds of thousands of college men who were in the Army and Navy and Marine Corps Air Service but have left the service, to continue their training in aeronautics, both as a measure of national preparedness and as a means of facilitating their remaining in the aeronautic movement, the Aero Club of America and the Aerial League of America have arranged to hold a series of intercollegiate tournaments at Atlantic City during the coming summer.

The first of these intercollegiate contests, which are to be held in May, are as follows:

Intercollegiate Seaplane Speed Race

Over a five mile course, for the $2,000 Intercollegiate Trophy. This event is open to graduates and under-graduates whether in military or civilian life.

Dirigible Speed Contest (With Handicap) For the Aerial League of America Silver Trophy

This contest is open to Army, Navy, aero clubs, colleges and aeronautic organizations. It will be held on the afternoon of Saturday, May 3; Saturday May 10; Saturday, May 17; Saturday, May 24; Friday, May 30, and Saturday, May 31.

Each member of the winning crew of each race will receive a silver plaque of the trophy.

The names of the members of the winning crew of each race will be inscribed on the trophy, which is to be competed for annually.

The race will be for the speed (under conditions of the handicap) made at each race.

After these events are over a few weeks will be allowed for preparation and then the following contests will be held:

Three Months Intercollegiate Seaplane Tournament

This will be an intercollegiate seaplane tournament to last three months. The contests will be held every Saturday, and the college holding the largest number of points at the end of the month, each month, will be considered the winner for that month. The second best the second; the third best the third.

But the final winner will be the college which has the largest number of points at the end of three months.

Each college will be permitted to have three entries. The pilots may be changed weekly, the change being left entirely to the discretion of the college which has made the entry.

This plan will permit the testing of a number of collegiate aviators and finding the best. It will also give an opportunity to a college which may have had a very low number of points during the first and second months to catch up with the leader during the last month.

Three Months Intercollegiate Aeroplane Tournament

There will also be held a Three Months Land Aeroplane Race, to be governed by the same rules as stated above.

Three Months Intercollegiate Dirigible Tournament

To provide for practice with dirigibles and give opportunities to college men to participate in the development of this wonderful and most progressive branch of aeronautics, there will also be held a Three Months Intercollegiate Dirigible Tournament, to be governed by the same rules as stated above.

The Aero Club of America and Aerial League of America authorities have been assured that the Army and Navy will be glad to co-operate and permit Army and Navy officers who are dirigible balloon pilots to represent their respective colleges in the dirigible balloon tournament.

Three Months Intercollegiate Spherical or Kite Balloon Operating Tournament

In view of the fact that, owing to the nearness to the Atlantic, it would be impossible to hold free balloon races from Atlantic City, plans have been made for holding the Intercollegiate Free Balloon Races elsewhere in the latter part of the Summer. To afford training to college men in the operation of balloons, there will be held a Three Months Intercollegiate Balloon Operating Contest, to be governed by rules similar to the rules for the seaplane tournament.

The contest will consist of the important work of lay out the balloon, inflating, and send it up, with two or more men on board, who will take observations and communicate with the people on the ground by telephone.

The trophy will be awarded for the speed and efficiency in laying out, inflating, and sending up the balloon, as well as for the work of the men on board.

Provision is being made at the Atlantic City Aviation Field for housing the land planes and balloons. Arrangements are also being made for housing and taking care of the seaplanes. Provision will be made for experts to look after the aircraft used for the intercollegiate races, and every facility will be given so that undergraduates, as well as graduates, can compete in the May contests with a minimum loss of expenditure of time.

Great enthusiasm has been aroused in intercollegiate circles by the announcement of these intercollegiate aerial contests, and it is expected that the entries will be numerous and the events will be of great value to the nation, and will be a means of keeping up the development of American aeronautics as well as giving an opportunity to college men to participate in the program of aeronautics.

United States Army, Navy and Marine Corps aviators and balloon observers, in the Service or out of the Service, who wish to compete with the teams of their colleges or to start teams, should apply to Mr. Alan R. Hawley, chairman, Contest Committee, Aero Club of America, 297 Madison Avenue, New York City.

An international contest in which the Allied aces already in this country or on their way over would compete, is being considered by the Contest Committee of the Aero Club of America, which includes the following prominent military and civilian authorities in aeronautics and intercollegiate sports: Alan R. Hawley, Chairman; Lieut. Com. P. N. L. Bellinger, U. S. N.; Col. G. C. Brant, U. S. A.; W. Redmond Cross, Lieut. Godfrey L. Cabot, U. S. N.; Walter Camp; Col. Milton F. Davis, U. S. A.; Col. C. de F. Chandler, U. S. A.; Major A. B. Lambert, U. S. A.; Major William McIlvain, U S. M. C.; Col. James Prentice, U. S. A.; Major J. C. McCoy, U. S. A.; Com. H. C. Mustin, U. S. N.; Lieut. Com. John H. Towers, U. S. N.; Henry A. Wise Wood and Henry Woodhouse.

TRANS-ATLANTIC FLIGHT AN INTERNATIONAL RACE

AT last the flight across the Atlantic is to be made. The certainty that it will be made is supplied by the fact that the four great nations, France, Italy, Great Britain and the United States are to try it almost simultaneously. Some of the trans-Atlantic flight plans which have been secret for a number of months are being announced in such swift succession that all of a dozen such plans will be made public before AERIAL AGE leaves the presses.

The plans made public at the time of going to press are as follows:

The American Efforts

Lieut. Commander Patrick N. L. Bellinger, until recently commandant of the air station of the Naval Operating Base at Hampton Roads and the 5th Naval District, will pilot the United States naval seaplane that will attempt to cross the Atlantic Ocean.

Lieut. Commander Bellinger received official notification from the Navy Department to come to Washington for a conference before attempting the flight.

He declared that he did not know just when the start would be made, but thought it would be as soon as there was reasonable likelihood of favorable weather setting in with the approach of spring. He said he did not have any doubts as to the final outcome unless the elements interfered. He felt confident that the flight would prove successful.

Lieut. Commander Bellinger is considered to be the Navy's best aviator. He has made some remarkable flights to sea and his general knowledge of all makes of flying machines won for him the command of the largest aviation unit in the Navy during the war. He stated that he did not know where the flight would start from, but it is said in naval circles that Hampton Roads has been selected and that the route would probably be from here to Bermuda, about 800 miles, thence to a point on the Irish coast, about 1,600 miles.

Lieut. Commander Bellinger has been conducting experimental flights for the last two weeks. He flew several hundred miles to sea a few days ago and picked up a speeding destroyer which had several hours' start on him. This experiment was conducted to familiarize the aviator with the lane followed by steamships in crossing the Atlantic Ocean. Other experiments have proved, naval experts say, that Bellinger is the logical man to attempt the flight for the American Navy.

Captain Roy N. Francis of the Army Air Service has been placed in charge of the Army's attempt. He pins his faith to the land type of machine, and it is rumored that a special machine is nearing completion at the Glenn L. Martin factory for this effort.

On March 21, Captain B. B. Lipsner, former Chief of the Aerial Mail Service, announced that Captain James V. Martin had placed at his disposal the newly perfected Martin machine, in which Lipsner says he will attempt a trans-Atlantic flight.

Captain Lipsner says he will take the Azores route, following the same course taken by President Wilson in the George Washington, and that he hopes to start in a week if arrangements can be perfected whereby the Navy Department will picket the route.

The Lunstedt-Hanning machine, constructed by the Witteman-Lewis Company, has undergone several tests recently and Capt. Hugo Lunstedt hopes for an early effort at the Atlantic trip.

The British Efforts

The British plans so far announced include two efforts with land machines, one with a flying boat and one with a large dirigible.

A secretly built aeroplane, accompanied by Harry G. Hawker, as pilot, and Commander Mackenzie Girve, Royal Navy, as navigator, was shipped from England on March 18 to St. John's, N. F., whence it will start at the earliest possible moment in an attempt to win the Daily Mail prize of $50,000 for the first machine to fly across the Atlantic.

The machine is a Sopwith two-seater biplane, with a 375 horse power Rolls-Royce engine.

Pilot Hawker said he believed the flight would occupy about nineteen and one-half hours. The machine, he added, had flown 900 miles in nine hours and five minutes on one-third of its petrol capacity, and is capable of maintaining a speed of 100 miles an hour for twenty-five hours.

Hawker won the British Michelin Prize for 1912 by a continuous flight of eight hours and twenty-three minutes. He has made many long distance flights along the British coast. He established a world's altitude record of 28,500 feet in 1915. Newfoundland, the nearest North American point to Europe, involves a flight of about 1,900 miles. Aviator Hawker is an Australian and is considered well qualified for the attempt.

The flying boat "Porte," which is named after Lieut. Col. John C. Porte, who designed it, has been shipped on a vessel across the Atlantic for the purpose of making from Newfoundland what may be practically described as the British official attempt to fly over the Atlantic.

The Porte machine comes from the Government workshop, and will carry the hopes and blessings of the Air Ministry. The Porte boat, as illustrated on another page of this issue, is the largest flying boat so far constructed by the British Air Ministry.

A British supertriplane, which will probably prove to be the biggest aeroplane in existence, is slowly nearing completion. The London *Chronicle* learns from one of the officers concerned in its construction that the machine was originally designed for bombing purposes, but is now being adapted to commercial use, and is expected to make its first flight under control of Captain Dunne at an early date. Its capacity is enormous, and, although the inside petrol tanks will limit the number of passengers to fifty, future machines may carry as many as 100. Reports state that the machine is a product of the Whitehead factory. One of the ambitions of the designers is a flight across the Atlantic.

Great Britain's biggest airship, the one with which an attempt to fly across the Atlantic is to be made shortly, rose for her first trial flights on March 19.

Swaying gently in a strong head wind she rose immediately and at 300 feet started eastward at seventy miles an hour.

Some months ago the British Admiralty placed orders for similar ships with two large contracting firms—Beardmore, on the Clyde, and Armstrong-Whitworth, at Barrow-on-Furness. The latter won the strenuous race to be first in the air with the R-33.

The airship, which is of the rigid type, was constructed for war purposes, the sinister indications whereof are manifested by openings in the underbody through which can be dropped four 800 pound and sixteen 120 pound bombs, and by provision in the upper works for eight guns.

The ship carries gasoline for an eighty hour flight at an average speed of sixty miles an hour. There are five twelve cylinder engines of 250 horsepower each. One of these is forward, one on each side of the cabin and two are aft, the latter driving a propeller nineteen feet in diameter, while the single engines drive sixteen foot propellers.

The French Efforts

It is known that the Farman Company is working on a large type of land machine for entry in the trans-Atlantic journey. Nothing has been divulged concerning the details of the machine, but it is regarded as possible that it will be similar in type to the "Aerobus" which this company recently flew with passengers from Paris to London.

The Italian Efforts

The well-known Italian inventor Gianni Caproni is constructing a huge triplane for the trans-Atlantic flight. It is said to be the largest machine ever attempted. When finished it is expected it will have facilities for carrying one hundred passengers. No definite date has been announced for the initial test, but it is expected early this spring.

THE NEWS OF THE WEEK

Thomas-Morse Biplane in Fast New York to Ithaca Flight

Ithaca.—A Thomas-Morse biplane, piloted by "Tex" Marshall and carrying a reporter for the *Sun* as passenger, reached this city late in the afternoon of March 20 after covering 200 miles from Hazelhurst Field, Mineola, in 150 minutes.

The trip was made on the direct line to Ithaca, the pilot steering a course above the rough country of northern New Jersey, where the only possible landing place in case of emergency would have been a lake or river. For this reason aeroplanes generally keep clear of this section, and the flight is said to have been the first ever made between New York and Ithaca.

Two Thomas-Morse planes, each equipped with a LeRhone rotary motor of 80-horsepower, left Mineola at 3.15 in the afternoon. After circling to a height of 2,000 feet both planes, the second piloted by Paul Wilson and carrying as a passenger a reporter for the New York *Times*, crossed the Sound, continuing to rise as the Hudson was passed and the Jersey plain reached. A wind from the northwest with a velocity of 40 miles made it necessary to head the machines almost due north to overcome the drift.

At Port Jervis, one hour after the start, the planes were still rising, and a little later the highest altitude of the trip, a little over 8,000 feet, was attained. Forty minutes later Lanesboro, Pa., was passed. "Tex" Marshall kept unerringly on the course, and when Binghamton was reached the dangerous part of the trip was over. The landing was made without difficulty. The second plane was compelled to descend at Binghamton owing to lack of gasolene.

Buying Dirigibles From England

Washington.—Both the Army and Navy are purchasing non-rigid dirigibles in England. One of these lighter-than-air craft, a new type in this country, has reached this country and will soon be put together. The Army is constructing a large hangar for such craft at Langley Field.

Aeroplanes to Combat Mexican Bandits

Owing to the many attacks by bandits which have been made upon paymasters of companies operating in Mexico several organizations are preparing to have the payroll carried by aeroplane from the main office to the various field camps. Returned soldiers who have been in the flying service will act as pilots of the machines. Whether this will entirely circumvent bandit raids on paymasters is a question. The resourceful Mexican bandit may decide to be as progressive as the companies themselves and take kindly to the sport of hunting paymasters with anti-aircraft guns.

Transatlantic Telephony From Belmar to Brest and Glace Bay to Carnarvon

Washington. — Wireless telephone messages were sent daily to the President's ship, the George Washington, while on her way to Brest, and the voice of the speaker was clearly heard when the ship was at anchor at Brest, according to naval officials. The Belmar Transatlantic Station in New Jersey using the Alexanderson alternator was used for transmitting.

At the same time, wireless telephone communication was successfully established between Glace Bay, Nova Scotia, and Carnarvon, Wales.

17th Aero Squadron Downed 65 Enemy Planes

New York, N. Y.—The 137th Aero Squadron, commanded by Lieutenant J. T. Heckel, of Rochester, and the 17th Aero Squadron under Major S. B. Eckert of Philadelphia, returned aboard a transport late in March. The 17th did most of its work with the British at Cambrai. Its report is 65 enemy planes. Seven of the fliers were decorated. On one occasion a combat group flew over Dunkirk and bombed the German aerodromes, destroying many planes, and killing, it was estimated, 30 enemy pilots and 120 men.

Senator Henderson Uses Air Route

New York, N. Y.—Senator Charles B. Henderson of Nevada flew from Washington to the Mineola field in an aeroplane piloted by Major W. C. Ocker of the United States Air Service. The flight, which took two hours, was made in a De Haviland machine equipped with a 400-horsepower Liberty motor. Senator Henderson made the return trip by air the following morning.

General Crowder Flies to Duty at Havana

Havana.—Maj. Gen. Enoch F. Crowder, Judge Advocate General of the American Army, who had been invited to Cuba by the Government to revise the election laws, arrived at Havana from Key West by seaplane. After landing, General Crowder went aboard the American cruiser Cincinnati. The plane carrying General Crowder was escorted by another plane.

Col. Bishop Ill

Roanoke, Va.—Col. William A. Bishop, famous Canadian aviator, was operated upon for appendicitis here. He was stricken as he was preparing to deliver an address. His condition was reported to be satisfactory.

Baltimore Seeks Transatlantic Flight Fame

Baltimore, Md.—William H. Logue, Jr., Industrial Commissioner of the Board of Trade of Baltimore, has a check for $1,000 which he wants a deposit as a starter on a fund of $100,000 with which to finance an overseas aeroplane flight from Baltimore to Europe.

Mr. Logue says a transatlantic flight from Baltimore will make this city the most talked-of place in the world. The flight could start, he says, from the Chesapeake Bay and Maryland aviators—men who have flown above the battlefields of Europe, who have destroyed German planes and bombed German munition factories—could man the machine. He wants to make the flight as much of a Maryland proposition as possible. The machine could be built in Baltimore, he declares, though the engines would have to be procured elsewhere.

Aircraft Can Be Sold to Balkans

Washington, D. C.—The War Trade Board announces the modification of trading restrictions covering trade with all ports of the Adriatic and territory adjacent thereto, including Albania, Montenegro, Croatia, Slavonia, Bosnia, Herzegovina, and Dalmatia.

A special license for shipment of aircraft of all kinds, including aeroplanes, airships, balloons and their component parts, together with accessories and articles suitable for use in connection with aircraft, must be obtained from the Board.

Augustus Post Enthusiastic Over Future of Aeronautics

Albany, March 21.—Consummation of a transatlantic air trip within the next thirty days was predicted by Augustus Post of New York City, secretary of the Aero Club of America, to-day, at the final session of the conference of general commercial organizations of the State. Mr. Post further prophesied that "They will be hitching giant dirigibles soon to New York City skyscrapers to take on and off passengers"; that seal and whale fishing would be promoted by the aeroplane, and that hereafter the possibility of an airman being lost in unknown stretches of land or water would be obviated.

Congressional Committee now in Europe to study aircraft problems. From left to right: W. R. Green of Iowa; A. T. Smith of Idaho; W. A. Ashbrook of Ohio; John E. Baker of California; C. W. Ramsayer of Iowa; Burton L. French of Idaho; and Hatton F. Summers of Texas

Mr. Post told of a device now near perfection which will keep the airman's route mapped out over an area of many thousands of square miles.

"They have been experimenting successfully with a new non-inflammable gas, and when it is ready to be commercialized they will be building 1,000-feet dirigibles which will have a cruising radius of at least 20,000 miles. These dirigibles can be fitted up for pleasure parties and with a roof garden and balconies. They will be extensively used, not only for pleasure purposes, but also for commercial uses."

He declared that within a few years there will be thousands of air tourists in New York State, and that with the Atlantic successfully crossed there will be established mail and passenger routes from this country to Europe.

British Dirigible Flies 1285 Miles in Severe Storm

London, March 22.—A record-breaking long-distance flight over the North Sea was performed by a British non-rigid airship during the last few days.

The voyage, which took the form of a circuit embracing the coasts of Denmark, Schleswig-Holstein, Heligoland, North Germany and Holland, was characterized by extremely unfavorable weather conditions. The total length of the round trip was 1,285 miles, and the time consumed was forty and one-half hours.

So violent was the wind during the last stage of the voyage that the crew had the greatest difficulty in controlling the airship. The flight was particularly noteworthy in view of the fact that the trip was carried out entirely over the sea. It is the longest non-stop sea voyage made by any British aircraft, and, as far as is known, is the world's record for non-rigid airships.

Interallied Commission Favors Adopting Marine Rules for Aircraft

It appears probable that all air vessels will have to obey rules similar to those laid down for maritime shipping, according to a dispatch to the New York *Sun*.

Passing on the right hand will be a universal rule. At night machines will be compelled to carry front, rear, and side lights. Aerial "roads" will come into use in much the same way as did land roads, merely from custom. Various routes naturally have been formed by past flying, and others will follow gradually. As soon as a certain route is seen by the authorities to be frequented landing stages, guiding lights at night and visible signs for the day will be established.

The commission also is considering what qualifications will be necessary before a driving license for personal conveyance and for carrying paying passengers will be granted. The pilot's certificate has been of varying standard in the past. This is to be changed. It is probable flying tests in the future will be more difficult than they were for war pilots, and it may be that two certificates will be authorized, first that of an apprentice, allowing the holder to fly within a restricted area, and then the certificate of a finished pilot.

A standard medical certificate will also have to be possessed by a pilot. In the past health qualifications varied with the climatic conditions of the country in which the flying was to be done; the new health test will qualify the pilot for flying the world over.

The British proposal in regard to frontier control seems to find general favor. The French, however, to save time in the new organization, appear to have decided to adopt the D. C. A. (defence centre avions) system, which was used during the war. It is certain it will be an international agreement that all planes passing a frontier will be obliged to land in specified aerodromes on the frontier line to have papers and cargoes examined.

The commission seems still in difficulty in regard to flying regulations to be imposed on enemy countries. It is very difficult to be sure that peace-time planes will not be able to be transformed in a short space of time into war machines. Yet it is rather hard to guarantee that if flying is prohibited there the order will be obeyed.

The possible outcome is that the Allies will take a longer lease on all commercial aerial lines in Germany. That would prevent the growth of flying on a large scale for a certain period. Such an agreement would necessarily have to be a clause in the peace treaty.

Original Discharge Papers No Longer Required to Obtain $60 Bonus

Washington, D. C.—The discharged officers and enlisted men entitled to sixty dollars bonus under act of Congress approved February 24, 1919, who do not wish to forward their discharge certificate to the Zone Finance Officer, Washington, D. C., may furnish a certified copy thereof under the following conditions:

"The copy will be a literal, full and complete copy of the original, and will contain both printed and written matter of every nature and description of both sides of the original discharge certificate. This complete copy, together with the original discharge and a letter addressed to the Zone Finance Officer, Lemon Building, Washington, D. C., stating the soldier's service since April 6, 1917, the date of last discharge

Lieut.-Commander Patrick N. L. Bellinger, who will pilot the Navy Flying Boat in the Trans-Atlantic Flight

and their present address, to which they desire their bonus check to be sent, will be presented to the nearest recruiting officer of the Army, who will make and sign a certificate in the margin on the back of the original discharge paper in ink, or stamped with indelible ink, reading as follows:

"A true copy of this discharge certificate has been made and attested to by me to enable soldier to obtain bonus.

"This officer will also place a certificate on the copy of the discharge that is to be forwarded to Washington, D. C., certifying that the copy is an exact, true and literal copy of the discharge.

"Officers signing certificates will show rank and station. After this certificate has been made the original discharge will be returned to the soldier and all other papers will be forwarded by the recruiting officer to the Zone Finance Officer, Lemon Building, Washington, D. C., for payment."

Senator W. B. Henderson to Take First Flying Lesson Up in the Air

With a United States Senator as the first pupil, a new system of teaching pleasure-flying without months of preliminary groundwork, physics and

Harry G. Hawker, who will attempt the Atlantic flight in a Sopwith land machine

chemistry, hitherto required of all aspirants for a pilot's license, will be tried out at Bolling Field, Anacostia, next week.

Senator H. B. Henderson, of Nevada, who recently made several trips in army aeroplanes from Washington to New York as a passenger, will be the first candidate for a pilot's wings that ever took his first lesson "in the air." Senator Henderson became so interested in the flying game as a result of his recent flights that he decided to learn to operate an aeroplane.

Beginning next week Senator Henderson will begin his flying lessons under the instruction of Major William C. Ocker, U.S.A., Department of Military Aeronautics, using a De Haviland plane of the Bluebird type, equipped with dual control. The senator will be thrown on his own resources once the aeroplane leaves the ground, just as the small boy is thown into the water over his head and told to "swim or drown."

Flighty Musical Comedy By Rockaway Airmen

Naval aviators of the station at Rockaway Point, New York, will play what they call "a syncopated satire in three acts," called "Hello Below." It was written by Ensign Vaughn Miller, and the cast includes 125 members of the Rockaway Point station. It deals with the training of airmen. The boys hope for a Brooklyn engagement and have designs on Manhattan if the show makes a hit in Rockaway, where the first performances are booked.

Eddie Stinson Tests Ace Plane

New York, March 25.—Eddie Stinson tried out the Ace Scout Plane built by the Aircraft Engineering Corporation of New York at their field at Central Park, L. I., to determine if the little machine would meet his requirements for an exhibition plane. Stinson "took off" in an easy climbing turn, and after trying the controls, performed a series of hair-raising stunts in the little machine.

Bureau of Mines Studied Aircraft Fuel Problem

Washington, D. C.—During the war the Bureau of Mines, Department of the Interior, made strenuous efforts to find a special fuel for aeroplanes that would be superior to others already in use. Of the numerous products and mixtures obtained some were originated by the bureau engineers and chemists, others were suggested by outside interests. Through its own experiments or by cooperation with other organizations, notably the research division of the Dayton Metal Products Co. and the Bureau of Standards, it was possible to establish the fact that certain types of fuels had elements of superiority that had not before been noted or appreciated. Of the fuels proving most satisfactory, gasoline refined from the crude petroleum of certain producing fields was distinctly superior to the type most extensively used. The blending of moderate proportions of benzol with gasoline was found to be distinctly advantageous, and motor fuel of this type would undoubtedly have been employed for military purposes if the war had continued much longer. It is believed that through the proper use of benzol and other distillates derived from coal, it may be possible to embody features in the design of internal combustion motors that will notably increase their efficiency. Benzol and other coal-derived fuels are already being sold for use in automobiles and are believed to be giving satisfactory results even with present types of motors.

The bureau was particularly interested in a special fuel tested in cooperation with the Dayton organization and named "hecter". This fuel, which was a mixture of cyclohexane and benzol, gave indications of marked superiority over any other product tested and should, unless unforeseen deficiencies appear, prove ideal for the military aviation service. In some experimental fights this fuel has given 10 miles an hour more speed. It is not certain that the cost of production will ever be low enough to permit its use in peace times, but it is planned to complete the work of obtaining comprehensive information regarding all of its possibilities and to publish reports on the subject in cooperation with the engineers of the research division of the Dayton Metal Products Co.

Transport Arizonan Brings Home Twelve Aero Squadrons

The Transport *Arizonan* sailed from Bordeaux March 18 and is due to arrive at New York April 2 with the following troops: 640th Aero Squadron, 5 officers, 145 men; 257th Aero Squadron, 3 officers, 151 men; 101st Aero Squadron, 4 officers, 143 men; 43d Aero Squadron, 1 officer, 148 men; 37th Aero Squadron, 3 officers, 125 men; 174th Aero Squadron, 2 officers, 151 men; 172d Aero Squadron, 3 officers, 161 men; 19th Aero Squadron, 5 officers, 148 men; 21st Aero Squadron, 3 officers, 147 men; 30th Aero Squadron, 5 officers, 129 men; 31st Aero Squadron, 3 officers, 133 men; 33d Aero Squadron, 3 officers, 135 men; 1 casual officer, Air Service; other casuals; civilians, 5. Also 1 Naval enlisted man.

The AIRCRAFT TRADE REVIEW

Caswell Predicts European Demand for U. S. Parts and Accessories

Never before has foreign trade opportunity knocked harder at the doors of American manufacturers than it does to-day. This seems to be the consensus of opinion among those who have watched the march of events in the international commercial arena since the signing of the armistice, says Mr. F. B. Caswell, the energetic sales manager of the Champion Spark Plug Co.

The conditions which have practically excluded European competition during the last two years have placed us in a favorable position to secure, for all time, our rightful share of the world's trade in many of our most important commodities. But it should be borne in mind that the circumstances under which we have lately made such gigantic strides as an

F. B. Caswell, sales manager of the Champion Spark Plug Co.

exporting country will soon cease to exist and will be followed by a period of competition such as the world has never before known.

The quality of our products and of our packing as well, our selling methods and our representatives—will all be pitted against the best that can be developed by those who, for centuries, have studied the art of cultivating good will. It would be foolish to suppose that the Anglo-Saxon, Teutonic and Latin peoples of the old world are going to relinquish their hold upon those markets without a struggle.

The principles of quantity production which form the keynote of our success are no longer a mystery to our conservative friends across the sea. The experience gained by the entente countries during the last two years of the war taught them many things—among them, the advantages of scientifically worked-out reduction methods—at which American manufacturers have always excelled. It would, therefore, seem clear that in order to successfully compete in many lines we will have to be satisfied with a small margin of profit.

To those who are interested in the manufacture of aircraft accessories, the outlook is particularly bright. The shipment of American-made aircraft and motors to Europe during the war has served to emphasize more than ever the ingenuity and skill of American inventors. When conditions get back to normal, there should be a ready sale for many of the accessories and parts with which these vehicles are equipped. This is particularly true if the accessories referred to are properly advertised in the language of the people to whom they are to be sold and intelligently placed within their reach.

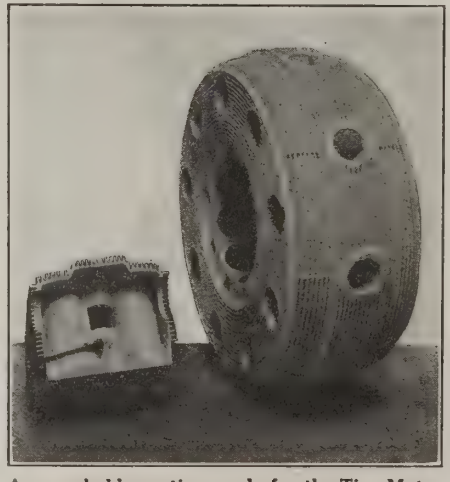
Personal Pars

Charles M. Manley, president of the Society of Automotive Engineers, has resigned as vice-president of the Curtiss Aeroplane Corporation and returned to New York, where he will continue the development of the Manley hydraulic transmission.

M. H. Blank has been appointed chief engineer of the Lynite Laboratories of the Aluminum Castings Co., Cleveland. He was recently honorably discharged as captain in the army. Previous to entering military service he was assistant engineer of the Premier Motor Corp.

Standard Parts Now in Own Building

Cleveland—On the first of the month the Standard Parts Co. moved from its central offices, which include the executive and supervisory staff, bookkeeping, advertising and contracting departments, to the Standard Parts Building on Walnut Avenue at East Eleventh Street, which has just been completed.



Aeronautic Committee Sails for Europe

Washington—A Congressional committee to study aeronautics in Europe has sailed with Secretary Daniels. The committee comprises W. R. Green, Iowa; A. T. Smith, Idaho; W. A. Ashbrook, Ohio; John E. Raker, Cal.; C. W. Ramseyer, Iowa; B. L. French, Idaho, and H. W. Sumner, Texas.

Aluminum Castings Co. Makes 18-Cylinder Rotary Motor Casting

Fairfield, Conn. — An exceptionally difficult piece of casting work was turned out at the Fairfield plant of the Aluminum Castings Co., under the personal supervision of Mr. J. F. Deiter, the plant manager for the Tipps Motor Co., of Woonsocket, R. I. This is an 18-cylinder rotary motor of radical design, described in the March 17 issue of Aerial Age. There are 26 ribs on the end of this casting and 15 on the side, the ribs being 1½ inches high and 3/16 of an inch thick. The castings were 48 inches in diameter and 17⅜ inches high. The total weight, ready for shipment, is 585 pounds.

Mr. Tipps informed Mr. Deiter that the castings he turned out were superior to the products turned out in the Belgian factories, where Mr. Tipps made his earlier experiments.

A remarkable casting made for the Tips Motor Co. by the Aluminum Castings Co.

J. G. Utz Chief Engineer for Standard Parts

John Gilmore Utz, director of the Engineering Department of the Standard Parts Company, has been one of the moving spirits in standardization in the automotive world.

Mr. Utz is a Cornell graduate and began his practical training while attending college, working one summer for Mr. Elmer Sperry on his electric car.

After graduation Mr. Utz became chief draftsman for the Olds Motor Works. Before leaving this concern he was promoted to the position of assistant engineer. In 1907 Mr. Utz joined the engineering forces of the Autocar Company and designed the truck which is still

J. G. Utz, chief engineer of Standard Parts Co.

in modified form being manufactured by that company.

At a later date Mr. Utz designed the light weight Chalmers Thirty, which was at that time one of the largest selling cars on the American market. Following this, Mr. Utz was identified with the Abbot Motor Company and the Perfection Spring Company.

Early in his career Mr. Utz became interested in the matter of standardization, being identified with the mechanical branch of the Association of Licensed Automobile Manufacturers, which concerned itself with the standardization of spark plugs, screw threads, etc. This work was continued by the Society of Automotive Engineers and has often been mentioned in the columns of Aerial Age Weekly.

Mr. Utz was successively a member of the Council and Chairman of the Standard Committee. In his latter capacity he was brought much in contact with governmental activities, when, upon the declaration of the war, the development of our motor transport became one of the large and urgent undertakings. Mr. Utz became supervisor of inspections in September, 1917, and in December of that year was made supervisor of engineering also. He retained his civilian status. The work ultimately led to his having charge of a party of Americans sent to France last May to assist in the organization of the work of the Motor Transport Corps, which was and is a big factor in the great showing of the American Expeditionary Forces. Mr. Utz is of the opinion that we will never return to pre-war standards or perhaps what might more aptly be termed pre-war lack of standards. Its value will become even more apparent when it is applied to the salvage of the 50,000 automotive vehicles, which were in commission at the close of the war.

The service which Mr. Utz has rendered toward bringing about this universal standardization will be a lasting benefit to the industry.

Post Office Announces New Speed Record for Aerial Mail

Washington, D. C.—D. H. De Hart, pilot, brought in the air mail from New York on March 20 in 2 hours and 14 minutes after a checkered trip at different altitudes to dodge bad winds and patches of rain and snow which lay in his course. He covered the stretch from New York to Philadelphia at the rate of 110 miles an hour, and from Philadelphia to Washington at 90⅓ miles an hour with a full load of mail.

On March 15 Aviator Ira O. Biffle made a remarkable trip through rain and fog from New York to Washington in 2 hours and 7 minutes. The trip from New York to Philadelphia was made at the rate of 90 miles in 48 minutes, or at the rate of 112 miles an hour, and from Philadelphia to Washington in 1 hour and 19 minutes, or at the rate of 97 miles an hour. He carried a load of 281 pounds of mail. Going against the storm from Washington to New York the speed of the mail plane was held down to an average of 51 miles an hour.

On Monday, March 17, Aviator E. V. Gardner flew from Washington to New York with the mail in 2 hours and 5 minutes, covering the run from Washington to Philadelphia at the rate of 98.4 miles an hour, and from Philadelphia to New York at the rate of 114 miles an hour. The trip from New York to Washington against the strong head wind was at the rate of 57 miles an hour.

On March 11 Aviator E. H. Lee brought the mail into Washington from New York at better than 100 miles an hour, flying from New York to Philadelphia at the rate of 102 miles an hour, and from Philadelphia to Washington at the rate of 101 miles an hour. The total elapsed time of the trip was 2 hours and 8 minutes with a mail load.

Aviator Leon H. Smith brought the mail to Washington on March 12 in 2 hours and 7 minutes flying time, covering the distance between New York and Philadelphia at the rate of 98 miles an hour and between Philadelphia and Washington at the rate of 110 miles an hour.

Peru to Have Aerial Mail Service

Lima, Peru.—The government has invited American and European bids for starting an aerial mail service in Peru.

British Officer Predicts Bright Future for Aeronautics

"Whether it be an Englishman, an American, a Frenchman or an Italian, it is certain that before many months a successful flight across the Atlantic in an aeroplane will be an accomplished fact," said Lieut. A. R. Hooper, a British aviator. "In my opinion, it would be possible now to fly across the Atlantic in a dirigible. I can recall the attempt made by Walter Wellman several years ago and its failure. Today there is not the slightest chance of failure, in my judgment. Dirigibles now built in England can fly across the Atlantic without stopping.

"Within a quarter of a century, in all probability in less time, I believe we shall have regularly established aeroplane routes between the cities, as we have railroads now. The development of the aeroplane in the four years of war has been marvelous. They are building now in England a machine that will make a vertical ascent into the air at a speed that would have amazed one two years ago. I do not believe it will be five years before the mails will be carried by aeroplane between all the great cities. Indeed, I am sure that within less than a half decade Washington will be receiving regularly letters from New York in less than two hours from the time they are mailed.

"One of the most interesting developments that came under my personal observation during the war was the taking of photographs from a high altitude. Many of the aerial photographers in the beginning found that after they had made their exposures when they came to develop their plates were black. An American discovered that this was due to the haze that screens the earth, and he found that by placing an apparatus on his machine he could penetrate the haze with his lens, and after that picture making was simple."

Aerial Terms of Peace Commission

From the progress made by the sub-commission of the Peace Commission, it appears that the proposal is to subject traffic by the air routes to virtually the same regulations as that by ground routes. It is planned to protect the customs regulations of the various countries by establishing landing grounds at the frontiers and making it obligatory for pilots to land before passing from one country to another in order that the customs formalities may be complied with at such landing points.

The aerial terms remain practically unaltered. Germany will be allowed no military or naval air force, except the maximum of one hundred seaplanes until October 1, which are to be employed for destruction of submarine lines, with a personnel of 1,000 men. No aerodrome or dirigible shed will be permitted within the 95 miles east of the Rhine, or west of the eastern frontier, or of the Italian and Czecho-Slovak frontiers. All the existing aviation grounds within these areas are to be demolished and the ground plowed up.

Free aerial passage and the right of landing will be given by the Germans to Allied aircraft until the complete evacuation of German territory by the Allied troops. Until the signature of the final treaty of peace, the manufacture or importation of anything connected with aeroplanes is forbidden. All the military aviation materials of any kind whatever is to be handed over.

Lighter Than Air Service Train Service Soon, Says Dr. Bell

Holyoke, Mass., March 22.—Train service in the air may be expected at no distant date, according to Dr. Alexander Graham Bell, inventor of the telephone, who spoke today before a women's club here.

He declared a lighter than air machine is best adapted for commercial purposes, and there was no reason why a fleet of such dirigible cars might not be run, drawn by one machine with motive power.

He predicted that before long it would be possible to have one's breakfast here and supper in Ireland.

Newton D. Baker, Jr., Celebrates Twelfth Birthday By Aeroplane Flight

Washington, D. C.—Newton D. Baker, jr., son of the Secretary of War, celebrated his twelfth birthday on March 13 by making his first flight over Washington in an army aeroplane from Bolling field. He was taken as a passenger by Lieut. Leo F. Post, and after on hour's circling over the city he didn't want to come down. The "joyride" was asked by the boy of his mother as a birthday present.

Capt. Leroy Leopold, engineer corps, Newton's uncle, and Mrs. Frank Baker, wife of Major Baker, brother of the Secretary of War, who has just returned from France, also made the flight as passengers in machines piloted by Capt. Felix Steinhle and Lieut. Thomas Graves.

U. S. Soldiers May Wear Chevrons or Badges for Service in Foreign Armies

Washington, D. C.—The War Department authorizes publication of the following circular:

Circular No. 123.

War Department,
Washington, March 13, 1919.

Chevrons and Badges for Service in Foreign Armies

Officers and enlisted men of the United States Army, who served in the armies of any cobelligerent with the United States in the present war are authorized to wear any chevrons or badges denoting such service which may have been awarded to them by the government of the country in whose army they served.

By order of the Secretary of War:

FRANK MCINTYRE,
Major General, Acting Chief of Staff.

Official:
P. C. HARRIS,
The Adjutant General.

Recent Naval Orders

Lieutenant (junior grade) Charles L. Andrews, to U. S. S. S-1.

Lieutenant (junior grade) Robert A. Fisher, to duty as inspector of engineers material (aero) U. S. N., Buffalo, N. Y.

Lieutenant (junior grade) Earl H. Miller, to duty naval air station, Key West, Fla.

Lieutenant Commander Emory W. Coil, connection with inflation rigging and flying dirigible C-5, Naval Air Station, Cape May, N. J.

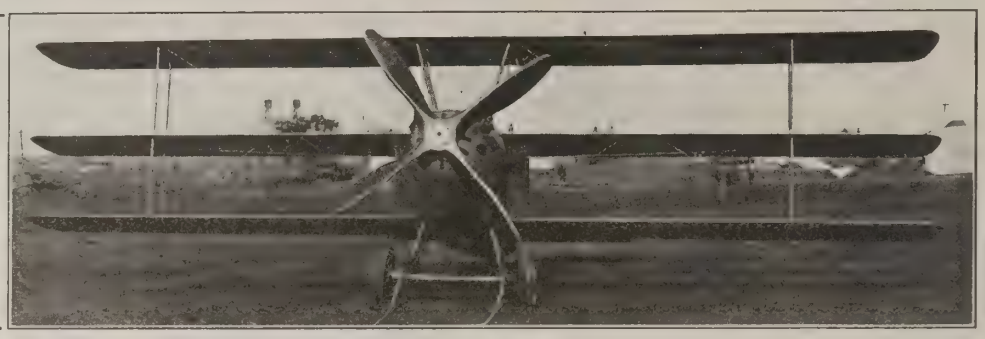
Lieutenant (junior grade) G. W. Shaw, to duty naval air station, Rockaway, L. I., N. Y.

Lieutenant (junior grade) F. W. Prescott, to duty naval air station, Pensacola, Fla.

Lieutenant Commander John L. Callan, to duty under chief of naval operations (aviation), Navy Department, Washington, D. C.

Lieutenant C. G. Little, to duty navy air station, Cape May, N. J.

Lieutenant Louis T. Barin, to duty under chief naval operations (aviation), Navy Department.



Lieutenant Rufus H. Bush given appointment as naval aviator in U. S. N., November 19, 1918.

Lieutenant Ralph M. Strader to duty navy air station, Pensacola, Fla.

Lieutenant (junior grade) Burr L. Moultrop, to duty navy air station, Rockaway Beach, L. I.

Lieutenant (junior grade) Gilbert W. Douglas, to naval air station, Rockaway Beach.

THE CURTISS MODEL 18-T TRIPLANE

CLOSE attention to the lines of air flow has resulted in the production of a machine which is pleasing to the eye and at the same time mechanically and aerodynamically correct. The fuselage presents an almost continuous contour; the tail units are so set that they appear as natural and expected extensions of the body; the engine cowling and exhaust manifolds complete the unity of the design.

In normal flight the Curtiss model 18-T triplane attains a speed almost equalling that of most machines diving vertically. In recent speed tests the 18-T established the world's record for speed for a successfully controlled continuous horizontal flight.

The machine is designed around the Curtiss Model K-12 aeronautical engine which was described in detail in AERIAL AGE on February 3, 1919. The propeller is practically centered on the engine and fuselage by the location of reduction gears integral with the engine.

The propeller, either two or four bladed, is supplied according to requirements of performance. Viewed from the pilot's seat, the propeller rotates in a clockwise direction.

Standard instrument equipment includes a tachometer, oil gauge, gasoline gauge, and complete set of tools. Additional equipment supplied as ordered.

General Dimensions

Wing span, upper plane	31′ 11″
Wing span, middle plane	31′ 11″
Wing span, lower plane	31′ 11″
Depth of wing chord (upper, middle and lower)	42″
Gap between wings (between upper and middle)	42″
Gap between wings (between middles and lower)	35 9/16″
Stagger	none
Length of machine overall	23′ 3 3/16″
Height of machine overall	9′ 10⅜″
Angle of incidence	0.2½°
Dihedral angle	none
Sweepback	0.5°
Wing curve	Sloane
Horizontal stabilizer—angle of incidence	0.5°

Areas (*Square Feet*)

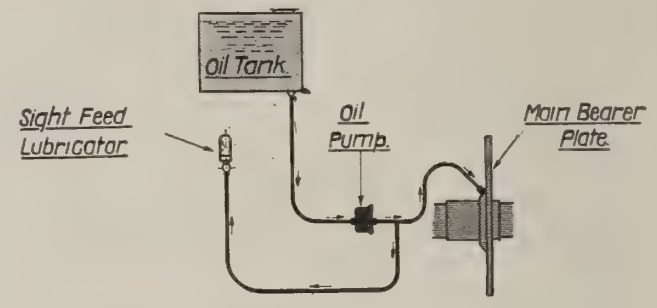
Torque re-action at 1,200 r.p.m.	127 h/p
Useful h.p. deducting windage	
Useful h.p. at 1,250 r.p.m.	112 h.p.
Useful h.p. at 1,200 r.p.m.	112 h.p.
Petrol consumption at 110 b.h.p.	.765 pint per h.p. per hour
Petrol—specific gravity	.072
Volume of compression space	417 cu. c/ms
Stroke volume of engine	1,672 cu. c/ms
Compression ratio	5 : 0
Rotation of engine facing propeller	anti-clockwise
Lift of exhaust valve	10.5 m/m
Lift of inlet valve	10.5 m/m
Diameter of inlet and exhaust valve	45 m/m
Clearance between rocking lever and inlet valve	1.0 to 1.2 m/m
Clearance between rocking lever and exhaust valve	0.8 to 1.0 m/m
Piston ring cap	0.5 m/m
Clearance between ring and piston groove	0.1 m/m
Magneto rotation	Clockwise
Magneto speed at 1,200	2,700 r.p.m.
Magneto speed at 1,250	2,812 r.p.m.
Magneto advance	20° to 26°
Tachometer speed at 1,200	2,160 r.p.m.
Tachometer speed at 1,250	2,250 r.p.m.
Tachometer rotation	Clockwise
Order of firing cylinders	1, 3, 5, 7, 9, 2, 4, 6, 8
Inlet valve opening past top dead center	30°
Inlet valve closing past bottom dead center	30°
Exhaust valve opening before bottom dead center	40° to 45°
Exhaust valve closing past top dead center	16°
Lubricating oil	castor oil
Lubricating oil specific gravity	.96
Lubricating oil consumption	9 to 10 pints per hour
Weight of engine with oil pump and magneto	323 lbs.

Fixed Part

The fixed part consists of a hollow crankshaft, which is keyed to and supported by the main bearer plate. The main bearer plate is rigidly fixed to the forward support of the aeroplane by means of bolts, whilst the centralizing plate, fixed to the rear support of the aeroplane, carries the end of the crankshaft.

The crankshaft projects in front of the main bearer plate, and the whole of the rotating parts are mounted on its support, but are free to revolve.

Various accessories, viz:—The magneto, the oil pump and the brush holder are carried on the main bearer plate. The carburetor is fixed at the extreme end of the crankshaft, through which passes the vaporized mixture into the crankcase and thence to the cylinders.

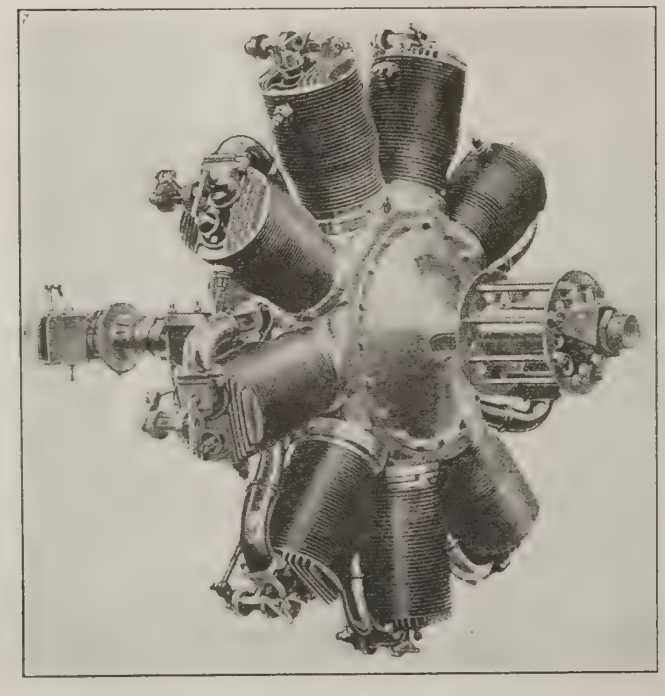


The crankshaft is extended in front by a short end crank.

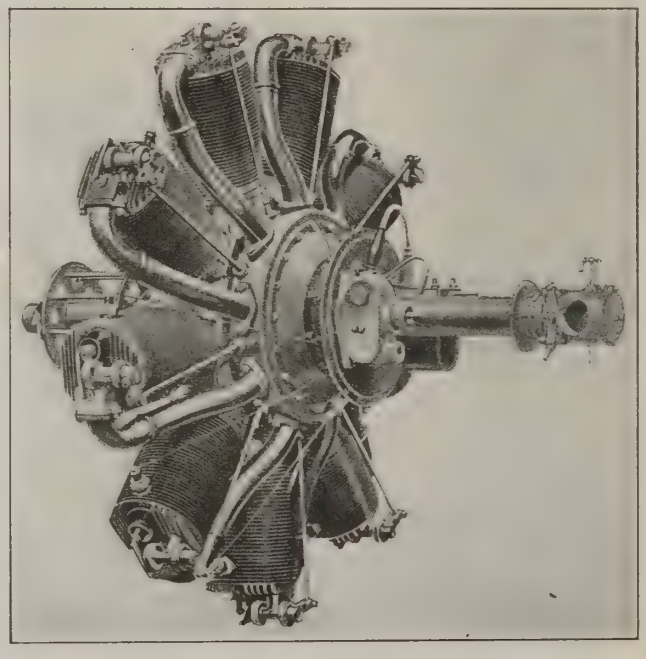
The lubricating arrangements are entirely contained in the crankshaft.

Rotating Part

The rotating part consists of:—The crankcase, the cylinders, connecting rods and pistons, valve gear and part of ignition arrangements.

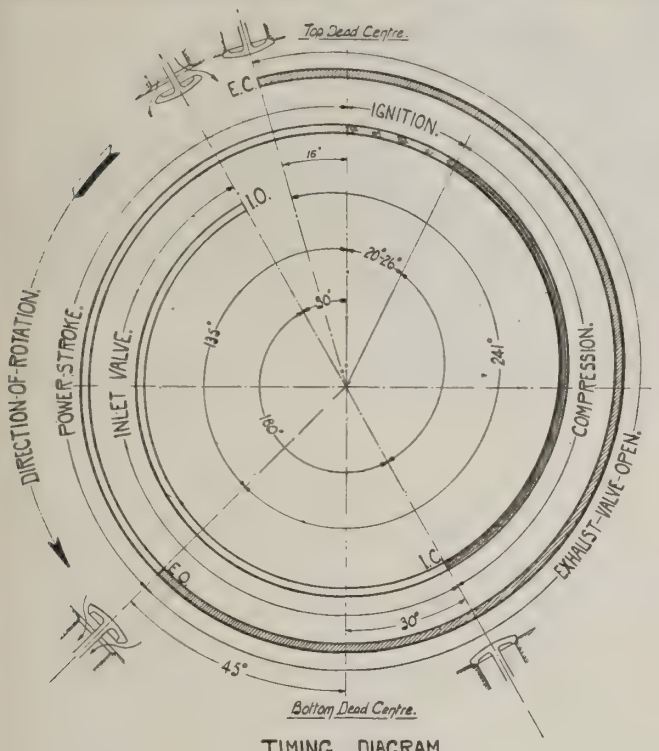


Crankcase:—The crankcase carries a medium nose in front, on which is fitted the propeller hub. On the back of the crankcase is fitted the back cover, to which is secured the cam driving gear wheel and the magneto driving gear wheel and the distributor. The whole turn about the crankshaft on three journal ball bearings. The last of these is of the double row radial and performs the additional function of absorbing the propeller thrust. Refer to Sectional Arrangement.



Diagramatic Sketch of Oiling System.

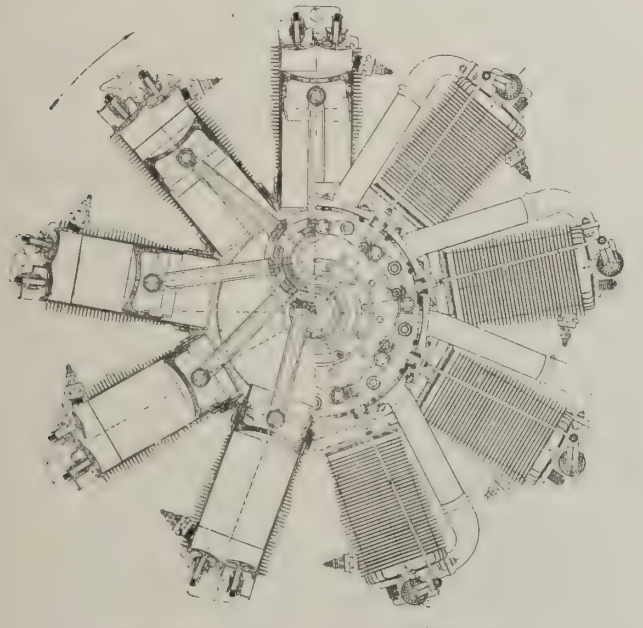
Cylinders



The cylinders are screwed into the crankcase and secured with locking rings. The interior is provided with a cast iron liner, which is put in under pressure. In the cylinder head are situated the seats for both inlet and exhaust valves, which

110 H.P. Le Rhone Engine—Front View

110 H.P. Le Rhone Engine—Rear View



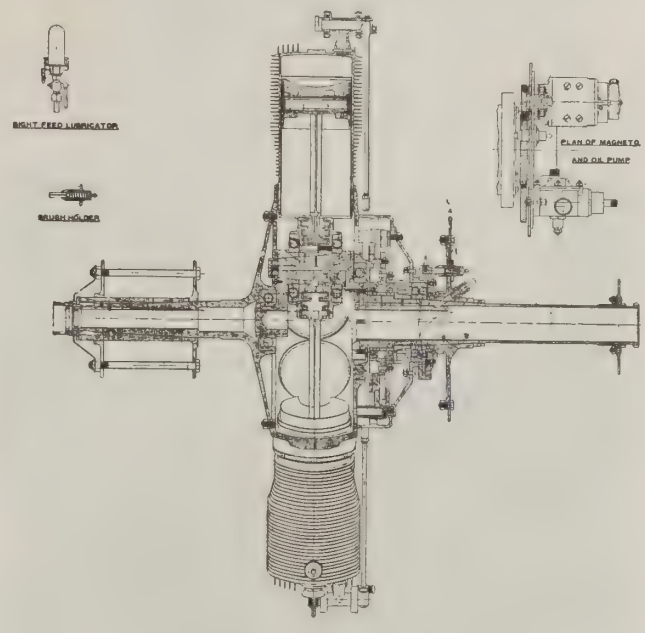
TIMING DIAGRAM.

are interchangeable. The inlet valve guide seating is screwed into the head of the cylinder. These valves are brought back to their seats by very light springs, which ensure their operating when starting up; when up to speed, centrifugal force brings them back to their seats. The valve rocker operates alternately the inlet valve and the exhaust valve, by reason of its oscillating motion in the valve rocker tea piece which is fitted with ball bearings. On this rocker is fixed a lever operated in turn by the valve rod. The induction pipes, each in two pieces, convey the carbureted mixture from the crankcase to the inlet valves.

Connecting Rods and Pistons

The connecting rods are connected to the crankpin by the connecting rod thrust block, which is made in halves running on two ball bearings mounted on the crankpin.

Three sets of three connecting rod heels, each set being of different size, slide in annular grooves lined with bronze, which are provided in the connecting rod thrust block. This arrangement allows the connecting rods to rock relatively to one another. Nine screws hold the halves of the thrust block together.



Rear diagram of the 110 H.P. Le Rhone Motor

The pistons are of aluminum fitted with two phosphor bronze bushes. The gudgeon pin is of the floating type and is prevented from rubbing the cylinder walls by means of two circlips, which are fitted into grooves in the bushes. There are five piston rings which are of special steel.

Valve Mechanism

The valve mechanism consists of two cams, one induction cam and one exhaust cam operating nine cam rockers, each connected to its valve rod. The rockers receive oscillating motion caused by contact of the induction cam rollers and the exhaust cam rollers on their respective cams. It will be seen that centrifugal force acting on the valve rod will tend to keep the induction cam roller hard on its cam. This consideration is very important, and the value of it will be understood in connection with the setting of the valve timing. A cam is fitted on each side of the cam boss which is free to rotate upon the ball bearing mounted on the crankshaft. On the back cover is bolted a gear wheel having 54 teeth, which is in mesh with a gear wheel of 60 teeth cut internally, which is mounted on the cam boss to keep the gears in mesh. The ball bearings are mounted eccentrically, the amount of eccentricity corresponding to the difference in the radius of the gear wheels.

The profile of each cam is repeated exactly five times round

Side view diagram of the 110 H.P. Le Rhone Motor

the periphery. This profile combined with the eccentricity and the centrifugal force of the valve rod gives the nine rockers the necessary motion at the moment of opening and closing the valves.

Ignition

To the main bearer plate is attached the magneto, the pinion (16 teeth) of which is driven by a gear wheel which rotates with the crankcase. The magneto is provided with a contact breaker determining the point of ignition, which is the same for all the cylinders. A high tension wire conducts the current to the brush holder, which is also fixed on the main bearer plate.

The brush in the brush holder works on the surface of the distributor, which is fixed to the back cover and has nine separate segments. A bare brass wire is carried from each of these segments to the corresponding sparking plug fitted to the cylinder.

Referring to the order of firing in the cylinders given in Paragraph II, it will be seen that the distributor must only transmit the current alternately and in the order 1, 3, 5, 7, 9, 2, 4, 6, 8, each point of ignition corresponding to the moment when the platinum points of the magneto separate.

Lubrications

The oil pump previously stated is fixed on the main bearer plate the spindle of which carries a pinion also driven by the gear wheel fixed to the back cover.

The worm is cut in the center of the oil pump spindle which drives the worm wheel mounted on the oil pump crank-

SAND TESTING OF AEROPLANES

By ALBERT S. HEINRICH

DURING the last year of the War the United States and foreign Governments spent millions of dollars in sand testing aeroplanes of different types from different designers to determine their structural strength, and correctness of design. Owing to the many different methods of analyzing the stresses in an aeroplane, and also the different type trusses employed in aeroplane design, it has been practically impossible to adapt any one type of truss and apply it to all types of machines, as what proves most satisfactory for one machine will be very unsatisfactory for another, and although the method of trussing the wings of different types of machines has been more or less standard all over the world, the past year has shown some radical changes in design, and the analytical method of determining the stresses and strength of different structures has proven to be most anything but correct in most cases; therefore, it has been necessary to adapt a standard method of sand testing all machines before they are flown or accepted in order to prove the correctness of design and show up any weak parts in the structure. The loading should be applied as quickly and uniformly as possible, and the total elapsed time after the first loading is applied should not take more than two hours, as the time element is often the leading factor in determining the ultimate strength of the structure, as material fatigue from keeping the members stressed and strained too long will often give misleading results.

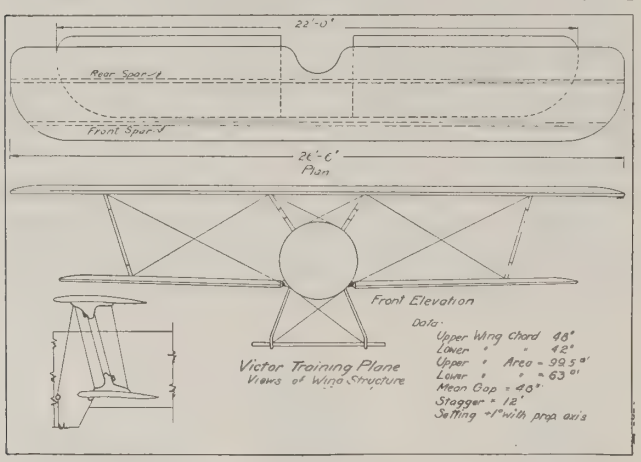

Figure 1—Three views of the wing structure, together with the landing chassis

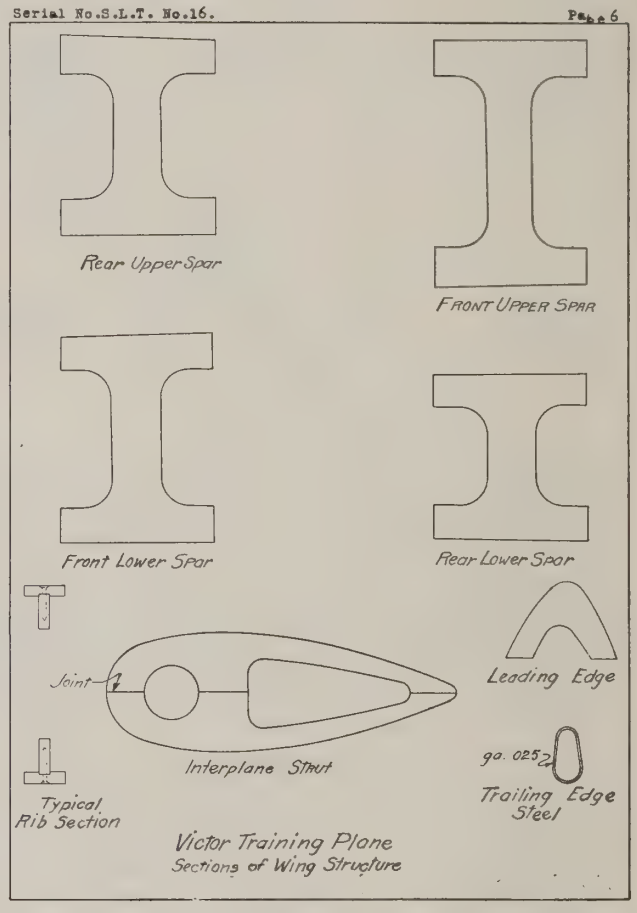
Figure 5—Machine set at proper inclination, ready for application of sand



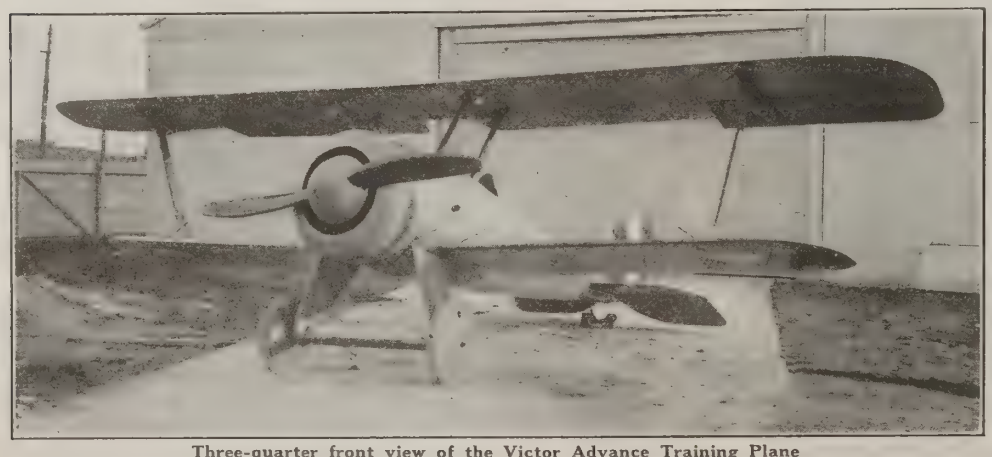


Figure 2—Sections of wing members and one of the large struts

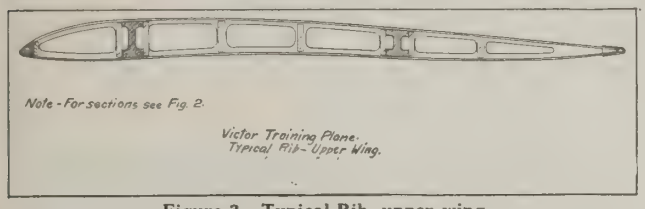
The following tests were conducted at McCook Field, Dayton, Ohio, on the Victor Advance Training Plane, shown in Photos 1, 2, and 3.

General Description and Dimensions

The Victor Aeroplane, built by the Victor Aircraft Corporation, Freeport, Long Island, is a single-seated training biplane, equipped with either a 100 H.P. Gnome or a 90 H.P. Le Rhone motor, with the Gnome motor it makes 115 m.p.h., and with the Le Rhone 110 m.p.h. The total weight with the Gnome motor is 1,235 lbs., and with the Le Rhone motor 1,065. The machine used in this test was built for the Le Rhone motor. Figure 1 shows three views of the wing structure, together with the landing chassis, which connects the lower wing spars in this machine. There are two spars in each wing,

Three-quarter front view of the Victor Advance Training Plane

interplane compression members consisting of single struts with large column heads, connected to both spars, thereby reducing the parasite resistance considerably. The full-size section of one of the large struts is shown in figure 2, and the upper end of one, after failure, may be seen in figure 8 showing the sheet steel end and details of other parts of the structure. The ribs are of very light construction, having plain webs, reinforced by thin strips of fibre fastened by wire staples to each side of the verticals, as shown in figure 3. Full-size sections of ribs, spars, and two edges are drawn in figure 2. Figure 8 also shows a part of one of the single-control masts operating each aileron. This mast has two long arms on the lower surface of the



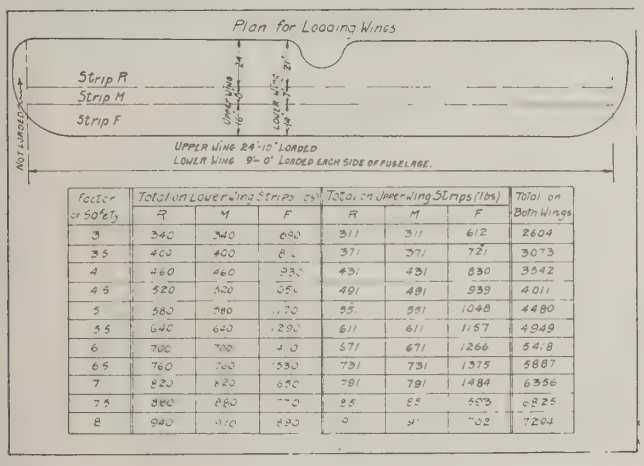


Figure 3—Typical Rib, upper wing

aileron, and the cables pass from the ends of these arms through the lower wing to the fuselage, thus giving a simple, strong control system.

The following is an abbreviated weight schedule:

Body complete	208
Empennage	24
Landing Chassis	51
Lower Wings	45
Upper Wings	70
Interplane Struts	32
Motor, Cowl, Prop, etc	320
Pilot	165
Fuel and Oil	150
Total	1,065 lbs.

Factor of Safety	Total on Lower Wing Strips (lbs) R	M	F	Total on Upper Wing Strips (lbs) R	M	F	Total on Both Wings
3	340	340	690	311	311	612	2604

8	940	940	890	9[illegible]	9[illegible]	702	7294

Table 1—Tabulation of loads applied to wings as shown in Figure 5

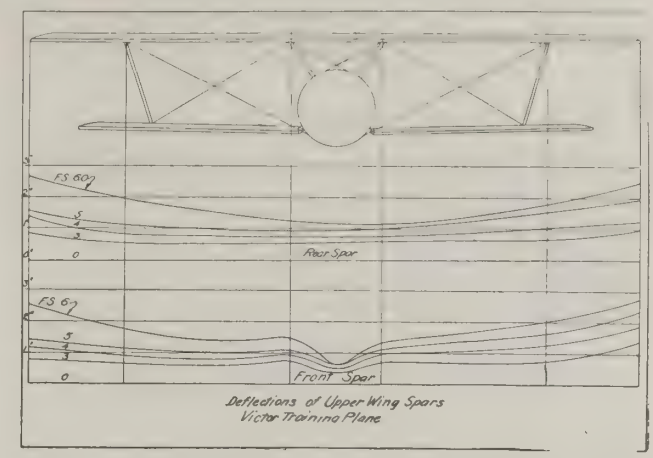
General Dimensions and Areas

Span, upper wing...26' 0"
Area, upper wing...99.5 sq. ft.
Chord, upper wing. 48"
Weight, per sq. ft..705 lbs. sq. ft. with ailerons
Span, lower wing..22' 0"
Area, lower wing..63 sq. ft.
Chord, lower wing. 42"
Weight, per sq. ft..715 lbs. sq. ft. with aileron cables
Stagger..... 12"
Mean gap..... 48"
Angle incidence....+1° with prop. axis
Weight, per sq. ft.. full load 6.56
Pounds, per H.P.... full load 11.85

The drag from the wings is taken by the lift wires, which are set forward at the fuselage for this purpose. Incidence wires are done away with in this design, being replaced by the rigid struts.

Procedure of Wing Test

The general formulat for deter-



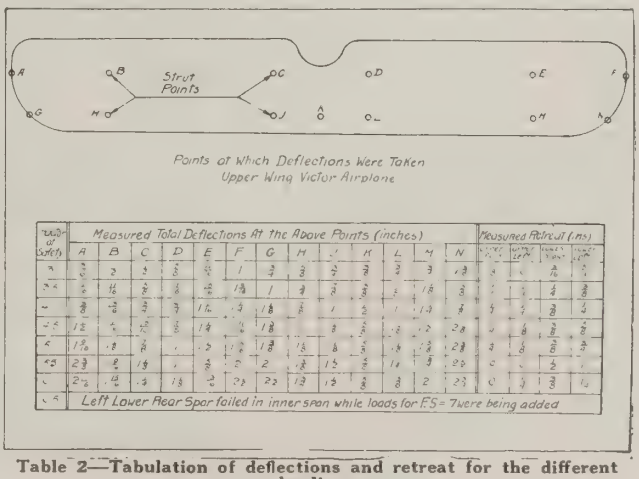


Figure 4—Deflection curves of wings during test shown in Figure 5

mining the send load to be applied to the wings is:

$$Wn = N\ (Wg - Ww) - Ww$$

where Wn = sand load to be applied
Wg = gross load
Ww = weight of wing truss complete
n = any factor of rapidity

If the machine is a Biplane, and the Gap/chord < 1 one sq. ft. of the lower wing is taken as equivalent to 8 sq. ft. of

the upper wing and, where the Gap/chord < 1 one sq. ft. of the lower wing is taken as equivalent to one sq. ft. of the upper wing, and the general formula for determining the load per sq. ft. of the upper and lower wing, respectively, when the Gap/chord < 1 is:

$$W = AuX + Al.\ 8X$$
$$W = Wg - Ww$$
Au = Area upper wings
Al. = Area lower wings
X = load per sq. ft. on upper wing
.8X = load per sq. ft. on lower wing

Direct side view of the Victor Advance Training Plane

Figure 6—General view after just failure in left lower rear wing spar at a factor of safety of 6.5+

The distribution of load along the span of the wings, both upper and lower, is taken as uniform when the variation of the chord is not great; although this condition does not actually exist in the air, the error is not large enough to appreciably affect the final results.

The wing chord is divided into three parts of one-third, one-sixth, and one-half, from front to rear, respectively, with $\frac{Wn}{2}$ on the front, $\frac{Wn}{4}$ on the middle, and $\frac{Wn}{4}$ on the rear part; no sand is put on the trailing edge, so that this method of loading gives the C. P. between 1/3 and ¼ of the chord from the leading edge. The machine is assembled in an inverted position, and trued up carefully after it is set up in the stand. It should be placed on an inclination so that the chord line of the wings makes an angle of 14° to the horizontal. This method imposes the necessary draft load on the wings that a machine would get when coming out of a dive suddenly, which is the worst condition that exists in flying. Figure 5 shows the machine set at the proper inclination, ready for the sand to be applied.

The wings attached to the fuselage were supported upside down on two timbers cut to the contour of the veneer fuselage, as shown in figure 5. Loads were added as per table 1, and vertical deflections and retreat at the wing tips observed for each loading. Table 2 gives a tabulation of all deflections

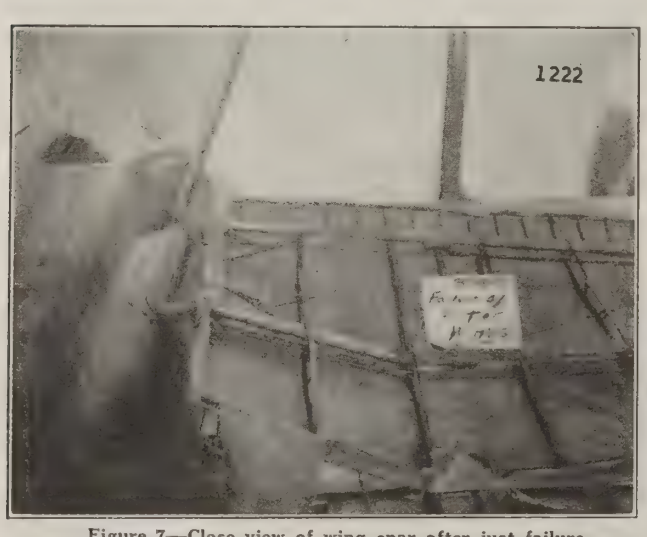

Figure 7—Close view of wing spar after just failure

and retreat for the different loadings, and figure 4 gives deflection curves.

The first failure occurred in the left lower rear spar, near the fuselage, as shown in photographs in figures 6 and 7, only the upper wing was supported by jacks while adding loads, the lower wing not being relieved of its load at any time. It is apparent from the front elevation in figure 1 that as only the flying wires are stressed during a sand test, no direct stresses can exist in the upper spars, but only beam action, which is not affected by jacks on the lower wing. In this case failure occurred while loads were being added slightly in excess of F. S. 6, 5. This test was continued on the other side until the lower rear spar broke at identically the same place as the left spar at a loading slightly over 8. No deflections were taken after the first failure, as they would not give a true indication of spar deflections. Slight buckling in the outer struts was observed at the higher loadings, but it did not assume alarming proportions at any time. Long before the first failure in the left wing, a sharp break was evident in the trailing edge at the place where the final failure occurred, this, undoubtedly, being caused by an accident that occurred to this wing when being set up, but at the time was not considered serious. It may have weakened this wing considerably.

This may be observed in the photograph figure 5, and is confirmed by the much greater strength of the right wing and the smoother deflection curve noticeable in this wing. The failure in the upper wing spar and strut head are not of much value as they were, probably, caused by eccentric loading due to the condition of the lower wing.

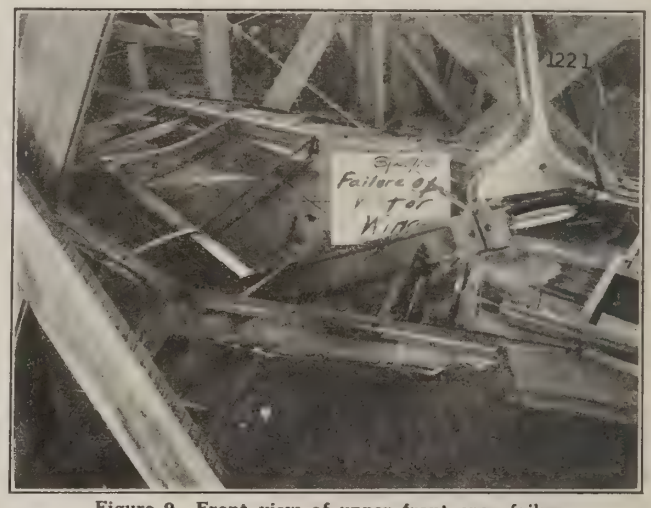

Figure 9—Front view of upper front spar failure

Conclusions

The Victor Plane was intended to have a factor of safety of 6.75, and taking into consideration the strength of the left wing, despite its weakened condition, and the much greater strength of the right wing, it may safely be concluded that the structure is strong enough and very satisfactory. The rather small retreat in the wings shows that the single struts are adequate in replacing the usual incidence wires in small machines of this type, but it is questionable whether this type of strut could be used on a much larger machine. The only drawback to this kind of construction is that it does not allow much freedom of adjustment of wings for stagger or incidence, but it, undoubtedly, does reduce the parasite resistance, and no fault can be found with the strength. Considering that the wings weigh less than .71 lb. per sq. ft. complete, the strength of the entire structure is very surprising, and a credit to the manufacturers.

(To be concluded)

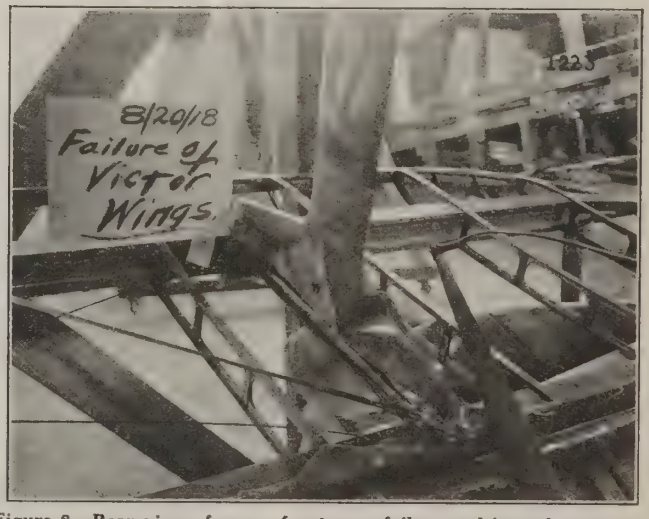

Figure 8—Rear view of upper front spar failure and interplane strut head at factor of safety of nine

SECOND PAN-AMERICAN AERONAUTIC CONVENTION AND EXHIBITION

To Be Held Under the Auspices of The Aero Club of America, The Aerial League of America and the Pan-American Aeronautic Federation.

From Thursday, May 1st, 1919,
to
June 1st, inclusive,
at
Atlantic City, N. J.

Intercollegiate Contests Throughout the Summer

CONTESTS TO BE HELD EACH SATURDAY

(1) Seaplane Contests (general),
(2) Curtiss Marine Flying Trophy and Prizes,
(3) Intercollegiate Seaplane Contests,
(4) Land Aeroplane Contests,
(5) Dirigible Contests,
(6) Kite Balloon Speed in Ascending and Descending, and Maneuvering Contests,
(7) Parachute Competition,
(8) Aviette (bicycles and motorcycles with wings) Contests.

EVERY DAY ACTIVITIES

(1) Exhibits of Aeroplanes, Motors and Accessories on the Steel Pier,
(2) Demonstrations and tests of Seaplanes, Land Aeroplanes, Motors, Dirigibles, Kite Balloons, to prospective purchasers and representatives of different governments,
(3) Aerial Passenger Carrying by seaplanes and dirigibles, and kite balloon ascensions,
(4) Moving pictures and Addresses by leading authorities on most important phases of aeronautics.

The Governments and Aeronautic, Sporting, Scientific, Industrial and Civic organizations of the United States and all the countries in the world, excepting Germany and her allies, are invited to send representatives to attend this great aeronautic event. On arrival in the United States these representatives should call at the Headquarters of the Convention Committee at No. 297 Madison Avenue, New York City, to register and receive their official badges and the official program.

In the event that it is more convenient for them to go directly to Atlantic City they will register at the offices of the Convention located at the following Atlantic City hotels: Hotel Traymore, Hotel Chalfonte, The Breakers Hotel, Hotel St. Charles, Hotel Marlborough-Blenheim, Hotel Chelsea, Hotel Alamac, Hotel Dennis and Hotel Haddon Hall.

Representatives of the Convention Committee will be at the Bureaus of the Aeronautic Convention at the above-named hotels and will issue the official badges which admit the bearer to the Aeronautic Hall, as well as the Aero Exhibition on the Steel Pier, the judges' enclosure during contests, and to the Aerodrome and seaplane stations where the aircraft and motors will be demonstrated.

All communications until May 1st, should be addressed to Rear Admiral Peary, Chairman, Aeronautic Convention, Aero Club of America, 297 Madison Avenue, New York City.

Entries for the competition should be addressed to the Chairman, Contest Committee, Aero Club of America, 297 Madison Avenue, New York City.

DAILY PROGRAM FOR PAN-AMERICAN AERONAUTIC CONVENTION, EXHIBITION AND CONTESTS

THURSDAY, MAY 1ST

Opening of Convention and Exhibit.

AFTERNOON—Reception at Aeronautic Hall on the Steel Pier. Addresses by United States Government State and aeronautic authorities.

EVENING—Aero Show and addresses by officials.

FRIDAY, MAY 2ND

AFTERNOON—Aero Show. Preliminary tests of seaplanes, dirigibles and kite balloons.

EVENING—Moving pictures and address on flying for sport and pleasure.

SATURDAY, MAY 3RD

AFTERNOON—Seaplane and dirigible races, and kite balloon ascending and descending contest.

EVENING—Ball.

SUNDAY, MAY 4TH

MORNING—Memorial service by eminent Divine for the dead airmen.

AFTERNOON AND EVENING—Reception to allied aces and heroes of the air and their parents, and announcement of the award of the Aero Club of America Medal of Valor, and the Aerial League of America Diploma of Honor.

MONDAY, MAY 5TH

AFTERNOON—First parachute contest for $500 Bennett Prize.

EVENING—"The Large Dirigible and Its Value for Transportation." Representatives of railroads, express, steamship and other transportation organizations invited to attend.

TUESDAY, MAY 6TH

AFTERNOON—Illustrated addresses on "Aerial Forest Patrol." Forestry Department of every State invited.

EVENING—"Work of Aerial Police Squadrons, and Why Every City Should Have One."

WEDNESDAY, MAY 7TH

AFTERNOON AND EVENING—Aerial Mail Day. Illustrated address on, and consideration of, "Aerial Mail Planes." Chairman of Post Office and Post Roads Committees of House of Representatives and Senate, and Postmaster General Burleson invited to deliver addresses. (26,000 United States Postmasters, and Chambers of Commerce of 13,000 cities invited to attend.)

THURSDAY, MAY 8TH

AFTERNOON AND EVENING—Illustrated addresses on the "Need of Municipal Aerodromes, and the Part to be Played by Aircraft in City Planning." Chambers of Commerce and City Planning Commissions of 13,000 cities invited to attend.

FRIDAY, MAY 9TH

AFTERNOON—Arrival of seaplanes and army planes from Army and Navy Air Stations. Second parachute competition for the $500 Bennett Prize.

EVENING—Illustrated addresses on "Latest Developments in Aerial Warfare and Adventures in Aerial Warfare," told by famous aces.

SATURDAY, MAY 10TH

AFTERNOON—Army, Navy and Marine Corps Day. Aerial contests and tournament.

EVENING—United States Army and Navy Officers' Reception. Reception and addresses at Aeronautic Exhibition Hall on the Steel Pier.

SUNDAY, MAY 11TH

AFTERNOON AND EVENING—Presentation of the flags by each State of the United States to the Aero Squadrons representing the States. Each State will present a flag to each Aero Squadron, the members of which were overwhelmingly natives of that State. The presentation will be made by representatives from the State and the Aero Club and Aerial League branch of that State. All States and cities invited to send delegates, and Army, Navy and Marine Corps to send representatives.

MONDAY, MAY 12TH

AFTERNOON—Demonstrations and illustrated addresses on the "Value of Aircraft for Advertising by Day and by Night." All national advertisers and advertising agents invited to attend.

EVENING—"Pan-American Aerial Transport Over Land." Addresses by members of the commissions of the 20 Latin-American Republics.

TUESDAY, MAY 13TH

AFTERNOON AND EVENING—"Pan-American Aerial Transport Over Water." Addresses by members of the 20 Latin-American Republics' Commissions.

WEDNESDAY AND THURSDAY, MAY 14TH AND 15TH

AFTERNOONS AND EVENINGS—"The Airways and Aerial Transport in Europe, Canada, Africa, Australia and Asia."

FRIDAY, MAY 16TH

AFTERNOON AND EVENING—"Aerial Navigation Instruments for Flying Over Land and Water." Aviators, navigators, scientific instrument makers and aeronautic experts invited.

SATURDAY, MAY 17TH

AFTERNOON—Aerial races and contests. Illustrated addresses on Aerial Photography.

EVENING—Extensive exhibit of aerial photographs and photographic apparatus. All photographers, professional and amateur, and makers of photographic apparatus invited.

SUNDAY, MAY 18TH

AFTERNOON AND EVENING—Illustrated addresses on "Aerial Exploration and the Use of Aircraft for Coast and Geodetic Survey."

MONDAY, MAY 19TH

AFTERNOON—Addresses on "Need of Broader Attitude Regarding Insurance for Aircraft and Aviators."

EVENING—Illustrated address on "How Army Medical Standards and Inspection Lessen Accidents." Insurance companies and agents invited.

TUESDAY, MAY 20TH

AFTERNOON AND EVENING—Illustrated addresses showing different ways of crossing Atlantic by air and the problems to be solved to accomplish same successfully.

WEDNESDAY, MAY 21ST

AFTERNOON—Aero Safety Day. Discussion of aero safety provisions made; improvements in aeroplane construction; increased reliability of aero motors; devices which make for safety in flying.

EVENING—"Progress Made in the Art of Piloting Aeroplanes." Illustrated.

THURSDAY, MAY 22nd

AFTERNOON AND EVENING—Addresses and discussions of meteorology—"How the Weather Forecasts Can be Extended and Made More Efficient by the Use of Aircraft in Exploring the Upper Air," also "How the Weather Forecasts Help Aerial Navigation," and "Telegraphic and Climatic Factors in Relation to Aeronautics.

FRIDAY, MAY 23RD

AFTERNOON AND EVENING—Addresses on "Aerial Jurisprudence—Aerial Laws and Regulation of Air Traffic." (First day.) Lawyers, traffic commissioners and police authorities of different countries invited.

SATURDAY, MAY 24TH

AFTERNOON—Races and contests.

EVENING—Illustrated address on "Need of Establishing Altitude Levels for International, Interstate and Interurban Air Travel."

SUNDAY, MAY 25TH

AFTERNOON AND EVENING—Aeronautic Art Day. Address on "Aerial Painting and Sculpture of Different Countries, and Exhibition of Aerial Paintings," by Lieut. Farre, Lieut. Ruttan and others. All prominent artists, managers of art galleries and art patrons invited to attend.

ENGINEERING WEEK.

MONDAY, MAY 26TH

AFTERNOON—"Aeronautic Engineering Problems and Their Prospective Solution."

EVENING—Opening of contests for designs and ideas for large aeroplanes.

TUESDAY, MAY 27TH

AFTERNOON—"Factors That Increase the Efficiency for Large Dirigibles."

EVENING—"Advantages of Veneer and Plywood for Aircraft Construction."

WEDNESDAY, MAY 28TH

AFTERNOON—Address on "Problems of Flying at 35,000 Feet and Over, and Their Prospective Solution."

EVENING—"Present Day Aero Engines."

THURSDAY, MAY 29TH

AFTERNOON—"Flying Boats Versus Hydroaeroplanes for Sport and Transportation."

EVENING—Contest for designs and ideas for large aeroplanes.

FRIDAY, MAY 30TH (Memorial Day)

AFTERNOON—Dirigible races, kite balloon speed ascending contest; parachute contest.

EVENING—Reception at the Aeronautic Hall, Steel Pier.

SATURDAY, MAY 31ST

AFTERNOON—Seaplanes, land planes and dirigible contests. Aviette competition at which all cyclists and makers of bicycles and motorcycles will be invited.

EVENING—"International Medical Standards for Aviators in War and Peace." Reports from different countries illustrated with attractive films. 50,000 medical men invited.

SUNDAY, JUNE 1ST

AFTERNOON AND EVENING—Award of prizes and diplomas for all events.

THE THOMAS-MORSE TYPE S-6 TWO-SEATER

TO provide a slow landing machine of the two-seater type for training purposes or civilian use, the type S-6 Tandem Two-Seater has been brought out by the Thomas-Morse Aircraft Corporation.

The Tandem Two-Seater follows along the lines of the S-4 C Scout with such modifications as are necessary to carry the passenger. The wing area has been increased to take care of the added weight and minor changes made with a view to reducing the gross weight without, however, infringing upon the safety factor which a machine of this type requires.

Dual stick type control is installed with flexible conections in the passenger's cockpit, so that the pilot may maintain control at all times. Good performances are observed in this machine. Its high speed is 105 M. P. H., landing speed 38 M. P. H., and it has the ability to climb to an altitude of 8,000 feet in the first ten minutes. The general specifications of the Type S-6 Tandem Two-Seater are as follows:

Side view of the Thomas-Morse Type S-6 Tandem two-seater

General Dimensions

Length	20′ 8″
Spread	29′ 0″
Height	8′ 10″

Weights

Total weight (loaded)	1,385 lbs.
Area lifting surface (including ailerons)	296 sq.ft.
Loading per sq.ft. of lifting surface	4.68 lbs.
Required horse power	90
Weight of machine (loaded) per h.p.	15.4 lbs.

Power Plant

Type of engine	80 h.p. Le Rhone (air cooled rotary)
Engine revolutions per minute	1,250
Fuel capacity	20 gallons
Fuel duration at full power	2½ hours
Oil capacity	4 gallons
Oil duration at full power	3 hours
Propeller type	2 blade
Propeller diameter	7′ 10″
Propeller revolutions per minute	1,250

Chassis

Type	"Vee"
Wheels	2 (tread 5 ft.)
Tires	26″ x 3″

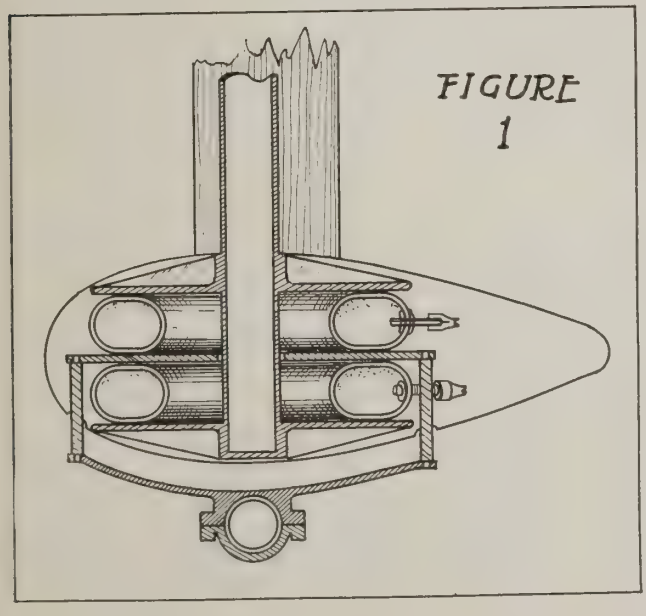
Areas of Control Surfaces—(*Square Feet*)

Ailerons (four)	31.5
Elevators	16.8
Rudder	8.5
Horizontal stabilizer	14.5
Vertical stabilizer	3.5

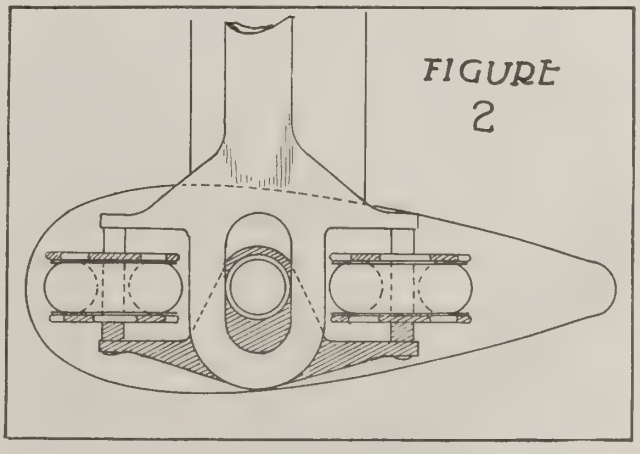
Stick type control used.

Performance

High speed	105 M. P. H.
Low speed	40 M. P. H.
Climb in first ten minutes	8,000 feet



A NEW PRINCIPLE IN SHOCK ABSORPTION



IT is well known that the most difficult part of flying is the "taking off" and in landing, for in these manoeuvers damaging strains are put upon the landing gear and distributed throughout the machine. Means for absorbing these shocks have led to many forms of landing gear designs and at the present time the problem seems to have resolved itself into devising the best manner of employing rubber shock absorber cord.

A point which has yet to be covered in the design of landing chassis is the elimination of rebound when the machine strikes the ground, and it is in this direction that designers must turn their attention before great progress can be looked for and before a solution can be found for overcoming difficulties in landing.

Experiments and research have been carried on by Colonel William N. Amory, the inventor of an air cushion shock absorber which has proven its value as far back as 1899, when he experimented with a pneumatic shock absorber for bi-

(*Continued on page* 175)

ATMOSPHERIC CONDITIONS AFFECTING POWER

By A. JOHNSON

IN estimating for aeronautical purposes the probable power and consumption of an engine at elevations above sea level, it is necessary to possess a table showing the density, pressure, and temperature of the atmosphere at different heights. It is the purpose of this article to give such a table, and to collect in a convenient form the mathematical reasoning on which it is based.

The atmosphere may be considered as a mass of elementary gas expanding in opposition to the action of gravity according to the adiabatic law so that pv^y is constant. If the expansion were truly adiabatic—that is, if the gas received no heat during expansion—the numerical value of y would be 1.4, and the temperature of the atmosphere would diminish with height at the rate of 3° Centigrade for each thousand feet. But the atmosphere does receive heat during expansion, directly from the sun and indirectly by radiation from the earth, and it has been found by observation that its temperature diminishes with height almost exactly at the rate of 3° Fahrenheit for each thousand feet. The value of y which would yield an exactly corresponding result is $y = 1.18985$, but it is near enough, and much more convenient for arithmetical calculation to put $y = 1.19$, and to assume that within the limits with which we are practically concerned the atmosphere expands so that $pv^{1.19}$=constant and $Tv^{.19}$= constant. It behaves, in fact, precisely as if it were a gas of higher specific heat expanding adiabatically.

Considering, then, a quantity of air weighing 1 lb., the following assumptions are made:

p_o = Pressure at sea level.
= 2116.8 lb. per sq. ft.
= 14.7 lb. per sq. in.
= 29.9 in. barometer.
T_o = Temperature at sea level.
= 60° Fahr. = 521° abs.
V_o = Volume at sea level.
= 13.09045 cu. ft.
W_o = Weight per cu. ft. at sea level.
= .07639 lb.

Then, by hypothesis:

$$Pv^{1.19} = C$$

$$v^{1.19} = \frac{C}{p}$$

$$V = C\frac{1}{1.19}p - \frac{1}{1.19}$$

$$\text{and } W = \frac{1}{v} = C - \frac{1}{1.19}p\frac{1}{1.19}$$

and, writing c for $C - \frac{1}{1.19}$,

$$W = cp\frac{1}{1.19} \quad \dots \quad \dots \quad \dots \quad (1)$$

This is a general statement, and since in the particular case $W_o = cp_o\frac{1}{1.19}$ the values of W_o and p_o are known, the value of c can be calculated. When p is expressed in lb. per sq. ft. log. $c = 4.08836$.

Fig. 1 represents a column of air one square foot in area. When h is height in feet, the weight of a thin slice of thickness ($ab = dh$) constitutes the difference of pressure in lb. per square foot between the heights at a and b. Since the pressure is less when h is greater, this difference dp is negative, and therefore

$$-dp = w.dh$$

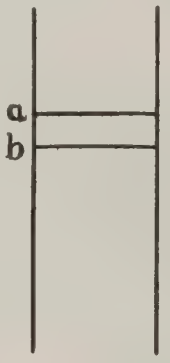


FIGURE 1

Substituting the value of W from Equation (1),

$$-dp = cp\frac{1}{1.19}dh$$

$$\therefore -p - \frac{1}{1.19} = c\frac{dh}{dp}$$

and, aggregating,

$$-\frac{1.19}{.19}p^{\frac{.19}{1.19}} = c.h + \text{const.}$$

$$\therefore p^{\frac{.19}{1.19}} = \text{const.} - \frac{.19}{1.19}ch$$

When h is O the term involving h vanishes, also when h is O, $p^{\frac{.19}{1.19}} = p_o^{\frac{.19}{1.19}}$; therefore

$$p^{\frac{.19}{1.19}} = p_o^{\frac{.19}{1.19}} - \frac{.19}{1.19}ch \quad \dots \quad (2)$$

Equation (2) gives the pressure at any height, and therefore the atmospheric density at the same height can be calculated from Equation (1). Both of these equations assume that the temperature falls in accordance with the adiabatic law, and the extent of the fall of temperature is found as follows, using the general index y:

$pv = RT$, where R is constant.

$$\therefore \frac{pv}{T} = R = \frac{2116.8 \times 13.09045}{521} = 53.186$$

It has been shown that $V = \frac{p^{-\frac{1}{y}}}{c}$

$$\therefore pv = RT = \frac{p^{1-\frac{1}{y}}}{c}$$

$$\therefore T = \frac{p^{1-\frac{1}{y}}}{cR} \text{ and } T_o = \frac{p_o^{1-\frac{1}{y}}}{cR}$$

Substituting from Equation (2) the value of $p^{1-\frac{1}{y}}$

$$T = \frac{p_o^{1-\frac{1}{y}} - \left(\frac{y-1}{y}\right)ch}{cR}$$

$$\therefore T = T_o - \left(\frac{1}{R}\frac{y-1}{y}h\right) \dots . (3)$$

The fall of temperature is therefore a constant multiple of h, and, if in Equation (3) $h = 1000$ and $y = 1.19$, it will be found on making the numerical calculation that $T_o = T = 3.002$ (deg. Fahr.), thus indicating that the value of y has been selected with sufficient accuracy. The table which follows has therefore been calculated from Equations (1) and (2) on the assumption that $y = 1.19$.

These determinations are intended as a conventional standard for the estimation of engine results likely to be obtained at different heights under what are assumed to be normal conditions. They will be found to agree closely with the figures yielded by current formulæ for the determination of elevations from observation of barometric pressures and temperatures at two stations.

Byt the use of the laws known to govern the expansion of gas within an enclosed space, such as a cylinder with a moving piston, it is, then, possible to determine the density and pressure of the atmosphere at various heights above the general surface of the earth with results which are in practically exact agreement with those of standard formulæ designed for the calculation of difference of elevation from observed differences of pressure

Height above Sea Level. Feet.	*Density per Cent.*	Pressure. *lb. per sq. ft.*	Pressure. *lb. per sq. in.*	*Barometer. Inches.*	*Temperature, Degrees Fahrenheit.*

and temperature. Difference of atmospheric conditions appropriate to different elevations affect the power, speed and consumption of an engine in ways which, without giving information to the enemy, may be considered in a purely elementary manner, omitting all reference to the method of supporting the engine (as in an aeroplane), which has its own influence on the results, and to such details as carburetion and ignition, which from a practical point of view are essential factors.

It will be assumed then (*a*) that the engine is simply supported in the atmosphere on an even keel and clear of obstructions, (*b*) that its work consists of driving a propeller, (*c*) that it is supplied with a mixture of a constant proportion by weight of air to petrol, and (*d*) that the barometer at sea level stands at 29.9 inches and that the temperature there is 60° Fahr. or 521° absolute. Since further approximations are used, it cannot be expected that the concluding table exhibits with complete accuracy even the results to be expected on these assumptions. Fractions are merely the arithmetical results of calculations from the assumed data and have no further significance.

If ABCD (Fig. 2) is an indicator diagram, the pressure at A will be p, the atmospheric pressure in lb. abs. per square

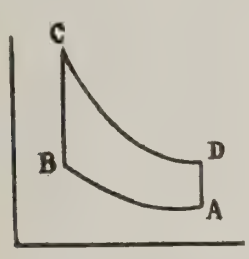

FIGURE 2

inch, and if n be the compression ratio the pressure at B will be pn^v.

With a constant mixture the pressure at C will be Mpn^v where M is a constant, and, since the mean pressure is proportional to the difference between the pressures at B and C, it is proportional to $p(M-1)$, since n^v is constant.

The temperature at A is t, the temperature of the charge at the end of the induction stroke; then the temperature at B will be tn^{v-1}, and, if N be the constant amount by which the charge is capable of raising its own temperature on firing, the temperature at C will be $N + tn^{v-1}$, which is $\frac{N + tn^{v-1}}{tn^{v-1}}$ or $\left(\frac{N}{tn^{v-1}} + 1\right)$ times the temperature at B, and therefore

$$M = \left(\frac{N}{tn^{v-1}} + 1\right) \text{ or } (M-1) = \frac{N}{tn^{v-1}}$$

and $(M-1)$ is proportional to $\frac{1}{t}$, and the mean pressure is proportional to $\frac{p}{t}$. Consequently horse-power is proportional to

$$\frac{p}{t} \text{ (r.p.m.)}.$$

This result is supported by experimental results obtained at ground level, but a difficulty arises in expressing by a simple formula the value of t so that calculations of the horse-power corresponding to higher elevations may be made. Since the charge is introduced into a hot cylinder containing part of the higher than the atmospheric temperature T, and since for equal volumes the specific heat of the denser gas will be higher, it may be assumed that the amount by which the temperature of the entering charge is raised will be inversely proportional to its density. The author considers, therefore, that it is sufficiently accurate to put:

H.P. = horsepower-constant

$$\times \text{ (r.p.m.)} \times \left(\frac{p}{T + \frac{100}{D}}\right) \quad (1)$$

where p is the atmospheric pressure, T is the absolute temperature of the atmosphere in degrees Fahr., and D is the density of the atmosphere expressed as a fraction, density at sea level being unity.

When an engine does work driving a propeller, the power is very nearly proportional to the cube of revolutions and to the density of the medium in which the propeller revolves, and so we may put:

H.P. = constant $\times$ (r.p.m.)$^3 \times$ D ... (2)

Equating the right-hand members of (1) and (2):

$$\text{Constant} \times \text{(r.p.m.)}^3 \times D = \text{(r.p.m.)} \times \left(\frac{p}{T + D\frac{100}{D}}\right)$$

$$\text{Constant} \times \text{(r.p.m.)}^2 = \frac{p}{DT + 100}$$

$$\text{(r.p.m.)} = \text{constant} \times \sqrt{\frac{p}{DT + 100}} \quad .. \quad (3)$$

Height above Sea Level. Feet.	*R.P.M. per Cent.*	*Horse-power per Cent.*
0	100.00	100.00
2,000	99.40	92.40
4,000	98.76	85.19
6,000	98.07	78.38
8,000	97.34	71.95
10,000	96.56	65.88
12,000	95.73	60.16
14,000	94.84	54.80
Height above Sea Level. Feet.	*R.P.M. per Cent.*	*Horse-power per Cent.*
16,000	93.90	49.77
18,000	92.90	45.05
20,000	91.83	40.66
22,000	90.71	36.57
24,000	89.51	32.77
26,000	88.25	29.25
28,000	86.91	26.01
30,000	85.51	23.03

The engine speed may therefore be calculated from (3) and the horse-power from (1) or (2), using the values of p, T, and D tabulated in the previous article and the constant which fits the sea level figures. The results for elevations up to 30,000 feet are stated in the above table.

If the truth of Equation (1) be assumed, the consumption per horse-power should be the same at all heights, for the consumption should be proportional to:

$$D \times \text{(r.p.m.)} \times \frac{T}{T + \frac{100}{D}}$$

and since $\text{H.P.} = \left(\frac{p}{T + \frac{100}{D}}\right) \text{(r.p.m.)}$

$$\frac{T}{T + \frac{100}{D}} = \frac{\text{h.p.} \times T}{p \times \text{(r.p.m.)}}$$

and consumption is therefore proportional to

$$D \times \text{(r.p.m.)} \times \frac{\text{h.p.} \times T}{p \times \text{(r.p.m.)}} = \text{h.p.} \times \frac{DT}{p}$$

but $\frac{DT}{p} = \frac{T}{pv} = \text{constant}.$

Therefore consumption is directly proportional to horse-power.

But the increase of temperature of the entering charge is due to two causes: First, the temperature gained by contact with heated metal which *does* affect the weight of the charge, and, secondly, the temperature gained by mixture with the products of previous combustion which *does not* affect the weight of the charge. This latter statement may appear self-evident to some readers, but will not to others. It may be proved shortly as follows, assuming that the two increases of temperature take place separately.

In Fig. 3 (*a*) v is the total cylinder volume and the compression space, unity. is filled with products of combustion at temperature M. On the induction stroke a

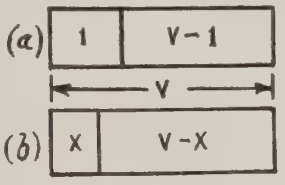

FIGURE 3

voluume of charge heated to temperature T by contact with the cylinder is mixed with the products of combustion, so that the temperature of the whole becomes N, which is less than M and more than T. If then the products of combustion and the charge were separated as in (*b*) they would occupy the volumes x and $(v-x)$, which also represent their relative weights, and therefore

$$N = \frac{xM + (v-x)T}{v}$$

But $\frac{x}{1} = \frac{N}{M}$

therefore $N = \frac{N + (v-x)T}{v}$

and $N(v-1) = T(v-x)$

and $(v-x) = (v-1)\frac{N}{T}$

which proves the proposition, and the charge is, therefore, always of $(v-1)$ volumes at temperature T.

It is not found, however, that the introduction of this complication into the calculation reveals any material departure from the simple relation stated that with a mixture of constant proportion by weight the consumption per horse-power remains constant at all heights.

Total Casualties in Aero Service Abroad Were 554

Washington, March 21.—Casualties in the United States Air Service personnel, serving with the American and Allied armies at the front, numbered 554. Of the total, 171 men were killed in combat.

A table made public by the War Department gives the following official casualty report for the air service at the front:

Killed in combat, 171; prisoners, 135; wounded, 129; missing, 73; killed in accidents, 42; other causes, 4.

The record by months shows the rapid rise in casualties as American fliers began to get into action. It follows:

March, 1918, 2; April, none; May, 27; June, 29; July, 65; August, 82; September, 181; October, 125; November to November 11, 43.

War Department Policy on Retirement of Officers Explained by Order

Washington, D. C.—The War Department recently made public a general order outlining the policy followed in the retirement of officers, as follows:

Circular No. 69.

War Department,
Washington, February 8, 1919.

Assignment and Demotion of Officers

1. During the period of the emergency, officers who are assigned to line duties will be assigned according to their temporary grades as prescribed in the Tables of Organization. In making assignments to staff or other duties, not line, below the grade of brigadier general, officers will be assigned without regard to the grades authorized by the Tables of Organization. General officers will be assigned to duties consistent with their grades, and when they cannot be so assigned orders will be issued by the War Department demoting them to their Regular Army rank.

2. When officers of the Regular Army become surplus in their emergency grades their names will be reported to the War Department. If vacancies exist to which they can be assigned in their emergency grades their names will be reported to the War Department. If vacancies exist to which they can be assigned in their emergency grades they will be so assigned. If no such vacancies exist they will be demoted to their Regular Army rank.

3. Class 1 and 2 emergency officers (Circular No. 75, W. D., 1918) who become surplus will be discharged as prescribed in previous instructions. Class 3 officers will be available for assignment to existing vacancies, or for assignment to Central Training Schools without reduction in rank. Class 3 officers who are not recommended for appointment in the Regular Army during or after attendance at such schools will be discharged when their services are no longer needed.

4. It is the policy of the War Department to return to the inactive list retired officers, now on active duty, who can be replaced by officers on the active list. Chiefs of bureaus and arms of the service and commanding officers who have retired officers on duty under them will submit on February 15, 1919, list of such officers. They will indicate which of these retired officers they consider should be retained on active duty for the best interests of the service. Recommendations for retention of retired officers on active duty must be accompanied by reasons. Retired officers holding emergency advanced rank will be demoted to their Regular Army rank upon being returned to the inactive list.

5. In addition to the normal demotions under paragraph 2 of this circular, officers of the Regular Army who have been found unsuited for their advanced rank and who have not already been demoted, and officers who may hereafter be found unsuited for their advanced rank, will be demoted to their Regular Army rank. Commanding officers and chiefs of staff corps and departments will submit without delay, and from time to time in the future, recommendations for the demotion of such officers. These recommendations will be carefully reviewed by the War Department in connection with the complete records of the officers concerned.

By order of the Secretary of War:

PEYTON C. MARCH,
General, Chief of Staff.

Official:
P. C. HARRIS,
The Adjutant General.

Air Service to Follow Overseas Organization Plan

Washington, D. C.—The War Department authorizes the following statement from the Director of the Air Service:

In connection with the recent announcement regarding the organization of the Army Air Service, Major General Charles T. Menoher pointed out that the system of the staff organization used overseas had been followed.

The Director of the Air Service, assisted by an executive officer who is his official mouthpiece and is authorized to sign his name and in general act as his executive in every sense of the word. The Director's Executive Staff is composed of four officers, one at the head of each division; namely, Supply, Information, Training and Operations, and Administrative. These four officers are not placed in any order of rank nor do they report to each other. They are all responsible to the Director of the Air Service and operate their own divisions.

The first assistant executive has charge of supply, aeroplane engineering, production, procurement, maintenance and finance disbursement for the entire air service in both aircraft production and military aeronautics.

The second assistant executive gathers and distributes all information and in war time would have charge of intelligence work for the whole air service.

The third assistant executive directs training and operations and is at the same time Director of Military Aeronautics. This is the office held at present by Brig. Gen. William Mitchell, who assisted General Menoher in working out the new system.

The fourth assistant executive is practically the Adjutant General of the Air Service, controlling administration and executive work, personnel, office management, cables and correspondence, etc.

Lieut. Col. Wm. C. Sherman, Corps of Engineers, who is a flier and who has been connected with the Air Service for some years, has been detailed as Chief of Air Service Training, which will include heavier-than-air training at the ground schools and flying fields under General Mitchell.

Air Service Division of Surgeon General's Office Discontinued

Washington, D. C.—The War Department authorizes the following statement from the Office of the Surgeon General:

The Air Service Division of the Office of the Surgeon General, created during the war to handle medical problems connected with the aviation service, has been discontinued, effective at once. Business heretofore transacted by this division has been taken over by the Air Service, under the jurisdiction of its chief surgeon.

War Department Announces the Fields It Will Purchase

Washington.—A decision by the War Department to proceed with the purchase of the sites of fifteen army camps and thirteen balloon and flying fields was announced by Acting Secretary Crowell. Less than $15,000,000 would be involved, Mr. Crowell said, and it would not be necessary to await action by Congress, as the department had the necessary funds.

With these purchases completed, the army will have thirty training camps, including the sixteen original cantonments constructed for the training of the National Army, and nineteen aviation centers, most of which will be in the Southeastern States, Texas, and California. The few fields to be retained in the North will be regarded as summer flying centers only.

Twenty-seven camps and fifteen aviation fields will be abandoned. Orders have gone out for the abandonment of twenty of the camps, including nearly all of the National Guard training centers set up after the United States declared war on Germany.

Construction work on the twenty-seven camps, according to War Department figures, represents a cost of approximately $110,000,000, of which $43,000,000 was spent on the four embarkation cantonments—Mills, New York, Merritt, New Jersey, and Stuart and Hill, Newport News, Va.

Approximately $280,000,000 has been spent in construction work on the fifteen cantonments to be bought and the fifteen now owned. It was largely because of the sum involved that the Department decided to go ahead with the purchase.

Most of the thirty camps are now being used as demobilization centers, but no definite plans for their employment after the war army is disbanded have been evolved. It was explained that the whole problem of the future use of the camps depended upon the nation's military policy and that no conclusion as to that could be reached until the Peace Conference at Paris had rendered its decision on world disarmament.

Announcement has already been made that only two flying fields will be actually used in training army aviators in peace time and that others purchased or now owned would become storage plants for material on hand or under contract. Location of the flying centers to be retained shows a plan to have three general training centers, one in the Far West, one in the southwestern part of the country and one in the Southeast, with the different fields in each section close enough together so that elementary and advanced training will be provided within a reasonable area. Total expenditures on the nineteen flying and balloon fields to be retained represent about $30,000,000.

Besides the fields to be bought for military purposes, one other, Chapman Field, Florida, will also be purchased "for business reasons" and subsequently sold. The same procedure will be followed in the case of Camp Sevier, South Carolina, which was used as a National Guard training center. Mr. Crowell said it was cheaper for the Government to buy this field at the option price of $597,940 and sell it again than to pay the damage claim made against the Government as the result of the building of the camp.

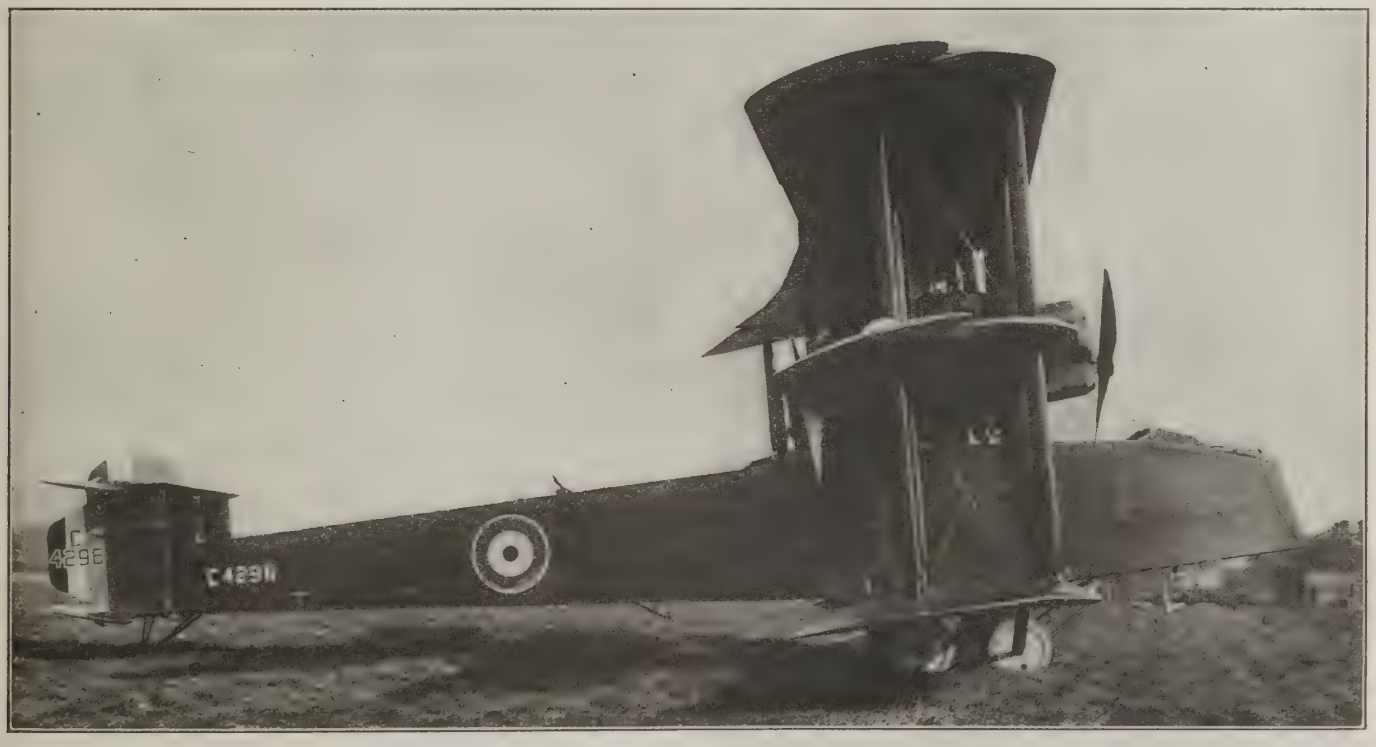
Secretary Crowell also said that the department had contemplated retaining Hazelhurst Field, on Long Island, but that the land would cost entirely too much. The option price on the field was placed at $1,550,000, or nearly twice the cost of the site of any of the thirteen aviation centers to be purchased. The Government has spent $5,348,898 on construction work at this field, considerable more than has gone into any other plant except Langley Field, Virginia, which is to be retained, and Wilbur Wright Field, Ohio, which is to be abandoned.

Decision on Aviation Fields

Flying and balloon fields, the sites of which are owned by the Government and which are to be retained and the cost of construction on each, are:

Langley Field, Virginia, $6,782,109.
Post Field, Oklahoma, $2,263,000.
Kelly Field No. 1, Texas, $1,928,000.
Rockwell Field, California, $832,000.
Lee Hall, Virginia, $818,150.
Fort Omaha and Fort Crook, Nebraska, $597,663.

Flying and balloon fields under option and to be purchased for military purposes, and the cost of construction on each, together with the price at which the land will be bought, are:



Arcadia Balloon School, California.
Brooks Field, Texas, $1,358,000—$170,273.
Dorr Field, Florida, $1,411,737—$5,120.
Carlstrom Field, Florida, $1,199,237—$5,120.
Scott Field, Illinois, $1,737,576—$122,892.
Chanute Field, Illinois, $1,168,022—$208,700.
Ellington Field, Texas, $2,328,991—$102,400.
Kelly Field No. 2, Texas, $2,599,686—$343,686.
March Field, California, $894,071—$64,000.
Mather Field, California, $750,062—$78,653.
Selfridge Field, Michigan, $2,455,426—$100,000.
Park Field, Tennessee, $2,097,079—$88,010.
Souther Field, Georgia, $1,220,497—$32,534.

Fields to be abandoned, with the cost of each, are:

John Wise Field, Texas, $268,266.
McCook Field, Ohio, $799,753.

Fields the sites of which are leased and which are to be retained for temporary storage purposes, and thereafter to be abandoned, follow, with the cost of construction on each:

Barron Field, Texas, $1,264,880.
Call Field, Texas, $1,172,209.
Carruthers Field, Texas, $1,114,311.
Eberts Field, Arkansas, $1,815,840.
Hazlehurst Field, New York, $5,348,878.
Love Field, Texas.
Payne Field, Mississippi, $1,373,815.
Rich Field, Texas, $1,112,385.
Taliaferro Field, Texas, $1,368,416.
Taylor Field, Alabama, $1,274,927.
Wilbur Wright Field, Ohio, $6,224,407.
Gerstner Field, Louisiana.

The Bristol Bomber Triplane Type "Braemar" with 4 Puma engines

FOREIGN NEWS

U. S. to Receive Zeppelins

Paris.—Definite information has reached Washington that Germany will be required to surrender part of her large fleet of Zeppelins, said to number more than fifty. Great Britain is understood to have demanded this action. The United States is expected to receive one or more of the German "Zeps."

London-Paris Record Again Broken

Paris.—Major General John E. B. Seeley of the British War Office on March 16 flew from Folkestone to Paris, a distance of 172 miles, in 74 minutes, establishing a new record for the flight. The aeroplane had the wind behind it.

Bolsheviki to Use Planes for Anti-Allied Propaganda

The Russian Bolshevik government is planning to use aircraft in a propaganda campaign in England and France, according to Swedish press reports made public by the State Department. Aviators for the work are said to be in training at Moscow.

The scheme is to drop papers containing Bolshevik propaganda written in invisible ink.

Michelins Warn of Danger of German Commercial Air Fleets

Paris.—Andre and Edouard Michelin, discussing in *La Liberte* the aerial clauses of the peace treaty, establish a good case, if not for the total suppression of commercial aviation in Germany, at any rate its strict limitations. It is known that aerial clauses in the peace treaty forbid Germany to have any military aviation at all.

The Michelins, who have played a great part in the development of French aviation in the war, declare that there is oniy one difference between a bombardment plane and commercial machine; that is, that the commercial plane has no bomb-throwing machinery.

At the present moment a bomb discharger can be fitted within an hour upon any civilian aeroplane, thus militarizing it. They draw a picture whereby Germany in one night by mobilizing all her civilian aeroplanes and fitting them with dischargers and bombs could send an enormous fleet over Brussels, London and Paris and over the arsenals and mobilization centers.

Commission on Aeronautics Appointed by Supreme Council of Peace Conference

Paris.—The Supreme Council appointed a Commission on Aeronautics on March 17. The American members of the commission will be Rear Admiral Harry S. Knapp and Brig.-Gen. Mason M. Patrick. The council named Belgium, Greece, Portugal, Brazil, Cuba and Rumania to repreesnt the small nations.

King Albert Visit to Pershing by Aeroplane

Chaumont, France.—King Albert and Queen Elizabeth of Belgium are planning a flight from Brussels to Chaumont to pay a visit of several days to General Pershing.

A temporary observation station equipped with sound magnifying amplifiers, which detect enemy planes at a distance of several miles

Two Giant Dirigibles Ordered by England

London.—Following successful trials of new British dirigibles of the rigid type of construction, the Government, according to the *Mail*, has ordered the building of two enormous airships. Each will be 800 feet long, with a capacity of 3,000,000 cubic feet. They will be driven by six engines, which will generate a total of 1,800 horsepower, and, it is said, will have a lifting power of 80 tons, compared with 29 tons, the largest load carried by any known to be in existence.

German Air Raid Damage Over $5,000,000

Basle.—According to official Berlin statistics, the damage done in Germany by air raids during the war period amounted to 23,500,000 marks ($5,875,000).

German Six-Motored Biplane for Transatlantic Trip

The Hague.—At Doberitz a new large Siemens-Schuckert biplane is now undergoing trials ostensibly with the view of ultimately making a bid for the transatlantic record. The machine as designed would, it is estimated, accomplish the flight from Hamburg to New York in twenty hours.

Tanks with about 750 gallons capacity are fitted upon the aeroplane, and it is believed that the total fuel required, amounting to about three times this figure, could be carried by the machine, which has six engines with a total of 1,800 horsepower, driving four propellers.

Ambassador Davis Flies to Coblenz

Coblenz, March 15.—Ambassador John W. Davis and a company of prominent Britons, including Lords Peel and Burnham, respectively Under Secretary for War and owner of the London *Daily Telegraph;* Lieut. Gen. Godley and two each of British major generals, brigadier generals and captains, arrived at Coblenz by aeroplane for a visit to the American Army of Occupation.

Vickers, Ltd., R-80 Dirigible Tested

London.—Another giant dirigible capable of crossing the Atlantic received its first trial on March 20. Her hull is the most careful streamline yet used on a dirigible and the craft is equipped with three bow mooring attachments, which enable her to be moored out from a tower in such a manner that it will be free to turn in any direction with the wind.

Four cars are attached to the hull. The forward control car, the passenger car and two wing cars for machinery only are attached on opposite sides of the airship. The control car is of sufficient size to contain all navigating controls, instruments and navigating crew.

A special type of buffer bag and buoyant covering is fitted in the forward car and also to each machinery car. These buffer bags will enable the airship to float on water and will absorb any bump when landing. The airship will be fitted with four Wolseley-Maybach engines of 240 nominal horsepower each. This engine is specially developed for airship work.

Arrangements are under consideration for preparing this ship to fly across the Atlantic this summer. The airship will carry a crew of sixteen men and will have ample endurance to cross the Atlantic, carry a good number of passengers and still have a considerable margin to allow for flying against adverse winds.

Canadian Airways Selected

The Canadian Government is planning a series of mail and passenger air routes, as follows:

(1) The "All-Red" Aerial Highway, extending from St. Johns to Quebec, Montreal, Ottawa, and straight west along the line of the Canadian Pacific Railroad to Fort William and Winnipeg, to Regine, Moose Jaw, Medicine Hat, Lethbridge, Calgary, through the Canadian National Parks, Revelstoke, Kamloops, Westminster and Vancouver and Victoria.

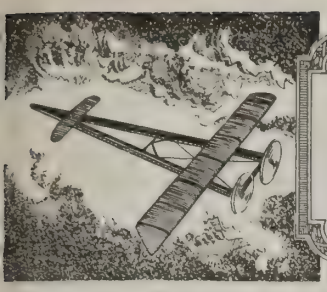
(2) The Sunset Airway extending from St. Johns, N. F., to Sydney, Halifax, St. John, N. B.; Frederickton, Edmundston, Riviere du Loup, Quebec, Three Rivers, Montreal Cornwall Prescott Brockville Kingston, Belleville, Cobourg, Toronto, Camp Borden, Owen Sound, Sault Ste. Marie, Port Arthur, Winnipeg, Prince Albert, Saskatoon, through National Buffalo Park, Edmonton, Mount Robson and Jaspar Parks, Yellowhead Pass Prince George, Hazelton, and Prince Rupert on the Pacific.

(3) The Hudson Bay Trail extends from Winnipeg to Port Nelson on Hudson Bay.

(4) The Dawson Trail extends from Victoria and Vancouver to Prince Rupert, Stewart and to Dawson (or via Juneaut by international agreement). From Toronto an extension of the Sunset Airway will run through central Ontario and connect with the Chanute and Bell Airway at Detroit.

Aircraft Cargo Insured

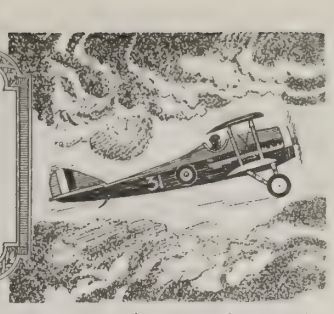
London.—Lloyd's were recently requested to quote on the insurance of an aircraft cargo, consisting of cloth valued at $7,000, for shipment from London to Paris. The rate quoted was 15 per cent for all risks, including theft.



A new corporation, Aviation and General Insurance Co., Ltd., has been organized, with a capitalization of $5,000,000, for dealing in aircraft insurance. Lord Furness is one of the prime movers of the new enterprise.

Another firm, Wheels and Wings Association, Ltd., is offering "flying insurance," and other large and old established insurance concerns are preparing to issue aircraft policies.

Kaiser Makes Another Strategic Retreat



Amerongen, Holland.—Considerable excitement was created at Amerongen Castle, where the fugitive Emperor William is staying, when six aeroplanes appeared suddenly at noon from behind a bank of clouds. They came from the east and, after encircling the castle twice, disappeared in a northerly direction.

The nationality of the machines could not be distinguished owing to the overcast weather, but it is generally assumed that they were Dutch.

ELEMENTARY AERONAUTICS *and* MODEL NOTES

By John F. McMahon

The Motorcycle Engined Aeroplane

(*Continued*)

The tail and rudder are built up in the ordinary way, and covered with muslin also. They are then doped and painted or varnished.

The turtle deck must be made as light as possible, and another thing to remember is that when bracing the body to the rear of the pilot's seat, the wires do not run from the top of the strut just behind the pilot to the bottom connection of the strut following, but instead it goes over to the bottom fitting of the next strut on the opposite longeron. This method does away with the customary cross bracing which holds the body rigid cross ways.

The wheels should be very light, in fact I would specify 20 x 2" and covering them over with muslin doped to insure them being drum tight. This makes a neat stream line wheel. The rim should be of wood instead of steel if possible.

The engine I will describe later, but if the reader wishes to use a standard two cylinder motorcycle engine he can do so; but it might be necessary to use a little more surface and to design some kind of reduction gear arrangement, as it would be impossible to run the propeller at the high speed that a motorcycle would turn up to develop sufficient horse power to insure the machine flying.

The propeller should turn up one to two, that is while the engine turns two times the propeller turns but once. This allows the propeller to turn slower, thereby insuring the maximum efficiency.

The Curve we are using is the U. S. A. No. 1, and a profile is given here with dimensions.

The accompanying cut gives all the dimensions necessary for the building of the Motorcycle Engined Aeroplane, mentioned in the last issue of AERIAL AGE.

The machine when complete should weigh no more than 300 lbs., net weight. This with the pilot and fuel will bring the gross weight to 500 lbs. The U. S. A. Wing Curve No. 1 shows a Ky of .003165 at an angle of 14° at 35 M.P.H. we need

$$\frac{500}{.003165 \times 35^2} = 128 \text{ square feet.}$$

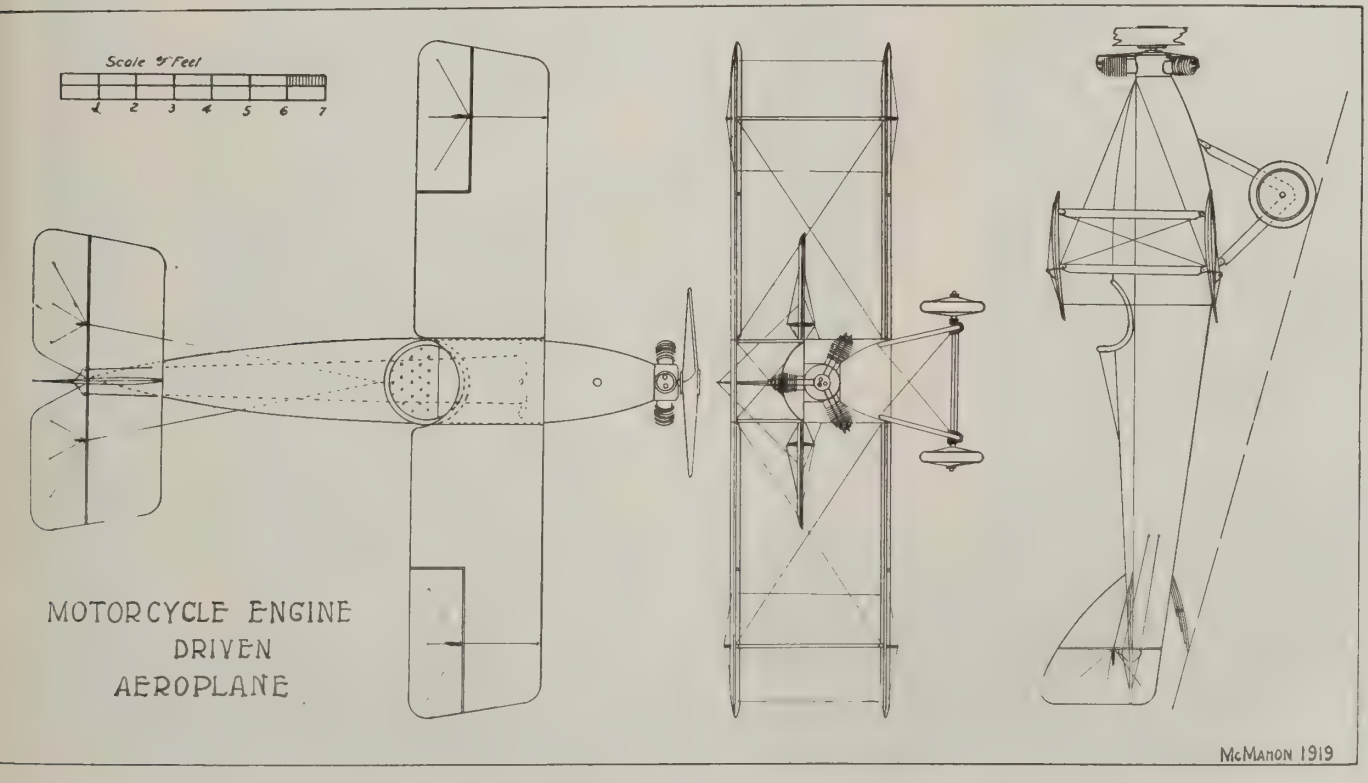
We are using a gap of four feet and a chord of three and a half feet. This combination gives us an efficiency of nearly 100 per cent in our biplane arrangement and we need not add any surface to compensate for theoretical loss.

The spread of the wings being 18 feet and the chord 3½ feet gives us approximately 120 square feet surface, considering the loss of the section over the pilot's head and the ends of the wings.

An engine of the kind I speak of as a Three Cylinder Motorcycle engine develops about 27 horse power, which is considerable for a machine of this light weight, and we should get good speed.

If the person attempting to build this machine should not care to construct a motor of this kind, he could use the W. B. B. Motor, which develops 38 horse power and weighs 130 lbs, and sold by the Lawrence Sperry Aircraft Co., Farmingdale, L. I; the Lawrance 60 horse power aero engine, sold by the Lawrance Aero Engine Corp., No. 644 West 44th Street, New York City. This engine also weighs but 130 lbs., and with this horse power the machine could attain tremendous speeds. Or a fair compromise and one that would just equal the performance of the three cylinder engine I proposed, is the Two Cylinder Opposed Lawrance Motor of 28 horse power and which is the type of motor the Government used on the training penguins. A quantity of these motors are advertised in the advertising columns of this paper by Mr. E. C. Marble, No. 12 South Jefferson Street, Chicago, Illinois.

Any of the motors mentioned above can be used with good results, but of course the greater the horse power the faster you fly. The weights of these motors, being almost alike, one or the other would not change the balance of the machine.



A single set of struts are used instead of two, as on the Ford Motored Machine. The controls are hooked up in the same fashion, and as I mentioned in an earlier article the Ford Motored fittings can be used on this machine.

The covering of the machine is unbleached muslin tightly stretched over the body and the wings, after which a couple of coats of wing dope is applied, and when dry a coat of good outside aero varnish.

A speed of close on to 80 M.P.H. will be attained with a motor of 27 horse power. The wings must be set at an angle of 1° only. 1° means that the entering edge must be about ¾" heigher than the trailing edge.

A machine of this type will be very difficult to handle for an experienced pilot and very cranky in the air.

(*To be continued*)

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

Aviation For Journalists

Time, space, everything will be brought by aeroplanes within striking distance of our great dailies. I can foresee news from all over the world side by side every morning with that from our own capital. And evening papers will vie with one another in the swift turn-out of racing and football results, etc. The problem of the future will not be: "Shall I buy a new linotype?" but "Ought I to invest in an aeroplane?"—M. L. N. in *The Newspaper World.*

Lieût. Matchez of this field announces his engagement to Miss Violet Paper, of Los Angeles.—*Ellington Field Tail Spins.*

We happen to know Lieut. Matchez; and we would suggest to Miss Paper that she watch out. She's liable to get burnt.—*Kelly Field News.*

AVIATION IN TIMES OF PEACE

"Yes! Two seats in the first class. You can come up"

—From "La Rive", Paris

This Is the Aeroplane's Day

The wonders of aircraft are come to stay,
For this is now the aeroplane's day,
And the time is coming when we shall see
Travel by airlines, and that there will be
Airships equipped o'er the ocean to fly,
On which 'twill be the fashion, by the bye,
To book passage should one's fancy incline
To visit Europe via "Cloud Line."

There is now a Cloudland mail as we know,
An air route by which our letters may go,
So that in a billet-doux we may say,
"My thoughts, dear, are flying to you today."
The aerial postman skilled must be
In aviation, in order that he
May perform his hazardous tasks with care
In deliv'ring the U. S. mail by air.

In the sporting world, too, we soon shall see,
Many contests for air supremacy,
With the bird-men competing for first place,
And matching their air yachts in a great race
For a cup; and the Fliers from ev'rywhere,
Interested in airsports will be there.
'Tis the world's new sport that is come to stay,
For this is now the aeroplane's day.—*Rose Villar.*

Hee—"What kinds of machines do they use for reconnoitering?"

Haw—"Seaplanes, I suppose."

A Flight to Fame

(*With Apologies to Messrs. Gilbert and Sullivan.*)

When I was a boy I went to war
As an air-mechanic in the Flying Corps.
I dished out dope, and I swung the "prop."
And I polished up my talents in the fitter's shop.
I polished up my talents so carefully
That now I am a General at the Ministry.

As an air-mechanic I made such a name
That a sergeant-major I soon became.
I wore a gay tunic and a Sam Browne belt,
And my presence on parade was acutely felt.
My presence was felt so overwhelmingly
That now I am a General in the Ministry.

As a sergeant-major I made such a hit
I demanded more scope in which to "do my bit."
Of my lofty ways there was never any doubt,
So they sent me up a-soaring in a Sopwith Scout.
I flew so finely over land and sea
That now I am a General in the Ministry.

I worked in France with such amazing zest
That the King grew tired of adorning my breast.
People boosted McCudden and Bishop and Ball,
But they readily agreed that I outsoared them all!
They declared my merit so convincingly
That now I am a General in the Ministry.

Now, air-mechanics all, wherever you may be,
If you wish to climb to the top of the tree,
If your soul isn't fettered to a pail of dope,
Just take my tip—then there's always hope;
Be smart in the Strand at saluting me,
And you all may be Generals at the Ministry.

—G. S. *in "Flying"—London.*

Champion
Dependable Spark Plugs

YOU'VE read how the fighting planes maneuver—a quick climb—then a plunge—a sharp turn—then a quick reverse turn—can you conceive of anything standing such strains?

Yet each plug must deliver an independent spark every sixteenth part of a second and every spark must come on the instant and fire every charge in every cylinder every time.

That dependability to which one may safely entrust life and limb if need be is inherent in Champion Spark Plugs.

When you realize that Champions supply the spark of life for an overwhelming majority of motors of all kinds, you appreciate how faithfully we are attaining laboratory results in quantity manufacture.

When you buy spark plugs see that the name "Champion" is on the insulator —not merely on the box.

Champion Aeroplane Plug

Heavy Load . . . . . 6000 ft. 10 minutes

THE DIRECTORS OF THE

MARYLAND PRESSED STEEL CO.'S AIRCRAFT DEPARTMENT

desire to announce that, consequent upon the interest in, and demand for the "BELLANCA TWO-SEATER" they purpose substituting the **LATEST MODEL 55 H.P. ANZANI AERO ENGINE** for the 35 H.P. "Anzani" specified in previous announcements, and thus effect a still greater degree of efficiency in important directions and service. Notwithstanding the increased cost of production THE ADVERTISED PRICE WILL BE MAINTAINED.

EARLY PLACING OF ORDERS IS RECOMMENDED

Machines delivered in strict rotation of order placing. Fullest information on request. Address all communications: Harry E. Tudor, Sales Manager, 299 Madison Avenue, New York City. **(Telephone 4332 Murray Hill)**

THE AIR-PILOTS' BUREAU
299 MADISON AVENUE
NEW YORK CITY
Telephone: Murray Hill 4332

Experienced Air-Pilots

(with or without own machines)

Residing in All Parts of the United States

desirous of securing Occasional, Periodical or Permanent engagements and appointments, are invited to send stamped addressed envelopes (or call personally if in or near the City) for Registration Form.

The Bureau covers all open fields for employment of efficient aviators, in the following directions:—

Occasional or Periodical

Flying Exhibitions (Straight, Stunt and Passenger Carrying) in connection with Summer Parks, Shore and Inland Resorts, State and County Fairs, Agricultural Shows, Civic Ceremonies, Fraternal Gatherings, Old Home Weeks, Circuses, Carnivals, and similar enterprises and outdoor events of any and all descriptions. Aerial Advertising, etc., etc.

Permanent

School Directing and Instructing, Piloting privately owned (commercial or pleasure) machines, Aerial Message and Parcel Delivery, and in all other directions where permanent appointments are possible.

The control and methods of the Bureau recommend themselves to those who may require the services of efficient Air-Pilots in any of the capacities named above, and any information desired will be afforded on request.

Address, **THE SECRETARY**

All the experience of this organization in the manufacture of *speed* indicating and *recording* instruments, is available to the manufacturer with a problem in this field of airplane accessory apparatus.

Correspondence is invited

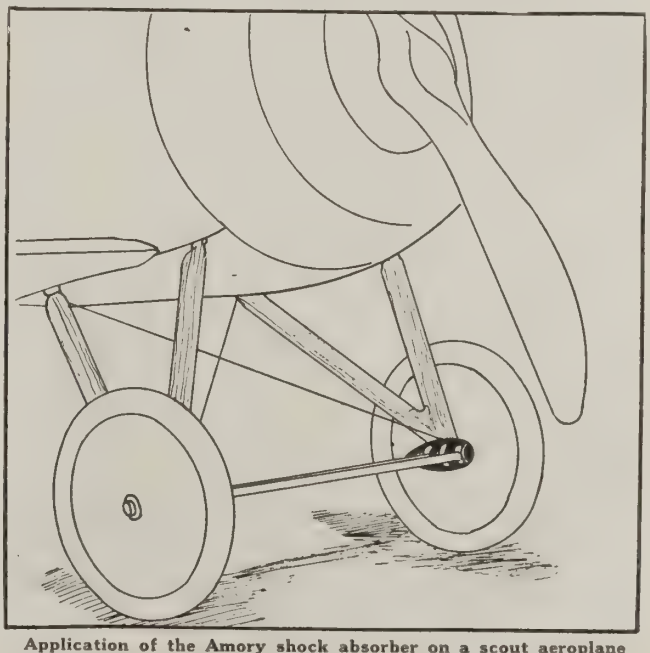
cycles and, later on, for the very first electrical automobiles, which were extremely heavy.



The Amory principle consists of a pneumatic rubber fabric cushion with resilient walls placed between flat metal plates, so arranged that the cushion is double acting and capable of absorbing shocks taken both upward and downward, thereby nulifying vibration. The cushion itself resembles a miniature automobile tire with the air valve on the outside tread. It may be inflated to any desired air pressure by means of a small hand pump. The size of the cushion depends, of course, upon the weight of the machine to which it is attached. It is expected that a pair of these absorbers suitable for the average training plane would probably not exceed 5 or 6 inches in diameter. The design has not as yet been applied to an aeroplane, but its natural evolution from bicycles, carriages, pleasure cars, and heavy motor trucks points the way to its adoption to the most modern vehicle, the aeroplane, where complete shock absorption is of even greater importance than in any of its forerunners.

The practicability of the cushions has been proven, and it merely remains for its designers to work out the actual attachment to the aeroplane. The cushion device might be applied in various ways; for instance, it might take the form of a fitting between the axle and the lower junction of the landing chassis members; it may be employed midway between the axle and the body incorporated in the chassis strut by means of telescoping tubes, or enclosed in a fitting terminating upper ends of landing chassis members.

Single pneumatic cushions may be used, arranged so as to resist the pressure of compression plates fixed respectively to the chassis members on one hand and to the axle or other lower members on the other hand (Fig. 2). These compression plates are alternately arranged and moved past each other as the fuselage moves up and down with the relation to the wheel carrying member.

Another form which this shock absorber may take is in the employment of pairs of pneumatic cushions, one upon the other and taking the landing shock and rebound respectively (Fig. 1). In this case the rebound cushion is brought into play more promptly and is much simpler in operation than the single cushion used for both impact and rebound.

The accompanying diagrams of the Amory air cushion principle, drawn by the Technical Editor of AERIAL AGE, do not represent the finished design, but merely illustrate the principle of action and give an idea of the varieties in which the device may take form. Laboratory experts will make exhaustive tests on the various fittings employing this air cushion principle, and reduce the device to an efficient, simple and compact arrangement that will result in minimization of dangerous rebound and secondary shock in landing.

Application of the Amory shock absorber on a scout aeroplane

Wings

HUNDREDS of thousands of people who visited the Aeronautical Exposition which ended last night must have realized that we are literally and without exaggeration on the threshold of a new age whose developments the most imaginative can hardly foreshadow. The change in the outward appearance of civilization made by the railroads between 1830 and 1880 will very possibly be far surpassed by the changes which aviation will make in the next half century. A few years ago one of Mr. H. G. Wells's romances predicted the settlement of cities on plateaus now inaccessible, and in oases now shut off by all but impassable deserts—sites which the commercial airship and aeroplane will make as easily attainable as is any seaport today. Even in 1913 this seemed fanciful, but it will hardly seem so to any one who studied the exhibits in Madison Square Garden and the Sixty-ninth Regiment Armory. The dominion of the air has been won, and securely won; and the whole direction of our life is likely to be changed in consequence.

The exhibits were the more striking in that almost all of the recent progress of the art of flying has been made under war conditions, and consequently was kept secret to a very large extent from the public. What we are seeing now revealed is the hitherto largely hidden accomplishment of three or four years of work.

The exhibits of aeroplane accessories were clear indication that within a few years there will grow up around the manufacture of aircraft a trade in accessories not much less important than that now ancillary to the automobile business. But while the commercial possibilities of aircraft may have to wait a few years for their fullest demonstration, their scientific importance can already hardly be overestimated. The aerial photographs shown at the Garden mark a wholly new stage in map making, and there are many other fields in which the conquest of the air will clear the way for the more satisfactory solution of problems that have long hampered geographers and meteorologists.—Editorial in *New York Times.*

New York Needs Nearby Aeroplane Landing Fields

IT is rapidly becoming apparent that it should be made some one's business to have landing fields provided for aeroplanes in the immediate neighborhood of Manhattan. The only regular departures and arrivals of mail carrying aeroplanes hereabout are made so far from the city's centre that a large part of the transit time saved by the speed of the planes is lost in the relatively slow transfer of their loads to the Post Office for sorting and other preparation for delivery. But that is only the beginning of this new traffic; only an incident demonstrating the need we have suggested.

Great things are in prospect for the commercial use of aeroplanes. It means something more than play or sport than an order has been placed involving the expenditure of half a million in planes, equipment and operation for a cross-continent aeroplane line; that in a successful experiment a merchant has delivered to an out of town customer a ton of household goods by aeroplane; that devices are announced which, it is confidently promised, will insure as great stability for a plane in the air as for a barge on the Hudson; that already a plane carrying passengers, its course laid by compass, has flown through fog from Dayton, Ohio to a Long Island field, making its appointed landing with speed and safety.

These things surely must be forerunners of large uses of aeroplanes for mail, express and passenger service, and not in the far future. But where, near Manhattan, are these ships to arrive and depart if the services they offer will not be attended with such delays and inconveniences as to handicap their popularity, restrict their patronage? Van Cortlandt Park has been suggested as offering landing sites; but park space is too valuable for recreational purposes to be otherwise occupied. The New Jersey meadows, drained or filled, neither a difficult undertaking, we are assured with thousands of acres crossed by railways offering quick entrance into Manhattan, suggest themselves. We hope that other and perhaps better adapted sites capable of great extension may be found. But some one who can do things must be alive to this.—Editorial in *New York Sun.*

AEROPLANE CRANKSHAFTS

WE have furnished crankshaft forgings for all the leading aeroplanes made in the United States and in the allied countries. The results of our experience gained in the rapid War time development in this and other important aircraft forgings are at your command.

shaft. The oil pump crankshaft drives the plunger which slides in the oscillating cylinder and an adjustable spring keeps the oscillating cylinder against the oil pump cover, which contains a pressure outlet. The inlet of the oil takes place through the lower tube; a plug is provided at the highest point to allow the air to be expelled from the pump before starting up.

The oil is conducted by a pipe to a union on the top of the main bearer plate; it penetrates the crankshaft and flows through a channel arranged in the aluminium oiling sleeve, from which it passes through oil holes drilled through the crankshaft into the crank web and crankpin.

The small oil channels from the aluminum oil sleeve provide lubrication for the ball bearing and the cam boss ball bearing.

A drilled hole in the crankpin provides oil for the connecting rod thrust block and its bearings.

On leaving the crankpin the oil passes through oil holes in the thrust block, which break through the three grooves in which the heels of the connecting rods run. The oil subsequent to leaving the thrust block is thrown by contrifugal force on to the small ends of the connecting rods, and finds its way into the gudgeon pin bushes and piston bushes.

The oil that lubricates the ball bearings on which the cam boss runs drops by gravity into an annular recess in the cam boss, from which it is thrown by centrifugal force into channels in the cam rockers. Oil holes in the cam rockers conduct the oil to the induction cam roller bush and cam rocker bush.

A sight feed lubricator is provided in the system, which shows by a pulsating movement that the oiling arrangements are in order. The air imprisoned in the glass is compressed at each stroke of the pump piston, and as long as there is indication of this, the pump is giving a regular supply of oil.

The Meissner Airfone

A Certain Means of Verbal Communication While in Flight

The AIRFONE provides a really practical and satisfactory means for intelligible conversation between occupants of aircraft and is especially valuable in training the student pilots.

A distinctive advantage of the AIRFONE is the elimination of all vibration and engine noises during conversation.

The AIRFONE is highly endorsed by many army and navy aviators.

VOL. IX NEW YORK, APRIL 7, 1919 No. 4

OWNERS OF NEW YORK WORLD AND ST. LOUIS POST-DISPATCH OFFER TROPHY FOR COMPETITION AT ATLANTIC CITY

$35,000 PRIZES AND TROPHIES

RALPH PULITZER and Herbert Pulitzer, the owners of the New York World and St. Louis Post-Dispatch, have offered a trophy for annual competition, to be open to U. S. Army, Navy and Marine Corps aviators, who will compete in number.

The first competition for this trophy is to be known as the "Aerial Derby," and is to be held in connection with the One Month Aeronautic Convention at Atlantic City, beginning with May 1st and ending May 31st.

The Pulitzer Trophy is to go to the aviator who covers the longest distance in non-stop flight in cross-country flying over land or over water, or both, in flying from any given point to Atlantic City or from Atlantic City to any other point during the month of May.

There are no restrictions as to the type of aeroplane to be used, or the amount of horse power, the purpose of the competition being to demonstrate the great distances that can be covered by present day aircraft, large and small.

It is provided, therefore, that there shall be inscribed on the trophy the name or names of the aviator or aviators who cover the longest distance with one, two, three or four motors. The aviator or crew who has covered the greatest distance in non-stop flight flying aeroplanes of any of the above mentioned classes will be designated as the winner or winners in their respective class.

To facilitate the organization of the "Aerial Derby" the Contest Committee of the Aero Club of America will accept the entries of aviators without the formality of having a special entry blank, provided the entries are made by letter or by telegram, stating the type of aeroplane they will use and the horse-power.

To facilitate the race the Contest Committee will also accept the written statement of the Commanding Officer of the Station from which the aviator starts, or his representative giving the time of departure of the aviator from the station.

In case the aviator has to make a forced landing before reaching Atlantic City or his destination, he will request the local authorities to sign a statement giving the time and place and circumstances of landing, to be forwarded to the Contest Committee of the Aero Club of America.

The aviators who come on land machines can land on the new Atlantic City Aviation Field, which covers 160 acres and affords two runways of 2,500 feet each. Water machines can land on the beach or at the special landing pontoon near the Steel Pier or on the water landing place on the north side of the Aviation Field. The naval seaplanes can then fly to the Cape May Station for the night, if preferred.

The aeronautic movement will be unanimous in expressing appreciation to Messrs. Ralph and Herbert Pulitzer for this evidence of their great interest in aeronautics and the encouragement which the offer of this trophy affords, especially at this time, when every effort should be made to stimulate aerial activity, so that American aeronautics may remain at the forefront.

The offer of the Pulitzer Trophy and the holding of the "Aerial Derby" will afford a splendid opportunity for American aviators to again demonstrate their efficiency.

BRITISH AIR MINISTRY TO SEND DIRIGIBLE TO ATLANTIC CITY IN MAY

THE British Air Ministry has sent a cable to Mr. Alan R. Hawley, President of the Aero Club of America, stating that the Ministry is considering flying a British dirigible to Atlantic City during the Second Pan-American Aeronautic Exposition and Convention, which is to be held at Atlantic City from May 1st to June 1st, under the auspices of the Aero Club of America, the Aerial League of America, and the Pan-American Aeronautic Federation.

The Aero Club invited the British Government to send one of its huge dirigibles to Atlantic City for the Convention in May. Following is the cable received:

"Your invitation for British airship to fly to Atlantic City, month of May, is under consideration. A further communication will be made to you shortly.

"(Signed) AIR MINISTRY."

Mr. Hawley stated that the British dirigibles which may come over are the new R-33 or the R-34, which have been launched in the past month. They are rigid, have a hydrogen capacity of about 2,000,000 cubic feet, are 670 feet long, 80 feet in diameter and 95 feet high, and weigh 30 tons, having 30 tons of useful load. They lift about 60 tons. They can easily make the trip to Atlantic City from England in about forty-eight hours, giving the crew Pullman car facilities. It will be de luxe travel.

Recently the R-33 made a trip with 5 officers, a crew of 23, and one passenger. She is equipped with five 250 h.p. Sunbeam motors. It has a cruising radius of 4,800 miles.

ARMY AERIAL ACTIVITIES CO-ORDINATED UNDER ONE HEAD

THE War Department authorizes the following statement from the Office of the Director of Air Service:

Co-ordination of all Army aerial activities under one head—the Director of the Air Service—is the aim of reorganization now under way, that is, the substitution of the fundamental principle which made possible unified operations overseas, for the rather cumbersome methods followed in the United States in the past.

The reorganization is designed to supersede the complicated dual war-time air establishment and at the same time to develop peace time activities, thereby assuring the full use of industrial, training and operation gains achieved during the conflict with Germany.

Major General Charles T. Menoher, who at the time he was recalled to become Director of the Air Service, was commander of the Sixth Army Corps, and throughout its long service at the front, was in command of the Forty-Second (Rainbow) Division. He endeavored to apply to the Air Service the principle of co-ordination which was followed overseas, not alone by the United States, but by Great Britain and France. He found the air establishment in two parts—Division of Military Aeronautics and Bureau of Aircraft Production. This plan of organization was temporary, destined under the terms of war legislation to pass out of existence six months after the signing of the treaty of peace.

Having in mind the problems of the future, General Menoher proposed a reorganization based on the divisional system. As Director of the Air Service he assumes the position of responsibility. As an advisory board, each member representing an important branch of the service, he has designated the following: Col. Walter G. Kilner, Col. Arthur L. Fuller, Col. Henry C. Pratt, Lieut. Col. George B. Hunter, Lieut. Col. B. Q. Jones and Major Charles R. Cameron.

Dealing directly with him also are the air attaches of foreign governments, thus enabling him to keep in contact with developments at home and abroad.

As every division overseas has had a general staff, so the new Air Service has an executive organization. To carry out the policies which he alone formulates, and to attend to the secretarial duties, the Director has designated an executive officer, Col. Milton F. Davis. Where two or more groups are concerned in any action, their activities are co-ordinated by the Executive Officer in carrying out the policies dictated by General Menoher.

The problem of dividing properly the duties of the various branches was solved by turning once more to the divisional system followed so successfully overseas. The work has fallen naturally into four main channels or groups—Training and Operations; Supply; Executive and Administrative; and Information, Publication and Statistics.

The Chief of the Supply Group has charge of supplies, aeroplane engineering, production, procurement, inspection, maintenance, and finance disbursement for the entire Air Service, including both the old branches—Aircraft Production and Military Aeronautics.

The Chief of the Information Group gathers and distributes all information, statistics and publicity. In war time he would have charge of intelligence work for the whole Air Service.

The Chief of the Training and Operations Group directs all training and operations.

The Chief of the Administrative Group is practically the Adjutant General of the Air Service, controlling administration and executive work, personnel, office management, the medical section, cables, correspondence, etc.

Brigadier General William Mitchell assumed charge of the most important activity, that of Training and Operations. Colonel William E. Gillmore became Chief of Supply. Lieutenant Colonel William F. Pearson assumed charge of administration, and Major Horace M. Hickam became Chief of Information. It is to be noted that the Supply, Administration and Information Groups exist practically for the creation and maintenance of the Training and Operation Group. The latter is the most important and has at its head the ranking officer among the branch chiefs—Brigadier General Mitchell.

Each branch chief is directly responsible to the Director of the Air Service, and in this manner the activities of the entire service are co-ordinated in and centered upon the office of the Director.

Again, following the overseas divisional system, the Director has designated the Supply Group as first in the organization, Information as second, Training and Operations as third, and Administration as fourth. This does not imply rank. Each chief is immediately responsible to the Director. The Director designates what action is to be taken, lays down service policies, and co-ordinates the activities of all four branches.

The primary purpose of this organization is to develop the Air Service, co-operate in the advancement of commercial aeronautics, and promote the principle that the United States deserves a leading place in the air, promised by our original application of the principles of mechanical flight.

TRANS-ATLANTIC FLIGHT PROGRESS

ACTING Secretary Roosevelt announced that the destroyer Barney had been ordered to proceed to Newfoundland to investigate the harbor facilities along the coast for the purpose of determining the best base from which the planes could put out overseas and harbors in which landings could be made in the event it became necessary for them to descend during the voyage from Rockaway to the flight base.

Lieut. Comdr. J. L. Kaufman will command the Barney, which is one of the most modern destroyers, and Commander P. N. L. Bellinger, of the trans-Atlantic section of the office of the director of naval aviation, and Lieut. E. F. Stone, of the coast guard, have been detailed to make the investigation.

Unless difficulties with ice floes are encountered, the Barney is expected to return to the United States within about ten days. The officers will submit their report at Washington.

Three of the four seaplanes with which the Navy Department plans to attempt its trans-Atlantic flight are now at the naval air station at Rockaway Beach, from which the flight will start. They are known as the N. C. 1 type of machine. The fourth plane is under construction at the manufacturing plant of the Curtiss Airplane and Motor Corporation, in Garden City.

Minor changes are now being made in all machines at Rockaway Beach, but it is expected that trial flights will be made within a week or ten days, and the actual trans-Atlantic flight started soon after May 1. At least two of the three machines at Rockaway have already flown. Each of the three seaplanes there is equipped with three Liberty motors, having 1,000 to 1,200 combined horsepower. Experiments are now being made in the arrangement of the motors, but it is believed that the final choice will provide for two tractor, or "pulling" propellers, and one "pushing" propeller.

There will be four Liberty motors in the fourth plane, now under construction at the Garden City plant of the Curtiss Company, and these will be arranged in the so-called "tandem type"—that is, two tractor and two "pusher" motors.

The speed of the first three seaplanes has been estimated by the builders at 100 miles an hour, and it is said that at least one of the planes has made approximately that speed in trial flights. The original gasoline consumption plan provided for a sustained flight of sixteen hours, but changes in design have allowed for largely increased storage space.

Other changes contemplate lowering the pilots' station nearer the pontoon, so as to render less dangerous the changing of pilots in flight.

Arrangements are said to be under way for the establishment of a line of destroyers along the route selected at intervals of less than two hundred miles.

Preparatory work is being done at Harbor Grace for the Handley Page Company in connection with the trans-Atlantic flight. The work is on a large scale, involving about $50,000. One square mile has been leased for twelve months and fences, barns, and other structure are being removed from the property. One hundred men will be placed at work on Monday clearing the property and building hangars for aeroplanes.

Machines for the ocean flight are expected to leave Liverpool on April 13 on the Fruness liner Sachem, which will arrive here about ten days later. The flight is planned for the first half of May.

Colonel Ray Collishaw, a Canadian aviator, sailed on the steamship Olympic for England recently to bring back an aeroplane with which to enter the trans-Atlantic contest. He will attempt his flight from Newfoundland early in May, accompanied by Major McKeever and a wireless operator.

Colonel Collishaw expects to accomplish the flight in twenty hours. His machine will be equipped with five motors of 400 horsepower each, and will be capable of carrying fifty people and remaining in the air for thirty hours.

Captain Zuloaga, who crossed the Andes Mountains in a balloon in 1916, has asked the permission of the Argentine War Minister to attempt a flight across the Atlantic in an aeroplane. The captain is the Argentine military attaché in Paris. It is not known what type of machine he intends using.

It is stated that Major J. C. P. Wood will pilot a Rolls-Royce motored Short biplane, and that the Whitehead Aircraft Co. are secretly building a huge plane for the attempt.

THE NEWS OF THE WEEK

Captain d'Annunzio to Build Popular Price Aeroplanes

Captain Ugo d'Annunzio, the noted aeronautic engineer and son of the famous Italian poet-aviator, has designed and is constructing an aeroplane which is intended to be in the field of aeronoutics what the Ford is in automobiling.

Captain d'Annunzio's aeroplane is to have a wing span of less than twenty feet, to be capable of landing on any country road, and will sell at $1250.00.

The plane is guaranteed to fly two and one-half hours with a man weighing 165 pounds, and to fly at less than 50 miles an hour, so that anybody can pilot it without special qualifications.

When Captain d'Annunzio announced his new plane at the Aero Club of America he promptly received orders for twelve planes from members of the Club, including one for a member of the Board of Governors of the Club, to be delivered at Atlantic City on May 1st, to be exhibited there and used in the aerial contests to take place at Atlantic City during the Second Pan-American Exhibition, which is to be held beginning with May 1st and ending May 31st.

Captain d'Annunzio has been in this country for over a year, being in charge of the construction of the Caproni aeroplanes built in this country for the U. S. Army. He is one of the leading aeronautic engineers of the world.

The plane can be housed in any good size automobile garage.

Twenty New York Police Aviators Sworn in

Twenty aviators, all veterans of the war, were sworn in as a nucleus of the aviation section of the Police Reserve. They were selected by Colonel Jefferson De Mont Thompson. One hundred and twenty-five applications for the aerial service were made to the Aero Club of America.

Landing places have been obtained at Governor's Island, Van Cortlandt Park and Speedway Park, Sheepshead Bay. Other places, Colonel Thompson said, including roofs of buildings in various parts of the city, are in contemplation.

The aviators took the oath of service in the office of Rodman Wanamaker, Special Deputy Police Commissioner, at Police Headquarters.

The aviators now on duty, subject to call, are Captain Joseph C. Stehlin, No. 3133 Ocean Avenue, Brooklyn; Captain S. Herbert Mapes, Union League Club; Captain Hugo Sunstedt, No. 45 West Eleventh Street; Lieutenant William E. Skillman, No. 315 East Eighteenth Street; Lieutenant Paul Micelli, No. 463 West 159th Street; Lieutenant Leigh J. Bair and his brother, Lieutenant Hilbert L. Bair, No. 274 West Ninety-fourth Street; Lieutenant Edmund C. Roman, No. 363 Twentieth Street, Brooklyn; Lieutenant John Robertson Hoyt, Great Neck, L. I.; Lieutenant Frank Sefern Ennis, No. 165 West Seventy-ninth Street.

Also Ensign J. G. Stewart, No. 662 Madison Avenue; Ensign Frank E. Hutcheon, No. 2787 Boulevard, Jersey City; Ensign Albert Pendleton Taliaferro, Jr., No. 440 Riverside Drive; Pilot Edward L. Smith, No. 540 West 145th Street; Pilot James R. McCaffrey, No. 2739 Bedford Avenue, Brooklyn; Charles Siems, No. 1150 South Ninth Street, Mount Vernon; Charles S. Jones, Garden City, L. I.; John W. Frost, No. 23 West Eighty-seventh Street; Francis P. Smith, Mamaroneck, N. Y., and Hugh Elsasser, No. 327 West Seventy-fifth Street.

Others to be enrolled soon are Lieutenant Charles W. Kerwood, of Bryn Mawr, Pa.; Captain Granville A. Pollock, No. 297 Madison Avenue; Lieutenant Francis Joseph Sweeney, No. 550 Metropolitan Avenue, Brooklyn; Miles E. Kellin, No. 727 Lexington Avenue; William J. Lee, No. 112 West 124th Street, and Leonard Emil Mins, No. 327 West Twenty-seventh street.

Akron Flying Club Races On April 15

Akron, Ohio.—Details of arrangements for the balloon races to be held under the auspices of the Akron Flying Club, of Akron, Ohio, on April 15, at the U. S. Naval Air Station, Wingfoot Lake, Ohio, are being rapidly completed.

The first balloon will start at 4 P. M. and the other contestants will follow at five-minute intervals

The race has been limited to 12 balloons, the following having already made entries:

1. Naval Air Station, Wingfoot Lake.
2. Superintendents Construction Office, Wingfoot Lake.
3. Major Baldwin's office, Akron.
4. Colonel Hensley's office, Akron.
5. Ex-Army men.
6. Ex-Navy men.
7. Goodyear Tire & Rubber Co.
8. Firestone Tire & Rubber Co.
9. B. F. Goodrich Co.

The committee in charge of the race is composed of the following: Ralph Upson, W. C. Young, Lieutenant White, George Hockensmith and Major Baldwin. Lieutenant White and Major Baldwin of the committee are endeavoring to obtain permission and papers for a landing in Canada in case of a northern route for Army and Navy entries.

All pilots must be members of the Akron Flying Club and must have spherical balloon license from the Aero Club of America or the International Federation. Any pilot who loses his balloon will, of course, lose the race, regardless of distance.

A committee will soon be appointed to fix prizes, a description of which will be published later.

Arrangements have been made to furnish transportation for the crowd. This work is under the supervision of George Hockensmith.

The club will have among their guests this summer the leading American aces who will start in July to pilot 40 planes across the United States and who will make a landing in Akron.

Aircraft contributed to New York's hearty reception of the 27th Division. A Glenn Martin bomber is shown over the Flatiron Building and the balloons in the foreground are anchored over "The Arch of Victory"

Washington Airmen Take Senators on Joy Rides

Washington, D. C.—Several Senators during the past week have made their maiden flights over the city of Washington.

Senator Norris and Senator Moses went up in Curtiss machines of the H type, piloted by Lieutenants Lucas and Benjamin. The flights lasted over an hour and both Senators expressed the hope that they might go up again in the near future.

Senators Fletcher of Florida, King of Utah and Sterling of South Dakota were taken up in a Glenn Martin bombing plane piloted by Captain Roy N. Francis, who is likely to pilot an army plane across the Atlantic and who has had more hours in the air than any military pilot.

Representative Cramton was piloted over Washington by Lieutenant Middletown, a Washington pilot.

Senators Myers (Montana) and Kendrick (Wyoming) were passengers in another army plane in a flight over the city lasting about half an hour.

Rickenbacker Lectures for French Wounded

New York, N. Y.—Captain Eddie Rickenbacker, America's ace of aces, who has twenty-six German planes to his credit, lectured on "The Arena of the Skies" at the Metropolitan Opera House on March 25, under the auspices of the American Fund for French Wounded. The proceeds of the lecture went to the fund which is being raised by that organization to build and support an American hospital at Rheims. The French Government has already given the site.

The lecture was illustrated by moving pictures showing Rickenbacker fighting in the air and also showing other American fliers, some of whom have been killed in service. Pictures of German aviators which Captain Rickenbacker obtained from a German pilot when he accompanied the American Army of Occupation into that country after the armistice were shown.

Handley-Page Flies 220 Miles in 134 Minutes

Americus, Ga., March 26.—The big Handley Page aeroplane en route from New Jersey to Houston, Texas, arrived here late to-day, having covered the 220 miles from Columbia, S. C., in 134 minutes. The machine, which is equipped with two Liberty motors, carried a crew of four officers and six enlisted men.

Ferry to Bahamas from Bermuda Contemplated

Palm Beach, Fla.—A large hotel company here, which also operates a hotel at Nassau, is considering the establishment of a ferry service between the two points.

The proposal calls for planes to carry twelve passengers and make the trip in fifty minutes. While the expense has not been worked out, it would be high but not for the sporting fraternity there is here to support the travel. Each plane would carry a wireless outfit, and if it got into trouble and had to alight, would summon the aid of express cruisers held in readiness both at Palm Beach and Nassau.

There will be no lack of passengers, it is said, as the Bahamas is a British possession and therefore beyond the pale of a certain recent constitutional amendment.

Aeroplanes Greet 27th Division

New York City, March 25.—As a feature of the enthusiastic reception tendered by New York City to its 27th Division were the manoeuvres of a squadron of Curtiss planes, a Glenn Martin bomber and several flying boats.

Army Aviator to Pilot Ranch Manager Over 250 Mile Wheat Fields

Ansonia, Conn.—J. Pierpont Morgan has engaged Erhardt Schmitt, son of the Rev. E. B. Schmitt, pastor of Christ Church of this city, to pilot the manager of his 250-mile tract of wheat fields at Hardin, Mont., in an aeroplane. Thus Mr. Morgan solves the problem of getting speedily to any part of the ranch. It is believed Schmitt will be the first man to pilot an aeroplane as agricultural equipment.

On a ranch the size of Mr. Morgan's it was impracticable to build roads to enable the manager to get around the ranch in an automobile, so the owner adopted the aeroplane, which will save much time and undoubtedly will prove to be less expensive. The aeroplane will be equipped with wireless, and stations will be established at intervals on the ranch.

Mr. Schmitt is a wireless operator, and so the manager will be able to keep in touch with every section of the territory. Mr. Schmitt was discharged recently from the United States Army. He was a First Lieutenant in the American Air Service in France.

Baker Tells of Automatically Controlled Aeroplane

Fort Worth, Texas.—Under automatic control, an aeroplane capable of carrying a heavy load and operated without a human guide has made a trip of 100 miles and landed close to the point it set out to reach, Secretary of War Baker disclosed in an address here. He and Gen. Peyton C. March, Chief of Staff, came here to inspect Camp Bowie.

The automatic guide which made such a flight possible, and which has been kept secret, Mr. Baker said, was invented in America. It is designed as an instrument of war, and the Secretary referred to it in describing to his audience the possible horrors of future wars if there is to be no League of Nations.

Secretary Baker did not explain the exact nature of the invention, but he made it clear that the War Department considers it one of the most wonderful pieces of mechanism for war's destructive purposes.

Senator Henderson Pilots Plane in Hour's Flight

Washington.—The first aeroplane flight over Washington of a machine piloted by a member of the United States Senate was made by Senator Henderson (Nevada). In a plane equipped for two pilot control, Senator Henderson ascended with Major W. O Ocker, an army aviator. After reaching a height of 5,000 feet Major Ocker turned over the work of piloting the plane to the Nevada Senator who manoeuvred the plane over the city for about an hour.

Leslie V. Spencer, M.E., newly appointed Special Contributing Editor to Aerial Age, formerly editor of technical publications, Experimental Department, Aeroplane Engineering Division of the Bureau of Aircraft Production at Dayton

Molly Pearson Flies Over New York

New York, N. Y.—Miss Molly Pearson, starring in "Penny Wise" at a Broadway theatre, flew over New York in a Curtiss training type aeroplane, six-cylinder engine, model K-6, the type used in training aviators for war. Joseph Bennett, who was in charge of the Curtiss field at Miami, Fla., was the pilot.

Miss Pearson started from Roosevelt Field, at Garden City, L. I., steering a course over the city to Columbus Circle, and then to Longacre Square.

Washington "Bombed" for Loan

Army aviators flying in six Curtiss machines "bombed" Washington with Victory Loan literature in the form of imitation German bombs. The squadron, headed by Col. R. S. Hartz, commanding officer at Bolling Field, was in the air 35 minutes and dropped 20,000 paper bombs, five of which were orders on the Treasury Department for German helmets.

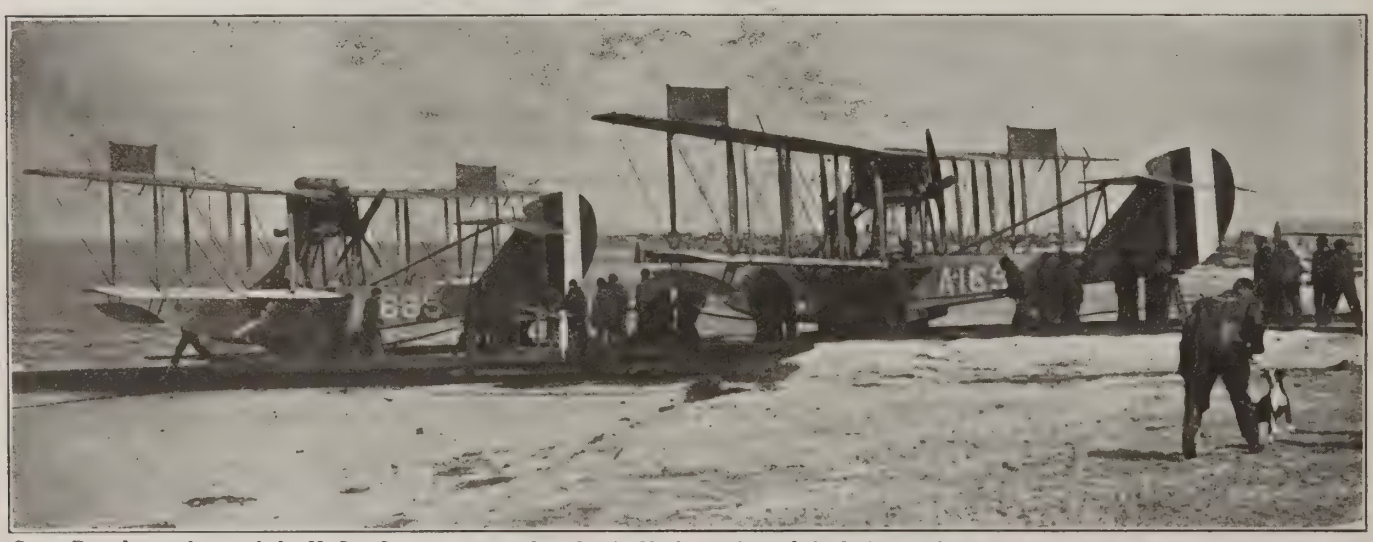
Coffin Leaves France

Paris, March 1.—Howard E. Coffin is leaving Paris this week for New York via England. Mr. Coffin has been on this side for the past three months and has traveled extensively in England, France, Italy and occupied portions of German territory. Mr. Coffin has been particularly interested while in Europe in everythign concerning aviation development, and particularly the role which America will play in the coming conference to decide on international agreements regarding air navigation.

It is understood that Mr. Coffin will spend but a short time in America in order to attend to his private business matters and then will return to Paris.

To Make Aircraft Parts

New York.—The Aircraft & Motor Products Co. has been formed here, with offices at 299 Madison Avenue, and will manufacture products for aircraft and motor vehicles that have been developed primarily from successful war products. The company has developed a spark plug, has a line of cup greases and gear oils, a bronze bearing metal, and will manufacture aluminum castings, bronze castings and gears. Rayburn Clark Smith of Philadelphia is president, other officers being: Vice-president, H. Allen Dalley, Philadelphia; general manager, Major Harry A. Budd, New York. Branches have been established in Philadelphia and Chicago. The company will brand its products "A-A."



Commander Towers' Aids in Transatlantic Flight Plans Designated

Washington, D. C.—Six officers of the Navy and one of the Marine Corps have been assigned to the transatlantic section of the office of the Director of Naval Aviation for duty in connection with the preparation of plans for the flight across the Atlantic Ocean, which is to be undertaken soon by a big seaplane of the N-C type. The officers are: Commander J. H. Towers, in charge; Commander R. C. Richardson, Construction Corps, experiments; Lieut. Commander P. N. L. Bellinger, operations; Major B. L. Smith, Marine Corps, material; Lieut. Commander G. de C. Chevalier, operations and liaison; Lieut. Commander R. E. Byrd, navigation; Lieut. Barrat, aerographing.

Some of these officers will make the flight, but as yet the crew of the plane has not been selected. Five men probably will be the maximum number to be carried, and, as all weight possible must be sacrificed to fuel-carrying capacity, it may be that only four men will go.

In addition to the two pilots, two mechanicians will be necessary. The commander of the ship will be the navigating officer, and, since he will be an experienced pilot, it has been suggested that he could take turns at driving the machine. Navy officers believe, however, the commander will find it necessary to give all his time to navigation problems.

Several new instruments for use during the flight have been perfected at the Navy Department, but these are carefully guarded secrets. In the preparation of the plans close co-operation is being maintained between the naval officers and the Weather Bureau, which will continue to prepare special charts and data concerning atmospheric conditions, air currents and the like.

Coast Patrol aeroplanes of the H. S. 1-L type stationed at Sandy Hook continue their duties as though enemy submarines were still threatening our coasts. They are in constant communication with shore by radio telephone and telegraph apparatus

Leslie V. Spencer, M. E., Joins Aerial Age Contributing Staff

AERIAL AGE is gratified to announce that it has secured the co-operation of Leslie V. Spencer, M. E., as a special contributing editor, whose writings will appear exclusively in this publication.

Mr. Spencer was editor of Technical Publications, Experimental Department, Airplane Engineering Division, Bureau of Aircraft Production, at the Cook Field, Dayton, until the termination of that publication, and in this capacity he secured a familiarity and knowledge of aeronautical engineering problems which will enable him to write most valuable material.

Mr. Spencer is a mechanical engineer—a graduate of Cornell University, 1911, where he specialized in automotive engineering. For six years he was on the technical staff of the Class Journal Publications.

The first article from Mr. Spencer will appear in next week's AERIAL AGE, and will discuss one of the most important aeronautical developments of the past year, something which has not hitherto been authoritatively discussed in any aeronautic magazine.

Sale of Surplus Air Service Material

The *Salvage Branch, Supply Section,* is charged with entire responsibility in matters pertaining to the sale of all surplus, inactive, and obsolete Air Service material within the Division of Military Aeronautics. In the future no sales of surplus, inactive, or obsolete Air Service material will be made until the Salvage Branch, Supply Section, has been advised.

Flying Field Ambulances

The Training Section, Office of the Director of Military Aeronautics, authorizes the following:

At active fields, an ambulance, with a medical officer and necessary medical personnel, will be on flying field during all flying. Ambulance equipment will include wire cutters, axes, fire extinguishers, etc.

At inactive fields, an ambulance, fully equipped, will be held at a convenient place, ready at all times for immediate action. A medical officer, and other necessary medical personnel, will be in readiness to respond to a call during the time flights are being made on the flying field. Commanding officers of inactive fields will use their judgment in arranging the details necessary to comply with the spirit of the foregoing instructions.

New Commanding Officers for Kelly and Rockwell Fields

The following named field officers were ordered to change station March 11, 1919, as follows:

Colonel Henry H. Arnold, J. M. A., A. S. A., ordered from Coronado, California, to Rockwell Field, San Diego, California, to assume command.

Colonel James E. Fechet, J. M. A., A. S. A., ordered from Houston, Texas, to Kelly Field, San Antonio, Texas, to assume command.

Colonel Henry C. Pratt, A. S. A., ordered from Kelly Field, San Antonio, Texas, to Washington, D. C.

Lieut.-Colonel Leonard H. Drennan, J. M. A., A. S. A., ordered from Washington, D. C., to Chicago, Illinois, for duty as Department Air Service Officer.

Keep Sending Magazines Overseas

General Pershing reports that the American soldiers abroad need reading matter more than ever before. The supply of magazines has dropped from ten to two tons a month, and Red Cross chapters are urged to stimulate the supply.

The decrease is due largely to the misapprehension that the one-cent postage for magazines sent unaddressed to the American Expeditionary Force had been increased to two cents. The one-cent regulation still is in effect and no addressing is necessary. Some of the magazines which dropped the announcement to this effect from their covers will be asked to renew it. Individuals are urged to send all magazines as soon as they have read them. The supply must be doubled or tripled.

Returning Aero Units

The War Department authorizes publication of the following:

The Transport Manchuria sailed from St. Nazaire, March 14th and is due to arrive at New York, March 27th, with the following troops: 636th Aero Supply Squadron, 3 officers, 140 men; 373rd Aero Pursuit Squadron, 4 officers, 152 men; 148th Aero Squadron, 11 officers, 183 men; 142nd Aero Squadron, 3 officers, 158 men; 89th Aero Squadron, 4 officers, 146 men; 36 Aero Squadron, 4 officers, 215 men; 182nd Aero Squadron, 4 officers, 182 men; 341st Aero Squadron, 4 officers, 162 men.

Air Service Attractive to Enlisted Men

Do you know that the Air Service of the Army pays more money to skilled mechanics than can be earned in civil life?

An automobile mechanic earns from $3.50 to $4.50 per day, counting 26 working days per month your salary at $4.50 per day equals $117.00 per month. Your expenses are:

Board and room	$35.00
Clothing (outside)	8.00
Shoes, hats, underwear, etc.	3.00
Doctor's and Dentist's Bills, Hospital and medicines	5.00
Loss of time due to holidays, sickness, etc., 2 days per month.	9.00
Loss of time due to lay off, lack of employment, vacations, etc., 3 days per month	13.50
Total	$73.50

Deduct this amount from your salary of $117.00 per month and you have left $43.50.

If you are a skilled mechanic and have confidence enough in your ability to put your skill to a real test, by enlisting in the Army, you can earn $44. to $121.50 per month, without a single cent of expense. Whether you get the $44. or $121.50, is up to you.

The Air Service of the Army offers steady employment with short hours and no "lay offs"; furloughs are granted with full pay and cheap transportation rates for your trips. When sick, pay goes on just the same. You receive, free, the best hospital facilities and medical treatment.

The Air service of the Army offers excellent opportunity to men between the ages of 21 and 35 who have mechanical inclination, or who are skilled mechanics.

Air Service Mechanics Schools enable the young apprentice to complete his education and become an expert tradesman, and qualify you for large earnings while in the service.

Skilled mechanics are always in demand and can save money through enlistment.

Congressional Flying School

Washington, D. C., March 24, 1919.

The Congressional "flying school," the student aviators of which are to be composed of Senators and Representatives, has a new pupil. Representative C. R. Evans, of Nevada, has followed Senator Charles B. Henderson's lead and "signed up" for a full course at Bolling Field.

Flying 225 miles in 110 minutes, Representative Evans made a trip from Washington to New York by airship recently and established the reputation of being the champion aviator of the Sixty-sixth Congress. He made the flight with Lieut. Lucas, one of the crack pilots of the United States Army, to attend the aeronautical exposition at Madison Square Garden, New York.

What's In a Name?

(*Written Exclusively for* THE AERIAL AGE WEEKLY.)

The securities the Government will issue in the Victory Loan will bear a different name from those in previous loans. They will be notes instead of bonds. What's the difference? Financiers may grasp a distinction. For practical purposes of practical people there is none. The Victory Notes will be promises of the Government to repay the sum advanced for the nation's purposes, just as the previous issues of Liberty Bonds were. They will bear a fair interest as their predecessors did, and will be as safe as the credit of the United States can make them.

In fact, the Victory Notes are calculated to be a somewhat better investment than the previous issues of Liberty Bonds. While the terms of the Victory Loan have not yet been announced, the Secretary of the Treasury has authority to fix interest rates, tax exemption privileges and retirement dates to make them attractive to all classes in the community. It is planned, as a practical measure, to fit them to market demands. Thus the perfectly proper self-interest of the thrifty American investor will dictate the purchase of as many of these Victory Notes as he possibly can see his way to pay for.

At the same time the motive of patriotism in purchasing will not be lacking. The war is not ended in the sense that its obligations have been fulfilled. The Government still has many commitments for war supplies. It must bring the fighters home. It must cure the sick and wounded, and re-educate the crippled so they again may earn their living as self-respecting citizens. The Treasury must be kept in funds to handle the vast problems of the reconstruction period. The war job is not done. Good Americans are not entitled to conclude that their part in the war has ceased.

Victory Notes will enable the loyal citizen to support his government now as he supported it by buying Liberty Bonds when there was fighting overseas. It needs his financial assistance as much now as then; it needs the evidence of his backing to enable it to attack and solve the problems of peace. There never was any question of the success of other loans, because the public understood the need for them and saved and sacrificed in order to raise money. The need now is as great. The response should be as inspiring.

Buy the Victory Notes!

Half-Wing Observer's Insignia Unauthorized

There is no official half-wing insignia known to the Navy Department, hence the wearing of insignia approximating the half-wing of the Army air observer is contrary to regulations. There is also no Navy insignia for radio gunners or engineer gunners. Rating badges for use of petty officers attached to Aviation Corps, as described in Changes No. 17, Navy Uniform Regulations, March 18, 1918, remain as of that date. This circular states: "These rating badges are provided for the ratings of chief petty officer, first class petty officer, and second class petty officer in all three branches. They will conform in all respects to the regulations for rating badges as incorporated in Articles 207 to 210, inclusive, of Uniform Regulations, United States Navy, 1913, except the eagle shall be one and three-quarter inches above the angle and just above the specialty mark." The rating badges shown in this circular are for chief quartermaster, carpenter's mate, first class; machinist's mate, second class.

Officers of the Trans-Atlantic Section of the Office of the Director of Naval Aviation Operations. Seated in the centre:—Comdr. J. T. Towers, U. S. N., officer in charge. Standing, left to right:—Lt. Comdr. G. de C. Chevalier, U. S. N., officer in charge of liaison and assistant officer of operations; Comdr. H. C. Richardson, construction corps; Lt. Barrett, U. S. N. R. F., officer in charge of aerographing; Lt. Comdr. P. N. L. Bellinger, U. S. N., officer in charge of operations; Lt. Comdr. R. E. Byrd, U. S. N., navigation officer and Major B. L. Smith, U. S. M. C., in charge of materials and equipment

The AIRCRAFT TRADE REVIEW

A. E. J.

Director of Sales Reports Nearly $1,000,000 in Aircraft Sales

Washington, D. C.—An official statement of the Office of the Director of Sales, War Department, Washington, announces sales of aeroplanes amounting to $319,000 and of aircraft supplies and equipment totalling $679,887 between the dates of March 8 and 14.

General Disque with American International Co.

Brig. Gen. Brice P. Disque, U.S.A., who received his discharge from the Army a short time ago, having served as director of the Spruce Division of the Aircraft Bureau, has been appointed chairman of the export and import branch of the American International Corporation, with headquarters in New York City, according to a press message from Portland, Ore.

Personal Pars.

F. X. Newman has resigned his position with the Wright-Martin Aircraft Corp., New Brunswick, N. J., to become vice-president and sales manager of the Automatic Safety Tire Valve Corp., Long Island City.

Howard M. Benedict, who has been a lieutenant in the Air Service, has been honorably discharged, and has returned to his position with the Oakes Co., Indianapolis. Mr. Benedict is connected with the pressed steel stamping department.

P. E. Barker, who was formerly experimental engineer of the Northway Motor Manufacturing Co., and more recently research engineer at the Aluminum Castings Co., Cleveland, is now in charge of the truck and motor equipment department of the Van Dorn Iron Works Co., Cleveland.

Grant of Land Offered Navy Air Service

Believing that the U. S. Navy is in need of a large inland tract of land for the development of lighter-than-air craft, the business men of Forth Worth and Dallas, Texas, have jointly offered as a gift to the Navy Department for this purpose one square mile of land lying about thirty miles from each place. The gift was offered in a letter received at the Secretary's office this week. The site is considered favorable for the needs of the Aviation Division of the U. S. Navy for lighter-than-air craft construction and experiment. The land offered is valued at approximately $35,000.

85,000,000 Barrels of Gasoline in 1918

Washington, March 25.—Gasoline production in the United States in 1918 was said by Van H. Manning, Director of the Bureau of Mines, to have borne out at least in part the statement of a British Admiral shortly after the cessation of hostilities that "we floated to victory on a sea of oil."

A little less than 50,000,000 barrels of gasoline was produced in the United States in 1916, Mr. Manning stated, while in 1917 the production was increased under the spur of war's necessity to 68,000,000 barrels, an increase of more than 50,000 barrels a day. In 1918 the production was over 85,000,000 barrels. The daily increase for the year over 1917 was about 47,000 barrels.

Fliers Visit Perlas Islands

A report from France Field, Cristobal, Canal Zone, dated February 15, 1919, states that:

A flight to the Perlas Islands was made recently in one of the H. S. 1 L flying boats. This group is situated about 30 miles off the Pacific Coast of the Canal Zone and inhabited by a few pearl fishermen. Due to the coral construction of the islands and reefs in the harbors it is not an ideal situation for the operation of seaplanes.

A report from two Air Service officers who made a reconnaissance of the San Blas Indian territory has been received. At the time of their visit there was certain amount of unrest among several of the tribal chiefs and they were requested to join the Panamanian Police in securing the loyalty of these tribes. They discovered in one instance that the Indians were not loval to Panama because they thought the Colombian flag more beautiful. In another case it was found that the tribe thought Italy still under the jurisdiction of Colombia and was not aware of the existence of the Republic of Panama. One chief refused to haul down the Colombian banner and it was necessary to use force and in doing so one of the native chiefs received a bayonet wound.

Mr. Fay L. Faurote, advertising manager of the Curtiss Aeroplane and Motor Corp., by his energetic work, substantially contributed to the success of the Aeronautical Exposition

Efforts were made to penetrate still further inland but it was impossible to obtain guides.

628 D.H-4 Planes at Front

(*Prepared by Statistics Branch, General Staff, War Department, March 22, 1919*)

628 De Haviland 4 Planes Put in Service at Front Before Armistice

The following table and diagram shows the status of production, shipments and use overseas of De Haviland 4 service planes at the date of the armistice:

	Number	Per cent. of total production
Produced	3,227	100
Floated	1,885	58
Received at French ports	1,185	37
Assembled overseas	1,025	32
Put into service overseas	984	30
Put into service at front	628	19
In commission at front	457	14

Contracts Canceled Up to March 19 Total $480,000,000

The following is a summary of the value of cancellations and suspensions of contracts to March 19, 1919; totals, $480,730,131.

	Value	Per cent. of total
Engines and spare parts	$250,409,982	52
Aeroplanes and spare parts	167,554,386	35
Chemicals and chemical plants	19,852,370	4
Instruments and accessories	13,832,902	3
Balloons and supplies	10,071,035	2
Fabrics, lumber and metals	7,968,324	2
Miscellaneous	11,041,132	2
Total	$480,730,131	

The Testing of Dopes

In discussing the standard tests for testing of dopes and the methods of determining inflammability and rate of burning, a contributor to British publications discusses the merits of the official tests prescribed.

The test for inflammability is to place a small cube 4 mm. of celluloid on top of the fabric and to ignite the cube. It is stated that "the celluloid cube shall not produce more than a slight charring and the fabric itself shall not ignite."

As regards the method laid down under the above specification for measuring the rate of burning, which is to ignite the edges of a hole in the fabric and to measure the time taken for the flame to travel, one cannot take exception to this, beyond suggesting that if the stringency of the test for inflammability were increased the dope that offers the better resistance to ignition should have the preference over one that burns at a slower rate, for when the fabric of an aeroplane wing is once aflame, if it does not blow out the aviator has a very small opportunity of getting to earth in safety.

The correspondent suggests a more efficient method of testing the danger from inflammability. To arrive at the correct relative values of dope in this connection the following tests should be made:

(1) Facility with which flame is put out by the wind, assuming the fabric to have ignited.

(2) Resistance the dope offers to ignition.

(3) Rate of burning if and when the fabric is ignited.

The qualities are placed roughly in their order of importance. If a dope offers a greater resistance to flame it may, as a general rule, be said that it is better than a dope that offers a less resistance to flame, even though the latter burns slower, for the reason that when the fabric is once ignited the short time it takes the wings to burn gives the pilot insufficient time to reach the earth.

Secondly, if the burning is of such a nature that it is easily extinguished by the wind, it will, in turn, be seen that such a dope, even assuming it to ignite more readily, is probably of greater value than one which is harder to ignite but is not blown out by the wind so readily.

The great disadvantage of the Cellulose Acetate Dopes in this connection is that they melt from the heat, and they are, in consequence, the most difficult to put out when once ignited, though, no doubt, something can be said in their favor in connection with the third quality, i. e., rate of burning, as they perhaps burn a little slower than a type of nitro dope made on the lines of "Titanine." The latter, however, offers a greater initial resistance to flame, and also has the advantage of being readily extinguished by the wind.

Until the Air Ministry lays down a definite standard for tautness all comparative dope tests have their value limited. Given a definite standard of tautness the fireproofing quality can, with certain types of dope, probably be increased without overstepping the limit.

In testing dopes for inflammability, they must obviously be applied on double-sided frames, so as to produce, as nearly as possible, the conditions of an aeroplane wing. These frames should, if possible, be moved quickly through the air during the process of sending incendiary bullets through them. And as much more efficient methods of incendiary attack will, no doubt, be found, should the war be prolonged, one should not necessarily limit this to the incendiary bullets at present in use, but should increase the stringency of the test so far as to insure the ignition of the fabric. This would definitely decide which dope offers the greatest resistance to flame, and would show whether the wind caused by the current of air would extinguish it.

The writer is of the opinion that it is not generally realized what a vulnerable target the fabric of an aeroplane wing affords. It is a common thing to read of machines that have had upwards of 30 or 40 bullets through the wings returning to their base without discomfort. Should any one of these cause the fabric to ignite, however, the machine would be doomed.

If we wish to retain the supremacy of the air we must be prepared for all eventualities, and by realizing exactly what might be done against us we should best be able to take the most effective precautions and counter-measures. There is no reason why aeroplanes should not be sent out capable of resisting much more effective media for conveying flame through igniting the fabric than the present tracer bullets. One might readily predict that if the necessity for this does not arise in the present war it is bound to in the next.

These remarks are limited to the possibility of setting machines on fire through the medium of the doped fabric. Ignition of the petrol through a tracer bullet penetrating the tank is quite another matter. The petrol tank, however, does not occupy more than 1 per cent. of the area of the machine, whereas fabric occupies more than 9 per cent. of it.

Berlin-Hamburg Air Mail Service

It is stated in the Berlin daily press that an aeroplane service was established between Berlin and Hamburg on March 1. It is intended to make two flights daily in both directions. On the first journey the machine only carried newspapers, but in future letters will be carried.

It is further stated that a daily aerial postal service has been established between Berlin and Frankfort-on-Main.

Caproni Mail Service Between Padua and Vienna

An aerial mail and passenger service was inaugurated on Sunday, March 2, between Padua and Vienna. Caproni machines are being used, and two of these will leave each town every three days.

The first flight on this service was made in four hours and a quarter, a distance of 304 miles being covered. The machines were then piloted by Italian military aviators, and, presumably, they will continue to be employed on this service.

Swedish Air Traffic Co. Organized

A company has been formed in Sweden under the title of the Swedish Air Traffic Co., Ltd., which has been financed by the principal banks of Stockholm for the purpose of establishing aerial traffic lines between Petrograd and London, via Stockholm, and Stockholm and Finland.

British-Dutch Co-operate to Establish Aero Mail

With a view to establishing an aerial mail and passenger service in conjunction with Great Britain, five commissioners, who were sent by the Dutch Government, have arrived in England.

The commission has been in existence for three months, and has made a great deal of progress in preparing for commercial aeronautics in Holland. Several aerodromes are in the course of constuction, including one situated near Amsterdam which covers 250 acres.

Aircraft to Patrol Forests

Washington.—Major Gen. Menoher of the Army Air Service has been instructed to prepare necessary equipment, personnel and other facilities for experiments in co-operation with the Department of Agriculture, in use of aircraft for forest fire patrol work.

Captured Bombers for French Mail Service

Paris.—German bombing aeroplanes of the Friedrichshafen type, which were surrendered under a clause of the armistice, will be used by the Department of Civilian Aviation in transporting foodstuffs between Paris and Bordeaux. The aeroplanes will be equipped to carry three tons of parcels and bundles. Before the end of April the department plans to have in operation an aerial post between Paris and Valenciennes by way of Maubeuge.

Royal Air Force Aerial Mail Services

For some considerable time past local military mail services in France have been successfully run by the R. A. F. Letters have been delivered regularly between Marquise and Valenciennes, Valenciennes and Namur, Valenciennes and Spa, and on other routes. During the period from December 17 to January 25 there were only five days on which no local services were run.

This scheme has now been superseded by a more elaborate one, embracing a long-distance service from Marquise (near Boulogne) right through to Cologne, as well as an extended series of local services.

The through service to Cologne, quite apart from mileage, presents peculiar difficulties which are not usually met with on the frontier routes. Between the flat country of North France and the valley of the Rhine there lies a range of hills rising in places to a height of 2,000 feet. Not only does this stretch of country contain very few places on which a forced landing can be made safely, but thick clouds and bad weather are invariably encountered in this district.

The Handley Page machines which were at first used on this route are now being replaced by D.H.9a machines, which have a greater speed.

A chain of wireless stations has been organized for the transmission of weather reports. In the event of a forced landing the pilot transmits his position to the nearest wireless station. The message is then passed on by wireless or telephone to the nearest R. A. F., or Army, unit, and transport is immediately sent to pick up the mails and to render assistance.

In the event of a pilot losing his way, arrangements are being made whereby he will be able to get into touch with a wireless-directional station, from where he will receive details as to his actual position. These stations will also direct pilots, in bad weather, to the nearest landing ground, and guide them during night-flying.

In connection with this service the establishment of a chain of balloon sections has been arranged. Each section is to maintain a balloon in the air during daylight. Later on these balloons will probably be fitted with signal lights and will remain aloft at night also.

These balloons serve several purposes. In the first place, they will be sent up above the clouds in order to show the position of landing grounds. Each balloon will be marked with signs which indicate its exact locality, thus enabling the aeroplane pilots to check their bearings when weather is bad or clouds are low.

A second useful purpose is that the balloon observers will be able to ascertain the height and thickness of clouds, and the condition of the weather above the cloud layer.

As the intention is to maintain a night service on this route, a chain of lighthouses has also been provided.

Emergency landing grounds have been established at suitable points along the route, in addition to the regular terminals. Telephonic communication is available at the emergency landing-grounds, but, to meet the case of possible forced landings elsewhere, pigeons are carried on all the machines as an additional precaution by which the pilot can immediately make known his position.

When the scheme is fully developed, the weather reports will be passed to the machines by wireless, by ground signals and by balloon signals, so that the pilot will know at each stage of his journey the conditions of the weather ahead.

It must be understood that this service is experimental, and owing to the nature of the country described above, and the time of the year, in which, of course, the weather conditions are the worst possible, the trial is a very practical test, and should provide valuable experience in meeting the difficulties likely to be encountered in eventual regular civil post services.

During the week-end an aerial postal service was established between England and France, mails for the Army of Occupation being conveyed from Hawkinge Aerodrome, near Folkestone, to the Maison Selle, in Northern France, a distance of 80 miles. D.H.9 machines were used, and twenty-three bags of mails were carried.

A French Aerial Ambulance, built by Voisin Brothers, carries full hospital equipment in the lockers mounted below the wings and shown open in the photograph. Two powerful search-lights permit medical assistance to be given at night and a special fuselage is provided for carrying injured

THE PHOTOGRAPHIC GUN

By EDGAR H. FELIX

Formerly Radio Engineer, Signal Corps

AT the time of the entrance of the United States into the war, British aviators were using a gun camera patterned after a Lewis machine gun, with a long lens barrel substituted for the shooting barrel of the machine gun. This camera was designed to make twelve exposures at loading and for each exposure a manual operation was required. In other words, the aviator could only make one shot at a time, an interval being required to advance the film for the next exposure, and could take but twelve pictures before reloading. With the true co-operative spirit that was evinced by all the Allies and especially Great Britain in giving us the benefits of their previous experience in the war, the British authorities turned this gun camera over to our Army men, who in turn gave the Eastman Kodak Company orders to make duplicates of it.

The improvements which our designers made on the British type resulted in the development of the camera so that aviators were trained to become expert aerial gunners in greatly reduced time without unnecessary waste of ammunition. The methods of training aviators in gunnery prior to the invention of the camera gun did not closely simulate actual conditions. It was customary to practice hitting clay pigeons from towers or elevated platforms equipped with standard machine gun mounts. Such platforms, however, are stationary, and firing from them is quite a different operation from aiming and firing from a swiftly moving plane. Secondly, clay pigeons present a mark unlike an aeroplane in flight. The range at which they can be fired at is limited.

Another means employed was to use as targets balloons and parachutes dropped from a high altitude or kites towed from the ground and fired at from planes in flight. None of these marks, however, could perform aerial acrobatics or move at the speeds encountered during aerial combat.

The British type of gun constituted a great improvement, for the aviator could now "fire" a camera, possessing a sight similar to that used on machine guns of types used on planes. The barrel of the gun, however, is much larger in diameter than the Lewis gun, for instance, and has a capacity of only twelve pictures. To take a picture, it is necessary to pull the trigger, and then to advance the film by advancing a lever. The machine gun has to be removed from the ship to permit the fastening of the camera.

When a sample of this gun was submitted to the kodak company, one of the managers at once questioned the need of a heavy separate gun camera with its big lens barrel. Why not have a special camera attachment that could be fastened to the gun itself that the aviator is continually using? The engineering department was given the job of answering the question. Not only did they build a camera that could be attached directly to the gun in place of the ordinary ammunition magazine, but they also produced a camera that could make 100 exposures at one loading, and, like the machine gun, make them in "bursts," continuing fire automatically as long as the trigger is under pressure.

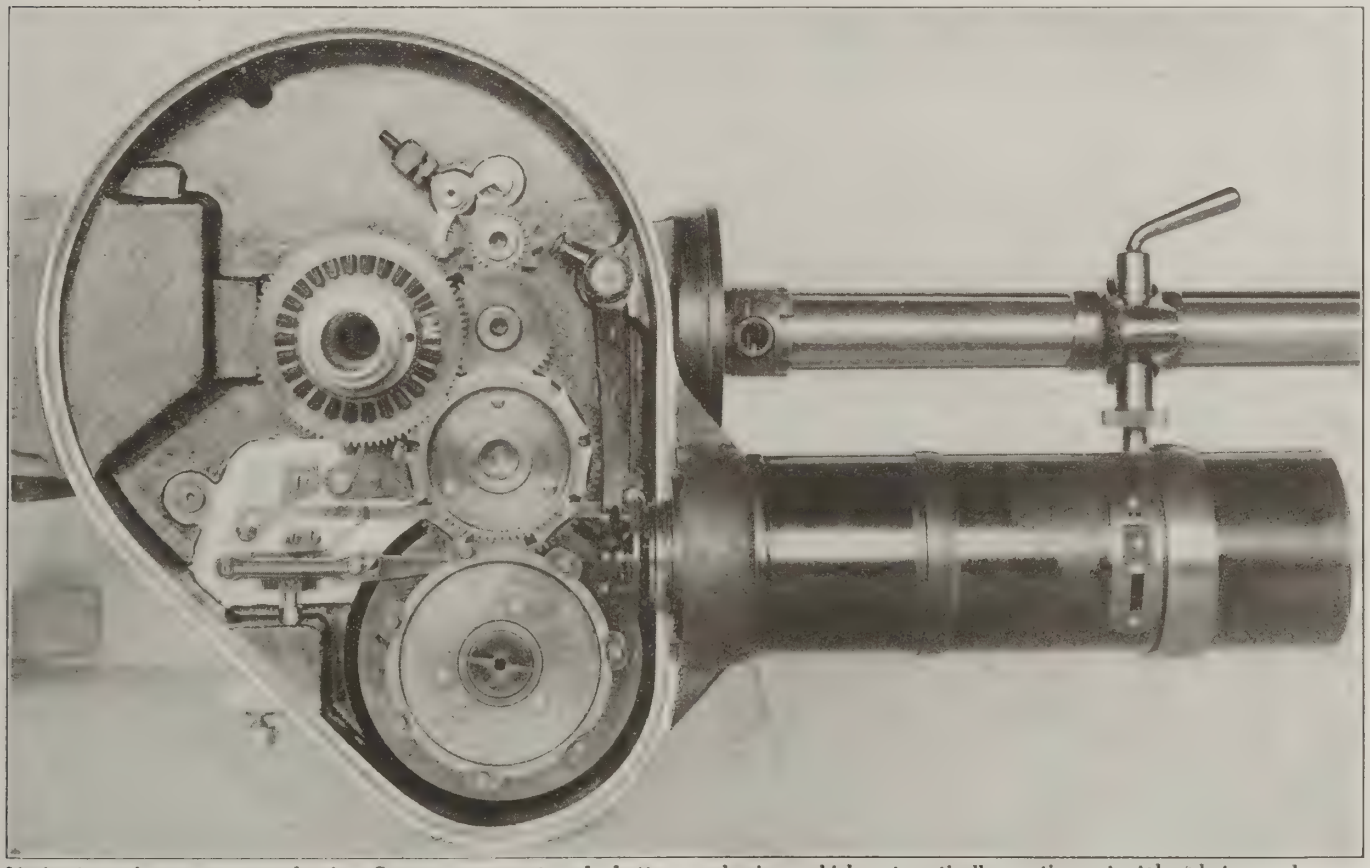
The Gun Camera, Mark 1, as it is officially called, weighs 13 pounds all told and has a lens barrel only 8 inches long and 2½ inches in diameter. It is of metal construction throughout. The magazine of the camera in which is placed a strip of film, instead of being circular as is the cartridge magazine of the machine gun, is oval-shaped; it is fitted with a Lewis gun magazine lock which completely fastens the magazine to the gun camera.

Each gun camera is ordinarily provided with three magazines which are loaded in a dark room. If the embryo fighting aviator, therefore, takes up with him these three magazines loaded to capacity he can "shoot" 300 times. The film in the magazine is ordinary motion-picture film, which travels from a spool in the small end of the magazine past a light trap, where it is exposed, to a reel 5 inches in diameter in the larger end of the magazine. The magazine is 10¾ inches long and 8 inches wide at the larger end.

Now in the Lewis machine gun after a bullet has been fired the gases resulting from the recoil eject the empty cartridge and automatically replace a loaded cartridge, so in order to

Mark I-A Gun Camera mounted on standard Lewis gun

continue firing all one needs to do is to continue pressure on the trigger. With the gun camera something must be substituted for the force of the cartridge charge, and so use is made of a spring which is wound up with a handle similar to that employed in winding up talking-machine motors. The spring is fastened directly to the shaft that turns the 5-inch reel and through a mechanism called a Geneva movement, which causes an intermittent action, to the shutter mechanism in the lens barrel. Thus as the film is moved steadily past the light trap the shutter opens and closes for making the various exposures to show the location of the opposing aeroplane, each opening occurring at the time a machine gun bullet would have been fired. The illustration very clearly shows the mechanism of the camera.



To facilitate spotting the shot from the gun camera, a glass plate called a graticule is placed in the barrel at the focal plane in contact with the film. This plate is marked with a vertical and horizontal line passing through the center and one small circle which one might say indicates the bull's-eye and two large circles drawn close together describing the outer field covered by the camera. These circles and bisecting lines are impressed on the film at each exposure and the position of the opponent aeroplane is indicated by means of them.

Of course, one must realize that in aerial flights machines are going at tremendous speeds and the position of the opposing machine at the time of "firing" (making the exposure) is not quite the same as at the time the bullet reaches the machine. One can tell, however, fairly well by the direction the opposing machine was going as shown on the film whether it would have been hit in a vital spot or not. Thus if the machine is pointed toward the center or bisection of the lines and is very close to the bisection, the chances of its having been hit would have been very good. If the machine had been shown in the same position with regard to the center point but going away from it, the margin of speed would probably just have saved it from being hit. In a straight pursuit a hit is indicated when some vital part of the machine covers up the center of the field. How the opposing aeroplane is shown in flight in relation to the lines of the graticule in the gun camera is indicated in the illustration, which is a reproduction of a strip of film exposed in the gun camera from another aeroplane.

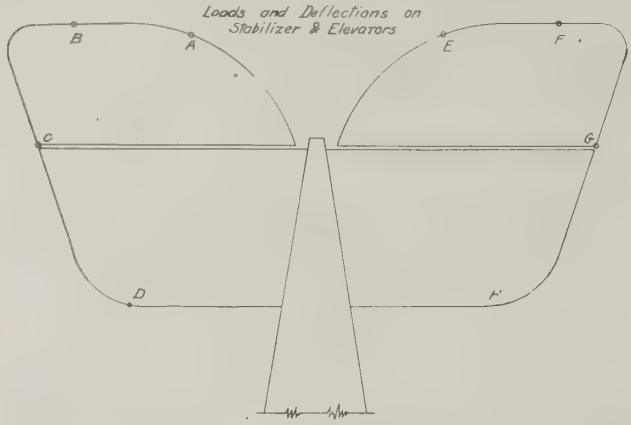
The gun camera is registered properly in relation to the sights of the machine gun to which it is attached by first sighting the machine gun sight on some definite point a certain distance away and then moving the camera so the point of the bisecting lines of the graticule fall exactly on the point on which the machine gun was sighted. The camera is then securely clamped to the machine gun.

The latest improvement on this gun is the attachment of an ingenious timing device which indicates on the film the exact time to fifths of a second at which the photo was taken. It is thereby possible to send up two aviators with their watches exactly in synchrony, and to go through aerial combat tactics and come down with an exact record of the hits scored and who scored the hits first—which under war conditions would represent the victor of the combat. The illustration of the gun does not show this feature, which is to be incorporated into guns in production.

The Eastman Company has also turned out a line of aerial mapping cameras, of automatic and hand-operated types, using both films and plates. They, too, have constituted great advances over existing types.

Mechanism of gun camera, showing Geneva movement and shutter mechanism, which automatically continues to take photos as long as trigger is depressed

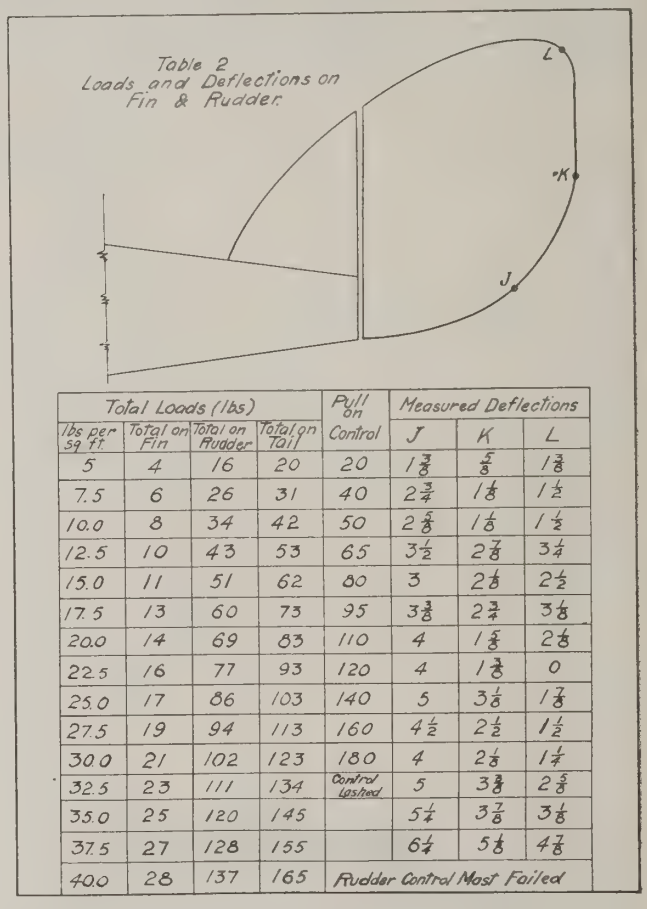
SAND TESTING OF AEROPLANES



By ALBERT S. HEINRICH

(Continued from page 160)

Test of Tail Surfaces



General Dimensions and Description

Figures 1 and 2 are sketches of the tail surfaces of this machine, and show full-size sections and views of some typical parts of the movable surfaces. The spruce ribs were held in place by steel clips brazed around the leading and trailing edges, and screwed to the flanges of the ribs. The elevators had spruce leading edges shown in section B-B, figure 1, and the flanges of the ribs were glued and nailed directly to them with brass brads. At the control masts in each case the ribs were built into a thick block of wood on each face of which the mast was bolted. The trailing edges of the elevators and rudder were of ½", 26 gauge steel tubing flattened as shown in the rudder elevation figure 2, and then wrapped with linen tape to prevent rust affecting the cloth. Each movable surface was held by small hinges taking 3/16" clevis pins.

10.0	8	34	42	50	2⅝	1⅛	1½
12.5	10	43	53	65	3½	2⅞	3¼
15.0	11	51	62	80	3	2⅛	2½
17.5	13	60	73	95	3⅜	2¾	3⅛
20.0	14	69	83	110	4	1⅝	2⅛
22.5	16	77	93	120	4	1⅜	0
25.0	17	86	103	140	5	3⅛	1⅞
27.5	19	94	113	160	4½	2½	1½
30.0	21	102	123	180	4	2⅛	1¼
32.5	23	111	134	Control Lashed	5	3⅜	2⅝
35.0	25	120	145		5¼	3⅞	3⅛
37.5	27	128	155		6¼	5⅛	4⅞
40.0	28	137	165	Rudder Control Mast Failed			

Table 2—Results and pull at the controls for each loading of the fin and rudder

The weight and areas of the surfaces are as follows:

Area of pin	1.375	covered wt. 2	lbs.
Area of rudder	6.66	covered wt. 4¼	lbs.
Area of stabilizer	11.44	covered wt. 8	lbs.
Area of elevators	9.00	covered wt. 7½	lbs.
Weight of all fittings		4	lbs.

Procedure

The loading on the stabilizer should be uniform, but on the

Figure 3—Arrangement for testing stabilizer and elevators

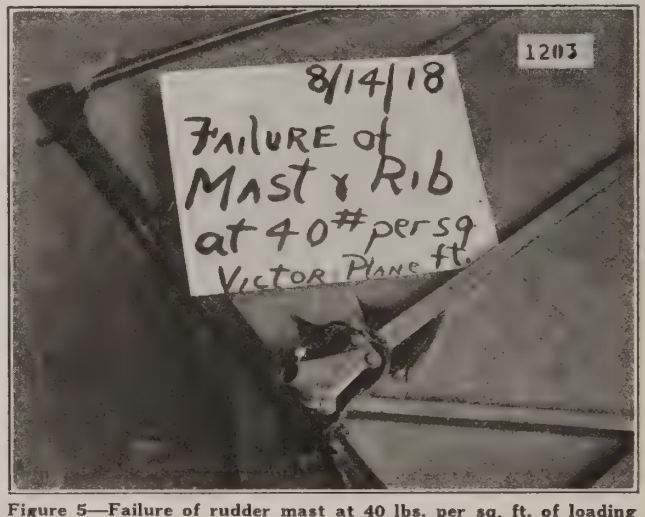

Figure 5—Failure of rudder mast at 40 lbs. per sq. ft. of loading

elevators it should be a maximum on the leading edge, and graduate down to nothing at the trailing edge. The loads should be put on in increments of 5 lbs. per sq. ft. for the first two loads, and 2½ lbs. per sq. ft. thereafter until failure of the surface seams. The same procedure is carried out in testing the rudder and tail fin.

The photograph figure 3 shows the arrangements for testing. The complete fuselage with tail surfaces was set up and supported at the tail post and at front lift fittings by stands. Struts connected the stabilizer to the tail post, which was part of the fin, taking both tension and compression, as shown in figures 1, 2, and 3, and the control cables were connected up with the control in their proper relation. A block and tackle were rigged inside the fuselage, and fastened to the upper end of the ship, and through a 300-lb. spring balance to the top of the joy stick and end of the foot bar for elevators and rudder test, respectively. Before taking deflection reading on the tail surfaces, the tackle was manipulated so that the control masts had their original position, as determined by the position of a point on the control cable. The deflection readings, therefore, give a true indication of the distortion of the frame work of the surfaces. Loads were added as per tables 1 and 2 in increments of 2.5 lbs. per sq. ft. and deflections taken at the points A, B, C, D, E, F, G, and H, as indicated in sketch at head of table 1. All loads were applied uniformly over the surfaces by means of sand bags.

Tables 1 and 2 give the results and pull at the controls for each loading. One of the elevators failed under a loading of 32.5 lbs. per sq. ft. Failure was in the box rib shown at C-C figure 1, and in photograph figure 4, which broke off sharply where it was attached to the control mast block. The rudder failure was at 40 lbs. per sq. ft. when the top of the control

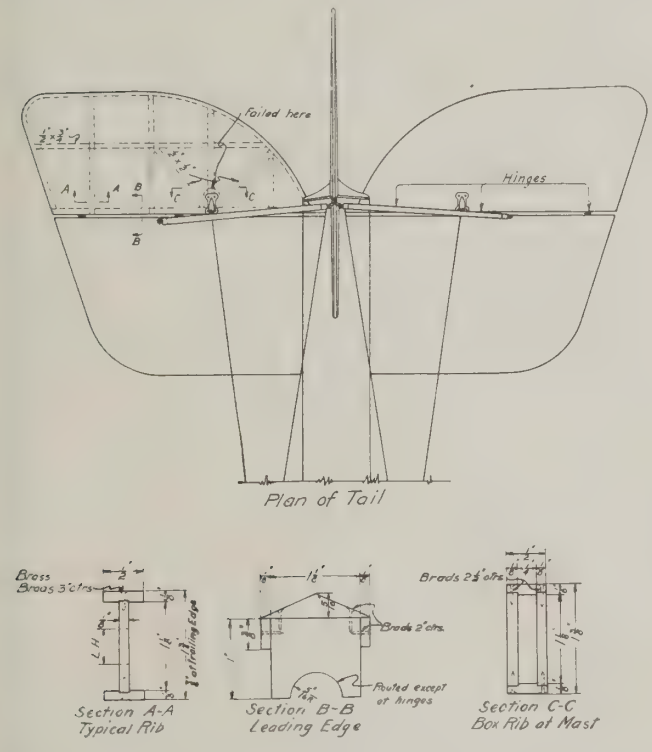

Figure 1.—Plan view of tail surfaces and enlarged sections of typical parts of the movable surfaces

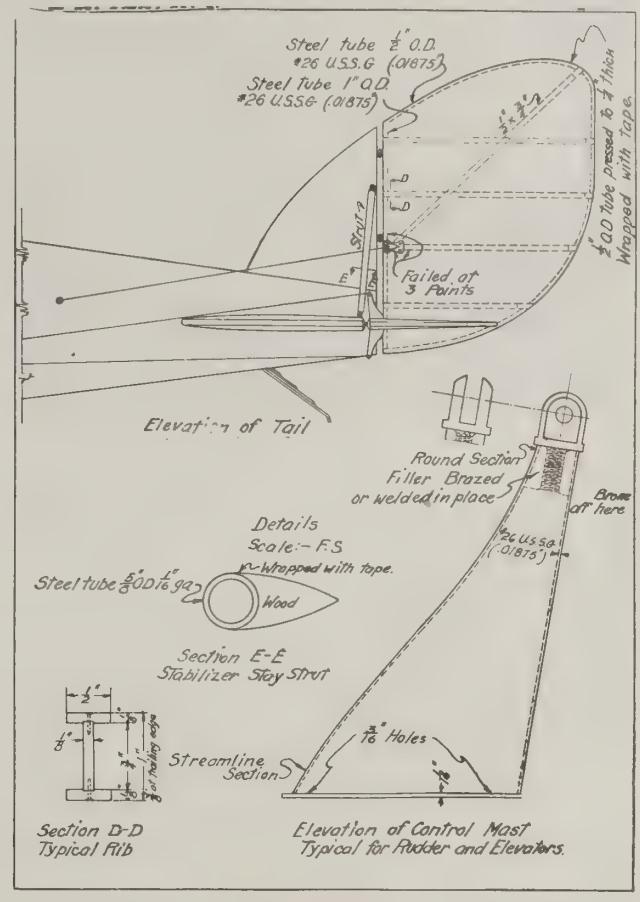

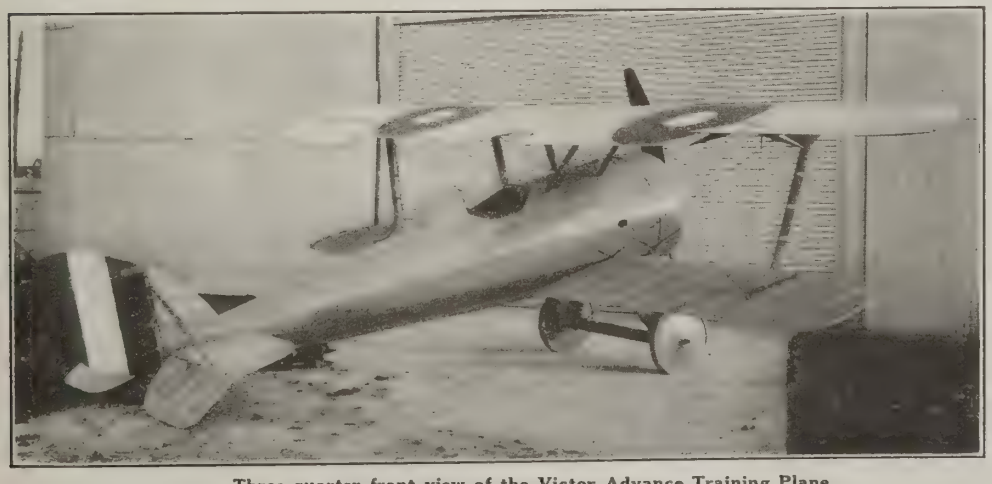

Figure 2—Side view of tail group showing outline and details of the fin and rudder

mast broke off where indicated in figure 2, and as shown in photograph figure 5. When the fabric had been removed, it was found that failure had also occurred in the rib at the mast, and in the leading edge tube between the mast and the adjacent hinge, which evidently was caused by shock when the control mast failed, as there was no evidence of failure in these places before the mast failed. Figure 6 shows the fuselage in position for rudder test.

The strength and weight of the covered surfaces expressed in pounds per sq. ft. are enumerated below for the Victor and two other designs of steel frame surfaces. These values are all test values, and those for the Kawneer are especially low, due to the poor location of the control masts, although the frame work itself was not much stronger. The unit weights are covered surfaces, and do not include fittings.

Three-quarter front view of the Victor Advance Training Plane

	Elevators		Rudder	
	W.T.	Ultimate load	W.T.	Ultimate load
Kawneer Curtiss J.N.	.8	10	.08	20
Art Metal C.1.....	1.2	35	.65	35
Victor	.8	32.5	.6	40

These values and values for De H-4 and other machines show that the tail of the Victor Aeroplane is exceptionally strong for its weight, and perfectly satisfactory from a structural point of view.

Figure 6—Arrangement for testing rudders

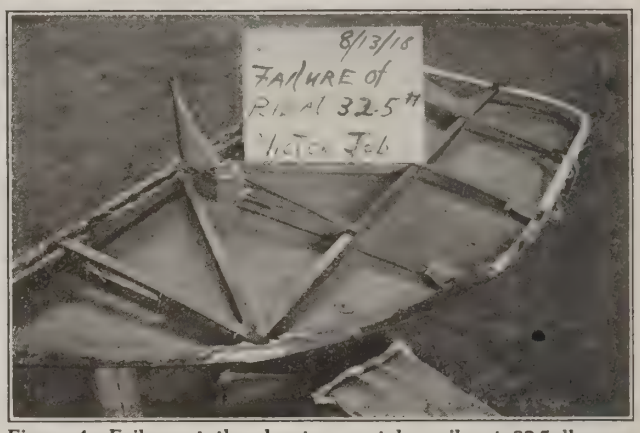

Figure 4—Failure at the elevator mast box rib, at 32.5 lbs. per square foot

Aeronautical Commission Nearing an Agreement

Paris.—The Aeronautical Commission of the Peace Conference held a meeting March 31 to receive and consider reports from sub-committees concerning military, legal, commercial and technical subjects. It was found that the sub-committees had not completed their work, but the commission approved the temporary reports submitted.

It was agreed to put before the Supreme Council the proposals to be finally submitted at the next meeting by the joint Military and Legal sub-committee. Good progress has been made in other directions and a substantial agreement has been reached on important points in connection with the future of commercial aviation.

THOMAS-MORSE S-7 TWO-SEATER

THE side-by-side seating arrangement of the Type S-7 Tractor permits conversation between the pilot and passenger without difficulty. The S-7 has been designed particularly for civilian use, special attention having been directed to comfortable seating arrangement, there being ample room without crowding. The cockpit is lined throughout and in all respects the comfort of the occupants has been given first consideration.

The S-7 is the first machine to be designed for side-by-side seating where a rotary engine is used and it is surprising to note the good streamline form which the body preserves. With an 80-h.p. Le Rhone engine and its 322 square feet of lifting surface the machine can fly at as low a speed as 40 M. P. H. while having a possible high speed of 90 M. P. H.

The general specifications of the S-7 Side-by-Side Two-Seater are as follows:

General Dimensions

Length	21′ 6″
Spread	32′ 0″
Height	9′ 0″

Weights

Total weight loaded	1,480 lbs.
Area lifting surface (including ailerons)	322 sq.ft.
Loading per sq.ft. lifting surface	4.6 lbs.
Required horse power	90
Weight of machine loaded per h.p.	16.5 lbs.

Power Plant

Type of engine	80 h.p. Le Rhone (air cooled rotary)
Engine revolutions per minute	1,250
Fuel capacity	20 gallons
Fuel duration at full power	2½ hours
Oil capacity	4 gallons
Oil duration at full power	3 hours
Propeller type	2 blade
Propeller diameter	8 feet
Propeller revolutions per minute	1,250

Chassis

Type	"Vee"
Wheels	2 (tread 5 ft.)
Tires	26″ x 3″

Areas of Control Surfaces—(*square feet*)

Ailerons (four)	40.0
Elevators	16.8
Rudder	8.5
Horizontal stabilizer	14.5
Vertical stabilizer	3.6

Stick type control used.

Performance

High speed	90 M. P. H.
Low speed	40 M. P. H.
Climb in first ten minutes	6,700 feet

Thomas-Morse Type S-7 80 H.P. Le Rhone engine, side-by-side two-seater, designed particularly for pleasure flying

SECOND PAN-AMERICAN AERONAUTIC CONVENTION AND EXHIBITION

To Be Held Under the Auspices of The Aero Club of America, The Aerial League of America and the Pan-American Aeronautic Federation.

From Thursday, May 1st, 1919,
to
June 1st, inclusive,
at
Atlantic City, N. J.

Intercollegiate Contests Throughout the Summer

CONTESTS TO BE HELD EACH SATURDAY

(1) Seaplane Contests (general),
(2) Curtiss Marine Flying Trophy and Prizes,
(3) Intercollegiate Seaplane Contests,
(4) Land Aeroplane Contests,
(5) Dirigible Contests,
(6) Kite Balloon Speed in Ascending and Descending, and Maneuvering Contests,
(7) Parachute Competition,
(8) Aviette (bicycles and motorcycles with wings) Contests.

EVERY DAY ACTIVITIES

(1) Exhibits of Aeroplanes, Motors and Accessories on the Steel Pier,
(2) Demonstrations and tests of Seaplanes, Land Aeroplanes, Motors, Dirigibles, Kite Balloons, to prospective purchasers and representatives of different governments,
(3) Aerial Passenger Carrying by seaplanes and dirigibles, and kite balloon ascensions,
(4) Moving pictures and Addresses by leading authorities on most important phases of aeronautics.

The Governments and Aeronautic, Sporting, Scientific, Industrial and Civic organizations of the United States and all the countries in the world, excepting Germany and her allies, are invited to send representatives to attend this great aeronautic event. On arrival in the United States these representatives should call at the Headquarters of the Convention Committee at No. 297 Madison Avenue, New York City, to register and receive their official badges and the official program.

In the event that it is more convenient for them to go directly to Atlantic City they will register at the offices of the Convention located at the following Atlantic City hotels: Hotel Traymore, Hotel Chalfonte, The Breakers Hotel, Hotel St. Charles, Hotel Marlborough-Blenheim, Hotel Chelsea, Hotel Alamac, Hotel Dennis and Hotel Haddon Hall.

Representatives of the Convention Committee will be at the Bureaus of the Aeronautic Convention at the above-named hotels and will issue the official badges which admit the bearer to the Aeronautic Hall, as well as the Aero Exhibition on the Steel Pier, the judges' enclosure during contests, and to the Aerodrome and seaplane stations where the aircraft and motors will be demonstrated.

All communications until May 1st, should be addressed to Rear Admiral Peary, Chairman, Aeronautic Convention, Aero Club of America, 297 Madison Avenue, New York City.

Entries for the competition should be addressed to the Chairman, Contest Committee, Aero Club of America, 297 Madison Avenue, New York City.

DAILY PROGRAM FOR PAN-AMERICAN AERONAUTIC CONVENTION, EXHIBITION AND CONTESTS

THURSDAY, MAY 1ST

Opening of Convention and Exhibit.

AFTERNOON—Reception at Aeronautic Hall on the Steel Pier. Addresses by United States Government State and aeronautic authorities.

EVENING—Aero Show and addresses by officials.

FRIDAY, MAY 2ND

AFTERNOON—Aero Show. Preliminary tests of seaplanes, dirigibles and kite balloons.

EVENING—Moving pictures and address on flying for sport and pleasure.

SATURDAY, MAY 3RD

AFTERNOON—Seaplane and dirigible races, and kite balloon ascending and descending contest.

EVENING—Ball.

SUNDAY, MAY 4TH

MORNING—Memorial service by eminent Divine for the dead airmen.

AFTERNOON AND EVENING—Reception to allied aces and heroes of the air and their parents, and announcement of the award of the Aero Club of America Medal of Valor, and the Aerial League of America Diploma of Honor.

MONDAY, MAY 5TH

AFTERNOON—First parachute contest for $500 Bennett Prize.

EVENING—"The Large Dirigible and Its Value for Transportation." Representatives of railroads, express, steamship and other transportation organizations invited to attend.

TUESDAY, MAY 6TH

AFTERNOON—Illustrated addresses on "Aerial Forest Patrol." Forestry Department of every State invited.

EVENING—"Work of Aerial Police Squadrons, and Why Every City Should Have One."

WEDNESDAY, MAY 7TH

AFTERNOON AND EVENING—Aerial Mail Day. Illustrated address on, and consideration of, "Aerial Mail Planes." Chairman of Post Office and Post Roads Committees of House of Representatives and Senate, and Postmaster General Burleson invited to deliver addresses. (26,000 United States Postmasters, and Chambers of Commerce of 13,000 cities invited to attend.)

THURSDAY, MAY 8TH

AFTERNOON AND EVENING—Illustrated addresses on the "Need of Municipal Aerodromes, and the Part to be Played by Aircraft in City Planning." Chambers of Commerce and City Planning Commissions of 13,000 cities invited to attend.

FRIDAY, MAY 9TH

AFTERNOON—Arrival of seaplanes and army planes from Army and Navy Air Stations. Second parachute competition for the $500 Bennett Prize.

EVENING—Illustrated addresses on "Latest Developments in Aerial Warfare and Adventures in Aerial Warfare," told by famous aces.

SATURDAY, MAY 10TH

AFTERNOON—Army, Navy and Marine Corps Day. Aerial contests and tournament.

EVENING—United States Army and Navy Officers' Reception. Reception and addresses at Aeronautic Exhibition Hall on the Steel Pier.

SUNDAY, MAY 11TH

AFTERNOON AND EVENING—Presentation of the flags by each State of the United States to the Aero Squadrons representing the States. Each State will present a flag to each Aero Squadron, the members of which were overwhelmingly natives of that State. The presentation will be made by representatives from the State and the Aero Club and Aerial League branch of that State. All States and cities invited to send delegates, and Army, Navy and Marine Corps to send representatives.

MONDAY, MAY 12TH

AFTERNOON—Demonstrations and illustrated addresses on the "Value of Aircraft for Advertising by Day and by Night." All national advertisers and advertising agents invited to attend.

EVENING—"Pan-American Aerial Transport Over Land." Addresses by members of the commissions of the 20 Latin-American Republics.

TUESDAY, MAY 13TH

AFTERNOON AND EVENING—"Pan-American Aerial Transport Over Water." Addresses by members of the 20 Latin-American Republics' Commissions.

WEDNESDAY AND THURSDAY, MAY 14TH AND 15TH

AFTERNOONS AND EVENINGS—"The Airways and Aerial Transport in Europe, Canada, Africa, Australia and Asia."

FRIDAY, MAY 16TH

AFTERNOON AND EVENING—"Aerial Navigation Instruments for Flying Over Land and Water." Aviators, navigators, scientific instrument makers and aeronautic experts invited.

SATURDAY, MAY 17TH

AFTERNOON—Aerial races and contests. Illustrated addresses on Aerial Photography.

EVENING—Extensive exhibit of aerial photographs and photographic apparatus. All photographers, professional and amateur, and makers of photographic apparatus invited.

SUNDAY, MAY 18TH

AFTERNOON AND EVENING—Illustrated addresses on "Aerial Exploration and the Use of Aircraft for Coast and Geodetic Survey."

MONDAY, MAY 19TH

AFTERNOON—Addresses on "Need of Broader Attitude Regarding Insurance for Aircraft and Aviators."

EVENING—Illustrated address on "How Army Medical Standards and Inspection Lessen Accidents." Insurance companies and agents invited.

TUESDAY, MAY 20TH

AFTERNOON AND EVENING—Illustrated addresses showing different ways of crossing Atlantic by air and the problems to be solved to accomplish same successfully.

WEDNESDAY, MAY 21ST

AFTERNOON—Aero Safety Day. Discussion of aero safety provisions made; improvements in aeroplane construction; increased reliability of aero motors; devices which make for safety in flying.

EVENING—"Progress Made in the Art of Piloting Aeroplanes." Illustrated.

THURSDAY, MAY 22nd

AFTERNOON AND EVENING—Addresses and discussions of meteorology—"How the Weather Forecasts Can be Extended and Made More Efficient by the Use of Aircraft in Exploring the Upper Air," also "How the Weather Forecasts Help Aerial Navigation," and "Telegraphic and Climatic Factors in Relation to Aeronautics.

FRIDAY, MAY 23RD

AFTERNOON AND EVENING—Addresses on "Aerial Jurisprudence—Aerial Laws and Regulation of Air Traffic." (First day.) Lawyers, traffic commissioners and police authorities of different countries invited.

SATURDAY, MAY 24TH

AFTERNOON—Races and contests.

EVENING—Illustrated address on "Need of Establishing Altitude Levels for International, Interstate and Interurban Air Travel."

SUNDAY, MAY 25TH

AFTERNOON AND EVENING—Aeronautic Art Day. Address on "Aerial Painting and Sculpture of Different Countries, and Exhibition of Aerial Paintings," by Lieut. Farre, Lieut. Ruttan and others. All prominent artists, managers of art galleries and art patrons invited to attend.

ENGINEERING WEEK.

MONDAY, MAY 26TH

AFTERNOON—"Aeronautic Engineering Problems and Their Prospective Solution."

EVENING—Opening of contests for designs and ideas for large aeroplanes.

TUESDAY, MAY 27TH

AFTERNOON—"Factors That Increase the Efficiency for Large Dirigibles."

EVENING—"Advantages of Veneer and Plywood for Aircraft Construction."

WEDNESDAY, MAY 28TH

AFTERNOON—Address on "Problems of Flying at 35,000 Feet and Over, and Their Prospective Solution."

EVENING—"Present Day Aero Engines."

THURSDAY, MAY 29TH

AFTERNOON—"Flying Boats Versus Hydroaeroplanes for Sport and Transportation."

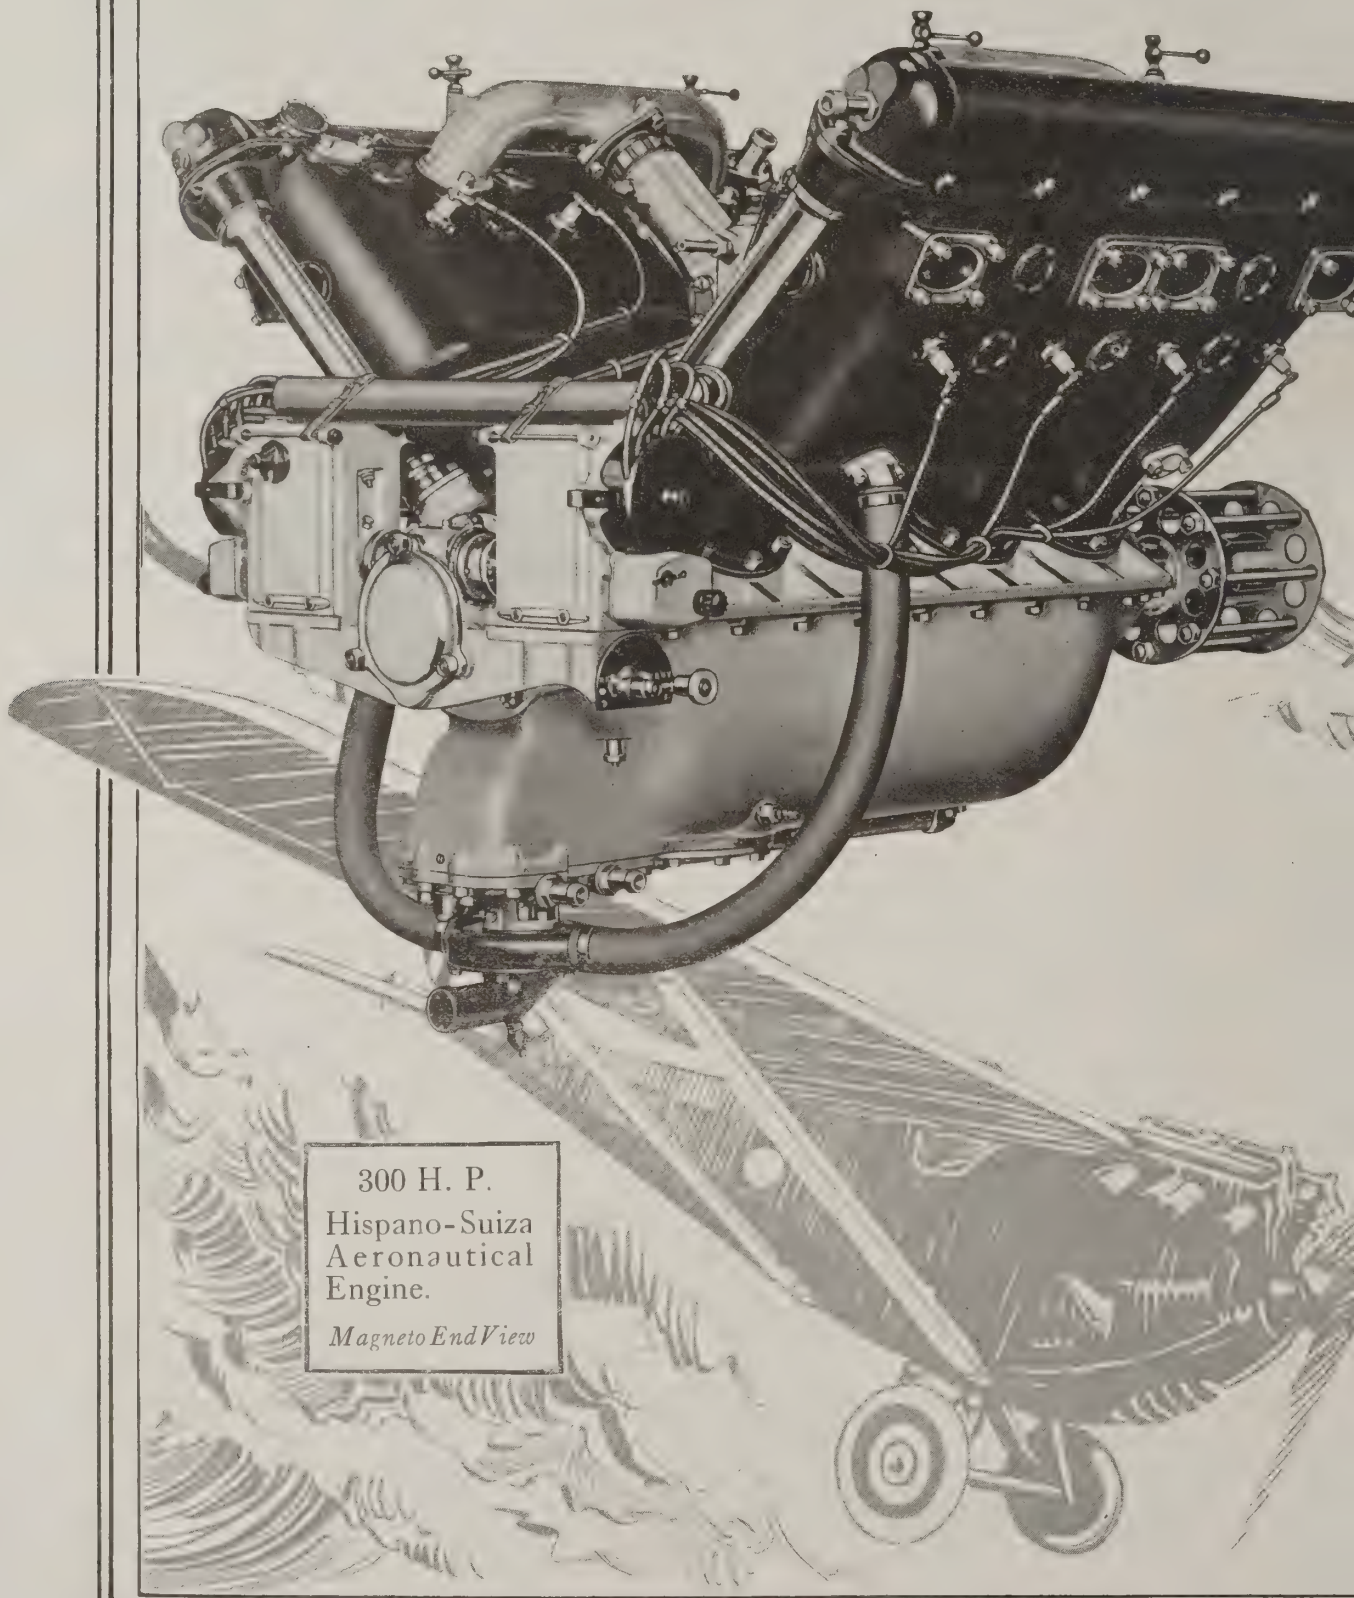
EVENING—Contest for designs and ideas for large aeroplanes.

FRIDAY, MAY 30TH (Memorial Day)

AFTERNOON—Dirigible races, kite balloon speed ascending contest; parachute contest.

EVENING—Reception at the Aeronautic Hall, Steel Pier.

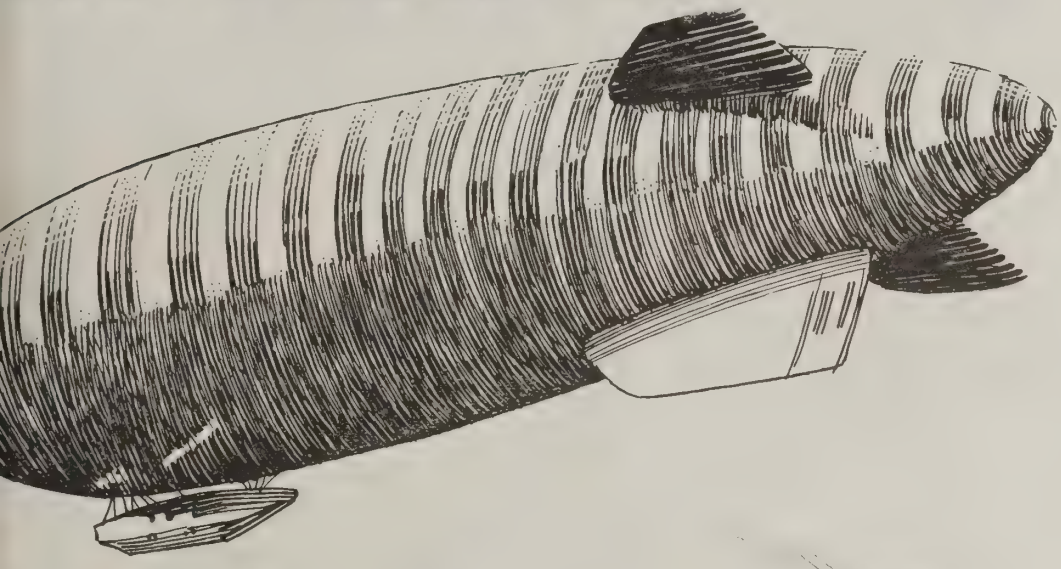
SATURDAY, MAY 31ST



AFTERNOON—Seaplanes, land planes and dirigible contests. Aviette competition at which all cyclists and makers of bicycles and motorcycles will be invited.

EVENING—"International Medical Standards for Aviators in War and Peace." Reports from different countries illustrated with attractive films. 50,000 medical men invited.

SUNDAY, JUNE 1ST



AFTERNOON AND EVENING—Award of prizes and diplomas for all events.

Air Service Demobilization

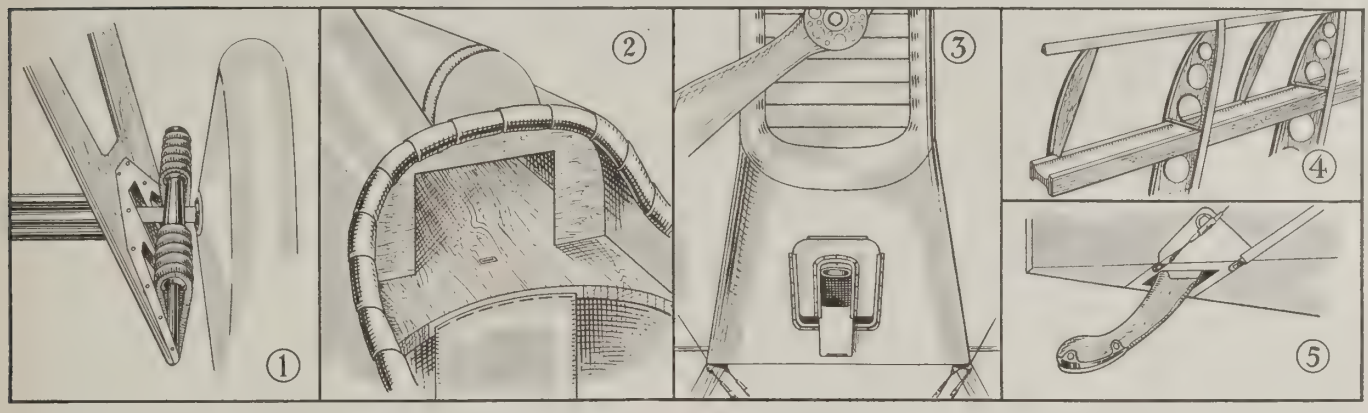
Commercial Aerial Transportation Concerns will find it to their advantage to write to

The Aerial Register

(To appear shortly under the auspices of AERIAL AGE WEEKLY)

For NAMES and QUALIFICATIONS of

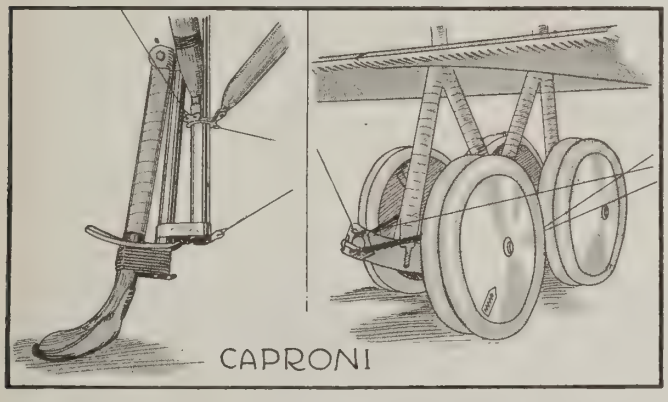
Pilots
Meteorologists
Aerial Navigators
Aerial Surveyors
Aerodrome Managers
Engine Specialists
Aerial Photographers
Aerial Traffic Managers
Aircraft Inspectors
Wireless Experts
Instructors
Airship Pilots
Rigging Specialists
Aerial Statisticians
Equipment Experts



And for INFORMATION CONCERNING COMMERCIAL AERONAUTICS IN ANY PART OF THE WORLD

If **YOU** hold any of the above qualifications, but have not yet registered, you are invited to communicate with the Editor (Air Service Demobilization Department) AT ONCE.

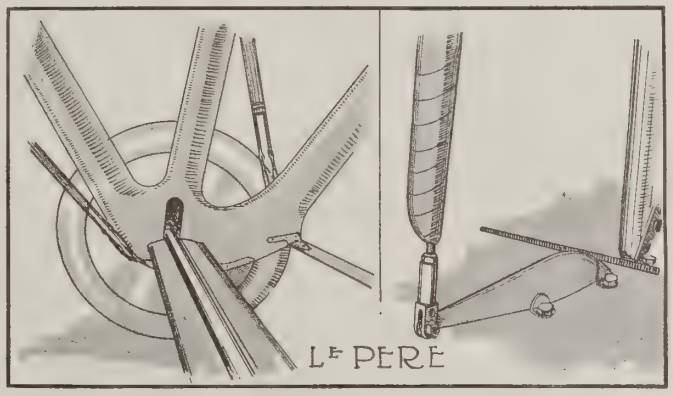
280 MADISON AVE., NEW YORK



SOME DETAILS OF MODERN AEROPLANES

THE PACKARD TWO SEATER TRACTOR

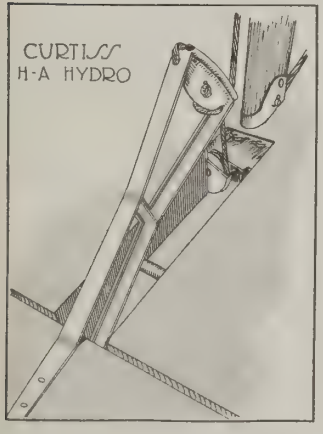
1—The shock absorber arrangement. The axle is square, where it runs in the chassis slot. The elastic cord is divided into two groups, one fore and one aft of the axle. 2—The roomy suit case locker compartment behind the pilot's seat. A veneer cover with dovetailed edges fits over the opening. 3—Double sliding cover plates are used to permit easy access to the under side of the engine in the vicinity of the air intake, projecting through the fuselage bottom. 4—Wing construction. Webs are of thin mahogany veneer. Cap strips and triangular section leading edge of spruce. Short false ribs run from leading edge to main front beam. 5—Tail skid and anchor plate for stabilizer braces



THE CAPRONI TRIPLANE

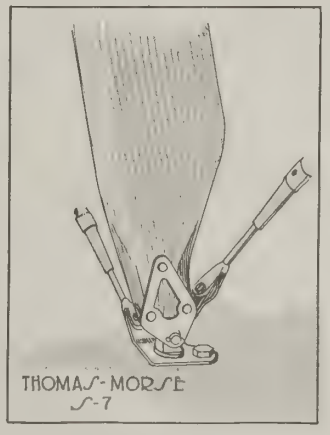
Left—One of the two tail skids. The skid itself is of ash, wrapped with linen and shod with a metal shoe.

Right—One of the two landing chassis units, composed of four wheels with double rims and double tires



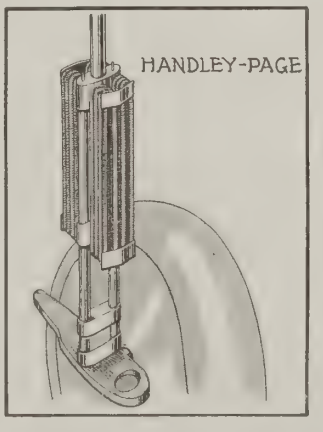
THE LE PERE FIGHTER

Left—Landing chassis. The tension of the rear brace wires is carried from one side of the landing gear to the other by a flat steel strap, following after the axle



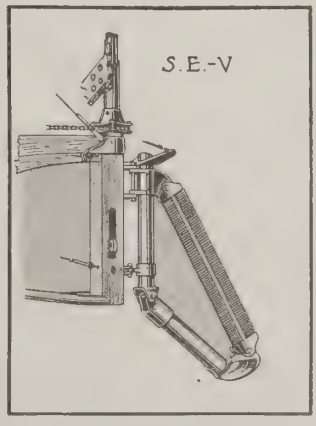
Right—Aileron inter-connecting strut and operating lever, showing the means for adjustment in the upper end of forked terminal

CURTISS



Actuating lever on lower right aileron of the Curtiss H-A Hydro, showing the cable connecting upper and lower ailerons following the interplane strut, and also the cable running through the wing to the control stick

THOMAS-MORSE



Lower wing fitting at the left outer strut, Thomas-Morse Side-by-Side Tractor; an eyebolt running through the turnbuckle plate attaches the strut fitting to the wing beam

HANDLEY PAGE

One of the four shock absorber units of the Handley Page Bomber. The streamline sheet aluminum casing is removed to show the method of stringing the elastic cord between saddles attached to the fixed brace and the sliding rods respectively

S. E.-V

Tail skid of the British S.E.-V single seater. In the sketch the covering is removed to show the compression springs and the joints. Note also the gear for altering the incidence of the stabilizer

Recent Naval Orders

Lieutenant (junior grade) Henry T. Stanley, to duty at naval air station, Key West, Fla.

Lieutenant (junior grade) Ford S. Peterson, to duty naval air station, Key West, Fla.

Lieutenant (junior grade) Donald H. Merrill, to duty naval air station, Coco Solo, Canal Zone.

Will Recommend for Decorations

A Board of Officers to consist of the following personnel is appointed to review recommendations for the Distinguished Service Medal, which have been received at this office, and to make recommendations to the Director of Air Service as to further action:

Brig. Gen. William Mitchell, J.M.A., A.S.A.
Col. Chalmers G. Hall, A.S.A.
Col. Arthur L. Fuller, A.S.A.
Col. Henry C. Pratt, A.S.A.
Lieut. Col. Oscar Westover, A.S., A.P.
Maj. Charles R. Cameron, A.S.A., Secretary (non-voting member).

Air Service Medical

By direction of the Director of Air Service, and by agreement with the Surgeon General of the Army, the Air Service Division of the Surgeon General's Office is discontinued, effective March 14, 1919, and its functions, including the supervision of the commissioned and enlisted personnel of the Medical Department on duty with the Air Service have been transferred to the Chief Surgeon, Air Service.

This new branch will be the Medical Section of the Executive and Administrative Group, and will be under the direction of Chief Surgeon, Air Service, Col. Albert E. Truby, M.C.

Personnel Orders

On March 17, 1919, the following named officers, having reported to the Director of Air Service, Washington D. C., were assigned to duty as indicated:

Lieut. Col. Wm. L. Sheep, M.C., to Administrative Staff.

Maj. Ora M. Baldinger, A.S.A., to Training and Operations.

The appointment of Lieut. Col. Edward E. McCammon, A.S., A. P., as Assistant to Chief, Air Service Materials Inspection, is announced.

Effective March 18, Maj. Maurice Connolly, A.S.A., is relieved from present duty and is assigned to Training and Operations Group.

Col. George H. Crabtree, M.C., and Col. Albert E. Truby, M.C., have been ordered to proceed from Washington, D. C., to Millington, Tenn.; Dallas, Texas; Fort Sill, Okla.; Fort Worth, Texas; San Antonio, Texas; Houston, Texas; and Lake Charles, La., on temporary duty. He will attend an important meeting of flight surgeons at Dallas, Texas, and co-ordinate the work of demobilization and reorganization of the medical service at other stations.

Lieut. Col. Thomas S. Bowen, M.A., A.S.A., was assigned to Training and Operations Group on March 17.

Col. Henry C. Pratt, A.S.A., was assigned to Office of Director of Air Service on March 20, 1919.

Lieut. Col. Henry W. Harms, J.M.A., A.S.A., is relieved from duty as a member of the Advisory Board, Air Service, created March 13, 1919, and Lieut. Col. Byron Q. Jones, M.A., A.S.A., is appointed a member of the Advisory Board, Air Service.

Honorable Discharges

The following officers of the Air Service have been honorably discharged: First Lieut. Herschel Lutes, First Lieut. Joseph O. Freck, First Lieut. Roger W. Andrews, First Lieut. Edward W. Clark, 3d, First Lieut. William R. Kiefer, Capt. D. Dwight Douglas, Capt. Frank B. Makepeace, Jr., Second Lieut. Louis M. Merrick, Maj. James A. Meissner, Maj. Curran S. Benton, Second Lieut. William B. Poynter, Capt. R. Hunter McQuistion, Maj. Cameron B. Waterman, First Lieut. Theron A. Clements, Capt. Truman W. Eustis, Capt. Oscar L. Halsey, Second Lieut. Alan F. Winslow.

Air Service Honors

The Director of the Army Air Service has just received a list of additional honors and awards made to the units and individuals of the Air Service, A.E.F.

The new list includes 21 individuals not previously reported, who have been awarded decorations from the American, British, French and Italian governments, 148 individuals who have been especially cited, and 8 units of the Air Service which have been cited in army or corps orders.

Second Lieut. John MacArthur, who brought down three planes on one day and two on another, is now rated as an American ace. His record was discovered in the following French citation, just received:

"Second Lieut. John MacArthur, 27th Aero Squadron.

"Excellent officer possessing in the highest degree the sentiment of duty. In the course of many combats he has shown the finest courage and greatest self-control. He distinguished himself especially on 13th of June, 1918, when, seeing two reconnaissance aeroplanes attacked by eight Albatros, he brought down three of these and dispersed the others; also on July 2 when, during a combat against nine adversaries, he brought down two of these. (G. O. No. 12,059 'D', G.H.Q., French Armies of the East, 30th November, 1918.)"

103rd Aero Pursuit Squadron Officially Cited

On December 23, 1918, the 103d Aero Pursuit Squadron, formerly the Escadrille, was disbanded. Its last citation from the commanding officer is of interest.

COMMENDATION

Headquarters, 103d Aero Pursuit Squadron,
American E. F.
December 23, 1918.

General Order No. 23:

1. This date the 103d Aero Pursuit Squadron dispatched without mishap all its aeroplanes to the First Air Depot, thus successfully terminating our major responsibility as a combat unit in the American Expeditionary Forces after nine months of active operations.

2. At this time it is my earnest desire to express sincerely and fully to each and every member of the command, both officers and men, my appreciation and admiration of their faithful and willing services so nobly and splendidly performed.

3. In February, 1918, the enlisted personnel of the 103d Aero Pursuit Squadron joined the pilots of the old Lafayette Escadrille and from that amalgamation there came a unit, purely American, that conscientiously and bravely struggled with its daily task of operating against the enemy. Serving as an independent unit for five months under four different French commands, the Fourth, the Sixth, the D.A.N. and the Eighth French Armies, you maintained always a high standard of efficiency. Especially was this true in the Flanders sector where you were able to perpetuate the name of the old Lafayette Escadrille which had its origin under French colors and brought added glory to its flag and traditions by winning a second French Army citation. This last citation should be treasured by all, knowing as you do it was given in recognition of valorous and meritorious operations against the strongest kind of enemy aerial activity in a sector where the whole personnel was nightly subjected to intensive bombardment from the air without affecting its morale or detracting from its efficiency. In July this command came for the first time under the immediate direction of the American Army, and from then until the cessation of hostilities you unceasingly labored with the same indomitable courage, tireless energy and tenacity of purpose that characterized your efforts while with the French.

4. On the eve of your departure to the land for which you have fought, reflect on the record that your Squadron has made and by your appearance and every act show to the people awaiting you that the sacrifices endured and difficulties overcome have not been in vain, but from the mighty test you have come forth valiant soldiers and worthy representatives of your country.

5. The Squadron Commander looks with pride upon your record and considers it a privilege to have served with such an organization.

R. SOUBIRAN,
Captain, A.S., U.S.A., Commanding.

Demobilization of Overseas Personnel

The net decrease in personnel overseas since January 30, is approximately 12 per cent, against a net decrease of 25 per cent in the United States.

	In U. S.	Overseas
Nov. 11	79,321	78,786
Nov. 18	80,689	78,973
Nov. 25	84,785	78,361
Dec. 2	84,844	78,061
Dec. 9	89,661	70,040
Dec. 21	81,607	61,245
Dec. 26	77,140	59,917
Jan. 6	67,833	59,584
Jan. 16	51,821	58,854
Jan. 23	46,467	58,133
Jan. 30	41,314	57,527
Feb. 6	37,537	56,299
Feb. 13	35,479	54,802
Feb. 20	33,240	53,604
Feb. 27	31,111	53,087
Mar. 6	30,823	50,763

Aircraft Production Demobilization of Personnel

According to reports received from the Bureau of Aircraft Production, the net decrease in the total commissioned and enlisted personnel from November 15 to March 11 was approximately 94 per cent.

The distribution and per cent. of net decrease to March 11 are shown below:

	Nov. 15	Mar. 6	Per cent of net decrease
Officers	1,898	649	66
Enlisted men	30,622	1,382	95
Total	32,520	2,031	94

Air Service Reorganization

In connection with the reorganization of the Army Air Service, Major General Charles T. Menoher, has pointed out that the system of staff organization, used overseas, was followed.

The Director of the Air Service is assisted by an executive officer who is his official mouthpiece, being authorized to sign his name and act as his general executive.

Orders No. 5, issued March 19, 1919, by the Director of Air Service, gives the following detailed information:

1. In naming the various subdivisions of this office, the following terminology will be used:
   (a) Headquarters will be known as the office of the Director of Air Service.
   (b) The First, Second, Third and Fourth Assistants will be Chiefs of Groups, known respectively as the Supply, Information, Training and Operations, and Administrative Groups.
   (c) The chiefs reporting directly to the Assistant Executives in any group will be known as Chiefs of Divisions.
   (d) Those subordinates who report directly to Division Chiefs will be known as Chiefs of Sections.
   (e) Subordinates reporting directly to Section Chiefs will be known as Branch Chiefs.

Should any further subdivisions be required, proper designation of the subdivision so formed will be given upon request to this office.

2. Effective this date, all matters arising in connection with Air Service activities other than that pertaining to cancellations of contracts and that which pertains to the approval or authority for funds, will be handled through the Executive Assistants and Division Chiefs of this office in the manner contemplated under the organization outlined in Orders Nos. 1 and 2 of this office.

3. Matters pertaining to the cancellation of contracts and the approval or authority for funds will continue to be handled by the Director of Military Aeronautics and the Acting Director of Aircraft Production, as the case may be, and when necessary, will be referred directly to this office for action.

The Chief of Supply Group has charge of supply, aeroplane engineering, production, procurement, inspection, maintenance and finance disbursement for entire Air Service, in both Aircraft Production and Military Aeronautics.

The Chief of the Information Group gathers and distributes all information, statistics and publicity. In war time he would have charge of intelligence work for the whole Air Service.

The Chief of the Training and Operations Group directs training and operations and is at teh same time Director of Military Aeronautics. This is the office held by Brig. General Mitchell.

The Chief of the Administrative Group is practically the Adjutant General of the Air Service, controlling administration, and executive work, personnel; office management, cables, correspondence, etc.

Editors of the Rich Field Flyer gave a dinner to General Beaumont B. Buck, hero of Catigny, at Waco, Texas. Major John J. Whitesides, commanding officer of Rich Field, acted as toastmaster

FOREIGN NEWS

American Seaplanes Make First Flight in Kingston, Jamaica

Kingston, Jamaica.—At the request of citizens, four seaplanes flew over Kingston before the departure of the fleet of American war vessels which have anchored here for several days. They were visible from all parts of the city, and, as this was the first aeroplane flight ever seen here, some consternation was caused among the natives.

Belgian Government Announces a Paris-Brussels Service

The Belgian Foreign Minister announced on February 26, says *The Times* Paris correspondent, that his Government will permit henceforth an aerobus service to run between Belgium and France. A provisional organization is already formed. Ten aeroplanes, each capable of carrying 12 passengers with luggage, a pilot, and mechanics, 16 persons in all, will be ready in March. They will be well fitted up, going so far as to possess a small library and a bar!

The price of a journey between Paris and Brussels—which includes a life insurance for £4,000—is to be 300 francs (£12), that is to say, a franc a kilometre. A French society will later take over this organization, which is expected to run a service between Amsterdam, Antwerp, Lille and Paris, and thence to Bordeaux and Nice.

Italian Mission to Argentina Takes Planes and Dirigibles

A mission for promoting better trading relations in Argentina has left Italy for that country, taking with it several areoplanes and a small Naval submarine-hunting airship. The former machines include an S. V. A. hydro-aeroplane, a small C.A., something from the Farman peoples' Italian representatives—the Savoia firm of Milan—and other craft, and the airship, it is stated, is a Usuelli product. The well-known pilots composing the mission are all men in the Services, so one scarcely knows whether to call the visit a commercial one, though one hopes that much trade may directly or indirectly be the result of the trip.

Four-Motored Plane for Trans-Atlantic Flight Entered by Dawson

It is understood that the John Dawson Co., Ltd., of Newcastle-on-Tyne, has entered a four-engined aeroplane designed by Mr. C. J. H. M. Kennedy for the "Daily Mail" Trans-Atlantic Competition.

The new machine is said to have a span of 108 ft. and a length of 54 ft. 6 ins., and a speed of 120-130 miles an hour is intended. The machine will be fitted with four Napier "Lion" engines, which will be arranged in pairs in tandem on either side of the fuselage, each pair driving a tractor airscrew. During the attempt on the Atlantic flight, the machine will carry two pilots, a mechanic, and a passenger, and care has been taken to render the accommodation as comfortable as possible, the interior of the machine being heated by the exhaust system.

A Cambridge Chair of Aeronautical Engineering

The following paragraph has appeared in the daily Press:—

Cambridge University has received an offer of £20,000 of 5 per cent. war stock from Mr. Emile Mond, of Hyde Park Square, for the endowment of a Professorship of Aeronautical Engineering, as a memorial to his son, Lieut. Francis Mond, R.F.A. and R.A.F., who was killed in action whilst flying on the Western front on May 15th last.

The Chair is to be designated the Francis Mond Professorship of Aeronautical Engineering.

The Council of the Senate recommended that the offer be gratefully accepted. The proposal is viewed with favor by the Air Ministry.

Unfavorable Air Conditions Off Newfoundland

London.—Warning to beware of "air reefs" off Newfoundland accompanied meteorological details furnished by the British admiralty and the meteorological bureau, it was learned, has been sufficient to hold up the plans of the imminent departure of the great airships R-33 and R-34, for their flight to America. It has just been discovered that a permanent wide area of "air reefs" in the trans-Atlantic route between Ireland and Newfoundland makes the success of even the most powerful airship dubious.

London-Amsterdam Service to be Inaugurated

Plans for an aerial post between London and Amsterdam have been drawn up by a Dutch steamship company, according to the *Telegraaf*, and the British Postmaster-General has expressed himself very sympathetically in regard to them. It is estimated that the crossing will only take two hours, and that a capital of about £83,000 will be required. A Bristol plan provides for the establishment of an aerial service between London and Amsterdam, thence *via* Denmark and Norway and Sweden, and then further *via* Danzig to Petrograd. A service between Amsterdam, Brussels, and Paris is also contemplated.

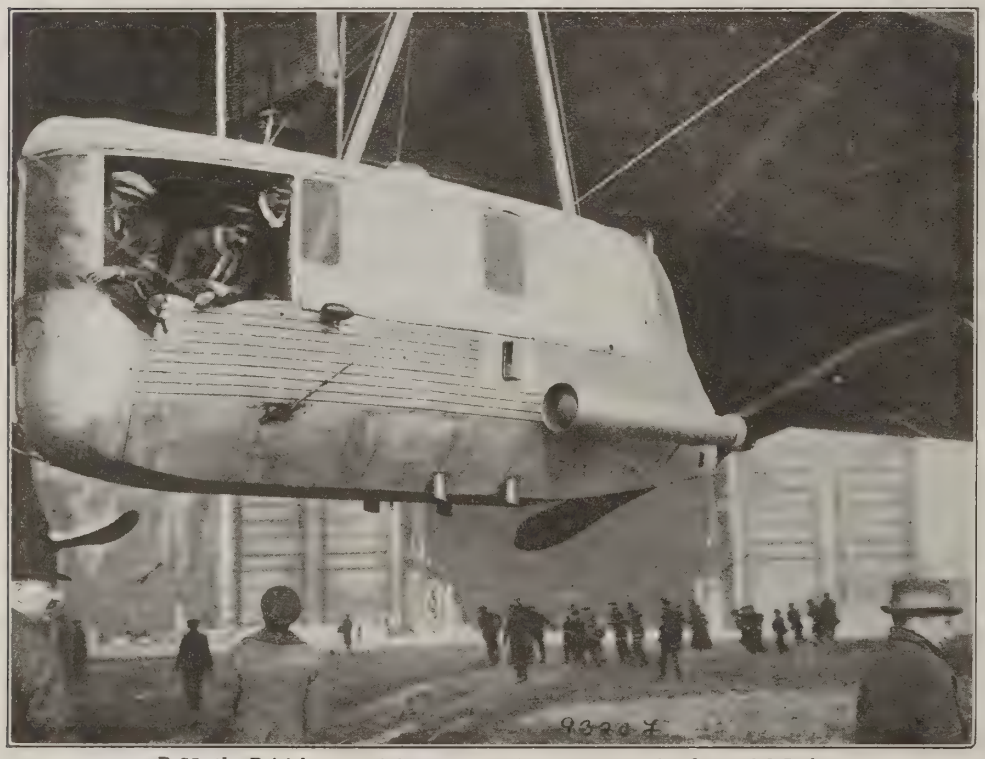
Air Ministry to Conduct Exhibition Tour Through Europe

It is understood that the Air Ministry is about to inaugurate a series of aeroplane flights to various parts of the world to demonstrate the excellence of British aeroplanes. The first flight will probably be to Madrid, and the start will be made in a few days. It is expected that the machine will be a giant Handley-Page biplane of the type which flew to India recently. Other flights in contemplation are from England to the Cape via Cairo, from England to Australia via Delhi, and from London to Lisbon.

Aviation School in Peru

Lima, Peru.—A military aviation school will be established in Peru, according to a recent decree by the president of the country.

Canada Contributed 8,000 Air Officers



London.—Canada sent 8,000 aviation officers overseas to join the Royal Air Service during the war, according to a statement made at Hendon by Sir Edward W. Kemp, Canadian Minister of Overseas Service. Of these, he said, 4,280 were directly recruited in Canada, and the most of the rest were transferred from the Canadian service to the Royal Air Service after their arrival in Europe.

Sir Edward's statement was made in the course of an address in which he accepted, in the name of Canada, fifteen aeroplanes which had been presented to the Dominion by Canadian and British residents of London, through the Overseas Club. The machines were formally presented by Lord Londonderry, representing the Air Ministry.

Another British Entry in Trans-Atlantic Flight

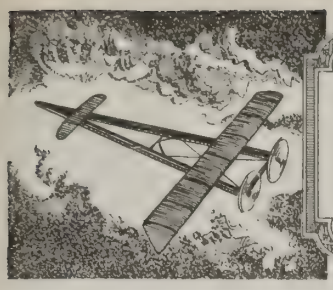
London.—Another entry for the $50,000 prize offered by the *Daily Mail* for the first flight across the Atlantic was made today in behalf of Maj. J. C. P. Wood, pilot, and Capt. C. C. Wylie, navigator. They propose to make the attempt in an aeroplane of 375 horsepower, capable of a speed of 95 miles an hour when carrying a weight of 2,632 pounds.

Maj. Wood has had considerable experience as an aviator, while Capt. Wylie, in addition to his flying experience, has been navigating destroyers in mid-Atlantic.

R-33, the British trans-Atlantic dirigible, starting on its first trial flight

Argentine-Paraguayan Air Route

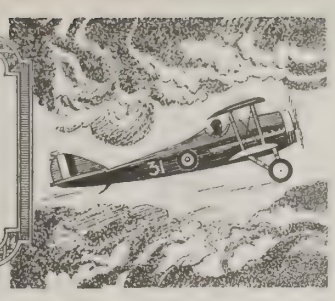
Buenos Ayres, Argentina, March 24.—Italian aviators have arrived here to establish an aerial communication system between Buenos Ayres and Ascuncion, the capital of Paraguay.



R-34 on 19 Hour Test Flight

London.—The British airship R-34 returned to her base on the Clyde at noon after a flight which kept her in the air continuously for nineteen hours. The itinerary included a flight to Dublin, the circling of the Isle of Man, and home by way of Liverpool and the Midlands. It was intended to remain in the air twenty-four hours and circle Ireland.

The *Evening Standard* says that the next flight of the ship will be over the ocean to make certain tests. An attempt will then be made to cross the Atlantic.



Italian Forlanini Carries 46 Passengers

The Forlanini 6, which was ready in time to get into the war zone and be useful there by carting about high explosives, flew the other week at Milan with 46 people on board. The O. C, Major Gallotti, is reported as having told the journalists that this number could have been increased to 60 if the car could have contained them all.

The Motorcycle Engine Driven Aeroplane

THIS machine was described and the description accompanied by a cut drawn to scale in last week's AERIAL AGE. All the dimensions could be ascertained by using the scale at the upper left-hand corner to determine the size of wings, fuselage, etc.

The sizes of struts and longerons in the body can be determined by scaling the body and deducting the thickness of the longerons, when determining the lengths of the struts, and allowing for the curves when measuring the longerons.

As I mentioned in a previous article, this three-cylinder motor can be built from three ordinary stock motorcycle cylinders, pistons, connecting rods, valves, etc.; the only thing necessary would be the crankcase.

The ordinary motorcycle motor uses a crankcase having but two holes for the cylinders; this one will have to be provided with three holes, spaced at regular intervals around the outside circumference.

It is no easy matter for the ordinary mechanic to construct one of these crankcases, and for this reason I have made arrangements with one of our advertisers to make up these crankcases, which are now being developed, and when ready announcement will be made in the advertising columns of this paper.

For those who wish to attempt the construction of one of these motors the writer will show a sketch in next issue of the general assembly of the proposed motor.

Cylinders from an Indian, Excelsior, Harley-Davidson or Reading motorcycles can be used. The Hendee Manufacturing Company claims for their motor 18 horsepower when running at the maximum speed, and being that we are using three cylinders instead of two we should get at least half again as much power, or, as stated before, 27 horsepower, which gives us a good bit of reserve horsepower for climbing and maneuvering.

Unless a reduction gear is built into the crankcase it will be necessary to use a very low pitch propeller which is not very efficient. A better way would be to have a reduction gear built into the crankcase, reducing the speed of the propeller to one-third or so of the engine speed. To accomplish this it is necessary to fasten a pinion gear to the end of the crankshaft and this turning a gear three times the size, to which is fastened the propeller-shaft.

The most difficult part will be the arrangement of the valve timing apparatus and the ignition, which in a three-cylinder engine must be very ingenious. The order of firing of the cylinders being 1, 3, 2, which you will see means that one cylinder is skipped on each revolution and the motor has one and one-third power impulses each revolution.

For the information of those who did not receive a copy of the first instalment, the fittings which were designed for the Ford motored aeroplane can be used on this machine as well, and also on a two-cylinder ordinary motorcycle engined machine which the writer will start in the next issue of AERIAL AGE.

The Aero Science Club of America

Just in time to enter the coming model aeroplane contests, the Aero Science Club of America has signified its intention of again reorganizing with most of its old members and many new ones on its membership list. This club is the oldest model Aeroplane Club in America, and has graduated some of America's greatest aeroplane mechanics, designers and fliers.

The Aero Science Club was formerly known as the New York Model Aero Club, and was the first in the United States to hold an engine driven model aeroplane contest—the motors being the "Baby" engine constructed of aluminum and having but one cylinder. Such famous aeronautical men as Carisi, Schober, Peoli and Lateiner, as well as a few others whom I cannot remember, competed. These men, with the exception of Peoli, who was killed in the South a few years ago in an aeroplane of his own design, are holding responsible positions in aircraft factories to-day, showing the benefits derived from model aeroplane competition.

More attention should be given to the engine driven model than is displayed by the model enthusiasts, because better prizes will be offered for this type of model than those offered for the rubber-driven type, and the rules allow the model builder to buy his power plant as long as he makes the remainder of the model.

Compressed air and steam engines can be purchased from model aeroplane supply houses for nominal sums of money.

Notice to Builders of the Ford Motored Aeroplane

The Jennings Machine Works, of Uniontown, Pa., one of our advertisers, announce a full line of parts for the Ford motored aeroplane recently described in these columns. These parts are made very strong and carefully as well as neat in appearance, each fitting being dipped in black aeroplane enamel. These fittings are made more elaborate and neater than those which appeared, as those which were given in AERIAL AGE were designed as simple as possible to enable the ordinary mechanic to make them; while these made by the above company are a strict factory production. Control stick, oil pan, propeller hub and special radiator are the other parts that are sold by this concern, as well as the fittings. Machine work and motor parts can be furnished.

Mr. Henry S. Villard Offers Cup

Mr. Henry S. Villard, of the Aero Club of America, has offered his cup for competition again. The Illinois Model Aero Club has two legs on this cup, and if they win it again it is theirs, the rules by which it was presented for competition being the club winning it three times was to get possession of this beautiful trophy, which is now on exhibition in the Aero Club of America rooms.

Mr. Villard is quite an enthusiast, and believes the model aeroplane is the correct method of studying mechanical flight. He is even more interested in the mechanical motor driven models of the compressed air and steam engined type.

Many entries are listed for the coming contests, and I would advise those young men who are alone in their towns or cities to get together their friends and interest them in model aeroplane flying, as it is necessary to have at least five competitors for the flying models contest. The construction and exhibition models can be entered separately, as they will be judged by the photos and the certification accompanying the photos. Get busy, model enthusiasts, as the time is drawing near.

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

A Grand Passion

"She seems interested in that aviator."
"That is hardly the word for it."
"No?"
"She says she loves the very air he flies through."

Lots of Such Cases We're Thinking

An Airnat sent his girl in Indiana a photo of himself. One year later when he returned to the land of the free, he was talking with his girl one night.

"Oh, by the way," he says, "you never did tell me whether you received that photo I sent you about a year ago."

"A photo," she exclaimed, "why, I thought that was one of those puzzle pictures in which you try to find a man's face."

There was a young flyer named Perc.
His flights grew from reckless to worse.
He lost his control
And all his petrol—
He now rides around in a hearse.

An Aviator's Description of a Fair Damsel at a Dancing Party

She was some 5 ft. 4 in. OVER-ALL LENGTH, TRACTOR TYPE, designed somewhat after the Mary Pickford model, faultlessly STREAM-LINED, and her features were slightly radical in design, but showed a very good ASPECT RATIO.

On the Chanute and Bell Airway in 1922—*Courtesy N. Y. Globe*

The ENTERING EDGE of her chin had a very noticeable PHILLIP'S ENTRY. Her nose took the place of a well designed FIN, with deeply CAMBRED eyebrows. Upon VETTING her ears she showed a two-degree DIHEDRAL and the NEGATIVE WASHOUT in the corners of her mouth gave a DERNIERE TOUCHE to her bewitching features. Her complexion at a distance was so CAMOUFLAGED as to give her the appearance of a school girl. Her hair was SWEPT BACK, giving effect of high INHERENT STABILITY with a solid gold CABINE having very little BRACING. Her shoulders would indicate a large KATHEDRAL. She being a TRACTOR TYPE, her FUSELAGE was carefully covered with the finest quality FABRIC and her LONGERONS so designed as to give exquisite effect.

She had a stately and well sprung UNDERCARRIAGE and as she TAXIED about the floor her graceful TAKE-OFF was very noticeable, although she had a slight DUTCH ROLL and a peculiar PITCHING MOTION at first, but she quickly asumed her PROPER POSITION.

In an attempt to test her CONTROLS, together with her RESISTANCE, the CRITICAL ANGLE was found and she started to STALL, giving the observer a beautiful example of HANDS OFF, which immediately showed sufficient FACTOR OF SAFETY.

Owing to a sudden RETREAT a large GAP must be left in the details of description, which leads us to suspect a WARPED disposition.

Although one of the PILOTS reports that she was so PERFECTLY ALIGNED that she responded very quickly to the CONTROLS, especially in a SPIN, and she readily assumed her GLIDING ANGLE.—*The Propeller.*

Huh-uh! Not Me

By An Officer at Scott Field

C'o'se, Ah ain't sayin' Ah won't do
Des what ma country want me to,
But dey's one job dat Ah fo'see
Ain't gwine to 'tach itself to me—
Huh-uh, not me.

Dat's dis heah ahplane stuff—no boss,
Ah'll pack some othah kin' ob cross
Lak, drive a mule, or tote a gun,
But Ah ain't flirtin' wif de sun—
Huh-uh, not me.

Ef Ah mus' do a loop de loop,
Let mine be roun' a bowl ob soup;
'Tain't gwine to be up whah de crows
Kin say Ah's trompin on deh toes—
Huh-uh, not me.

It sho look sweet, Ah don't deny,
To be a-oozin' roun' de sky,
But dat's fo' folks dat's in de mood
To pass up love an' gin an' food—
Huh-uh, not me.

Down heah Ah firs' saw light ob day,
Down heah am whah Ah's gwine t' stay;
Folks, Ah don't keer to hab ma feet
Get too blamed proud t' walk de street—
Huh-uh, not me.

So, Ah'll des wait till Gabr'el brings
Dem good ole-fashioned angel wings,
Den as Ah pass de ahplane by,
In pity, Ah'll look down and sigh—
Huh-uh, not me.

Missouri Freemason.

FIRST AIR PORT IN WORLD ESTABLISHED AT ATLANTIC CITY

WHAT is considered to be the most important step in popularizing aeronautics so as to insure the United States from again being unprepared in the event of an emergency was announced by Mr. Augustus Post, the secretary of the Aerial League of America.

Mr. Post announced that there is being established at Atlantic City the first "air port" ever established, the purposes of which are as follows:

(1) To establish the first air port in the world to be operated as seaports are operated, the aircraft starting from this port to be registered under the rules of the Aircraft Inspection Service of the Department of Commerce, having clearance papers just as the ships of the sea have.

(2) To supply a flying field for the Aero Club of America, the Aerial League of America and the Atlantic City Aero Club.

(3) To provide a municipal aviation field, an aerial mail station and aerial police station for Atlantic City.

(4) To supply an air port for trans-Atlantic liners, whether of the seaplane, land aeroplane or dirigible balloon type.

(5) To supply an aerodrome for land aircraft and a naval air station for seagoing aircraft, where those among the 10,000,000 people who visit Atlantic City each year, who wish to use aircraft as a means of conveyance, may put up their aircraft and have the necessary expert service and gasoline and hydrogen supplies, and may rent aircraft.

(6) To provide a service station or aerial garage for air travelers where they may house their aircraft temporarily or permanently, just as they house their automobiles at garages at present.

(7) To provide an air station at Atlantic City for the coming New York-Atlantic City passenger-carrying air lines which will cut the time required for travel between the two cities to fifty minutes, thereby enabling business men to commute between the two places.

(8) To establish a model air port which shall serve as a model for the other American cities to follow in establishing municipal or public air ports or aerodromes.

(9) To provide a station and facilities for instructing the chiefs of aerial police of different cities in the art of organizing and operating aerial police sections.

This work will be under the direction or supervision of Colonel Jefferson DeMont Thompson, the head of the Aviation Section of the New York Police Department, who, by appointment of Chief Commissioner Enright, and the cooperation of Special Commissioner Rodman Wanamaker and Commissioner Dyer, has established the first aerial police in the world.

(10) To provide a station and facilities for extensive research work in the medical side of flying. This work will be under the direct supervision of the Air Medical Committee of the Aero Club of America and Aerial League of America, of which Brigadier-General Theodore C. Lyster are chairman and vice-chairman respectively. Colonel Jones is now in Europe collecting all the available data regarding what has been done by other countries in this line. He will return to this country in time to participate in the Aeronautic Convention and Exposition at Atlantic City in May.

(11) To establish an extensive land and water aerodrome where intercollegiate seaplane, landplane and dirigible tournaments can be held, with hangar facilities for housing the college aircraft and a competent staff to take care of same.

(12) To supply a permanent civilian aviation field for demonstrating aeroplanes, dirigibles and kite balloons, as well as motors and accessories, where concerns can send their machines to be demonstrated to prospective purchasers or to make tests.

(13) To provide a suitable station for the study of meteorological conditions, the exploration of the upper air, the employment of aircraft for the Coast and Geodetic Survey, and other scientific purposes. Colonel E. Lester Jones, the Director of the Coast Geodetic Survey, has accepted the use of this station for the work of his important department.

(14) To provide an air station for the Coast Guard and Life Saving Service and other similar purposes.

(15) To set an example which, if followed by approximately 100 cities in the United States in the near future, will supply the aerial transportation which this country needs; will keep American aeronautics to the forefront; will give employment to a large number of American Army and Navy airmen, aeronautic engineers and mechanics who have been demobilized, will permit the utilization and salvage of war aeronautical material worth tens of millions of dollars; and will insure the United States from again being caught unprepared in the event of war.

The Atlantic City Air Port is the official aviation field of the Aero Club of America, the Aerial League of America and the Atlantic City Aero Club.

The joint committee of the three organizations in charge of the air port consists of the following gentlemen:

Rear-Admiral Robert E. Peary, Alan R. Hawley, Captain Robert A. Bartlett, Captain Granville A. Pollock (late of the Lafayette Escadrille), Augustus Post, Major Reed G. Landis, son of Judge Landis, the second greatest American Ace; Mr. Albert T. Bell, president of the Atlantic City Aero Club; Thomas F. Powers, John Hays Hammond, Jr., Charles Jerome Edwards, Colonel E. Lester Jones, Director of the U. S. Coast Geodetic Survey; Hon. Charles D. White, Brigadier-General T. C. Lyster, U. S. Air Medical Service (retired); Lieutenant Colonel I. H. Jones, U. S. A. M. S. (retired); Earl L. Ovington, Colonel Jefferson DeMont Thompson, Chief, Aviation Section, Police Department of New York City; Captain S. Herbert Mapes, Major Thomas S. Baldwin, Henry Woodhouse, Captain William Menkel, K. M. Turner, G. Douglas Wardrop, Lieutenant Edgar Henry Garland and Captain Charles J. Glidden, U. S. A.

The Atlantic City Air Port is located in the heart of Atlantic City and covers 160 acres of land with the riparian rights on what is known as the Thoroughfare, which also affords a fine location for hangars for seaplanes.

The field covers the entire section of Atlantic City which is known as Chelsea Heights and has a frontage of 3,200 feet on Albany Avenue, with a frontage of 2,500 feet on South Boulevard.

The entrance to the aviation field is only 2,000 feet from the Boardwalk and four minutes by automobile from the Atlantic City Railroad Station.

All the land on the aviation field is flat, cleared and ready for the aeroplanes which will land there during the Second Pan-American Aeronautic Exposition, which is to be held at Atlantic City beginning May 1st and continuing until May 31st.

AERIAL DERBY FOR PULITZER TROPHY AN ASSURED SUCCESS

MESSRS. RALPH PULITZER, Joseph Pulitzer, Jr., and Herbert Pulitzer, the owners of the New York World and St. Louis Post Despatch, have offered a trophy for annual competition to be open to U. S. Army, Navy and Marine Corps aviators, as well as all others who desire to compete. This trophy is a challenge trophy and is to be competed for annually, the event to be decided upon each year by the Aero Club of America, and must be won three times before it becomes the permanent possession of any competitor. The winner each year holds the trophy for the ensuing year—until permanently won.

The first competition for this trophy is to be known as the "Aerial Derby," and is to be held in connection with the one-month Aeronautic Convention and Exhibition at Atlantic City, beginning May 1 to May 31.

The Pulitzer Trophy this year is to go to the aviator who covers the longest distance in a non-stop flight in cross-country flying over land or over water, or both, in flying from any point to Atlantic City during the month of May or from Atlantic City to any given point.

There are no restrictions as to the type of aeroplane to be used or the amount of horsepower; the purpose of the competition being to demonstrate the great distances that can be covered by present-day aeroplanes, large and small. It is provided, therefore, that there shall be inscribed on the trophy the name or names of the aviator or aviators who cover the longest distance with aeroplanes equipped with one, two, three or four motors. The aviator or crew who covers the longest distance in non-stop flight, flying aeroplanes of any of the above-mentioned classes, will be designated as the winner or winners in their respective classes, and their names will be inscribed on the trophy.

To facilitate the organization of the "Aerial Derby" the Contest Committee of the Aero Club of America will accept entries without the formality of special entry blanks, provided the entries are made by letters or telegram, stating the type of aeroplane to be used and the horsepower.

To facilitate the race, the Contest Committee will also accept the written statement of the Commanding Officer of any Army, Navy or Marine Corps station, or a duly appointed observer, giving the time of departure of the aviator from his point of departure.

In case the aviator has to make a forced landing before reaching Atlantic City or his destination, he will request the local authorities to sign a statement giving the time and place and circumstances of landing to be forwarded to the Contest Committee of the Aero Club of America.

The aviators who come to Atlantic City on land machines can land on the new Atlantic City Aviation Field, which covers 160 acres and has two runways of 2,500 feet each. Water machines can land on the water landing place on the north side of the Aviation Field. The aeroplanes can then fly to the Cape May Station for the night, if preferred.

Henry Woodhouse, member of the Board of Governors of the Aero Club, Vice President of the Aerial League of America, sees in the Aerial Derby a valuable means for keeping alive interest in flying.

"Eighty per cent of the 30,000 Army and Navy aviators have just been demobilized," he said, "and unless something is done to induce them to take up aeronautics as a sport or business they will take up something else. If they do take up something else they are lost to aeronautics, because an aviator quickly gets out of practice and aeronautic progress goes on very fast.

"If there were no aerial activities for a year the United States would be so far behind other nations that we would never regain our present position in this wonderful new art and science. The offer of the Pulitzer Trophy is, therefore, a great help toward solving the problem which is facing American aeronautics."

"The results of the competition for the Pulitzer Trophy will amaze the country," declared Captain Granville A. Pollock, late of the Lafayette Escadrille, commander of the 1st Aero Squadron of the New York Police.

He said he spoke for twenty aviators who would like to enter for the Aerial Derby.

"The Army, Navy and Marine Corps have excellent aviators, and they and the civilian aviators can during the month of May give demonstrations of aeronautic possibilities undreamed of at present," he continued.

Flight between Chicago and Atlantic City will be common before the competition for the Pulitzer Trophy ends on May 31, in the opinion of Major Reed G. Landis, son of Judge Kenesaw Mountain Landis. Major Landis is America's second ace, having twelve enemy machines to his credit. His home is in Chicago, and he counts on the Derby of the air to develop distance flights until Chicago and the seaboard are in constant touch by the air routes.

Captain Pierre Bosc of the French Air Service, who wears the Croix de Guerre and the Italian War Medal, said he hoped he could remain in the United States long enough to enter for the trophy. Captain Bosc arrived in New York on Saturday on his first visit to America.

He declared that the institution of the Aerial Derby will prove an incentive to French as well as to American aeronautics. A French mission, he said, is on its way to this country and will be at Atlantic City during May to attend sessions of the Second Pan-American Aeronautic Convention and Exposition.

"Splendid for Aviation"

Colonel Charles Elliott Warren, Treasurer of the Aero Club and President of the Lincoln National Bank, was among those who expressed gratification at the offer of the trophy.

"It is a splendid thing for aviation," he said, "and Messrs. Ralph Pulitzer, Joseph Pulitzer, Jr., and Herbert Pulitzer deserve the thanks of the American aeronautic movement for their progressiveness and continued support of the art."

Mrs. William Allen Bartlett, Chairman of the National Treasure and Trinket Fund, who with others has been trying to save the services of the country's trained flyers for future work along that line, said:

"The Pulitzer Trophy will start a great many activities which we do not foresee at present and will supply employment for scores of aviators who are now idle. It is a great relief to us to know there will be aerial activities at Atlantic City in May. Already a dozen aviators have secured positions through the Aerial League of America in connection with the Atlantic City activities. Hundreds of aviators will be interested in the Pulitzer Trophy, from the standpoint of sport, and hundreds of others because it will demonstrate the practicability of aerial transportation."

Airmen Indorse Contest

In the long list of aviators who inquired about the contest and expressed enthusiasm regarding it were Captain Maurice G. Cleary, assistant to Colonel Archie Miller, commander of Hazelhurst Field; Captain S. Herbert Mapes, Lieutenant Samuel J. Mustain, who has just returned from France; Ensign Alfred E. Poor, U. S. N.; Ensign Charles H. Payne, U. S. N.; Lieutenant J. W. M. Richardson, Lieutenant Paul W. Ward, Lieuteuant Stuart Morgan and Captain William Menkel.

One point about which questions were asked was the condition regarding point of departure or arrival. The stipulations make it clear that contestants must either start from or finish at Atlantic City, and the Contest Committee of the Aero Club anticipates that most of the entrants will make their start there. It was pointed out, however, that an entrant may make as many flights as he pleases during the month the Pan-American Convention is in progress at Atlantic City, so that if he starts on a flight for that place and is compelled to stop en route he may continue and try again.

The fact that no limitations are placed on design or number of motors also appeared to cause some confusion. The trophy will be awarded for the longest non-stop flight by a plane of any class, and the names of the leaders in non-winning classes will be inscribed on it. Three years' consecutive winning carries permanent possession.

Approval was expressed of the wording of the conditions which leaves it possible that contests after this year may be for other performances than non-stop flights. With the rapid development of aviation it seems probable that a twelve-month hence flights will be limited only by the fuel carrying capacity of planes and their climbing or weight carrying ability then may offer contest points.

Rear Admiral Bradley A. Fiske, retired, in speaking of the offer of the Pulitzer Trophy, laid special stress on the aid such gifts offer Army and Navy aviation. Admiral Fiske is President of the Army and Navy Club and Vice President of the Aero Club of America. He said:

"Competition in the early days of the automobile industry, when many questioned whether motor-driven cars would ever prove of much practical value, served to demonstrate what they actually could do and helped materially to raise automobile building into one of the greatest businesses in this country.

"At the present state of flying competition is of the greatest service, and the generosity of Messrs. Ralph Pulitzer, Joseph Pulitzer, Jr., and Herbert Pulitzer will prove of the greatest value at the present moment."

Entry blanks for the Pulitzer Trophy are being drawn and will be ready this week. It is the desire of the Contest Committee of the Aero Club to have the conditions as liberal as is consistent with fairness, in keeping with the terms of the deed of gift.

THE NEWS OF THE WEEK

Captain Pollock Elected Major of New York Police Squadron

New York, N. Y.—Equipped with wireless telephone, armed with machine guns and driven by aviators in uniforms of a distinctive pattern, the twenty aeroplanes of the aviation branch of the New York Police Reserves will soon be doing regular duty in the air about the city under Captain Granville A. Pollock, who was elected major in charge of the flying squadron at a special meeting in Police Headquarters on April 2.

The first work of the aviation branch will be the photographic mapping from the air of the entire city of New York.

Already, it was said, several progressive Western cities, following New York's lead, have laid out landing fields in preparation for municipal aeroplane service.

At the close of the meeting the following statement was issued:

"The aviation branch probably will be divided into two large sections—a number of pursuit scouts and a larger number of aerodrome police.

"With an aeroplane service like this catastrophes like the Minnesota fire, which destroyed entire communities and caused losses amounting to millions of dollars, or the Dayton and San Diego floods, could be isolated quickly, thus saving lives and property.

"Equipped with a Culver wireless telephone, such as is used by the United States Navy to direct aerial operations, the police aviator can receive orders direct from the office of the chief of the aviation section of the Police Department and report directly to him as to conditions at any port within a radius of from ten to fifty miles, which he can survey from a height of two thousand feet. Having received radio telephone orders from the aviation chief, the aerial policeman can in turn transmit the orders to captains of ships and can carry out the orders at lightning speed.

"The chief duty of the pursuit scouts will be in the heading off of negligent aviators from prohibited areas. Inasmuch as even an orange or other small object dropped from an aeroplane through the roof of a powder mill is considered by experts to be sufficient to cause an explosion, regulations in this respect are likely to be very drastic.

"The scouts in all probability will be armed with machine guns, from which tracer bullets will be fired as a warning or to shoot down air pirates, as no other means of dealing with lawbreakers in the air at present suggests itself.

"Deputy Police Commissioner Rodman Wanamaker, who is responsible for the forming of the aviation branch of the Police Reserves, has long been interested in aviation. Not only did he purchase and bring over a Bleriot monoplane back in 1909, but he also acquired one of the first balloons purchased in the United States, besides organizing and backing a trans-Atlantic flight in 1914, which project was only sidetracked because of the war.

Miss Marion Cassidy, the first Canadian woman to fly, will pilot plane to Atlantic City Convention

"Aviators' Good Landing Club" to Open New York Clubhouse May 1st

New York, N. Y.—The Aviation Committee of the National Special Aid Society, Inc., is opening a club house for our aviators to be known as the "Aviators' Good Landing Club" the first of May at 114 East Thirty-ninth Street, New York. It is at the request of the fliers that this club is opening, and it will fill a long-felt want, they assure the committee. The club will include an aeronautical library, rest room, writing room and informal grill. Mrs. William Allen Bartlett, chairman Treasure and Trinket Fund. This fund has raised and spent $100,000 on Uncle Sam's aviators with the hearty approval of the War Department and the National Investigation Bureau, and the gratitude of the fliers. Initiation fee, $1, and dues, $1; hours between 8 A. M. and 12 P. M.

Miss Marion Cassidy, First Canadian Aviatrix, Has War Service Record

Miss Marion Cassidy, the eighteen-year-old Canadian aviatrix, is now in New York after serving as chauffeur for Brigadier-General Gurney Hoare, Commander in chief of the Royal Air Force in Canada. Miss Cassidy took a thorough course in aeronautics under Major Herbert Fisher, Chief Instructor of the Royal Air Force and has flown with Miss Ruth Law and General Hoare. She has had twenty-five hours of solo work at Borden, Ontario and twenty hours at the Long Island Aviation School, Central Park, L. I.

Miss Cassidy is an Honorary Member of the Canadian Aero Club, which has a membership of 3,000, and is the only member of her sex.

Early in May, Miss Cassidy will fly to the Atlantic City Aeronautic Convention from New York City.

Planes Greet Admiral Sims

New York, N. Y., April 7.—An air escort of eight seaplanes and one dirigible participated in the hearty welcome extended to Admiral Sims on his arrival on April 7 aboard the Mauretania.

Curtiss Type R Mail Plane, which successfully delivered mail from Philadelphia on March 28, during the worst gale recorded by the Weather Bureau in many years

Aircraft Board Abolished by Presidential Executive Order

President Wilson has issued an executive order under date of March 19 abolishing the Aircraft Board and placing all aircraft production, as well as aircraft funds, under the control of Major General Menoher, the newly appointed Director of the Army Air Service. The order was necessary, General March explained, to keep the record straight and no change in system was involved.

General March's statement follows:

I have been asked something about the Executive Order which was released on April 5 concerning the Director of Aircraft Production. It was necessary to issue this order because the original order establishing the Air Service specifically put Mr. John D. Ryan as the man who could perform certain functions, and as the head of the Aircraft Board he had other functions to perform; and this order simply gives General Menoher the same status with regard to these matters that Mr. Ryan had. There is no change in the actual system that is going on.

Executive Order

By virtue of the authority in me vested as Commander-in-Chief of the Army, and by virtue of further authority upon me specifically conferred by "An Act authorizing the President to co-ordinate or consolidate executive bureaus, agencies and offices, and for other purposes, in the interest of economy and the more efficient concentration of the Government," approved May 20, 1918, I do hereby make and publish the following order:

I.

The Aircraft Board, created by Act of Congress, approved October 1, 1917, having accomplished the important purposes for which it was created, is hereby dissolved.

The last paragraph of Section 3, Article I, of the Executive Order of May 20, 1918, is hereby revoked and the following paragraph substituted therefor:

"A Director of Aircraft Production, selected and designated by the Secretary of War, shall hereafter have direct charge, under the direction of the Director of Air Service, of the Bureau of Aircraft Production, and he shall perform such duties in connection with the activities, personnel and properties of said Bureau as may, from time to time, be assigned him by the said Director of Air Service, or as may be prescribed by law."

II.

All unexpended funds of appropriations heretofore made for the Signal Corps of the Army and already specifically allotted for use in connection with the functions of the Aviation Section of the Signal Corps and specifically placed under the jurisdiction of the Director of Military Aeronautics, as well as all such funds already specifically allotted for use in connection with the functions bestowed upon the Bureau of Aircraft Production and specifically placed under the jurisdiction of the Director of Aircraft Production are hereby transferred to and placed under the jurisdiction of the Director of Air Service for the purpose of meeting the obligations and expenditures authorized by law or Executive Order in the field of activity of the Aviation Section of the Signal Corps and the obligations and expenditures authorized by the Bureau of Aircraft Production.

Woodrow Wilson.

Coincidental with the announcement of the order, the War Department disclosed the status of Air Service appropriations. The total appropriations for the Air Service since the beginning of the war, after deducting $487,000,000 carried to the surplus fund and covered into the Treasury, amounted to $1,097,304,758. Of this amount $712,000,000, or about 65 per cent., had been spent up to March 18, 1918. The estimated outstanding obligations are $200,000,000, and the estimated balance is $187,000,000, or 17 per cent. of the total. The figure of $200,000,000 given as representing estimated outstanding obligations is based, it was explained, on the assumption that approximately $340,000,000 would be saved in the liquidation of suspended contracts.

Announcement was made that current air service appropriations authorized by the act of February 25, 1919, had been reduced $485,000,000. This act carried $944,304,758, of which $760,000,000 was allotted to the Bureau of Aircraft Production, and $184,304,758 to the Division of Military Aeronautics. Up to February 25, 1919, the appropriation for the former had been reduced $360,000,000. This was a 53 per cent. reduction. The appropriation for the Division of Military Aeronautics was reduced $85,000,000.

Announcement was made that the Packard Motor Car Company made the final deliveries of Liberty-12 motors during the week which ended March 21, and that this completed all contracts for Liberty motors. The number of Liberty-12 motors completed was 20,478, as follows: Packard Motor Car Company, 6,500 motors, 32 per cent. of total; Lincoln Motor Company, 6,500 motors, 32 per cent.; Ford Motor Company, 3,950 motors, 19 per cent.; General Motor Company, 2,528 motors, 12 per cent.; Nordyke-Marmon Company, 1,000 motors, 5 per cent.

The value of the cancellations and suspensions of Army Air Service contracts up to March 22, 1919, was $493,342,379, distributed as follows: Engines and spare parts, $266,961,771; aeroplanes and spare parts, $165,288,590; chemicals and chemical plants, $18,648,239; instruments and accessories, $10,761,081; balloons and supplies, $10,071,035; fabrics, lumber and metals, $7,977,445; miscellaneous, $13,634,218.

Although the demobilization of the Army Air Service will continue until the enlisted personnel is reduced to 15,000, twenty-one aero squadrons will be retained in the service, as follows:

Pursuit squadrons, 27th, 94th, 95th and 147th.

Bombardment squadrons (day), 11th, 20th, 96th and 166th.

Army observation squadrons, 9th, 24th and 91st.

Army artillery squadrons, 99th, 135th and 258th.

Corps observation squadrons, 1st, 12th, 50th and 88th.

Surveillance squadrons, 8th, 90th and 104th.

Colonel E. Lester Jones Wins Italian Decoration

Washington, D. C.—Word has just reached this country that King Victor Emmanuel of Italy has made Colonel E. Lester Jones, director of the United States Coast and Geodetic Survey, an officer of the Order of the Saints Maurizio and Lazzaro, First Class, for distinguished civil and military service. The decoration is the oldest given by the kingdom of Italy, established in 1434, and rarely conferred on a foreigner.

Colonel Jones has just retired from the air service, having returned a month ago from overseas.

Carrier Pigeon Brings Relief

Atlantic City, N. J., April 6.—As a result of the arrival late on April 5 of a carrier pigeon, which flew into a room on the eighth floor of the Hotel Marlborough-Blenheim, Ensign Finch of the Naval Air Service was safely back at his base at Cape May instead of a captive in a disabled hydroaeroplane drifting helplessly off the coast in the grip of the Gulf current.

Exhaustion of the gasoline supply caused Ensign Finch to come down. The heavy seas caused the seaplane to ship a good deal of water and the assistance which the pigeon brought was urgently needed.

Radio Telephones Used by Army as Beacons for Aeroplane

Washington, April 6.—Experts of the Army Signal Corps, it was learned recently, have begun experiments with a recent invention, described as an "audible beacon," which they believe will prove valuable in making the aeroplane a commercial utility. The new contrivance is designed as a signal which will advise the aviator not only of his own position regardless of weather conditions, but will provide accurate marks for suitable landing places.

"The beacon" is said to be a combination of the new wireless telephone and the ordinary phonograph. Its operation will be more or less automatic and will repeat a word or signal designating its position. For instance, one at Langley Field, the inter-departmental aviation base, might send out the call "Langley" at stated intervals.

Officials working on the invention be-

An easy method of transporting a large aeroplane. A 3-engined Caproni biplane carried by a Ford. Temporary braces are placed between the landing gears and fuselage, in the absence of flying rigging

lieve that the next step will be the adoption of the sound-ranging device, now used by armies in connection with artillery fire, to enable aviators to determine without delay the distance and direction of the call of any one of these sending stations.

International Aeronautic Conference Personnel Officially Announced

Washington, D. C., April 7.—The State Department announced that the International Air Conference now in session in Paris is officially designated as the Inter-Allied Aeronautical Commission of the Peace Conference. The president of the commission is Colonel Pauldhe, the Director of French Military Aeronautics. The commission is charged with the consideration of any aviation questions which may be requested by the Peace Conference, and to draft a convention relative to international air navigation during peace. The commission has appointed sub-committees on technical matters, on commercial, legal and financial matters, and on military operations. The sub-committees are in continuous session.

The following are the official delegates:

United States—Rear Admiral H. S. Knapp, U. S. N.; Major General M. T. Patrick, U. S. A.

Great Britain—Major General J. Seely, Royal Air Force; Major General Sir S. H. Sykes, Royal Air Force.

France—Colonel Pauldhe, French Military Aeronautics; Capitaine de Vaisseau Chauvin, French Naval Aeronautics.

Italy—Mr. S. E. Chiesa, Italian Parliamentary Deputy for Aviation; General Moris, Italian Military Aeronautics.

Japan—Major General K. Tanaka, Imperial Japanese Army; Mr. Kamakawa.

Belgium—Colonel de Crombrugghe.

Brazil—Capitaine de Fregate, Armando Burlamqui, Brazilian Navy.

Cuba—Mr. De Boustamente.

Greece—Colonel A. Mazarakis.

Portugal—Colonel J. M. R. Norton de Mattos.

Roumania — Colonel D'Etat Major, Thomas Dimitresco.

Serbia—Chef d'Escadron, Mirko Marinkovitch.

THE TRANS-ATLANTIC FLIGHT

PREPARATIONS for the trans-Atlantic flight continued during the past week with unabated vigor. It is now the general opinion that the weather will be the most important factor in determining what date the start is to be made.

British and American Destroyers to Co-operate

British destroyers will co-operate with the American Navy in patrolling the course to be followed by American naval seaplanes in the projected flight across the Atlantic. It was learned at the Navy Department that from forty to fifty British ships would be on duty from the Azores to the British Isles, where, under present plans, the flight will end.

American destroyers will patrol the course from St. John's, N. F., to the Azores. From fifty to sixty of the craft will be used, and they will be stationed at intervals of less than 200 miles.

Along the greater part of the course there will be an almost continuous stream of army transports going to and returning from France, and these vessels will form additional safeguards for the crews of the planes in event accidents force any of them to descend.

Franklin D. Roosevelt, Acting Secretary of the Navy, who realizes that public interest in the coming trans-Atlantic flight must be considered, made it known that the press associations probably would be permitted to have representatives aboard the American destroyer Melville, which will act as fuel ship for the seaplane. The Navy Department will have the Melville stationed at some point in the Atlantic where the plane may come down for fuel if this is required, and if the press associations desire to have representatives aboard and take their chances of getting news en route from the flight Mr. Roosevelt will make the necessary arrangements.

Navy Planes Being Tuned Up

The N-C-2, one of the four giant naval flying boats which will attempt the trans-Atlantic flight, was given a short preliminary test flight recently. After a short run on the waters of Jamaica Bay the ship took the air gracefully. The plane circled around for five minutes before descending and then was taken back to her moorings.

Four motors will be carried by the N-C-4, now being completed at Garden City, L. I., and most officers favor the use of this number on the flight, both because of the increased power and because the planes could be better managed in the event one motor went out of commission during the volage.

These four motors are fitted in pairs and develop 1,600 horsepower.

The United States Army plan for a trans-Atlantic flight, using a Glenn L. Martin bomber, to be undertaken by Captain Roy N. Francis, is still under veil of secrecy. No details of the preparations have been made public.

Captain B. B. Lipsner, former chief of the aerial mail service, announced his intention of attempting the flight in a special machine built by Captain James V. Martin. Captain Lipsner will make the attempt over the Azores route, along practically the same course as the transport George Washington took to France.

British Airmen Waiting for Good Weather

Harry A. Hawker has established an aerodrome at Glendenning Farm at Mount Pearl, four miles west of St. John's, Newfoundland. Five mechanics are assembling his 375-horsepower Sopwith biplane. Hawker is quoted by newspaper correspondents as stating that he did not believe that the start could be made within two weeks, owing to the unfavorable weather conditions.

The R-34, sister ship of the R-33, received a trial flight at Mehinnan, Scotland, last week. The R-34 has a hydrogen capacity of 2,000,000 cubic feet, is about 700 feet long, 80 feet in diameter, and 95 feet high. It will lift 65 tons, including its own weight, carries a crew of 30 men, and travels at about 70 miles an hour. The R-34 is equipped with five Rolls-Royce Eagle engines, giving an aggregate of approximately 2,000 horsepower.

Another British entry is a huge triplane flying boat designed by Lieutenant Colonel John C. Porte for the British Air Ministry. No details regarding it are available. A supertriplane built for Captain

The AIRCRAFT TRADE REVIEW

Essington School in Philadelphia for Water Flyers Will Open Soon

Essington, Pa.—Frank Mills, well-known Curtiss flier, who has had over 2,000 hours in the air and who was a senior flying instructor for the Air Service during the war, will soon open a flying school for seaplane pilots near Philadelphia.

The site of the Essington School was formerly used by Mr. Robert Glendenning, the Philadelphia banker, as the first water flying school in Pennsylvania. All the Army runaways and material for hangars has been purchased by Mr. Mills and a plane is already in operation.

The price of a course at the Essington School will be $400.

Cantilever Aero Company to Build Trans-Atlantic Aeroplanes

Announcement has been made by Dr. William Whitney Christmas, president of the Cantilever Aero Company, that his organization will immediately commence building two aeroplanes for trans-oceanic flights. The Cantilever Aero Company has been building the strutless and flexible wing aeroplane known as the "Bullet" which is credited with a speed of 200 miles an hour.

In his new design Dr. Christmas plans to build aeroplanes of the biplane type having the following specifications:

Span of upper wings	180 ft.
Span of lower wings	90 ft.
Chord of upper wing	24 ft.
Chord of lower wing	12 ft.
Total lifting surface	5,000 sq. ft.
Lifting capacity	57,000 lbs.
Number of motors	4
R. P. M. motors	600
Overall height	24 ft.
Propellers	3 bladed, 21 ft. diameter

Dr. Christmas, in commenting on the special feature of design, said:

"After six years in carefully considering every detail of the trans-Atlantic aeroplane I believe our company has developed a type of machine suitable for the successful passage across the Atlantic.

"This aeroplane has a wing spread of 180 feet, with a surface area of 5,000 square feet. The motive power of the machine consists of four motors of 800 horsepower each, which, while they are a collective unit, can also be run independently. This allows adjustments or temporary repairs. While the 3,200 horsepower thus obtained by the four motors is more than the amount needed, it can be split up into such units of power that there will be no danger on account of engine trouble. This aeroplane is of the biplane type, but has characteristics which are essentially different from the most common variety of biplane. The span of the upper wing is 180 feet and its chord is 24 feet. The span of the lower wing is 90 feet, and its chord 12 feet. This gives the best characteristics of both monoplane and biplane types.

"It is well known that the monoplane has much higher efficiency per square foot of surface than the biplane, and for this reason we determined to make the upper wing so large that it has all the lifting capacity of the monoplane. By such construction we are able to build a machine which is not overhigh, and although a machine of this size would ordinarily demand excessive height our design permits a total overall height of only 24 feet.

"The machinery and all the driving mechanism is contained within the fuselage where it can be under the eye of the engineer in charge. The motors are connected by an electro magnetic clutch, also the transmission gear. Extending out on each side of the fuselage are brackets, at the end of which are the propellers—one on each bracket. These propellers are 21 feet in diameter, three-bladed, and revolve at 600 R. P. M. The power from the motors is transmitted to the propellers through a shaft gearing, which is encased in a tube lined with ball bearings.

"The controls are partly mechanical, operated by electric motors. The power for these controls is supplied by a gasoline-electric generating plant from the four motors used for propulsion. This generating plant also supplies electricity for heat and light.

"The new Cantilever type will be controlled by a captain who is an experienced navigator and who is in charge of the pilot and engineer. The captain communicates his commands by telephone.

"The lifting capacity of this trans-Atlantic flyer is 57,000 pounds, which includes dead weight of ship and supplies as well as passengers. Thus the ship will be able to carry a large amount of fuel for passage. This fuel can be greatly conserved by utilizing only half the motive power after sufficient altitude is obtained. This ship has a high gliding characteristic.

"Many advocate crossing the ocean in a series of more or less comparatively short flights, starting, say, from Newfoundland. While the trans-Atlantic flights may be accomplished in this manner at an early date, it is not believed that such a route will be a commercial success. It is doubtful if the public would look kindly on such a routing, which is circuitous and interrupted. The Cantilever Aero Company plans to send its aeroplanes direct from New York or Philadelphia.

Time Limit for Turning in Claims for War Contracts

Washington, D. C., April 5.—Mr. Crowell, Assitsant Secretary of War, gave notice to-day that contractors desiring to adjust cancelled war contracts through the machinery set up by the War Department for that purpose must present their claims prior to May 15.

In a letter to Mr. Glass, Secretary of the Treasury, Mr. Crowell said nearly one-half the claims involved had not been formally presented, and that this is greatly handicapping the organization which is handling this work.

Orders for Liberty 12 Engines Completed

The Packard Motor Car Company made the final deliveries of Liberty 12 motors during the week ended March 21, 1919. This completes all contracts. The following shows the number and per cent. produced by each factory:

Firm	Number produced	P. C. of total
Packard Motor Car Co..	6,500	32
Lincoln Motor Co.....	6,500	32
Ford Motor Co.....	3,950	19
General Motor Co.....	2,528	12
Nordyke-Marmon Co...	1,000	5
Total	20,478

Specifications for Multi-Motored Planes Issued by P. O. Department

The Post Office Department has issued specifications for multi-motored aeroplanes of strictly commercial type and particularly adapted for the carrying of mails. The specifications are general in their terms and are designed to allow aeroplane builders the widest latitude of design and construction to give the performance required for carrying the mails. They are the result of a symposium of views of pilots, aeroplane mechanics, aeronautical engineers and practical aeroplane builders on what should be the qualifications of a practical commercial plane. Consideration will be given to a plane of two, three or more motors connected on one shaft or set in the wings or central fuselage, or both, and carrying a minimum of 1,500 pounds of mail. While the needs of the Department are preferably for a plane carrying a ton or 1½ tons of mail, consideration will be given to a machine of 1,500 pounds mail carrying capacity.

What the Department especially desires is an aeroplane of the lowest possible landing speed, whether that speed is structurally inherent in the machine or accomplished through mechanical devices, and a cruising speed of between 90 and 100 miles an hour, with a top speed of between 110 and 115 miles and a cruising radius of about six hours with normal load. A serviceable ceiling of at least 15,000 feet is wanted. If the planes are built around Liberty or Hispano-Suiza engines the Department will furnish the motors.

According to the views of postal officials, a plane with a mail carrying capacity of 1½ tons, with a six-hour cruising radius, should not exceed 100 feet in the wing span. Engines if placed in the wing must be made accessible with safety to the mechanic for minor repairs in the air. Each engine is to be equipped with independent and, as far as possible, dual gas, oil and ignition systems to minimize engine failure.

The bids are to be opened on June 2 and it is expected that planes will be ready for delivery within six months after letting the contract.

Frankfort-Berlin Aerial Mail in Operation

A daily aerial mail service is in operation between Frankfort-on-Main and Berlin. Registered mail is carried, and the trip takes four hours.

Heavy Gale Does Not Halt Aero Mail

Washington, D. C., March 29.—Despite the furious gale which raged east of the Mississippi, John N. Miller, Post Office pilot, made a successful trip from Philadelphia to New York. Owing to the heavy and blinding snow, Miller was unable to discern the flares which were lit in order that he might find the landing field, but he estimated after two hours of flying that he had arrived at Belmont Park. On landing he found himself eight miles off his course.

Pilot Mike Eversole, who was detailed to carry mail from Philadelphia to Washington, came off next best. He was the only pilot other than Miller who got more than fifty or sixty feet from the ground. For three hours he battled with the heavy gale and was then forced to descend because his gasoline gave out. The landing was made at Newcastle, Del. He had gone approximately fifty miles, thus averaging 16 2-5 miles an hour.

Cost per mile, overhead, $.3822; cost per mile, flying, $.2764; cost per mile, maintenance, $.5839.

NOTE—Slight increase in cost per hour and cost per mile over January due to short month—24 operating days—and to one plane receiving general overhauling, and one rebuilt.

OTTO PRAEGER, Second Assistant Postmaster General.

THE CAPRONI TRIPLANE

CAPRONI Triplanes have become world famous, and it is interesting to follow the trend of their development, and to notice the many variations in detail that may occur in a single design. This is well illustrated in the accompanying outline drawing, the photograph below, and the complete description of the Caproni Triplane published in the March 17th issue of AERIAL AGE. Various engines have been used in the big triplane. The 8-cylinder Issotta-Fraschini 250 H.P.; the S. P. A., and 6-cylinder Fiat being the most common. Recently the Navy type low compression type Liberty Motors have been used with success.

The outline drawing shows an arrangement whereby the radiator for the central engine is located at the front of the nacelle and radiators for the fuselage engines placed at the fuselage nose. With some of the engines, three vertical radiators were used, located above the engines and braced to the interplane struts.

The Type C A-4 is an improvement upon the older triplane, of a similar type, which had a third group of landing wheels in front of the nacelle. Machines with this extra landing gear were used principally for training purposes.

The usual crew is composed of two pilots seated side by side, a gunner in the forward cockpit and two gunners placed in compartments in each fuselage, just aft of the main planes. It is possible for the crew to change places with one another while the machine is in flight.

The general specifications of the type C A-4 1915 Triplane are as follows:

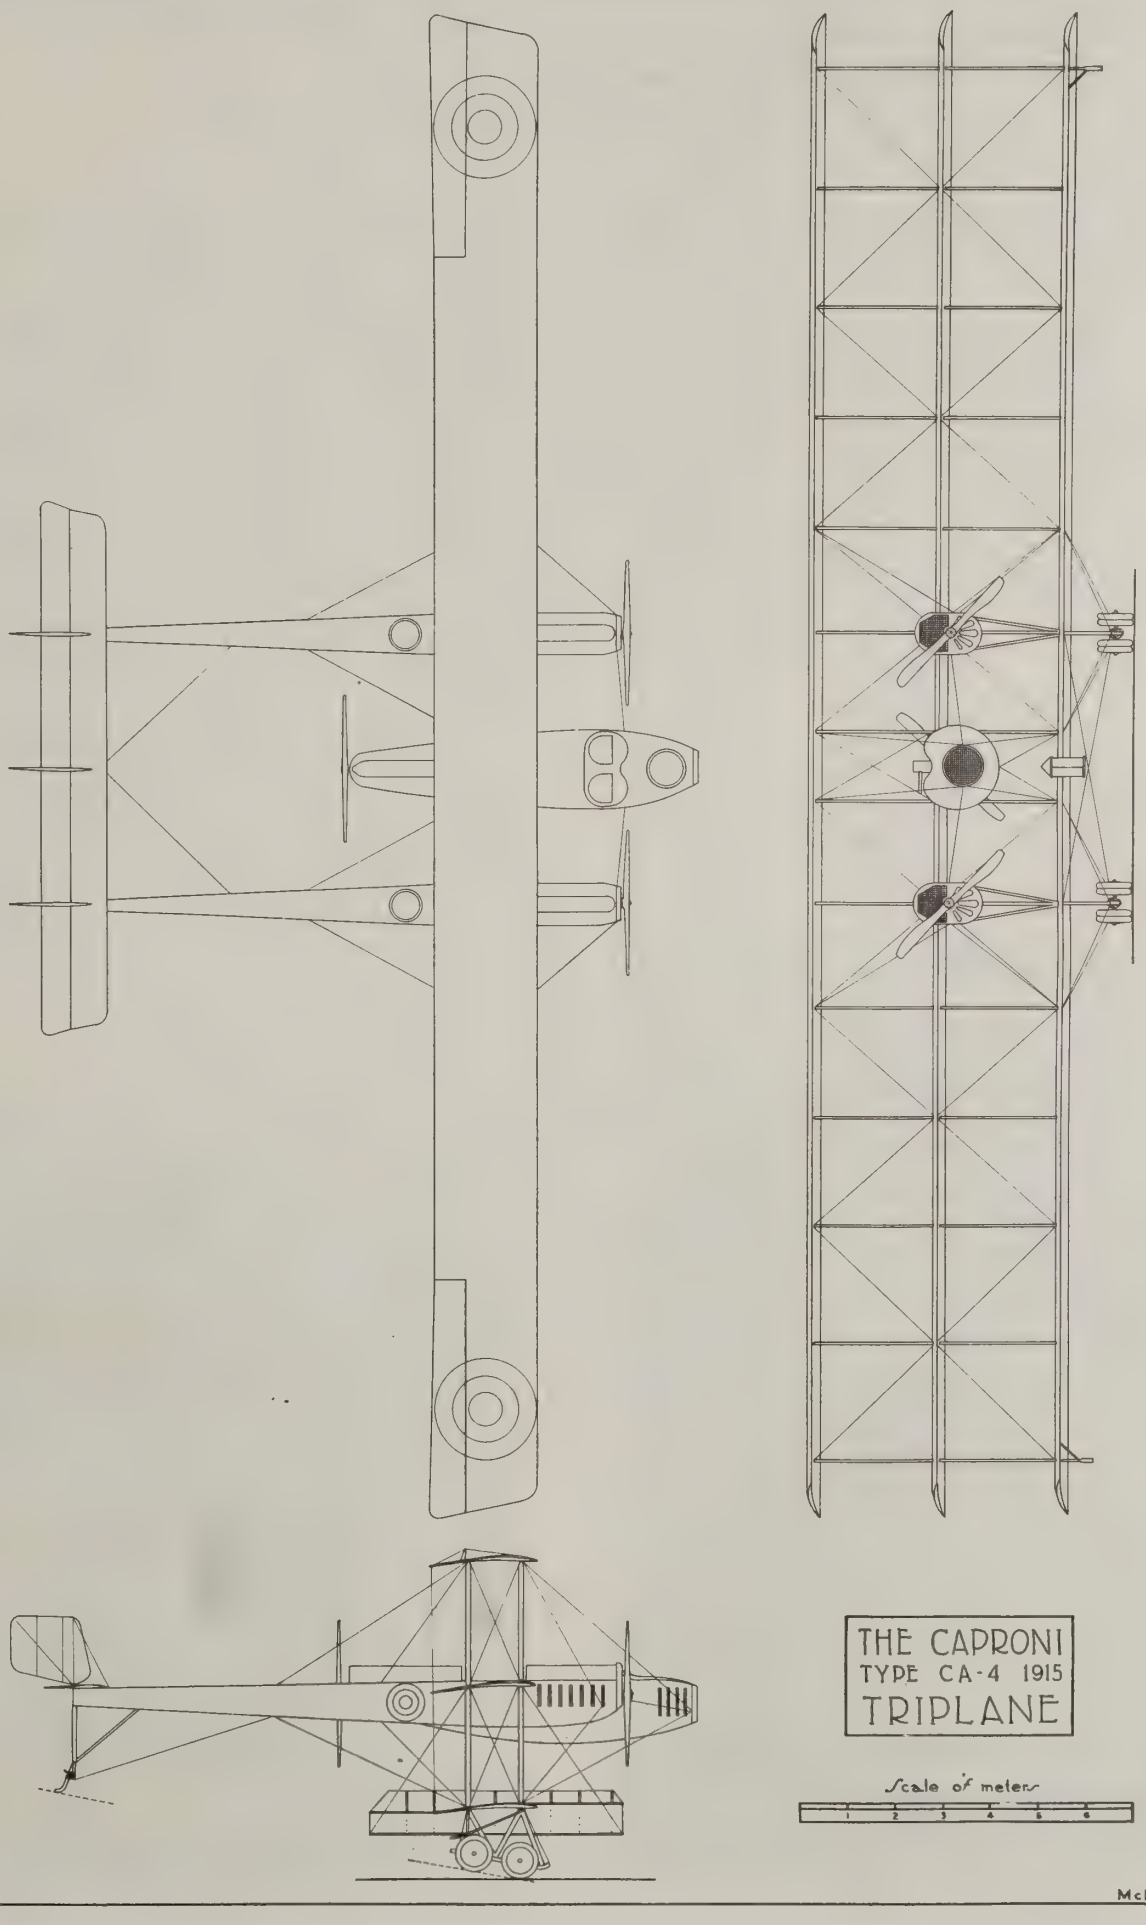
Span (all planes)	96′-6″
Length over all	42′-11″
Height over all	20′-8″
Chord	7′-0″
Gap between planes	8′-0″
Total area	2,223 sq. ft.
Engines (3) Liberty, each	350 H.P.
Weight empty	11,100 lbs.
Weight fully loaded	17,700 lbs.
Bomb capacity	3,000 lbs.
Speed at 6,500 feet (Liberty Engines)	98 M.P.H.
Climb to 6,500 feet	14 minutes
Ceiling	16,000 feet

Main planes are composed of 21 sections; middle sections 5′-6″ in span; inner and outer intermediate sections, 13′-1″; and outer sections, 18′-3″. All planes have a chord of 7′-0″. Gap between planes, about 8′-0″. Gap to chord ratio, 1.004.

Tail control surfaces are built up of steel tubing. Rudders are balanced, braced by faired steel tubes and interconnected with piano wires. The elevator is one continuous surface 36′-4″ long and 1′-7″ wide. Horizontal stabilizer 34′-1″ long and 3′-1″ wide. There is no vertical fin.

Fuel is carried in tanks near each of the engines, with a separate wind vane, centrifugal pump for each. Two small gravity tanks are provided for running the engines preparatory to flight. An oil tank and oil radiator are provided for each engine.

The landing gear units are especially robust on account of the machine's great weight. The two M-struts are of laminated ash and spruce, wrapped with canvas fabric. The chassis carries on each side one front and one rear axle; these axles are attached to the chassis by means of shock absorber rubber cord and radius rods fastened at the other end in a universal joint, so as to absorb whatever oscillation the machine may make in taxing or landing. Each of the front axles carries two double wheels, one on each side of the M-strut. The chassis is braced in the usual manner with double steel cables.



The nacelle is of dirigible form and perfectly streamlined. Two main longerons with compression steel tube struts between them and diagonal steel brace wire and cables form the frame on which a set of ribs are fastened. The outer edge of the ribs determines the shape of the nacelle. Birch veneer and walnut are employed in the construction of these ribs, said construction being of a somewhat likewise manner to that employed for similar elements of flying-boats. The front of the nacelle, upper part, is formed by a cowling made of veneer with interposed layers of fabric.

The two pilots are seated back of the front gunner. Behind is a gasoline tank, and before them a large dashboard for the instruments, while between them they have a board for the controls (gas, spark and altitude adjustage) for the three engines. The gasoline system is controlled by various cocks and a special distributor, all disposed in such a manner as to render them easily accessible to either pilot. In the rear of the gas tank (which is of the same circular section as the nacelle has in that tract) there is a short path that allows free access to the rear motor. The engine bed is braced with adjustable steel tubes and steel braces. The rear part of the nacelle around the engine is also cowled. For the remaining parts, linen and veneer are used for covering.

The fuselages are flat-sided and of the usual construction with four ash longerons, and between them compression struts, steel cables and wire bracing. All the fittings, to which the diagonals are fastened, can be manufactured with the one and the same set of dies. They are extremely simple and light in weight, without welding or bracing, and applied so as to avoid the longerons being pierced by bolts or screws. The front end of the fuselage around the motor is aluminum cowled. The gas tank is placed in the rear of the motor, and an oil tank under it. At a short distance from the trailing edge of the middle wing a seat for the rear gunner, with the usual arrangement for machine guns and ammunition, is installed. From the height of the gunner's seat to the rear end the fuselages are linen-covered. A Pensuti tail skid with shock absorber is at the end of each fuselage.

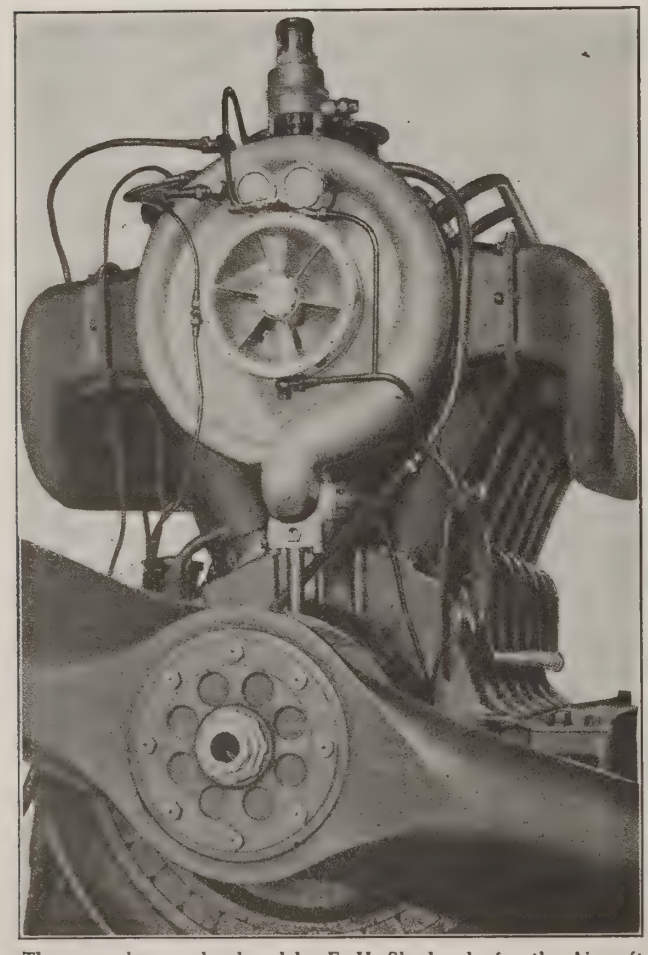
MAINTAINING CONSTANT PRESSURE BEFORE THE CARBURETORS OF AERO ENGINES REGARDLESS OF THE ALTITUDE

By LESLIE V. SPENCER, M.E.

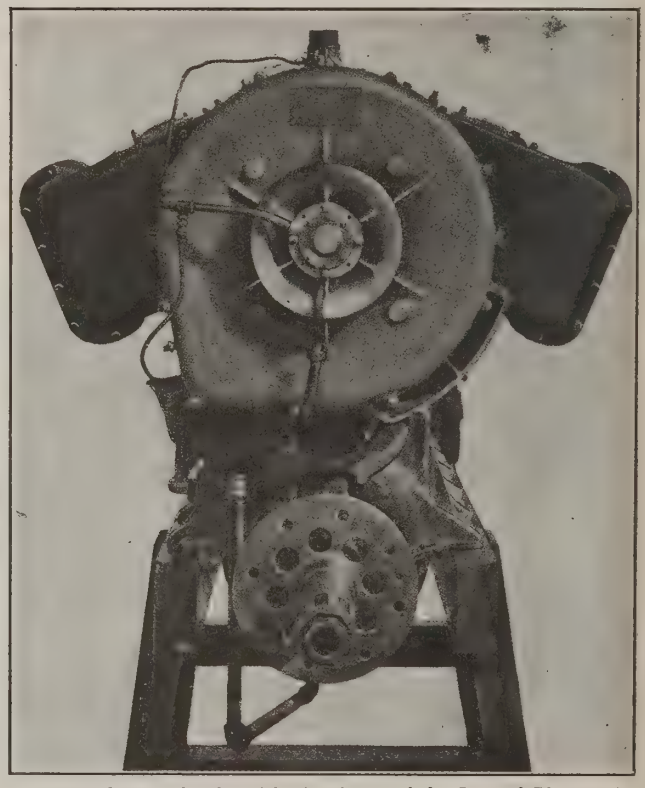
Formerly Editor of Technical Publications, Experimental Department, Aeroplane Engineering Division, Bureau of Aircraft Production at the McCook Field, Dayton

IN the development of engines for aviation service, an entirely new problem, with which the designer of motors for ground level operation has no concern, is encountered. That is, the aero engine has to contend with a constantly decreasing atmospheric pressure as the altitude increases. This means that unless some method of compensating for the pressure drop is provided, the engine will deliver a decreasing amount of power as it ascends. For instance, at 15,000 feet an engine can deliver only about 60 per cent. of the power which it is capable of developing at the ground (practically sea level).



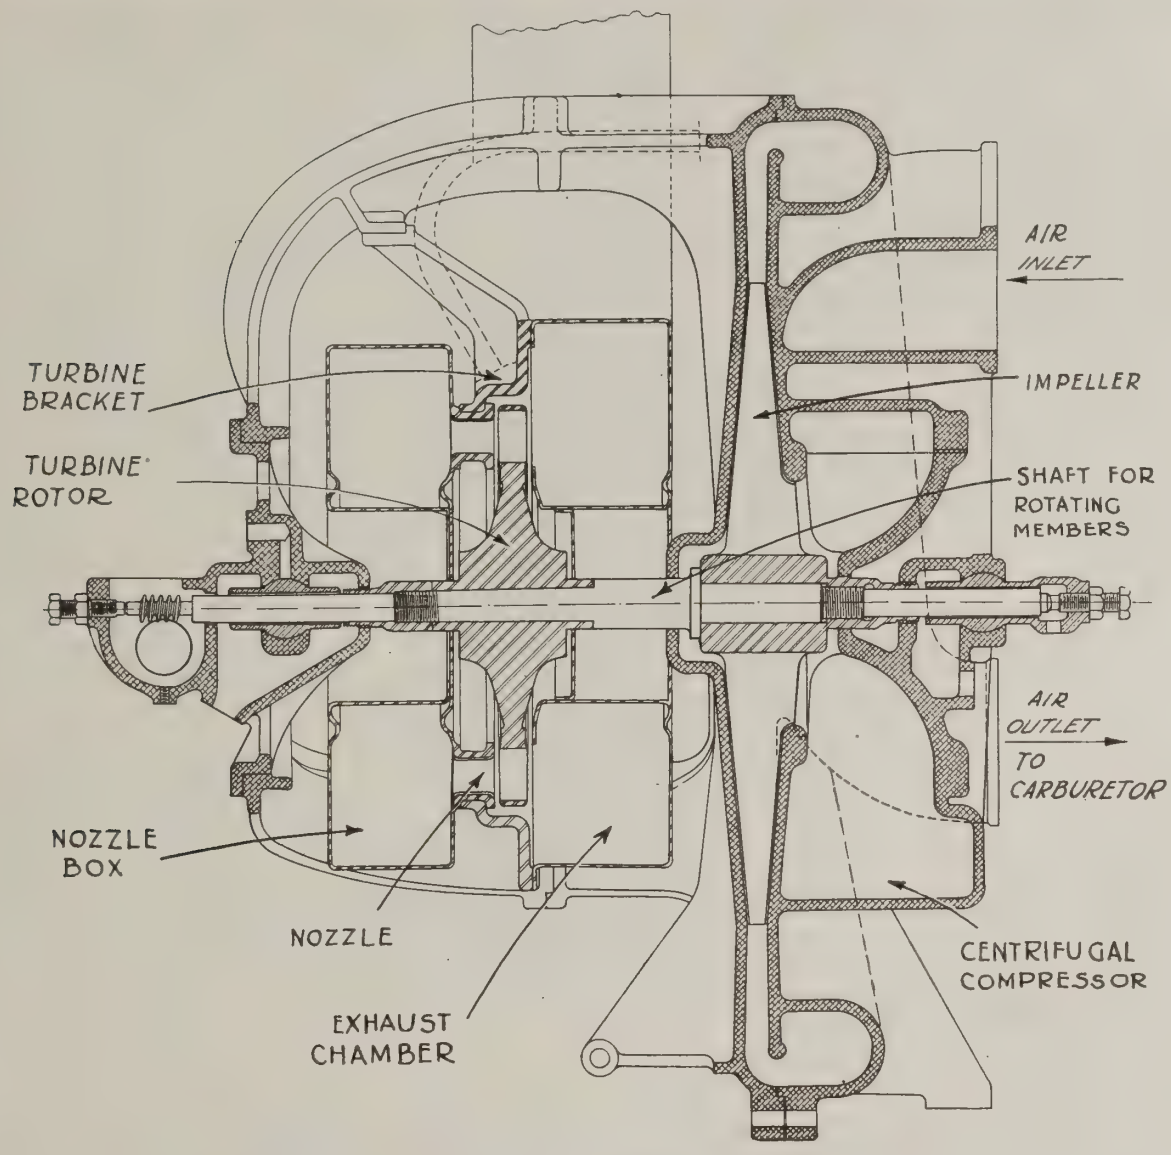
The altitude-pressure chart shown in Fig. 1 brings this out. It will be seen that at 20,000 feet an engine must operate with an intake pressure of approximately half that at ground level. This means that the power of the engine will suffer accordingly.

In order to overcome this difficulty in the operation of engines at high altitudes, engineers have turned to the idea of supercompressing the air sent to the carburetor or carburetors so as to maintain as nearly as possible the ground level pressure regardless of the height. This scheme of constant intake pressure maintenance has been given various names, and perhaps the best of these is the term *supercharging*. Therefore a supercharging device or supercharger may be regarded as a machine which serves to increase the power of an internal combustion aviation engine above that which this engine would normally have at any specific atmospheric pressure. In other words, its function is not to *increase* the normal ground level power of the engine, but to maintain as nearly as possible that power up to the limiting altitude for which the supercharger is designed. It must supply the deficiency between the atmospheric conditions encountered at any particular altitude and those necessary for maintenance of the normal ground level power. The supercompressor must supply only enough additional air, which when added to that obtainable at a given height, will total the amount available at the ground. Accomplishing this, the engine is able to deliver approximately the same power irrespective of its height above the earth, within limits, since for all practical purposes it may be regarded as being ignorant of the fact that it is operating in an atmosphere rarer than that at the ground.



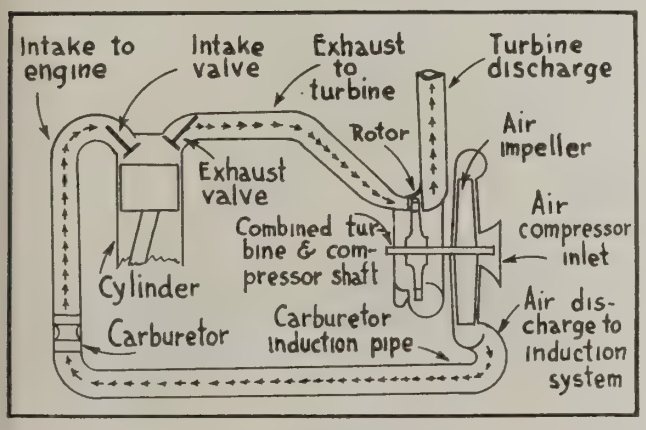
Undoubtedly, had the war lasted longer, we would eventually have had fighting planes operating with superchargers, but up to the time of the signing of the armistice none of the development work either in this country or abroad had progressed to such an extent that it was ready for practical application. Reports have been received from time to time that the Germans were operating planes on the Western Front equipped with supercharging devices, but there has been no corroboration of such rumors. It is certain, however, that the enemy recognized the supercharger as a potent factor in the design of fighting planes, realizing that such equipment would add greatly to the performance qualities of the ships. Little is known as yet as to the exact lines along which the German development has been carried.

In Europe, serious attention, as early as 1915, was given to the development of means for maintaining constant atmospheric pressure at altitudes, but in this country, along with the rest of our aeroplane development, nothing was done by the government in this connection until after our entrance into the struggle. The British, French and Italians each carried on independent experimental development work, and it is a striking indorsement of the turbo-supercharging scheme, as first worked out by Prof. Rateau in France, that at the present time this method of super-compression is most in favor with all experimenters after other systems have been given exhaustive trials. This applies to European development work, which was begun two years before our own. Work in this country has practically all been with the Rateau system, modified mechanically, it is true, but still preserving the same principles of operation as first advanced and tried by Rateau. Full details of this method of supercharging will be taken up in detail later. Suffice it to say here that the Rateau system so far, at least, appears to have the most advantages.



From the foregoing it will be apparent that the problem of keeping a constant pressure before the carburetors is an ex-

The supercharger developed by E. H. Sherbondy for the Aircraft Production Bureau



The supercharger developed by Dr. Moss of the General Electric Co.

Cross section of an exhaust turbine driven supercharger designed by Prof. Rateau in France

tremely difficult one. Development work, however, has progressed far enough to make it certain that there are distinct advantages to the idea, and in Europe experimentation has been carried beyond the strictly laboratory stage, a number of planes both in France and England having been flown experimentally with superchargers operating on the engines. Experimental work in this country, while never brought to the point of applying the devices to planes in actual flight, has been carried forward to the extent that one of the devices developed during the war has been tested with gratifying results at the summit of Pike's Peak which has an altitude of some 14,000 feet. All altitude tests that have been made have borne out the theories involved, and have shown conclusively that all that hinders the practical application of the machines to planes is mechanical difficulties, which are rapidly being overcome as the experimental work progresses.

Although other methods of maintaining constant inlet pressure are possible, all the systems of supercharging which have been experimented with so far depend upon the general scheme of connecting the air intake of the carburetor with the air outlet from a compressor, which is driven by one of several methods. The degree of compression of the air sent to the

The cycle of the exhaust turbine supercharging system shown diagrammatically

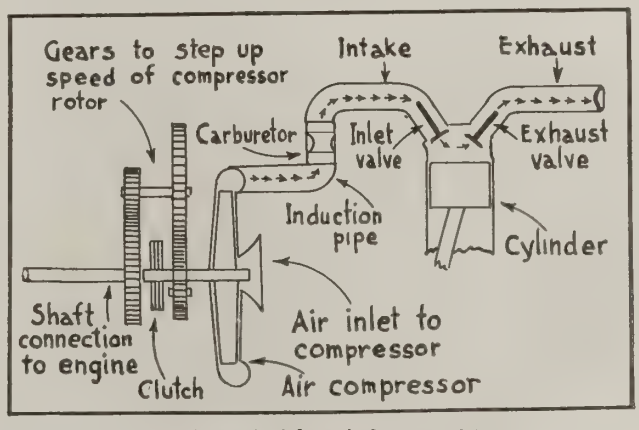


Diagram of operating principles of the gear driven compressor system of supercharging

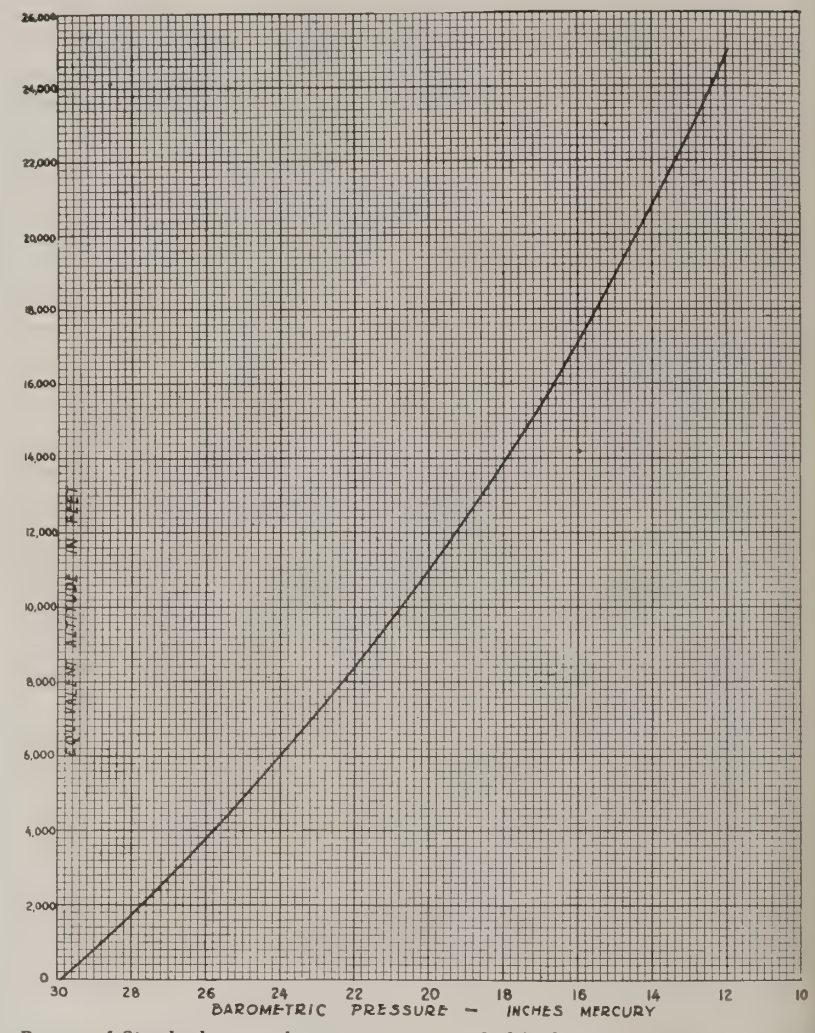


carburetor intake is governed by the speed of the compressor which is in turn either automatically controlled to supply the right amount of air for any given altitude, or is governed by some mechanical means.

Three types of compressors could be used for the purpose. These are the reciprocating, the centrifugal and the rotary designs. In order to make use of a reciprocating compressor, its volumetric displacement in a given time must be in excess of that of the engine. This eliminates this type, since it would require larger diameter cylinders than the engine, which of necessity would mean that the compressor would be as large if not larger than the engine itself.

The rotary compressor or blower has been tried under all conditions in competition with the centrifugal type of compressor by the British at the Royal Aircraft Establishment, and has been discarded in favor of the latter. Although light and of small bulk, the rotary blower does not appear to be capable of extended operation at high speed, due to mechanical limitations. Its capacity is also not so great for a given speed as that of the centrifugal type, in the small sizes such as required for such service.

In general, the centrifugal form of compressor unit has proven the most desirable when all considerations are weighed. Having a minimum of working parts, being very compact for a given capacity and being capable of operation satisfactorily at top speed over long periods of time due to its simplicity of construction, the centrifugal compressor would seem to warrant exclusive attention in competition with the other two possible types. As a matter of fact experimenters with compressors for this service have all come to this conclusion, and only the centrifugal type is now thought of when laying out a system for supercompression.

As to the methods of driving the compressor, there are also three possibilities. It can be direct-connected through the engine just as a magneto or other accessory is operated. The gear train with the crankshaft or other driving shaft of the engine just as a magneto or other accessory is operated. The gear train must, of course, be so designed as to produce the proper relative rotative speed of engine and compressor, so as to give the rotor the requisite speed for the purpose in hand. As a second consideration, the compressor might be driven by a small steam turbine, the steam being produced by suitable utilization of the heat of the exhaust gases from the engine. A third alternative is to drive the compressor impeller by means of an exhaust gas turbine, receiving its energy directly from the engine exhaust gas.

Bureau of Standards curve between pressure and altitude at temperature of 50°F.

Taking these up in the order named, much experimental work has been carried on with the direct-connected means of drive through an intermediate gear train. England and Italy have done a great deal of experimenting with the gear drive, and have experienced great difficulty in coping with the severe stresses developed in the rapidly operating mechanism due to sudden fluctuations in the speed of the engine. In order to take care of these variations in the speed of the engine so as to relieve the mechanism of any ill effects of sudden changes, some form of clutch or a series of clutches can be inbuilt into the drive to absorb them. But this means added complication that is not altogether desirable. Consequently, those who at first favored gear drives are gradually leaning towards the turbine drive.

Turning to a consideration of the steam turbine, this need not be given very serious attention, in that its use would involve the installation of a boiler, condenser and other complicated apparatus necessary to steam generation. Such a system of turbine propulsion has never been tried, but it is entirely possible to utilize the heat of the exhaust gases to produce the steam. Although such an arrangement could undoubtedly be built to operate satisfactorily in the laboratory, it has no practical value for application to an aeroplane, where every added complication is serious, and where every added ounce of weight is important. Aside from these considerations, a steam generating set would be exceedingly hard to incorporate within the narrow confines of the engine part of the fuselage.

We therefore arrive at the conclusion that the turbine driven by the energy of the exhaust gases offers the best possibilities from every standpoint, and that this conclusion is correct is evidenced by the fact that although England primarily designed its supercharger systems for direct-connection of the compressor to the engine through gearing, this idea has practically been abandoned at the Royal Aircraft Establishment in favor of the exhaust-gas turbine-driven centifugal compressor. This is the Rateau system, with which the efforts of the French engineers have been almost entirely concerned.

The exhaust-gas turbine can be connected direct with the exhaust ports of the engine through special manifolding replacing the standard manifolds, so that all the exhaust must pass through the turbine nozzles and give up its energy to the turbine rotor before being allowed to escape into the atmosphere through the turbine discharge passage. In the designs which have been experimented with thus far, the turbine rotor and the impeller of the centrifugal compressor are mounted on the same shaft. Thus the building of the turbine and compressor as a unit is made possible, resulting in an exceedingly compact machine, which in most instances can be mounted directly on the front of the engine. By this arrangement, the outfit takes up a minimum of space, and although such a position of the device makes it necessary to remove the radiator from the front of the fuselage, this offers no difficulties, since a great many designers of planes place the radiator in the wings or at the sides, or at the bottom of the fuselage from choice.

It will be seen that inasmuch as there is no direct mechanical connection between the turbo-compressor and the engine, this type of apparatus is entirely free from troubles due to sudden variations in the rotative speed of the engine, which is one of the principal objections to the gear-driven compressor installation.

In conducting the engine exhaust gases to the nozzle box of an exhaust gas turbine, and thence through nozzle ports to the turbine wheel, no difficulties are encountered, except that the high temperatures of the exhaust gases must be coped with. To date, this has been the main trouble designers of turbo-superchargers have had, viz., designing the device in such a way that the excessive heat can be cared for without damage to the turbine parts. This trouble seems to be close to satisfactory solution, and it is not looked upon as being

(*Continued on page 264*)

THE 270 H. P. BASSE-SELVE AERO ENGINE

[*We are indebted to the Technical Department (Aircraft Production), British Ministry of Munitions, for the following details concerning the latest German aero-engine development.*—EDITOR.]

Introductory Note

The following report on the design of the 270 h.p. Bassé-Selve engine is based on a detailed examination of the engine (No. 550) taken from the remains of a German Rumpler two-seater biplane (R.A.F. identification No. G/5BD/14), which was shot down and destroyed in France on May 31, 1918. Unfortunately, this is the only engine of its type which has been captured up to the time of writing, and as it was seriously damaged it is impossible to carry out any power and consumption tests of the engine; consequently the following report deals with design and construction only. Certain figures connected with the performance have, however, been calculated by assuming the engine speed and brake mean effective pressure to correspond approximately with those of other German engines of about the same capacity. The figures adopted for these items are as follows:

Normal engine speed.....1,400 r.p.m.
Normal B.M.E.P. at 1,400 r.p.m., 110 lbs. per sq. in.

All the figures in the data at the end of this report, which are based on the above assumption (and therefore only to be accepted with reserve) are marked with an asterisk. Actual figures and test reports on the running of these engines will be issued as soon as an engine of this type is captured in good condition.

General Description

These engines, manufactured by Bassé and Selve, Altena, Westphalia, have but recently appeared in the field. In most of their leading details of construction they closely resemble both the 260 h.p. Mercedes and 230 h.p. Benz engines, on which the design is evidently based. Markings on the engine indicate the year of manufacture to be 1917, the crankshaft being marked "A. G. Krupp, Essen, 1917." The nominal rating of the engine according to a cast plate on the crankcase is 270 h.p., and the norman engine speed would probably be about 1,400 r.p.m. Assuming the B.M.E.P. to be 110 lbs. per sq. in. at 1,400 r.p.m., the power developed would be approximately 260 b.h.p.

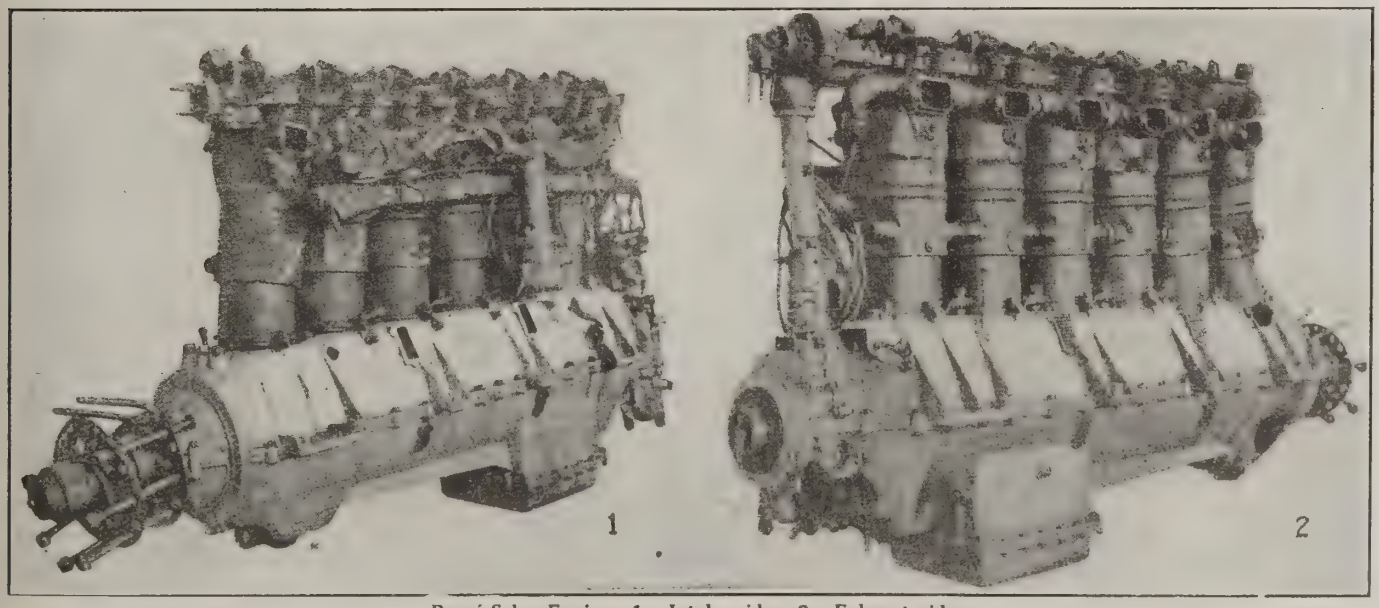
The accompanying photographs show the engine to be of the usual six-cylinder water-cooled type, the bore being 155 mm. and the stroke 200 mm., *i.e.*, 5 mm. less in the bore and 20 mm. longer in the stroke than the 260 h.p. Mercedes engines. Owing to the damaged condition of the cylinders and pistons it has been difficult to ascertain the exact clearance volume. This is approximately 1,130 c.c., giving a compression ratio of 4.34:1, which is lower than any of the previous enemy engines. Twin inlet and exhaust valves are fitted in the head of each cylinder, and the method of water cooling the exhaust valve stems by an annular passage, which completely surrounds the valve stem guides, is a novel detail of construction in enemy engines. The valves are operated by an overhead camshaft, running in bronze bearings in a cast aluminum casing; the design of the valve rockers and valve gear is worthy of notice. An unusual type of compression release gear is used, which is of remarkably simple construction. Aluminum pistons are fitted. These are machined all over, inside and out. The slightly convex crowns are supported by conical pillars which bear upon the center of the gudgeon pins through the slotted small ends of the connecting rods. This construction, together with the design of the tubular

Bassé-Selve Engine—View of cylinder

connecting rods, is essentially Benz practice, whilst the construction of the steel cylinders is taken from the 260 h.p. Mercedes design, but incorporates several improvements.

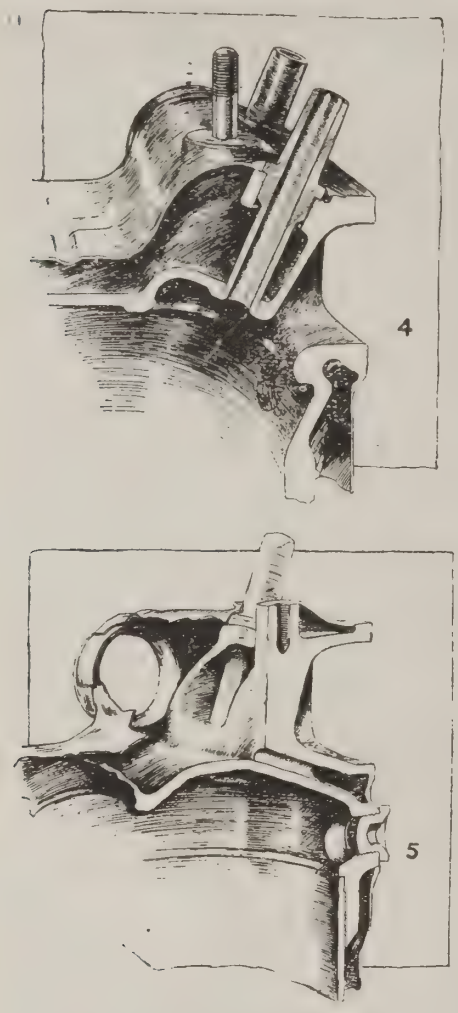
A large oil-cooling radiator is attached to the bottom of the crankcase, and is used in conjunction with a new design of duplex-plunger oil pump, which works vertically at the rear end of the crankcase. The design of the oil pump is somewhat similar to that now used on the new 200 h.p. Austro-Daimler engines. Two separate two-jet carburetors fitted with annular floats are employed. These are apparently equipped with some form of altitude adjustment. Unfortunately, only one incomplete carburetor was found on the engine, the parts of which are shown in Fig. 20. No details can be given of the construction of the water pump, as this component was missing from the engine. The crankshaft is of ordinary, but exceptionally heavy, design. The main journal bearing shells are machined with a screw-thread bedding for the white metal linings in a similar manner to the 300 h.p. Maybach engines. The propeller hub is fitted to a detachable tapered extension piece, which is bolted by a flange to the end flange of the crankshaft. Further details of the design are given in the following description, and the leading particulars of the engine are given in the accompanying data, which are as complete as the condition of the engine allows.

Details of Construction



Cylinders

A sectional drawing showing most of the construction of the steel cylinders is given in Fig. 6. The cylinder barrels are screwed into the heads and welded in position. This construction is similar to the 260 h.p. Mercedes, as also are the eight ribs machined on the outside of the barrels. The cylinder heads are of cast steel, and the four valve pockets in each cylinder are cast integrally with the head. The formation of the combustion chamber and the unusual inclination of the valves at 23.5 deg. to the vertical axis of the cylinder are interesting points. The formation of the water passages in the heads and the construction of the water jackets have evidently received the most careful consideration in this engine, especially in the cooling of the exhaust valves. The cylinder water jacket capacity is remarkably high, and the water passages through the cylinder heads are exceptionally good. The water connections between the cylinders are all on the exhaust valve side, and are of large diameter. The water connections in the cylinder heads are arranged as close up to the exhaust valves as possible.



The construction of the valve stem guides is as follows:

The valve guides are steel tubes lined with phosphor bronze; they are pressed into the valve pockets, and are acetylene welded in position top and bottom; an annular passage cast in the exhaust valve pocket entirely surrounds the central portion of each exhaust valve stem guide for a distance of 35 mm. These passages are shown in the sketches, Figs. 4 and 5. The water jackets are of pressed sheet steel, with two angular corrugations, and the bottom joints of the water jackets are welded to bevelled flanges turned on the outside of the cylinder barrels. This joint is of the same design as is now used in the 200 h.p. Austro-Daimler engines.

A water passage is cast in the cylinder heads between each pair of exhaust valves, as shown in Fig. 5, which allows of water circulation completely around the head of each exhaust valve, and the exhaust valve stems are completely water cooled. The cylinders are bolted down to the crankcase by steel dogs, which clamp the base flanges of the cylinders at six points. The cylinders are registered in the crankcase by spigots extending 8 mm. below the base flanges. Each cylinder is held down at six points by means of dogs which clamp the cylinder base flanges on each side. These dogs

Bassé-Selve Engine—1. Intake side. 2. Exhaust side

4. Sketch of water-cooled exhaust valve seatings

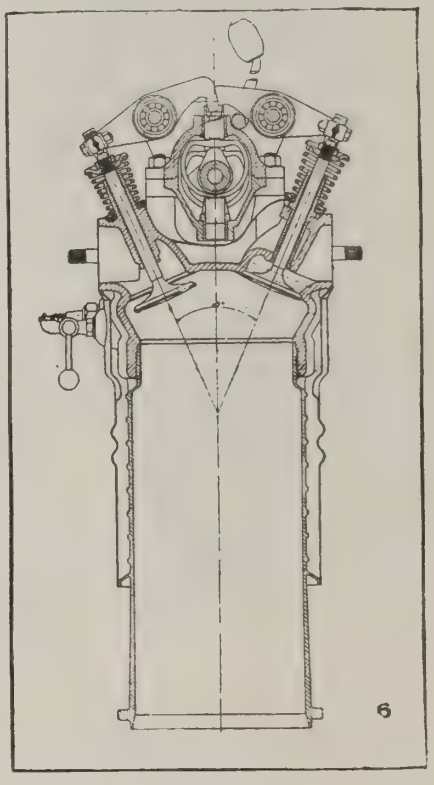
5. View of water cooling passages around exhaust valve guides

are secured by studs screwed into the top half of the crankcase. The main journal bearing bolts, which pass through the top half of the crankcase, are also used to hold down the cylinders by bridge clamps between each pair of cylinders, as shown in the photograph. The lower halves of the main bearings are integral with the bottom half of the crankcase. Locknuts are screwed on the upper ends of the main bearing bolts beneath the cylinder holding-down dogs, so that the cylinders can be removed without disturbing the main bearings.

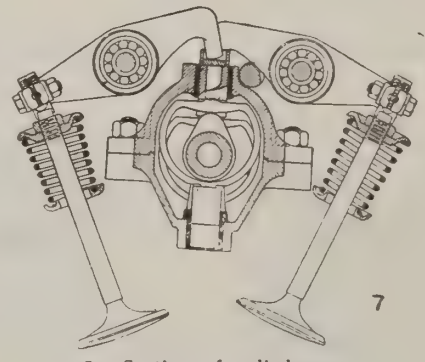
Valves

The inlet and exhaust valves are of the same diameter in the heads and stems, and of similar section. The valves measure 61.0 mm. across their slightly convex heads. The effective diameter of the valves at the valve seatings is 56 mm. The valve seatings of each pair of valves merge into single inlet and exhaust ports in the cylinder heads. These are rectangular, and the passages are remarkably short and free.

Single valve springs are fitted to each valve, and the wire for the springs is of light gauge (approximately 4.0 mm. diameter). The same design of valve spring is used for both inlet and exhaust valves, but the exhaust springs are more compressed. The ends of the valve stems are screwed to take the spring collars, which are locked by a plain castellated locking nut and split pin.



Valve Gear



The general lay-out of the valve gear is shown in the cross-sectional arrangement drawing, Fig. 13, and presents some interesting details of design. The camshaft runs in eight comparatively short plain bearings of phosphor bronze, which are held in split aluminum housings of hollow section and large diameter. These are carried in the halves of a cast aluminium camshaft casing, and are located by dowel pegs in the usual way. The camshaft is made in two parts, joined together at the center by two flanges and four short bolts. This valve gear is very similar to that used on the Peugeot racing cars (four valves per cylinder) about seven years ago.

Each pair of valves is depressed by a rocker lever mounted on ball bearings. The inner arm of each rocker lever is operated by its cam through a tappet in the top half of the camshaft casing. The design of these tappets is clearly shown in the cross-sectional drawing, Fig. 7, and in the sketch, Fig. 9. The tappets are made in the form of stirrups which encircle the cams, and are supported in bronze bushes at the top and bottom ends. The cams and their tappets are case-hardened, and the camshaft bearings and tappets are lubricated under pressure through the hollow camshaft.

Compression Release

A simple form of compression release gear is used in place of the usual half compression cams and mechanism. This is operated by means of a rod which lies horizontally along the outside of the camshaft casing directly underneath the exhaust valve rocker arms. This rod has slots cut in it (as shown in Figs. 6 and 10), which lift the exhaust valve rockers when the rod is partially rotated by means of the hand

6. Section of cylinders

7. Details of valve gear

lever fixed to the rear end of the horizontal rod. The purpose of this compression release is apparently to facilitate swinging the propeller.

Pistons

The aluminium pistons are illustrated in Figs. 11 and 12.

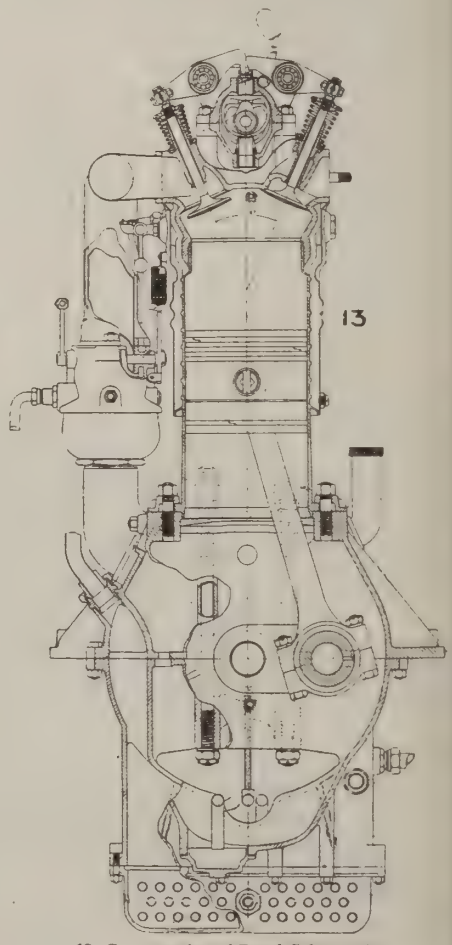
The crowns are considerably domed and the pistons are machined all over, both inside and out. Both the material and the machining are excellent. No ribs are formed on the inside of the pistons, the crowns being supported by a hollow conical pillar which bears on the center portion of the gudgeon pin, as in the Benz and other engines. This conical pillar is integral with the piston crown. The inside of the pillar is machined through a hole in the center of the crown which is afterwards plugged with a flanged cap screwed into the center of the crown, as shown in the drawing. Three cast-iron compression rings are provided above the gudgeon pin and one at the bottom of the skirt, all with stepped joints. The machining processes of this type of piston are obvious from the illustrations. No bushes are provided as liners in the gudgeon pin bosses. The gudgeon pin is fixed in position by a large hollow set-pin which passes through both sides of the boss and gudgeon pin as shown. The weight of each piston complete with rings is 5.18 lbs.

Connecting Rods

These are of tubular section, and closely resemble the Benz connecting rods in design, but are of considerably larger proportions throughout. The inner surfaces of the big-end shells are machined with a fine pitch screw thread to take the white metal liners as in the 300 h.p. Maybach engines. The crankshaft journal bearings are machined in a similar manner. Other details of the connecting rods may be seen in the photographs attached. These rods are particularly heavy, the weight of the complete connecting rod being 9.0 lbs.

Crankshaft

The crankshaft is of normal design, and apart from its massive proportions requires no special description. All the hollow crankpins and journals are of the same internal diameter (40 mm.), and are plugged with gunmetal discs expanded into grooves. All the crank webs are drilled for lubrication with oil passages connecting the hollow crankpins and journals. A large double-thrust ball race is fitted to the front end of the crankshaft by means of a shoulder machined on a flange just behind the propeller hub; the thrust races are threaded on over the cranks, and are secured by a large screwed collar and spring locking ring. The main distribution bevel gear floats on the splined rear end of the crankshaft, and is fitted with a thrust ball race between the bevel and the rear end of the journal bearing.



Propeller Hub

This is of the standard 260 h.p. Mercedes type, and is fitted to a short tapered extension of the crankshaft. This extension is detachable, being bolted to a flange on the crankshaft; the propeller hub is secured on the tapered extension by a key. The standard Mercedes locking device is used.

Carburetors and Induction

Unfortunately, only one incomplete carburetor was found on the engine. This is shown dis-

SECOND PAN-AMERICAN AERONAUTIC CONVENTION AND EXHIBITION

To Be Held Under the Auspices of The Aero Club of America, The Aerial League of America and the Pan-American Aeronautic Federation.

From Thursday, May 1st, 1919,
to
June 1st, inclusive,
at
Atlantic City, N. J.

Intercollegiate Contests Throughout the Summer

CONTESTS TO BE HELD EACH SATURDAY

(1) Seaplane Contests (general),
(2) Curtiss Marine Flying Trophy and Prizes,
(3) Intercollegiate Seaplane Contests,
(4) Land Aeroplane Contests,
(5) Dirigible Contests,
(6) Kite Balloon Speed in Ascending and Descending, and Maneuvering Contests,
(7) Parachute Competition,
(8) Aviette (bicycles and motorcycles with wings) Contests.

EVERY DAY ACTIVITIES

(1) Exhibits of Aeroplanes, Motors and Accessories on the Steel Pier,
(2) Demonstrations and tests of Seaplanes, Land Aeroplanes, Motors, Dirigibles, Kite Balloons, to prospective purchasers and representatives of different governments,
(3) Aerial Passenger Carrying by seaplanes and dirigibles, and kite balloon ascensions,
(4) Moving pictures and Addresses by leading authorities on most important phases of aeronautics.
(5) Competition for the Pulitzer Trophy.
(6) Competition for the Atlanta Journal Trophy.
(7) Competition for the Curtiss Marine Flying Trophy.

The Governments and Aeronautic, Sporting, Scientific, Industrial and Civic organizations of the United States and all the countries in the world, excepting Germany and her allies, are invited to send representatives to attend this great aeronautic event. On arrival in the United States these representatives should call at the Headquarters of the Convention Committee at No. 297 Madison Avenue, New York City, to register and receive their official badges and the official program.

In the event that it is more convenient for them to go directly to Atlantic City they will register at the offices of the Convention located at the following Atlantic City hotels: Hotel Traymore, Hotel Chalfonte, The Breakers Hotel, Hotel St. Charles, Hotel Marlborough-Blenheim, Hotel Chelsea, Hotel Alamac, Hotel Dennis and Hotel Haddon Hall.

Representatives of the Convention Committee will be at the Bureaus of the Aeronautic Convention at the above-named hotels and will issue the official badges which admit the bearer to the Aeronautic Hall, as well as the Aero Exhibition on the Steel Pier, the judges' enclosure during contests, and to the Aerodrome and seaplane stations where the aircraft and motors will be demonstrated.

All communications until May 1st should be addressed to Rear Admiral Peary, Chairman, Aeronautic Convention, Aero Club of America, 297 Madison Avenue, New York City.

Entries for the contests should be addressed to the Contest Committee, Aero Club of America, 297 Madison Avenue, New York City.

DAILY PROGRAM FOR PAN-AMERICAN AERONAUTIC CONVENTION, EXHIBITION AND CONTESTS

THURSDAY, MAY 1ST

Opening of Convention and Exhibit.

AFTERNOON—Reception at Aeronautic Hall on the Steel Pier. Addresses by United States Government State and aeronautic authorities.

EVENING—Aero Show and addresses by officials.

FRIDAY, MAY 2ND

AFTERNOON—Aero Show. Preliminary tests of seaplanes, dirigibles and kite balloons.

EVENING—Moving pictures and address on flying for sport and pleasure.

SATURDAY, MAY 3RD

AFTERNOON—Seaplane and dirigible races, and kite balloon ascending and descending contest.

EVENING—Ball.

SUNDAY, MAY 4TH

MORNING—Memorial service by eminent Divine for the dead airmen.

AFTERNOON AND EVENING—Reception to allied aces and heroes of the air and their parents, and announcement of the award of the Aero Club of America Medal of Valor, and the Aerial League of America Diploma of Honor.

MONDAY, MAY 5TH

AFTERNOON—First parachute contest for $500 Bennett Prize.

EVENING—"The Large Dirigible and Its Value for Transportation." Representatives of railroads, express, steamship and other transportation organizations invited to attend.

TUESDAY, MAY 6TH

AFTERNOON—Illustrated addresses on "Aerial Forest Patrol." Forestry Department of every State invited.

EVENING—"Work of Aerial Police Squadrons, and Why Every City Should Have One."

WEDNESDAY, MAY 7TH

AFTERNOON AND EVENING—Aerial Mail Day. Illustrated address on, and consideration of, "Aerial Mail Planes." Chairman of Post Office and Post Roads Committees of House of Representatives and Senate, and Postmaster General Burleson invited to deliver addresses. (26,000 United States Postmasters, and Chambers of Commerce of 13,000 cities invited to attend.)

THURSDAY, MAY 8TH

AFTERNOON AND EVENING—Illustrated addresses on the "Need of Municipal Aerodromes, and the Part to be Played by Aircraft in City Planning." Chambers of Commerce and City Planning Commissions of 13,000 cities invited to attend.

FRIDAY, MAY 9TH

AFTERNOON—Arrival of seaplanes and army planes from Army and Navy Air Stations. Second parachute competition for the $500 Bennett Prize.

EVENING—Illustrated addresses on "Latest Developments in Aerial Warfare and Adventures in Aerial Warfare," told by famous aces.

SATURDAY, MAY 10TH

AFTERNOON—Army, Navy and Marine Corps Day. Aerial contests and tournament.

EVENING—United States Army and Navy Officers' Reception. Reception and addresses at Aeronautic Exhibition Hall on the Steel Pier.

SUNDAY, MAY 11TH

AFTERNOON AND EVENING—Presentation of the flags by each State of the United States to the Aero Squadrons representing the States. Each State will present a flag to each Aero Squadron, the members of which were overwhelmingly natives of that State. The presentation will be made by representatives from the State and the Aero Club and Aerial League branch of that State. All States and cities invited to send delegates, and Army, Navy and Marine Corps to send representatives.

MONDAY, MAY 12TH

AFTERNOON—Demonstrations and illustrated addresses on the "Value of Aircraft for Advertising by Day and by Night." All national advertisers and advertising agents invited to attend.

EVENING—"Pan-American Aerial Transport Over Land." Addresses by members of the commissions of the 20 Latin-American Republics.

TUESDAY, MAY 13TH

AFTERNOON AND EVENING—"Pan-American Aerial Transport Over Water." Addresses by members of the 20 Latin-American Republics' Commissions.

WEDNESDAY AND THURSDAY, MAY 14TH AND 15TH

AFTERNOONS AND EVENINGS—"The Airways and Aerial Transport in Europe, Canada, Africa, Australia and Asia."

FRIDAY, MAY 16TH

AFTERNOON AND EVENING—"Aerial Navigation Instruments for Flying Over Land and Water." Aviators, navigators, scientific instrument makers and aeronautic experts invited.

SATURDAY, MAY 17TH

AFTERNOON—Aerial races and contests. Illustrated addresses on Aerial Photography.

EVENING—Extensive exhibit of aerial photographs and photographic apparatus. All photographers, professional and amateur, and makers of photographic apparatus invited.

SUNDAY, MAY 18TH

AFTERNOON AND EVENING—Illustrated addresses on "Aerial Exploration and the Use of Aircraft for Coast and Geodetic Survey."

MONDAY, MAY 19TH

AFTERNOON—Addresses on "Need of Broader Attitude Regarding Insurance for Aircraft and Aviators."

EVENING—Illustrated address on "How Army Medical Standards and Inspection Lessen Accidents." Insurance companies and agents invited.

TUESDAY, MAY 20TH

AFTERNOON AND EVENING—Illustrated addresses showing different ways of crossing Atlantic by air and the problems to be solved to accomplish same successfully.

WEDNESDAY, MAY 21ST

AFTERNOON—Aero Safety Day. Discussion of aero safety provisions made; improvements in aeroplane construction; increased reliability of aero motors; devices which make for safety in flying.

EVENING—"Progress Made in the Art of Piloting Aeroplanes." Illustrated.

THURSDAY, MAY 22nd

AFTERNOON AND EVENING—Addresses and discussions of meteorology—"How the Weather Forecasts Can be Extended and Made More Efficient by the Use of Aircraft in Exploring the Upper Air," also "How the Weather Forecasts Help Aerial Navigation," and "Telegraphic and Climatic Factors in Relation to Aeronautics.

FRIDAY, MAY 23RD

AFTERNOON AND EVENING—Addresses on "Aerial Jurisprudence—Aerial Laws and Regulation of Air Traffic." (First day.) Lawyers, traffic commissioners and police authorities of different countries invited.

SATURDAY, MAY 24TH

AFTERNOON—Races and contests.

EVENING—Illustrated address on "Need of Establishing Altitude Levels for International, Interstate and Interurban Air Travel."

SUNDAY, MAY 25TH

AFTERNOON AND EVENING—Aeronautic Art Day. Address on "Aerial Painting and Sculpture of Different Countries, and Exhibition of Aerial Paintings," by Lieut. Farre, Lieut. Ruttan and others. All prominent artists, managers of art galleries and art patrons invited to attend.

ENGINEERING WEEK.

MONDAY, MAY 26TH

AFTERNOON—"Aeronautic Engineering Problems and Their Prospective Solution."

EVENING—Opening of contests for designs and ideas for large aeroplanes.

TUESDAY, MAY 27TH

AFTERNOON—"Factors That Increase the Efficiency for Large Dirigibles."

EVENING—"Advantages of Veneer and Plywood for Aircraft Construction."

WEDNESDAY, MAY 28TH

AFTERNOON—Address on "Problems of Flying at 35,000 Feet and Over, and Their Prospective Solution."

EVENING—"Present Day Aero Engines."

THURSDAY, MAY 29TH

AFTERNOON—"Flying Boats Versus Hydroaeroplanes for Sport and Transportation."

EVENING—Contest for designs and ideas for large aeroplanes.

FRIDAY, MAY 30TH (Memorial Day)

AFTERNOON—Dirigible races, kite balloon speed ascending contest; parachute contest.

EVENING—Reception at the Aeronautic Hall, Steel Pier.

SATURDAY, MAY 31ST

AFTERNOON—Seaplanes, land planes and dirigible contests. Aviette competition at which all cyclists and makers of bicycles and motorcycles will be invited.

EVENING—"International Medical Standards for Aviators in War and Peace." Reports from different countries illustrated with attractive films. 50,000 medical men invited.

SUNDAY, JUNE 1ST

AFTERNOON AND EVENING—Award of prizes and diplomas for all events.

HOME!

The boys are home!

A year and more ago they marched away and left their homes and happiness and friends behind to go to France to fight for us. They fought—they won—and now they're home again.

They've done their part, those boys of ours—they saw it through.

And we who crowd the curb and wave our hats and cheer to let them know we're glad—how about us?

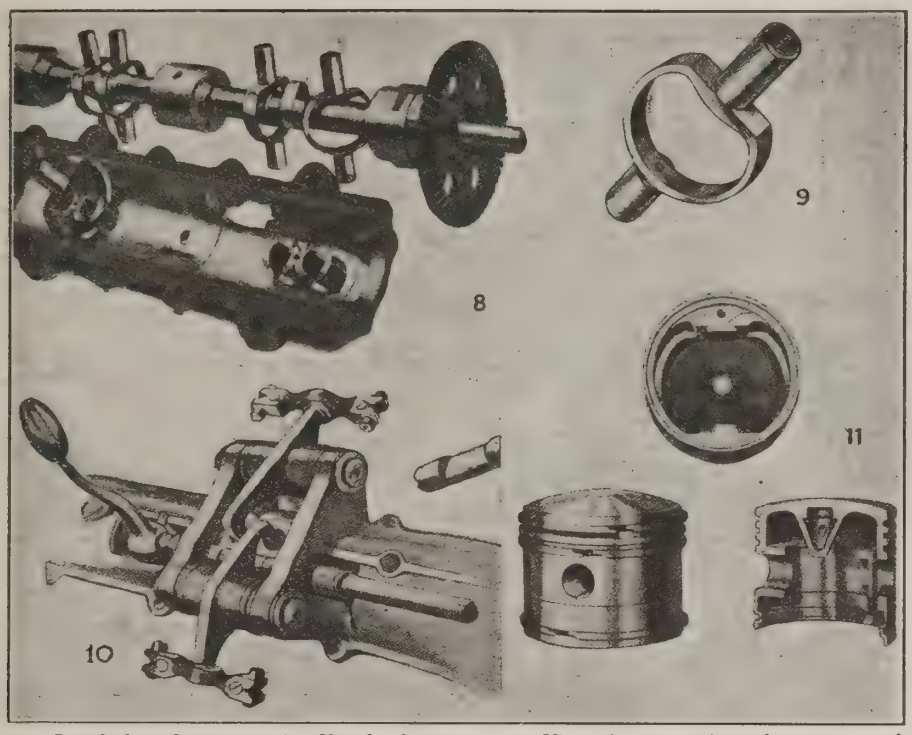
We bought Liberty Bonds to put up the money to buy the guns those fellows fought with. They're proud of us.

They know we backed them to our limit while they were "over there."

But our work isn't over.

We can't let the job those boys have done in France go unfinished.

We've got to see it through.



We've got to raise the money to make sure of the Victory they've won and bring the rest of our soldiers back.

The Victory Liberty Loan is coming—Let's see it through!

FINISH THE JOB

GOVERNMENT LOAN ORGANIZATION

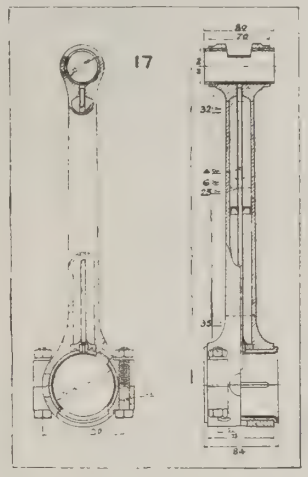
8. Camshaft and tappets. 9. Sketch of tappet. 10. View of compression release gear and valve rockers. 11. Three views of aluminum piston

(*Continued from page* 248)

mantled in Fig. 20. The carburetors, which are quite separate, are of unusually light and simple construction compared with previous German design. The floats and float chambers are of the annular type, and encircle the main air intakes directly below the throttles, which are of the ordinary butterfly type. The body of each carburetor and throttle is made of cast aluminium and the main jet is formed by a hole drilled in a tube which is screwed diagonally into the water-jacketed body of the carburetor, and lies across the choke tube directly beneath the throttle. The jet tube is open at the bottom end, and projects into the bottom of the annular float chamber, which is made of pressed sheet steel of very light gauge. The pilot jet is formed by a second tube of small diameter inside the main jet tube. This pilot jet tube is also open at the bottom end, and is drilled radially with a small hole, just above the main jet. It communicates with the mixing chamber just above the throttle by a passage drilled in the carburetor body. An altitude compensating control is fitted. This takes the form of a pipe opening into a passage drilled in the top of the float chamber, and no doubt connected by a rubber tube to a control

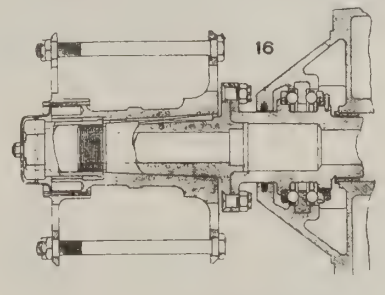
19. Section of carburetor



cock in the pilot's seat. Each carburetor feeds three cylinders through a branched induction manifold, the vertical part of which is water-jacketed. The total weight of each carburetor complete should not exceed 2 lbs.

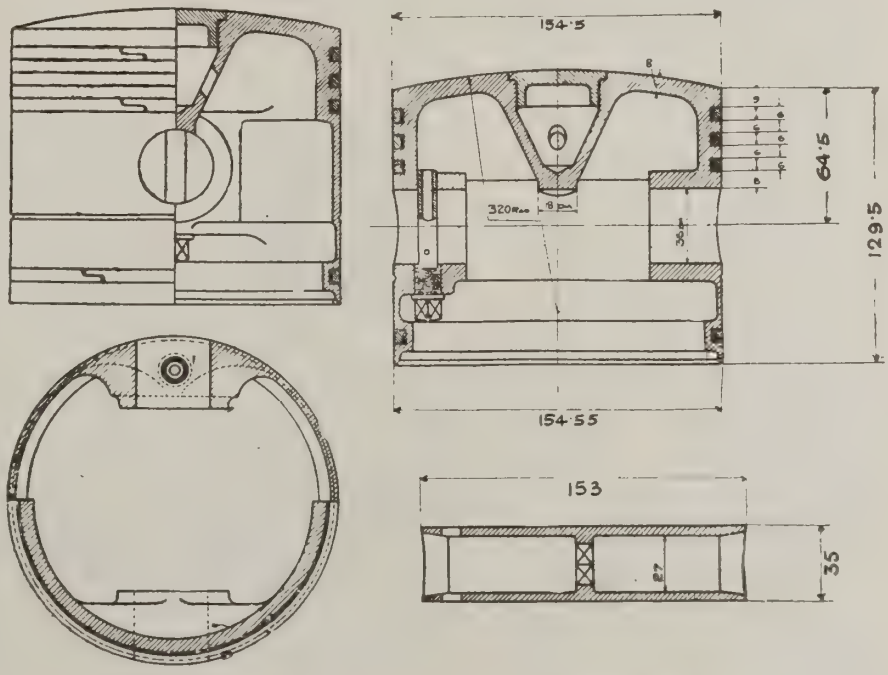
Crankcase

The design of the top half of the crankcase requires no description, being constructed on Mercedes lines; it is shown in the engine photographs. The lower half also closely follows standard Mercedes design, with the exception of the oil reservoir and oil-cooling radiator on the bottom of the rear end. The construction of this cooler may be seen in Figs. 21 and 22; it consists of a cast aluminium oil chamber, having a number of thin aluminium tubes (12 mm. diameter) running longitudinally in three rows, and expanded at the ends. The cooler is bolted to the bottom flange of an oil reservoir below the base chamber, and is not an oil sump, inasmuch as there are no oil connections between it and the base chamber. This oil reservoir and cooler is provided for the purpose of forming the service oil tank, and for cooling the oil on the scavenger circuit; separate oil sumps are provided at each end of the base. (See notes on Lubrication.) For the purpose of refilling the supplementary oil tank and cooler a passage cast in the side of the base chamber communicates with the space between the transverse webs of the main bearing housings. At the bottom of the crank chamber a trough is formed in the casting. This is semi-circular in cross section, and is provided to take the main oil supply and return pipes. Two air intake passages are cast on each side of the crank chamber, as shown in Fig. 21; they are arranged to communicate with the carburetor through passages in the top and bottom halves between the transverse box-housings of the main bearings.

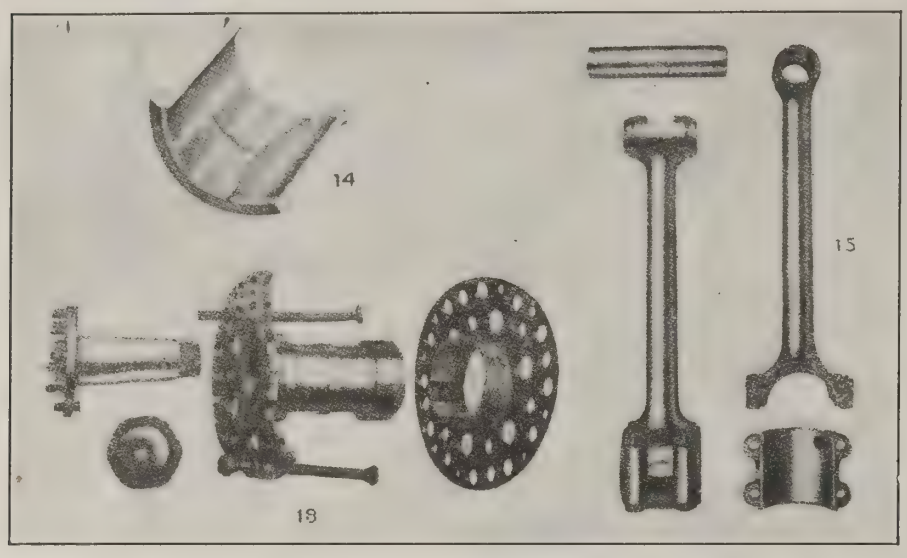


Oil Pump and Lubrication System

The oil pump is attached to the bottom half of the crankcase at the rear end, and driven by a worm gear off the rear end of the crankshaft through a short transverse layshaft. Most



17. Details of connecting rod



of the details of construction of the oil pump may be seen in the photograph of the pump, Fig. 23, which has been specially sectioned to show as much as possible of the various oil passages, ports and connections. The pump consists of two double-acting steel plungers, which work vertically in the barrels formed in the ends of the cast aluminium pump body. In action, the plungers are rotated by means of the worm gear, and are simultaneously reciprocated by the action of the scroll-cam cut in the spindle (Fig. 24), and operated by a hardened steel roller working on a pin screwed into the pump body. At every stroke of the two double-acting plungers, oil is drawn from the cooler tank and sumps in the base chamber, and is delivered to the main bearings and camshaft or returned to the oil cooler respectively, through the four distributing ports in the pump plungers. These ports when in action coincide with the drilled passages in the body casting of the oil

16. Section of propeller hub and thrust race

12. Details of pistons and the gudgeon pin

14. Sketch of big end bearing lining. 15. Connecting rods. 18. Propeller hub and detachable extension piece

pump, which are connected to the various leads as shown in the lubrication diagram, Fig. 25.

The functions of the oil pumps and circuits are as follows:

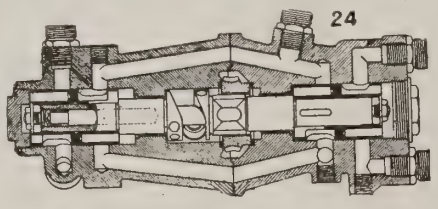
1. *Main Pressure Circuit,* by the two inner pumps to crankshaft and connecting rod bearings and also to the hollow camshaft, returning by gravity to the two sumps at either end of the base chamber. The oil for this circuit is drawn from the supplementary oil cooler tank, which is replenished by fresh oil from the service oil tank.

2. *Scavenger Circuit.*—Oil is drawn by the two outer pumps from the two oil sumps in the bottom of the base chamber, and is returned to the oil cooler.

The total weight of the oil pump complete is 5.0 lbs. No details can be given of the construction of the water or air pumps, which were missing from the engine examined. The water pump, however, was evidently driven by the short transverse shaft which drives the oil pump at the rear end of the engine. This shaft is situated directly underneath the floating distribution bevel gear on the rear end of the crankshaft, as shown in the general arrangement drawing of the engine, Fig. 26, in which the oil pump, for the sake of clearness, is drawn on the exhaust side of the engine. The air pump, which was driven by a small crank fixed in the front end of the camshaft, was probably similar in design to the 260 h.p. Mercedes, and is shown thus in the general arrangement.

Ignition

Ignition is by two Z.H. 6 magnetos, which are driven obliquely to the crankshaft axis by bevel gears off the camshaft driving spindle at the rear end of the engine.



Two Bosch 3-point plugs are fitted to each cylinder, and are situated just below the induction valves. Provision is also made for fitting one sparking plug on the exhaust side of the cylinders, the holes not in use being plugged.

The H.T. cables are carried in fibre tubes attached to the cylinders.

The machine-gun interrupter-gear triple drive is bolted to the camshaft bevel gear case, and is driven off the rear end of the camshaft as shown in Fig. 2. The wireless dynamo is driven off the rear end of the crankshaft by a standard type of friction-clutch belt pulley described in a previous report.

General Analysis of Weights

Description of Part.	No. per Set.	Average Unit Wt. lbs.	Wt. of Complete Set. lbs.	Percentage of Total Wt.

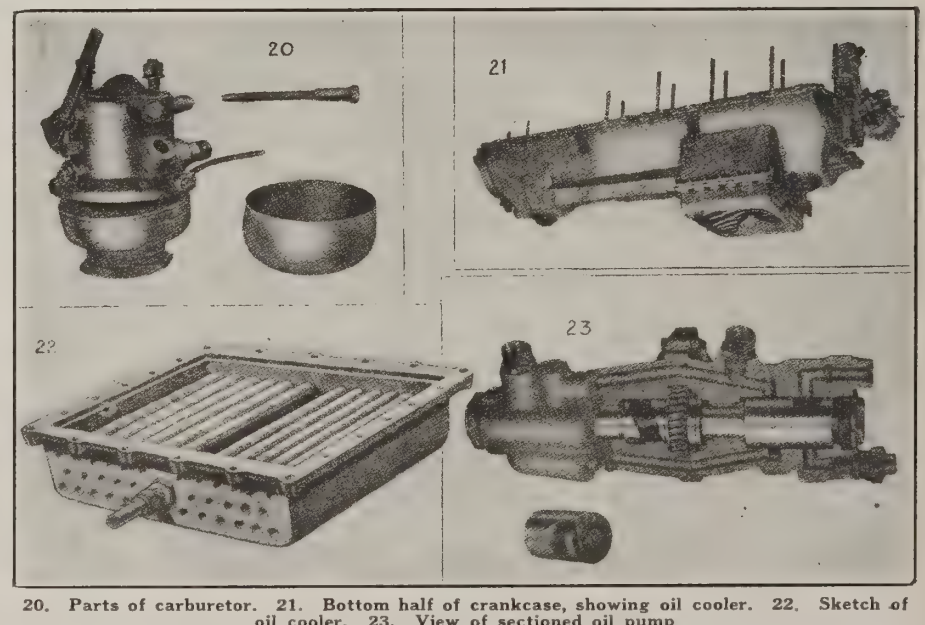
General Data

Type number, No. 550; number and arrangement of cylinders, six, vertical; bore, 155.0 mm. (6.10 in.); stroke, 200.0 mm. (7.87 in.); stroke/bore ratio, 1.29:1; area of one piston, 188.7 sq. cm. (29.24 sq. in.); total piston area of engine, 1132.2 sq. cm. (175.44 sq. in.); stroke volume of one cylinder, 3774.0 cub. cm. (230.21 cub. in.); total stroke volume of engine, 22644.0 cub. cm. (1381.28 cub. in.); clearance volume of cylinder, 1130 cub. cm. (68.96 cub. in.); compression ratio (approximate), *4.34:1; normal b.h.p. at 1,400 r.p.m., *269 b.h.p.; maximum b.h.p. at 1,600 r.p.m., *302 b.h.p.; direction of rotation of crankshaft and propeller, r.h.t.; type of valve gear, overhead camshaft; type of starting gear, compression release; weight of complete engine, dry, *885 lbs.; weight per normal b.h.p., ditto, *3.29 lbs.



Carburetors.—Number and type of carburetors, two, 2 jets; diameter of choke tube, 50.0 mm. (1.96 in.); bore of main jets, 2.59 mm. (0.0102 in.); bore of pilot jets, 1.17 mm. (0.0046 in.).

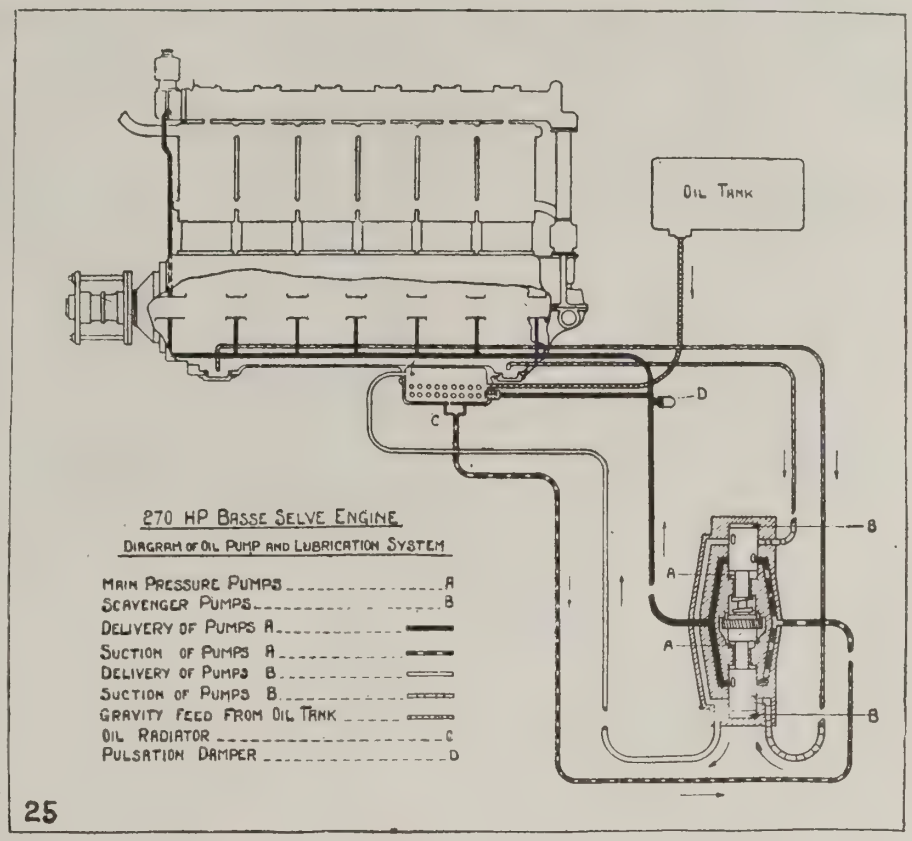
Valve Areas, Gas Velocities, etc.—Diameters—Induction pipe, 58.0 mm. (2.28 in.); inlet and exhaust effective valve ports (each), 56.0 mm. (2.20 in.). Cross sectional areas—Induction pipes, 26.4 sq. cm. (4.10 sq. in.); inlet valve (π dh) and exhaust valve (π dh) (each), 17.6 sq. cm. (2.72 sq. in.).

Mean Gas Velocities (1,400 *r.p.m.*).—Piston speed, *1,837 ft. per min.; induction pipe, *219 ft. per sec.; inlet valve, *164 ft. per sec.; exhaust valve, *164 ft. per sec.

Inlet and Exhaust Valves.—Number per cylinder (each), two; largest diameter, 61.0 mm. (2.40 in.); effective valve port diameter, 56.0 mm. (2.20 in.); angle of seating, 45 deg.; lift of valve, 10.0 mm. (0.39 in.); diameter of stem, 11.0 mm. (0.43 in.); length of valve guide, 90.0 mm. (3.54 in.); overall length of valve, 146.0 mm. (5.74 in.); number of springs per valve, one; free length of spring, 80.0 mm. (3.14 in.); length of spring in position (no lift), inlet, 58.0 mm (2.28 in.); length of spring in position (no lift), exhaust, 55.0 mm. (2.16 in.); mean diameter of coils (top), 36.0 mm. (1.41 in.); mean diameter of coils (bottom), 28.0 mm. (1.10 in.); diameter of wire, 4.0 mm. (0.157 in.); ratio, length of spring/lift of valve (inlet), 5.8:1; ratio, length of spring/lift of valve (exhaust), 5.5:1; weight of valve complete with spring, 0.75 lb.; weight of spring, 0.25 lb.

Inertia Forces, Bearing Loads, etc.—Weight of piston, complete with rings and gudgeon pin, 6.187 lbs.; weight per sq. in. of piston area, 0.211 lb.; weight of connecting rod, complete, 9.00 lbs; weight of reciprocating part of connecting rod, 2.25 lbs.; total reciprocating weight per cylinder, 8.437 lbs.; weight per sq. in. of piston area, 0.288.; length of connecting rod (centers), 360.0 mm. (14.17 in.); ratio, connecting rod/crank throw, 3.6:1; inertia lbs./sq. in. piston area: Top center, 80.7 lbs. sq. in.; bottom center, 45.7 lbs. sq. in.; mean, 31.6 lbs. sq. in.; weight of rotating mass of connecting rod, 6.75 lbs.; total centrifugal pressure, 1,480 lbs.; centrifugal pressure, lbs./sq. in. piston area, 50.7 lbs. sq. in.; mean average fluid pressure, including compression, 44 lbs. sq. in.; mean average loading on crankpin bearing, total from all sources in terms of lbs./sq. in. piston area, 115.7 lbs. sq. in.: diameter of crankpin, 70.0 mm. (2.75 in.); rubbing velocity, 16.8 ft. per sec.; effective projected area of big-end bearing, 53.9

20. Parts of carburetor. 21. Bottom half of crankcase, showing oil cooler. 22. Sketch of oil cooler. 23. View of sectioned oil pump



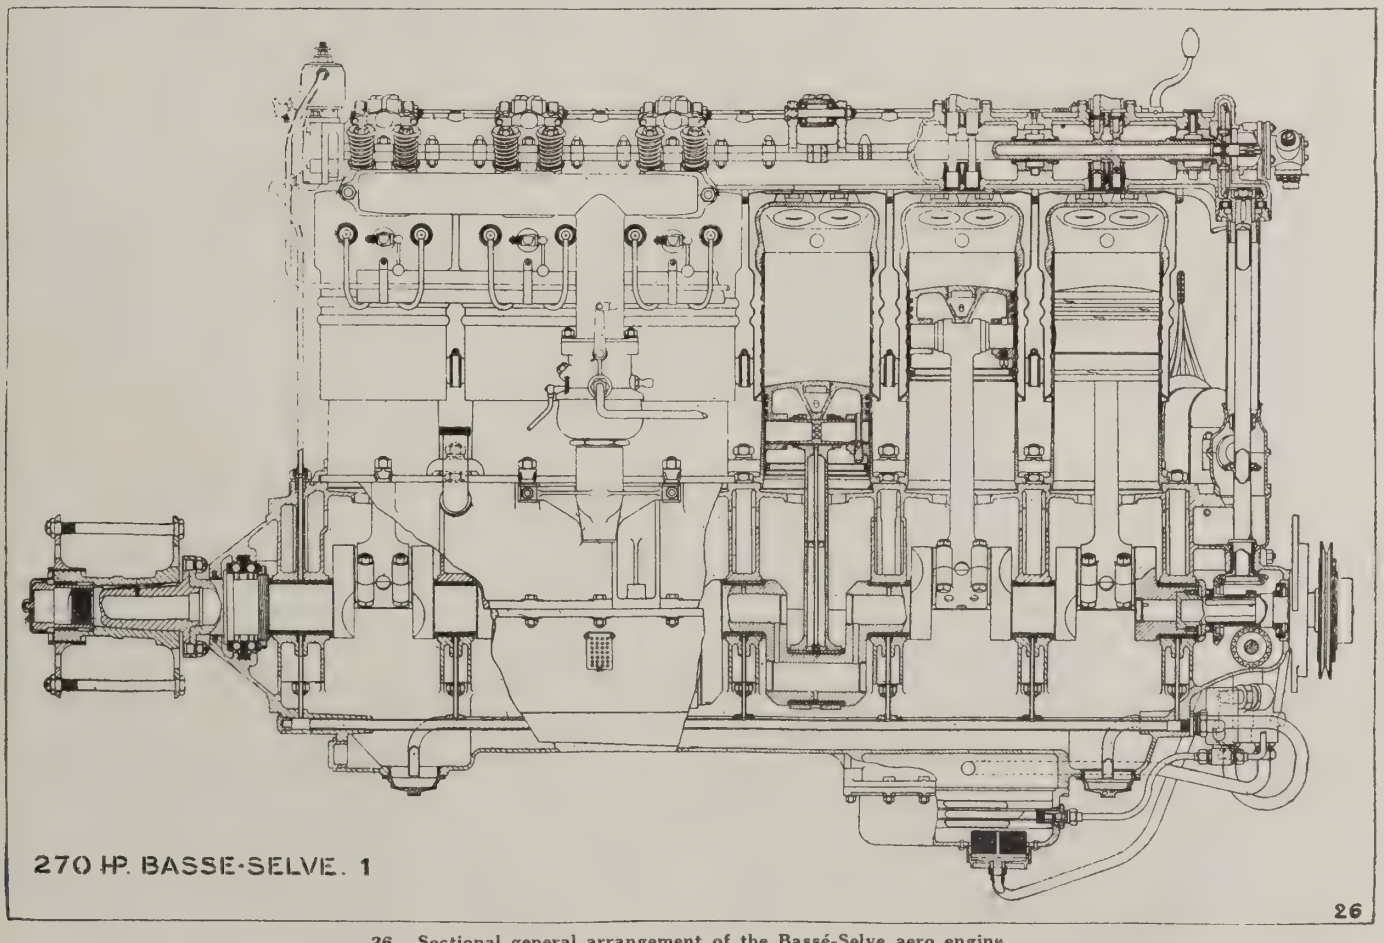
sq. cm. (8.35 sq. in.); ratio, piston area/projected area of big-end bearing, 3.50:1; mean average loading on big-end bearing, 405 lbs. sq. in.; load factor on big-end bearing, 6,800 lbs. ft.-sec.

Cylinders.—Depth of spigot at base of cylinder, 8.0 mm. (0.31 in.); thickness of flange at base of cylinder, 10.0 mm. (0.39 in.); number of holding-down studs per cylinder, six; diameter of holding-down studs, four of 16.0 mm., two of 14.0 mm.; thickness of water-jacket, 1.0 mm. (0.039 in.); mean thickness of combustion chamber wall, 7.0 mm. (0.27 in.); mean thickness of cylinder barrel, 3.0 mm. (0.118 in.). .. ..

Piston.—Types of piston, aluminium (convex crown); diameter of top, 154.5 mm. (6.08 in.); diameter of bottom, 154.75 mm. (6.09 in.); length, 130.0 mm. (5.11 in.); ratio, piston length/cylinder bore, 0.838:1; number of rings per piston, four; position of rings, three above pin, one below; width of rings, 6.0 mm. (0.23 in.); type of joint in rings, stepped.

Connecting Rod.—Length between centers, 360 mm. (14.17 in.); ratio, connecting/crank throw, 3.6:1; little-end bearing, type, phosphor bronze; little-end bearing, diameter, 35.0 mm. (1.37 in.); little-end bearing, length, 80.0 mm. (3.14 in.); little-end bearing, projected area, 28.0 sq. cm. (4.34 sq. in.); ratio, piston area/projected area of little-end bearing, 6.74:1; big-end bearing, type, bronze shell lined white metal; big-end bearing, diameter, 70.0 mm. (2.75 in.); big-end bearing, length effective). 77.0 mm. (3.03 in.); big-end bearing, projected area, 53.9 sq. cm. (8.35 sq. in.); ratio, piston area/projected area of big-end bearing, 3.50:1; number of big-end bolts, four; full diameter of bolts, 12.0 mm. (0.47 in.); total cross-sectional area bottom of threads (0.460 sq. in.); pitch of threads, 1.75 mm.; weight of big-end cap, with two bolts and bearing shell, 2.562 lbs.; total load on bolts at 1,400 r.p.m., 3,460 lbs.; total load on bolts at 1,600 r.p.m., 4,530 lbs.; stress per sq. in. at 1,400 r.p.m., 7,500 lbs. sq. in.; stress per sq. in. at 1,600 r.p.m., 9,850 lbs. sq. in.

Crankshaft.—Number and type of main bearings, seven bronze shell lined white metal; cylinder centers, 210.0 mm. (8.26 in.). Crankpins: Outside diameter, 70.0 mm. (2.75 in.); inside diameter, 40.0 mm. (1.57 in.); length, 85.0 mm. (3.34 in.). Journals: Outside diameter, 70.0 mm. (2.75 in.); inside diameter, 40.0 mm. (1.57 in.); length (propeller end), 60.0 mm. (2.36 in.); length (rear end), 90.0 mm. (3.74 m.); length (intermediate), 63.0 mm. (2.48 in.). Webs: Width, 84.0 mm. (3.30 in.); thickness (front one), 37.0 mm. (1.45 in.); thickness (others), 31.0 mm. (1.22 in.). Radius at ends of crankpins and journals, 4.0 mm. (0.158 in.); weight of complete shaft, 138.5 lbs.; length of complete shaft, 820 mm. (38.28 in.).



25. Lubrication diagram

Ignition.—Number and type of magnetos, two, Bosch Z.H.6; firing sequence of engines prop. 1, 5, 3, 6, 2, 4; number of plugs per cylinder, two; type of plugs, Bosch three-point; ratio, magneto speed/engine speed, 1.5:1.

Lubrication.—Number and type of oil pumps, one, duplex (double-acting); bore, 45.0 mm. (1.77 in.); stroke, 12.0 mm. (0.47 in.).

Recent Naval Orders

Lieutenant (junior grade) Arthur P. Teulon, to duty Navy Air Station, Key West, Fla.

Lieutenant (junior grade) Louis A. Peterson, to duty Navy Air Station, Hampton Roads, Va.

Lieutenant (junior grade) Clarence A. Hawkins, to Brunswick, Ga., Naval Air Station, for duty.

Lieutenant (junior grade) A. S. Williams, to duty Navy Air Station, Key West, Fla.

Lieutenant (junior grade) A. W. Hawkins, to duty Naval Air Station, Rockaway Beach, L. I., New York.

Lieutenant Commander Victor D. Herbster, to Queenstown for duty as commander Air Station, Ireland.

Demobilization of Air Service Personnel Overseas Increasing

During the two weeks from February 27 to March 13 the strength of the Air Service overseas decreased 5,140 men against 4,440 during the previous four weeks. The strength of the Air Service in the United States and overseas is shown for various dates in the following diagram:

	In U. S.	Overseas
Nov. 11	111,846	78,786
Dec. 2	115,216	78,061
Dec. 26	99,010	59,917
Jan. 30	46,919	57,527
Feb. 27	33,649	53,087
Mar. 6	33,068	50,763
Mar. 13	33,331	47,947

Progress in Demobilization

According to reports received from the Air Service the net decrease in the total commissioned and enlisted strength from the date of the armistice to March 13 was 57 per cent.

The following table shows the distribution and per cent. of net decrease to March 13. The strength figures include only officers and men not yet ordered discharged; they do not include men at demobilization camps awaiting discharge.

	Nov. 11	Mar. 13	Per cent net decrease
Cadets	5,775	1,187	79
Officers	20,586	7,631	63
Enlisted men	164,266	72,460	56
Total	190,527	81,278	57

Officers for Air Service May Be Drawn from Infantry and Artillery

War Department circular No. 148 recently made public outlines of the plans of the War Department with reference to the retention in the service of officers who expressed their desire to remain in the permanent establishment. Such officers are particularly urged to reconsider their decision, particularly those who are fitted only for staff duty. This includes officers of the Air Service. The circular states that the present system of filling vacancies in the staff corps by temporary details from the line officers—that is, Cavalry, Field Artillery, Coast Artillery, Infantry, Engineers or Medical Department—may or may not be continued.

The War Department authorizes publication of the following circular:

Circular No. 148.

War Department,
Washington, March 27, 1919.

Information as to Retention in the Service of Officers Placed in Class Three

1. At the beginning of demobilization instructions were issued dividing emergency officers into classes according to their desires and suitability for future service. Officers of the third class were those officers desiring and found qualified for future appointment in the Regular Army, should legislation provide an increase in the permanent establishment. This is to be the last class of officers discharged. Subsequently boards of officers were convened wherever possible to determine the suitability of class three emergency officers for retention with a view to appointment in the permanent establishment. . . .

4. As no legislation concerning the permanent establishment has been enacted, and as there appears to be no prospect of any such legislation in the immediate future, many matters pertaining to the future appointment of class three officers in the permanent establishment are still in doubt. The election of an officer to remain in class three is a matter of considerable importance to the individual and each officer is advised to consider fully the following matters in arriving at his decision whether to continue as a class three officer or request reclassification with a view to discharge when his services can be spared:

(a) In the classification of an officer there is no promise expressed or implied that he will receive a future appointment in the permanent establishment. It is the hope of the War Department that such officers will be made a preferred class in filling such vacancies, if any, as future legislation may provide.

(b) The appointment of such officers in the permanent establishment must be subject to their eligibility under such legislation as may hereafter be enacted. Examinations for appointment in the past have been academic as well as practical in order to establish the ability of the appointee to meet the requirements of the military service in the matter of professional education and improvement.

(c) The present system of commissioning all officers in the Cavalry, Field Artillery, Coast Artillery, Infantry, Engineers or Medical Department and the filling of vacancies in other staff corps by a temporary detail from time to time of officers of the above branches (Medical Department excepted) may or may not be continued. An officer who has been found suitable for appointment in one of the above branches or for appointment in either one of the above branches or a staff corps has therefore a much greater chance of appointment than an officer who has been found suitable for appointment in the staff corps only.

(d) In the absence of legislation should the number of class three officers in service become in excess of the number required for duty, the discharge of surplus class three officers will in the interests of economy become necessary. Should such officers be discharged, their applications if they so desire will be retained on file for consideration should future legislation provide vacancies to be filled in the permanent establishment.

(e) During the emergency officers have, in general, been advanced to grades above those which they could expect to hold under normal conditions and a general reduction in grade of class three officers upon entering the permanent establishment therefore appears probable. Regulations governing the grade to which officers are to be appointed and their realtive rank in such grade have not been and cannot be formulated until legislation authorizing appointments is enacted. While due credit will be given for service rendered during the war, officers cannot expect to retain the grades attained by them under war conditions. . . .

PEYTON C. MARCH,
General, Chief of Staff.

Official:
J. T. KERR,
Adjutant General.

Lieut. Manning, U. S. M. C., one of the judges, congratulating Lieut. Benjamin Reisweber on winning the stunt flying contest at the Miami Mid-Winter Regatta

Brig. Gen. Wm. Mitchell Decorated

Washington, D. C.—Brigidier General William Mitchell, chief of operations, United States Air Service, has been awarded the decoration of Companion, of the British Order of St. Michael and St. George. This is the fourth decoration awarded General Mitchell. He has received a Croix de Guerre, with a star and two palms designating subsequent citations, the decoration of Commander of the Legion of Honor, and the American Distinguished Service Cross.

The decoration was presented to General Mitchell by Lord Reading, British Ambassador to the United States at Washington. At the same time Lord Reading presented General March with the Knight's Grand Cross of this order.

Distinguished Service Medal for Officers and Civilians Who Aided Aeronautic Development

Colonel James G. Steese, Corps of Engineers, U. S. Army. For exceptionally meritorious and conspicuous service. As Assistant to the Chief of Engineers and in charge of the personnel, equipment, construction and maps divisions of the Office of the Chief of Engineers he displayed exceptional ability in handling commissioned personnel matters and developed special apparatus and methods for the production of aerial navigation maps. Since September, 1918, the solution of the many difficult problems in the organization and operation of the Personnel Branch, General Staff, has been due largely to his special knowledge of personnel matters, his untiring zeal, good judgment and administrative ability.

Brigadier General Charles McK. Saltzman, U. S. Army. For exceptionally meritorious and conspicuous service. While assigned to duty in the Air Service, he voluntarily undertook and successfully accomplished the difficult task in the face of many obstacles of preparing an organization for the procurement and supply of the Signal Corps equipment.

Mr. Frank B. Jewett, late Lieutenant Colonel, Signal Corps. For exceptionally meritorious and conspicuous service in connection with the development of the radio telephone and the development and production of other technical apparatus for the Army.

2nd Anti-Aircraft Battalion Cited

Washington, D. C.—A letter from the Chief of the Anti-Aircraft Service, A. E. F., reveals the record of the 2nd Anti-Aircraft Machine Gun Battalion as having downed 17 enemy aeroplanes in one and a half months. The letter is as follows:

"Headquarters, Anti-Aircraft Service, First Army, A. E. F.
"16th January, 1919.

"From: Commanding Officer.
"To: C. O., 2nd Anti-Aircraft Machine Gun Battalion.
"Subject: Service in Meuse-Argonne Offensive.

"This is to bear witness to the valuable service performed by the 2nd Anti-Aircraft Machine Gun Battalion during the trying times of the Meuse-Argonne offensive. The units of this command, scattered along the front of three American corps attacking the strong German lines, many times found themselves in the very front lines and always conducted themselves, during their comparatively long period of front line work under frequent shell fire, in a most creditable manner.

"The record of seventeen enemy aeroplanes shot down by the battalion in the average period of one and a half months has not been equalled by any other organization, American or Allied, so far as the writer has been able to determine.

"Words of praise from any one cannot add to the record, which is an ineradicable evidence of faithful devotion to duty on the part of every member of the command.

"This letter will be read to each organization at its next formation after its receipt and a true copy should be furnished to all who desire one.

(Signed) "R. W. COLLINS,
"Colonel Coast Artillery Corps,
"Chief Anti-Aircraft Service,
"First Army, A. E. F."

Air Service Wants Men

In a statement issued from the office of the Air Service Officer, Headquarters, Eastern Department, U. S. Army, at 105 Broad Street, an appeal is made for recruits. The statement, signed by Major J. McClintock, U. S. A., declares that if flying is to continue in the American Army men now experienced in that branch of the service must re-enlist. Under the reorganization plans of Major General Charles T. Menoher, head of the Air Service, authority has been granted by the General Staff to enlist 15,000 men.

"At the present time," says the Air Service statement, "enlisted men constituting the Air Service forces are men who have been in for the period of the war, and most of them desire to sever their connection with the army. It is thought that from among this number who desire to get out of the service, if the proper inducements that the Air Service is able to give were presented to them in the right light, they could be induced to stay in for a period of one year.

"It is possible at this time for these men to take their discharge, receive the $60 that is allowed each discharged man, re-enlist in the Air Service for one year, then to be given one month's furlough, and in most cases it will be perfectly possible for that man to retain the non-commissioned grade that he has attained, and upon his re-enlistment, in addition to the $60 allowed each discharged man, be allowed five cents per mile to his home. Inasmuch as he can obtain a one-cent-a-mile rate when going on a furlough, and return to his proper station, he can save from this amount a certain nominal sum.

"For men who have had service in the Army it is believed that that is a decided advantage for the period of one year enlistment or until labor conditions have become more stable, at which time they can expect more positive market for their service in civilian life."

FOREIGN NEWS

French Assist in Development of Japanese Air Service

Tokyo.—Seventeen officers and twenty men of the French air forces, headed by Colonel Faure, have arrived in Japan to supervise the reorganization of the Japanese air service. The mission comes in fulfillment of a promise made by the French government to the Japanese war ministry during the war that such assistance would be given as soon as possible after the cessation of hostilities.

The French government is sending one hundred aeroplanes to Japan to be used in the reorganization work. It is expected that the visiting aviators will be here three months. They have been given a very hearty reception by Japanese officials, and French flags are crossed with Rising Suns throughout Tokyo in their honor.

The officers are all veterans of the air, and each wears several decorations and ribbons indicating his service for France and for the Allies. One of the members of the mission, Lieut. Georges Richardson, fought with the United States marines last year, having been assigned to duty as a liaison officer. Commandant Lefevre, who downed a Zeppelin on its return from a bombing expedition to London, is a member. Some of the officers have seen service on all battle fronts.

King Albert Flies from Brussels to Paris

Paris.—Albert, King of the Belgians, who arrived in Paris from Brussels by aeroplane, came, according to the *Intransigeant*, to plead the cause of Brussels as the seat of the League of Nations.

King Albert reached an aviation camp near Paris soon after noon.

London to Paris in Eighty Minutes

London.—A new air record between London and Paris was established on March 28th when a De Haviland machine of the official communication squadron, used by the Peace Conference delegates, flew the two hundred and fifty miles in eighty minutes.

740 Cross-Channel Passengers Carried Without Accident

In connection with the cross-channel ferry service, it was learned that 740 officials had been carried to and from the Peace Conference without accident.

Five Passengers Climb 20,340 Feet in Goliath Plane

Paris.—A Goliath aeroplane, carrying five passengers, has reached an altitude of 6,200 metres (about four miles). The climbing occupied one hour and fifteen minutes and set a new record by several hundred metres for this kind of flight.

British "Mystery" Plane Described

It is stated that plans for the new mystery aircraft to which Major-General Seely referred in the House of Commons last week have already been drafted, and experiments have begun. The Government is not building the new type; that is being left to a private firm in co-operation with the Air Ministry. It will be a tailless machine, a square in appearance, with two planes in front and two planes of the same dimensions behind. These planes are connected fore and aft by lattice frames, below which are swung enclosed Pullman cars for passengers and crew. Two, three, or possibly more cars will be carried between the front and rear planes. In the machine with three cars the crew will occupy the center one, the two on either side being left for passengrs or cargo. Rudders will be on the upper rear plane. The possibilities of the new type are considered to be such that a machine could be engined up to almost any power. A speed of 200 miles an hour would easily be attained. It is believed that the new machine can be made so stable in the air as almost to fly itself. When coming to earth it will be able to "pancake" down almost vertically and quite slowly.

French Government Aids Aircraft Industry

With a view to stimulating activity among French aeroplane constructors, the Military Aeronautic Department is organizing an exhibition of commercial aeroplanes, seaplanes, and airships.

Dutch Will Hold Aero Exposition at Amsterdam

The first Dutch exhibition devoted to aerial traffic is to be held at Amsterdam from July 5th to July 28th. The honorary president is M. Colyn, Senator and Ex-Minister of War. Great Britain and France will be represented at the exhibition, and efforts will be made to arrange an aerial service from Amsterdam to London.

Honolulu to Hilo Service Started

Honolulu.—An army aeroplane carried four persons from Honolulu to Hilo recently, the first successful trip. They averaged a mile a minute, and returned the same afternoon.

Pershing Awards D. S. M. to Allied Aeronautical Officers

Chaumont, France.—General Pershing has awarded the Distinguished Service Medal to the following officers in the Allied Military Services for their work in connection with the Air Service:

Major D. V. G. Blake, C. O. 3rd Squadron, Australian Flying Corps.

Major C. G. Boyce, Attached as Staff Officer, Units of R. A. F., serving with 2nd U. S. Army Corps.

Major Filippo Molteni, Chief of Paris Section, Italian Foreign Military Aeronautical Mission.

Lieutenant Colonel B. R. Peal, in charge British Aviation Office at Paris.

Lieutenant Colonel P. H. L. Playfair, C. O., 13th Wing, R. A. F.

Major General Sir Hugh Montague Trenchard, K. C. B., D. S. O., Chief of Air Staff.

Norway Arranging an Aeronautical Exposition

An international aeronautic exposition is being arranged in Norway to be held next summer at Kjell. Prominent French and British aeronautical houses have been invited to exhibit their planes.

Australians Have Mapped Route to London; Flight for July

A Melbourne telegram says that with reference to the London Aerial League's request for Commonwealth co-operation in the flight to Australia, Lloyd cabled on January 9th, stating that his Australian company has a complete charting of Australian landing places. In July they will carry out at their own expense an experimental flight from Sydney to London.

Lloyd expects the Federal Government to recognize his claim to priority before subsidizing English private enterprise.

British Government to Settle Inventors' Claims

King George has approved the following appointments as members of a Royal Commission to determine what awards and royalties shall be paid to inventors in respect of the use of their inventions by Government Departments during the war: Mr. Justice Sargant, chairman; Halford J. Mackinder, Esq., M.P.; Robert Young, Esq., M.P.; Professor the Hon. R. J. Strutt, F.R.S.; Sir James J. Dobbie, F.R.S.; W. Temple Franks, Esq., C.B.; G. L. Barstow, Esq., C.B.; A. C. Cole, Esq.

Contest for Touring Planes in Italy

The National Aerial League of Milan is organizing a competition for small aeroplanes to carry light loads, specially designed for aerial touring, to be held in July at Taliedo.

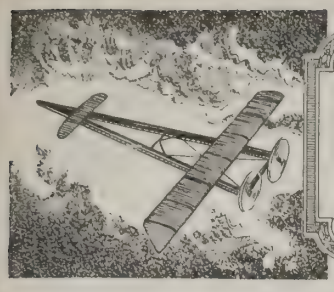
Canada's First Air Squadron

An interesting statement was made at a meeting of the Liverpool branch of the Overseas Club, which was held at the Adelphi Hotel, by Mr. F. R. Jones, on the eve of his departure to Canada as the club's special commissioner. Apart from its other functions, said Mr. Jones, the club had been instrumental in raising £300,000 for the purchase of 172 aeroplanes, and the Canadian Club had provided the British Government with seven aeroplanes during the war. The Government has now promised to return to Canada seven aeroplanes, and, in addition, to make her a gift of eight other machines. Apart from this, Captain Simpson had given £1,500 for the purchase of one machine, which would be added to the others. These sixteen machines will be flown to Canada and will form the first air squadron of the Canadian Air Forces.

3,965 "Scrapped" Since the Armistice by Royal Air Force

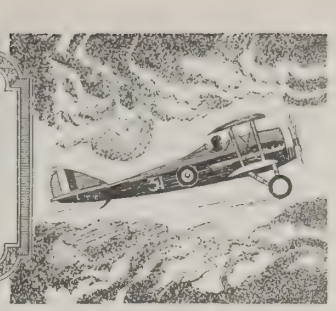
General Seely, in written answers to Mr. Joynson-Hicks, states that the number of aeroplanes on charge at the date of the Armistice was 20,850, and the number of seaplanes was 1,248. Since then and up to the date of the last return 2,142 obsolete machines have been reduced to produce and in addition 1,823 machines of standard types which have been damaged and were not repairable have also been reduced. These figures include 2,460 which were reduced to produce in England. The disposal of aircraft surplus requirements is undertaken by the Ministry of Munitions.

Twelve machines of obsolete type were burned in France after removal of the engines and instruments. They had been damaged in landing at places where there were no facilities for reducing them to produce nor means for transporting them elsewhere, nor was there any possibility of selling them. There is no information regarding the use of petrol to assist in burning them.



It is stated that a large number of new and second-hand R.A.F. aeroplanes, seaplanes, and flying boats are to be sold by the Aircraft Department, Ministry of Munitions, York House, Kingsway.

A French Caudron training plane



British Aircraft Insurance Profit of Ten Millions

Mr. Bridgeman, in a written reply to Mr. Kennedy Jones, who asked the Chancellor of the Exchequer if he would state what surplus moneys resulting from aircraft insurance were in the hands of the various insurance companies who, on behalf of the Government, effected aircraft insurance, and what were the intentions of the Government respecting such surplus, said: "The moneys resulting from aircraft insurance in the hands of the various insurance companies who, on behalf of the Government, effected aircraft insurance, are purely nominal, as they have been regularly paid over to the Government in monthly accounts in accordance with agreement. The excess of premium over payments, which amounts to over ten millions, has, of course, gone into the National Exchequer."

A Ford Motor Rebuilt for Aeroplane Work

THE accompanying photos show a very neat piece of work in the form of a Ford motor for an aeroplane.

This motor was built by Mr. P. P. Belt, proprietor of Belt's Garage, of Fredonia, Kansas, and is to be used in the Ford motored aeroplane, which was recently described in these columns.

Mr. Belt built the motor according to the drawings furnished by the author, with an addition of a few very ingenious ideas of his own.

He has built many machines for his own enjoyment, pictures of one of his latest appearing in these columns recently, along with a Ford motor having a gear and sprocket reduction, which Mr. Belt used in a Curtiss pusher type.

In summing up Mr. Belt says: I am enclosing two photos of my latest development in the reconstruction of a Ford motor as an aeroplane power plant. Photo No. 1 shows the water circulating pump connected to the end of the camshaft, as well as the magneto fastened directly to the end of the crankshaft. The magneto base is welded to the crankcase, as shown. The oil pump gears can also be seen in the front of the engine just behind the propeller hub extension. The oil pump itself can be seen plainly in photo No. 2, as well as the bevel gear drive fastened to the end of the camshaft, and it is bracketed to the end of the crankcase.

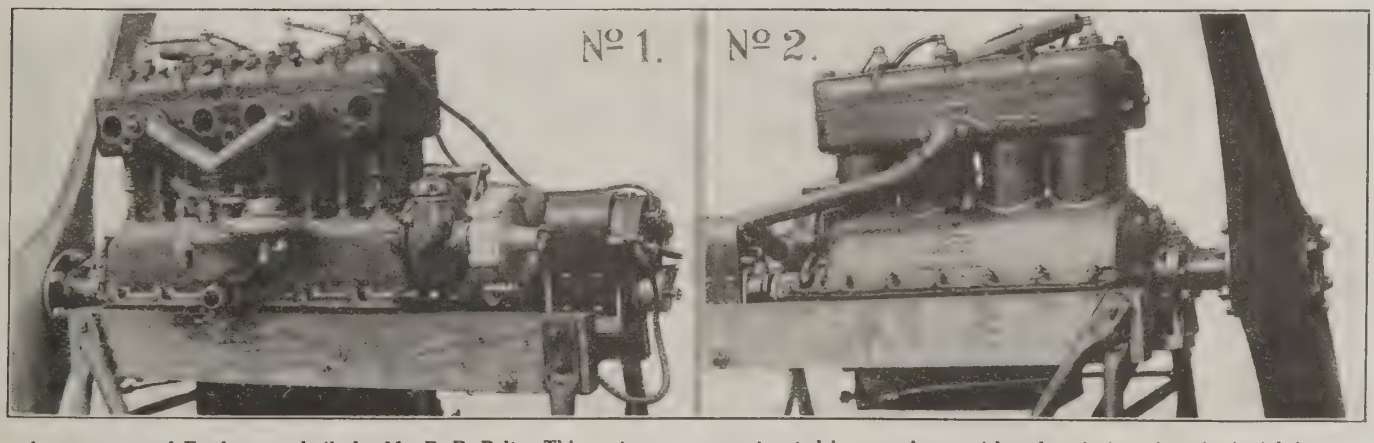
The oil pan is brazed to the crankcase lower half and fitted with a light oil gauge. The cylinder head is planed down on the lower side that fastens to the cylinder block 3/16 of an inch, which increases the compression, makes the engine snappy and materially increases the power. The top of the cylinder head is planed as well, and a flat steel plate 3/32 inch thick is brazed to it. The cylinder head when finished weighs only 21 pounds.

All the intake and exhaust ports are enlarged as well as the valve seats and the valves. This allows free suction and exhaust of new and burnt gas. The standard Ford camshaft and timing is still used, as better results have been accomplished than when the motor was timed earlier or later.

The motor is bolted onto a testing stand which has 4 inch wood wheels to allow free movement forward when testing and permits a scale to be fitted between the stand and a fixed object so as to be able to correctly determine the correct thrust at all times. The analytical method of figuring thrust is by no means as accurate as the stand and scale method which Mr. Belt employs.

The motor was tested with a 6 foot diameter 4½ foot pitch propeller of his own make. Running at only 1,500 R.P.M., it gave a maximum of 250 and a minimum of 191 pounds thrust, which is considerable more than is needed to fly the Ford motored aeroplane recently described in this column. This performance checks out very nearly with figures that the writer has computed for a motor of his own.

This motor developing 250 pounds thrust on the scale would pull the Ford aeroplane which I described at a speed of between 70 and 75 M.P.H. The thrust developed would indicate that this motor is developing between 35 and 40 horse power, which is quite high.



Mr. Belt promises to send photos of his machine when finished and also in flight.

New Club Organized

Mr. E. A. Jenkins, No. 1141 Bushwick Ave., Brooklyn, N. Y., who was recently membership secretary of the Correspondence Model Aero Club, until that club's disbandment, sends me notice that the old members of the Correspondence Model Club have organized a new one to be known as the Universal Model Aero Club.

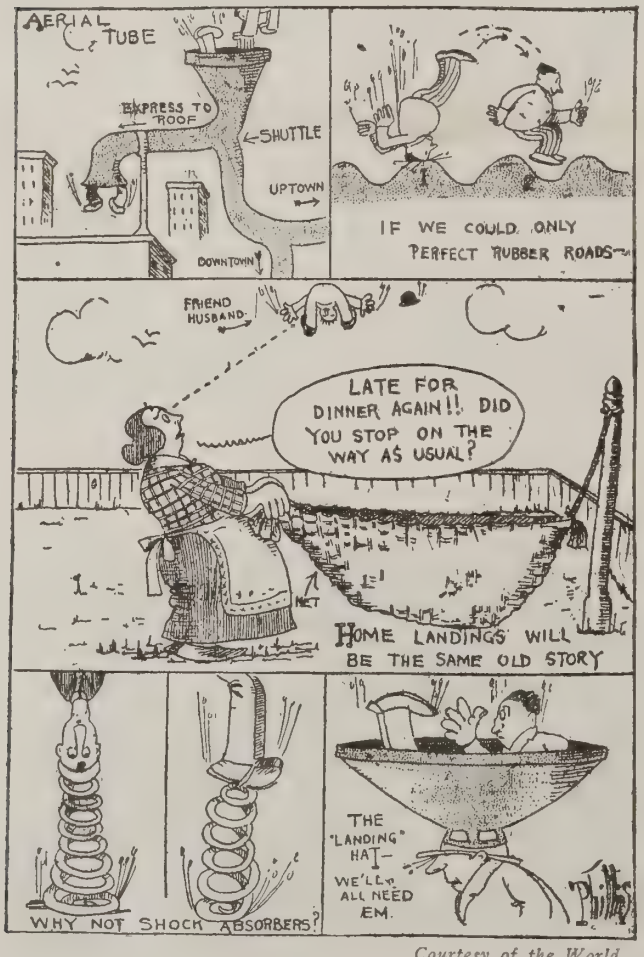
The officers are as follows: President, Archibald D. Wellborn, Dallas, Texas; 1st Vice-President, Thomas F. Stanton, Babylon, N. Y.; 2nd Vice-President, Carl Fastje, Denison, Iowa; Secretary, Donald P. Simpson, Seattle, Wash.; Membership Secretary, Edwin A. Jenkins, No. 1141 Bushwick Ave., Brooklyn, N. Y. Canadian Representative, A. F. Adams, Montreal, Canada.

New members are wanted, and those wishing to join are referred to the membership secretary.

A reconstructed Ford motor built by Mr. P. P. Belt. This motor was reconstructed in accordance with a description given in Aerial Age

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

The Pilot



O little man, O great big wings,
O worlds that made a thousand things,
O cloudless skies, and vaulting blue,
Their wings of flight for you,—for you.

To soar to yonder heights and see
Thine own soul stretch to eternity;
Thy thoughts go on with white, white wings.
To worlds that say a thousand things.

Lift up your soul, O man of power;
Fling wide the portals; and guarded hour
High up, up, up, to heaven youth sings,
Transcending in beauty thy white, white wings.

January 12, 1919. R. V. W.

There's one happy thought about that air train service predicted by Dr. Alexander Graham Bell—it will not be delayed by cows on the track, washouts, snowslides or worn-out trackage.

Aeroplane Landing Places

Owed to the Ships

(With apologies to R. K.)

I've flown my ships where I've found 'em,
And I've handled some wrecks in my time,
For some of those Kites were awful,
And a few that I've had were prime.
One was a streamlined spider,
And one with two eighty Le Rhones,
And one called a flaming coffin,
But it always carried me home.

Now, I ain't no judge of Coo Cooes,
For, takin' them all along,
You never can tell till you've tried 'em,
And some day you'll try one that's wrong.
There's times when I hoped to outrun 'em,
And there's times when I thought all was lost.
But the things that I've learned from the Fokkers
Have helped me a lot with a Pfalz.

When I first landed at Tours,
Anxious as —— to begin,
I met a G. 3. and a Frenchman—
To call it a ship was a sin.
Older than me, but my first one,
Anzani motored she were;
You carried her tail on the joy-stick,
But I learned about flying from her.

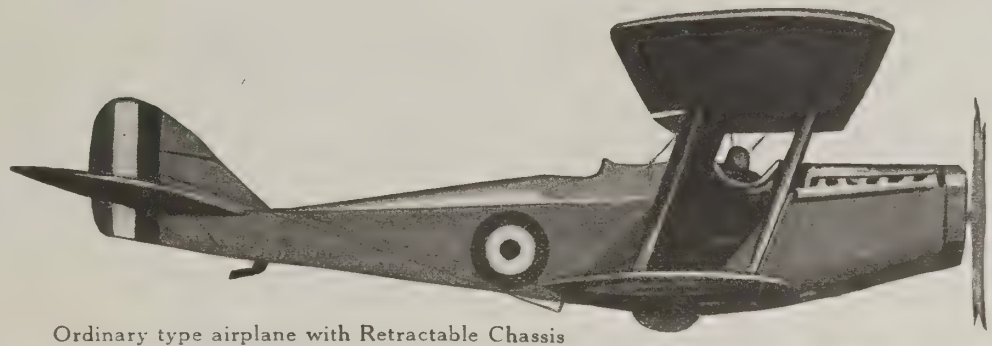
Then I went on the Nieuports,
At Issoudun, 3rd A. I. C.,
To fight the cheval on the take-off,
And to try to land on the "T."
There were doubles, and singles, and eighteens,
And the baby fifteen—a gem—
And stunts most thrilling, promiscuously killing,
But I learned about flying from them.

Then in the course of events
I was put on the flexible Sop;
Built by the French for the Russians,
Or built by a yegg for a cop.
Taught me the art of forced landings,
Slinging her oil with a whirr,
The motor would bust whene'er you took it on trust,
But I learned about flying from her.

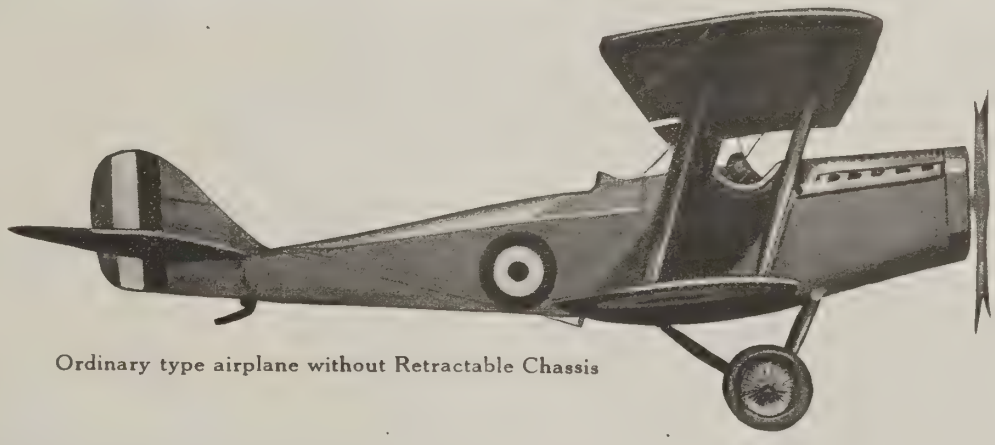
Then I went to the front in a coffin,
What's known as the D. H. 4.
And I ran from the Pfalz and the Fokkers
Till I don't want to fly any more.
Jerry had fire-balls and archies,
And Fokkers with Spandau guns;
And the things that he shot in our path were a lot,
But I learned how to fly from the Huns.

So I've taken my ships as I've found 'em,
And I've had my fair share of the fun;
But the more that I see of the Camels,
The more do I pity the Huns.
And the end of it's sittin' and thinkin',
And following the circle 'round.
So be warned by my tale, which I admit is some wail,
And fight your damned wars on the ground.

Lt. C. C. Seale, 135th Aero Squadron.



EVERY FIRST CLASS AEROPLANE REQUIRES A RETRACTABLE CHASSIS



Can you Imagine These Birds in a Race for Speed?

Or These Planes in a Speed Test?

Ordinary type airplane with Retractable Chassis

Ordinary type airplane without Retractable Chassis

The following is an extract from a report by Mr. L. V. Kerber on one of the latest U. S. Army airplane designs:

Effects of retracting the Chassis

Total Resistance of Extended Chassis	59.6#
Total Resistance of Retracted Chassis	11.0
Difference	48.6
At 100 miles per hour the structural resistance with chassis extended is 230# plus 48.6	278.6
By retracting the chassis the structural resistance is decreased $\frac{48.6\#}{278.6}$	17.4%
At 100 miles per hour the total resistance with chassis extended is 210 plus 278.6	488.6#
By retracting the chassis the total resistance is decreased $\frac{48.6\#}{488.6}$	10%
By retracting the chassis the maximum horizontal velocity is increased $\frac{145}{137} - 1$	6%

In order to meet both aerodynamical and practical demands the following patented features will be recognized as indispensable to any type of retractable chassis:

1—The chassis should be equally strong in spite of its retractable feature.
2—It should not weigh more including retracting mechanism than the ordinary chassis.
3—It should neither occupy useful space when retracted nor require an enlarged fuselage to house it.
4—It should be adapted in strength as an alighting device in any intermediate position between fully extended and fully retracted, both in case the pilot should make a hurried descent and in order to make available a ready means of varying the position of the chassis relative to the centre of gravity of the aeroplane.
5—It should automatically close the housing recesses so that the fuselage or wing skin forms a flush surface when chassis is retracted.
6—The gage and tread of the chassis should be independent of the width of the fuselage.
7—It should utilize the forces of flight, since they are always available, for power to retract and extend and such action should be entirely automatic when released by the pilot.

WALT MASON

of the

New York Evening Globe

You played YOUR part and did your share, —p'raps over here, p'raps over there—and hate like smoke to quit the game, and life somehow don't seem the same. You hung around the dear old ship and said "Good Bye" with quiv'ring lip and now it's back to bench or chair (Gosh, it WAS good, away UP THERE)—And now you're grouchy, sore and glum, and think the world's gone on the bum. Cheer up, old top, it ain't so bad, for there's good news to make you glad and comes from North, South, East and West,—of all good news it's far the best. BELLANCA'S 'BUS has shown how soon the flying game is timed to boom. Ere long the skies will tell the tale how sky-high enterprise can't fail, with YOU at work with work galore, all you can do and then some more. 'Twould take too long to tell it here, but just to prove the news sincere, just sit down NOW and write a line, address it "Number two nine nine" and say just what you'd like to do and see if wishes can't come true.

Chemical Analysis

The chemical compositions of the crankshaft and piston are as follows:

Crankshaft—	Per cent.
Carbon	0.48
Silicon	0.32
Sulphur	0.061
Phosphorus	0.016
Manganese	0.32
Nickel	2.59
Chromium	1.17
Vanadium	Nil
A 1 Piston—	
Silicon	0.45
Iron	1.06
Copper	1.90
Tin	Nil
Zinc	15.62
Manganese	Nil
Aluminium (by diff.)	80.97

Mechanical Tests

Mechanical tests on the crankshaft gave values stated below:

Mark.	A. Web. Longitudinal.	B. Web. Transverse.	C. Pin.
Diameter	.249 in.	.253 in.	.249 in.
Yield point, tons/sq. in.	44.6 in.	44.5 in.	46.3 in.
Ultimate stress, tons/sq. in.	55.5 in.	54.4 in.	56.4 in.
Elongation on 4 √A.	19.5%	12.8%	20.8%
Reduction of area	48%	24%	56%
Impact, ft. lbs.	28 / 25	26 / 25	41 / 41

(*Continued from page* 239)

Dunne at the Whitehead factory in England is another British entry. It is stated that this machine will have a capacity for fifty passengers.

The fifth British entry has been made by Major J. C. Wylie, pilot, and Captain C. C. Wylie, navigator. Major Wood purposes to use a special plane equipped with a 375-horsepower motor, capable of a speed of 95 miles an hour when carrying a weight of 2,632 pounds.

F. P. Raynham, a veteran aviator, is the sixth British entry. He will fly a machine designed for the trans-Atlantic flight by the Martinsyde Aeroplane Company, of England.

Sydney Pickles, an Australian aviator, also entered, states he has a machine faster than any of the others.

Both the French entries contemplate flying from Cape Dakar, Senegambia, Africa, to Pernambuco, Brazil, the shortest distance across the Atlantic. It can be made in three short flights—from Cape Dakar to Cape Verde Islands, 400 miles; from Cape Verde Islands to St. Paul Rocks, 900 miles, and from there to Pernambuco, 450 miles.

Lieutenant Fontan actually started on this flight March 18, but had to postpone it on account of a cracked cylinder. The other French entry is Captain Coli, who recently crossed the Mediterranean and made the return trip within 24 hours.

The Caproni Aeroplane Company of Italy is building a huge biplane for the trans-Atlantic flight, but no details have been made public nor has it been stated who is to be the pilot.

The Last Lap

(*Written exclusively for the* AERIAL AGE WEEKLY)

Emerging victoriously from the smoke of war, America slowly is advancing toward the peace and prosperity for which all men and women have been yearning. Dedicated to ideals consecrated by the sacrifices of her thousands of sons, she advances toward what should be a future of larger and finer development of national resources and energies.

The only obstacle in our path as we seek prosperity now is the cumulative war debt, consisting of bills owed for munitions, supplies, maintenance and transportation costs and other items for building up and later demobilizing our great military machine. The debt is a huge sum; to pay it the Victory Loan is to be flotaed by popular subscription. Carter Glass, Secretary of the Treasury, commenting on the outlook for its success, a few days ago said:

"Four Liberty Loans have gone over the top and nothing nor anybody can shake my faith in the purpose of the country to put the capstone to the splendid structure of national credit by making the Victory Loan an abundant success."

The faith proclaimed by Mr. Glass is echoed by opinions of veteran observers of American moods. There are alive in America to-day two factors which guarantee the success of this loan—the spirit of thanksgiving for our victory, and the earnest desire for the advent of an era of unhampered peace and prosperity.

Successful flotation of the Victory Loan means the Government will pay the war bills and money will circulate again in ordinary commercial channels. The tonic effect on business cannot be overestimated; we confidently can look forward to a tremendous revival of trade projects, provided we buy enough Victory Notes.

CLEVELAND

Contractors to the United States Government

(*Continued from page* 246)

serious enough to overbalance the other advantages of the exhaust turbine driven supercharger as compared with other types.

Of course, around the turbine rotor there is atmospheric pressure, whatever its value may be at any given altitude, and as the supercharged engine exhausts at a normal pressure of about 30 in. of Mercury, corresponding to a normal atmospheric pressure of about 15 lbs. per sq. in. at sea level, the expansion of the gases from this pressure to that of the atmosphere at any given altitude is sufficient to operate the turbine at high speed. Ordinarily, the turbine rotor speeds run up to 25,000 or 30,000 R.P.M. in these devices, due to this expansion. There is plenty of energy to take care of the needs of the device, as will be evident.

The rotating member of the compressor being on the same shaft as the turbine rotor, it is designed to draw in the rarefied atmosphere and compress it to normal ground level value —also approximately 15 lbs. per sq. in. This compressed air is sent direct to the carburetor or carburetors through the intake piping system.

Thus it will be seen that the engine gets its charge at sea level pressure and discharges at this pressure, and although this condition is artificially maintained regardless of the height (up to the limits of altitude for which the turbo-compressor is designed), the engine may be considered as being always operating in ignorance of the fact that it is not on the ground at or near sea level.

From this it will be seen that in order to maintain efficient operation, the induction piping system of the apparatus must be proof against air leakage. That is, there must be no chance for pressure escape between the carburetor air intake connections and the induction piping running from the air compressor. Similarly, the junction between this induction piping and the compressor casing proper must be air-tight. While maintaining air tight connections of this kind offers some difficulties under service conditions, this is not considered a very difficult matter, since special types of gaskets and connections have been and are being devised to take care of this point efficiently.

Experiments with this system indicate that of the energy of combustion, the engine and turbo-compressor utilize about 33 per cent., whereas approximately 45 per cent. is lost in the exhaust which finally escapes from the discharge ports of the turbine. The balance of the combustion energy is given up to the cooling water and is dissipated in other mechanical losses throughout the cycle.

When the United States entered the war, as has already been pointed out, the Allied countries had already done 2 or 3 years experimental work on various types of supercharging systems. Soon after our entry into the struggle, Mr. E. H. Sherbondy and Dr. Sanford A. Moss were requested by the government to take up the investigation and research and development work on supercharging for our own Air Service. Mr. Sherbondy brought to the work long experience in the design of internal combustion engines and in power-plant and turbine construction. Likewise, Dr. Moss, engineer for the General Electric Co., Lynn, Mass., has had a great deal of experience with exhaust turbines, carrying on such experimental work for his concern over a long period.

Both of these engineers worked primarily with the Rateau system, as already described, and although the same cycle of operations was followed in each case, as Rateau originated, their work is mechanically very little like that of Rateau. Dr. Moss and Mr. Sherbondy carried on their experimental work also entirely independently of one another, evolving units which have no mechanical similarity whatever. It was only after careful study of the various types of compressors, drives, etc., that they arrived at the centrifugal compressor-exhaust turbine system as presenting the greatest possibilities.

The designs of the machines and the results of the tests of the Moss and Sherbondy devices offer an interesting series of experimental and engineering records, and although up to the time of the signing of the armistice the machines had not been developed to the stage where there were ready for flight testing, the various difficulties incident to any new development work were so far toward practical solution that if the war impetus had been maintained, it is probable that we should have seen American supercharging systems in the air this spring or summer.

VOL. IX NEW YORK, APRIL 21, 1919 NO. 6

BOSTON "GLOBE," CLEVELAND "PLAIN DEALER," AND ATLANTA "JOURNAL" OFFER TROPHIES AND $3,500 CASH PRIZES FOR COMPETITION IN MAY

President Wilson May Attend Atlantic City Convention

THREE other leading American newspapers, the Boston *Globe*, the Cleveland *Plain Dealer* and the Atlanta *Journal*, have joined the New York *World* and the St. Louis *Post-Despatch* and have offered trophies and cash prizes for competition at Atlantic City during the Second Pan-American Aeronautic Convention and Exposition which will last from May first to June first.

The Boston *Globe* and Cleveland *Plain Dealer* decided to offer a trophy and $1,750 in cash prizes each for a competition to be open to Army, Navy, Marine Corps and civilian aviators. The cash prize of $1,000 and the trophies are to go to the aviators who make the best time in flying from Atlantic City to Boston or vice versa, and from Cleveland to Atlantic City, or Atlantic City to Cleveland, during the month of May. The aviators making the second and third best records will receive the second prize of $500 and the third prize of $250, respectively.

This makes a total of nine trophies that have been offered for competition at Atlantic City in the month of May, as follows:

(1) The Curtiss Marine Flying Trophy and $1,000 cash prize;

(2) The Pulitzer Trophy, to be awarded to the aviator who makes the best record in flying from anywhere to Atlantic City, and from Atlantic City to anywhere during the month of May;

(3) The Boston Globe Trophy and $1,750 cash prizes to be awarded as follows: $1,000 and the trophy to the aviator who makes the best record in flying from Atlantic City to Boston, or from Boston to Atlantic City, during the month of May; $500 and $250 to the aviators who make the second and third best records, respectively.

(4) The Cleveland Plain Dealer Trophy and $1,750 cash prizes, to be awarded as follows: $1,000 and the trophy to the aviator who makes the best record flying from Atlantic City to Cleveland, or from Cleveland to Atlantic City, during the month of May; $500 and $250 to the aviators who make the best records, respectively.

(5) Colonel William A. Bishop's "Ace of Aces Trophy," to be awarded to the aviator who makes the best record in flying from Toronto to Atlantic City, or from Atlantic City to Toronto, during the month of May.

(6) $2,000 Intercollegiate Seaplane Speed Trophy, to be awarded to the college whose representative makes the best record in flying twenty times over a five-kilometer course at Atlantic City during the month of May.

(7) $2,000 Intercollegiate Aeroplane Trophy, to be awarded to the college whose representative makes the best record in flying twenty times over a five-kilometer course at Atlantic City during the month of May.

(8) The Intercollegiate Dirigible Trophy.

(9) The Intercollegiate Balloon Trophy.

All of these contests, except the intercollegiate, are open to Army, Navy, Marine Corps, intercollegiate and civilian aviators. The rules are similar, so that a competitor can compete for more than one trophy in one flight.

The intercollegiate contests are open to both graduates and undergraduates.

Besides the above there are the Valentine prizes, amounting to $10,000, awarded under the will of Mr. Samuel H. Valentine, late member of the Board of Governors of the Aero Club, also to be competed for at Atlantic City during the month of May.

A number of entries have already been received and it is expected that the total number of entries will be close to one hundred, including five Lafayette Escadrille aviators and numerous Army, Navy and Marine Corps aviators.

President Wilson May Attend Convention

President Wilson may attend the Aerial Races and Second Pan-American Aeronautic Convention to be held at Atlantic City from May first to June first, according to advice received by Mr. Augustus Post, the Secretary of the Joint Convention Committee of the Aero Club of America and the Aerial League of America.

The President has received invitations to attend several of the conventions to be held at Atlantic City during the month of May, including the Pan-American Aeronautic Convention and Exposition, which will last the entire month. It is understood that he will accept one of these invitations. As two other invitations were extended ahead of the Aeronautic Convention, the Aero Club and Aerial League authorities can only hope that their invitation may be accepted. But no matter which the President accepts, a special aerial contest will be held in his honor in which Army, Navy, Marine Corps, Aerial Police and collegiate aviators will participate in number.

Army Will Use Atlantic City Aviation Field

To facilitate the work of the Army, Navy, Marine Corps and Post Office Department aviators on the Atlantic Coast, the Aero Club of America, the Aerial League of America and the Atlantic City Aero Club have offered the use of the Atlantic City Aviation Field to these Government fliers. The Army has accepted the offer. General Charles T. Menoher's letter follows:

WAR DEPARTMENT
AIR SERVICE
Washington April 10, 1919

My dear Mr. Post:—

I beg to acknowledge receipt of your telegram of even date, extending the invitation of the Aero Club of America and the Aerial League of America to me and through me to the United States Air Service for the unlimited use of their official aviation field at Atlantic City. I desire to assure you that the courtesy thus extended is deeply appreciated. Permit me, on behalf of the United States Air Service, to express my sincere thanks for their kind offer and the spirit which prompted them to make it.

Co-operation and cordial feeling between the Aero Club of America and the Aerial League of America and the Air Service of the United States is a condition of affairs much to be sought, and should result in material advantage and benefit to the future of aviation in this country.

Again thanking you for your courtesy, I am

Sincerely yours,
(Signed) Charles T. Menoher,
Major General, U. S. Army.

This field, which is located only 2,000 feet from the Boardwalk, is ready for use now, but will be duly fenced and fully graded and have hangars within the coming two weeks. In the meantime, it can be used as it is.

This field covers approximately 160 acres and affords runways on two sides of a square of 3,000 feet each. It is surrounded on two sides of the square by water and flat land, without obstructions, making an ideal field in every way.

It affords landing facilities for landing aeroplanes and seaplanes.

Within two weeks it will be possible to supply Army and Navy aviators with gasoline, oil and other facilities.

No charge will be made for the use of the field, police protection, etc.

The field has a frontage of 3,400 feet on Albany Avenue and 2,500 feet on Southern Boulevard. The entrance is on Albany Avenue, only 2,000 feet from the Boardwalk and four minutes' auto ride from the railroad station.

A suitable clubhouse will be ready within a few days near the field, where Army and Navy aviators will find club facilities.

The field is also the municipal field of Atlantic City and the official field of the Aero Club of Atlantic City. There will be conducted on it important experiments in different lines of aeronautics, especially dealing with the application of aircraft for useful purposes.

Army and Navy May Permit Reserve Aviators to Compete

About two hundred reserve Military and Naval aviators who were demobilized during the past two months are eager to compete for the trophies and prizes offered and Mr. Alan R. Hawley, President of the Aero Club of America, telegraphed to the War and Navy Departments urging the Departments to supply the aeroplanes needed to permit these aviators to compete.

The War Department and the Navy Department have thousands of aeroplanes and motors which are not being used and which really constitute a problem to the authorities, who have to find ways and places to store them away.

Under the rules, these reserve aviators are to be given an opportunity to get flying training periodically. If they are permitted to use the machines which are idle they will get their training and the machines will be employed at this time when conditions are most propitious and the aviators can compete for the Pulitzer Trophy, the Boston Globe Trophy and $1,750 prizes, the Cleveland Plain Dealer Trophy and $1,750 prizes, the Colonel Bishop "Ace of Aces" Trophy, the $10,000 Samuel H. Valentine prizes and other trophies and prizes to be competed for at Atlantic City during the Second Pan-American Aeronautic Convention, which will be held from May first to June first.

The aeroplanes of which the Army and Navy have a great number are the De Haviland biplanes, equipped with a 400-h.p. Liberty motor, and the Curtiss seaplanes, equipped with one and two low-compression Liberty motors rated at about 340-h.p. The Army also has a lot of machines equipped with Hispano-Suiza motors.

In telegraphing to the Army and Navy authorities urging the loan of aeroplanes to reserve aviators, Mr. Hawley pointed out that the forthcoming aerial contests will greatly help the Liberty Loan and the recruiting of the 15,000 men needed by the Army Air Service.

Columbia Forms Aero Club to Buy Aeroplanes to Compete In Intercollegiate Events

A luncheon was given at the Aero Club of America April 12 by the newly formed Aero Club of Columbia University, of which Colonel Edwards is the Honorary President, for the purpose of discussing plans to enter the intercollegiate contests to be held during the SECOND PAN-AMERICAN AERONAUTIC CONVENTION AND EXHIBITION, to be held at Atlantic City during the month of May, and to compete for the Pulitzer Trophy and the Boston Globe Trophy, which have been offered for long-distance cross-country flying. It was decided to acquire a number of aeroplanes and to enter for all the events.

The meeting was addressed by Mr. Alan R. Hawley, President of the Aero Club of America; Mr. Henry Woodhouse, member of the Board of Governors of the Aero Club of America; Dean George B. Pegram and Lieut. Edward L. Smith of Columbia University; Major John M. Hauser, U.S.A.; Captain Granville A. Pollock, U.S.A.; Mr. A. Francis Arcier, Chief Designer of the Handley Page Company, England, and Augustus Post, Secretary of the Aero Club of America.

Among the members of the Aero Club of Columbia University present were the following officers and guests: Alan R. Hawley, President of the Aero Club of America; Dean George B. Pegram, Engineering Department of Columbia University; Lieut. Floyd Gahman, U.S.A.; Lieut. Bryan M. Battery, U.S.A.; Capt. Granville A. Pollock, U.S.A.; Major John M. Hauser, U.S.A.; Lieut. A. K. Doolittle, U.S.A.; Lieut. Arthur L. Tait, U.S.A.; Lieut. Aubrey R. Marrs, U.S.A.; Lieut. Guy Lennstrand, R.A.F., Secretary of Columbia Aero Club; Captain S. Herbert Mapes, U.S.A.; Lieut. Lee Britton Land, U.S.A.; Lieut. Campuzano; Major Thomas S. Baldwin, U.S.A.; Lieut. Edward L. Smith, U.S.A.; Dean H. W. Hawkes, of Columbia University; Mr. Henry Woodhouse; Mr. A. Francis Arcier, Chief Designer, Handley Page Co., England; Capt. O. J. Gangnier, R.A.F.; Capt. William Menkel, U.S.A.; Lieut. D. W. Lane; Lieut. James Finley Cavagnaro; Lieut. Malcolm G. Spooner, U.S.A.; Lieut. Rutledge G. Barry, U.S.A.; Augustus Post, Secretary of the Aero Club of America; Lieut. R. M. Craigmyle, R.A.F., Treasurer of the Columbia Aero Club.

FEDERAL JUDGE HOLDS THAT WAR HAS LEGALLY ENDED HERE

IN line with an informal statement from the bench on March 24th, Federal Judge Walter Evans, April 3rd at Louisville, Ky., handed down a decision finding that the war in Europe legally is at an end and that a plea for a new trial on conviction of violating war-time military regulations after the armistice was signed has standing in court.

Judge Evans based his decision upon an address by President Wilson before both Houses of Congress in joint session November 11, 1918, in which he said, referring to the defeat of Germany: "The war thus comes to an end." The President, said the court, had authority to make the pronouncement under that section of the Constitution which provides that he may from time to time go before Congress and give it information as to the state of the union.

This decision is most interesting to the aeronautic fraternity from many standpoints. It places the aeronautic movement on a peace time basis and brings to an end all the war restrictions.

The News of the Week

The Trans-Atlantic Flight

Despite the warning of the British Admiralty on April 13 that weather condition were "very unsatisfactory for an aerial crossing of the Atlantic and also are such that a forced landing on the sea would be attended by considerable risk," Harry Hawker announced after a test flight that he was going to start from Newfoundland as soon as conditions were in any way favorable. The test flight was made on April 10 and lasted forty-five minutes. Everything was pronounced as ready for the flight.

Major C. W. F. Morgan, a British aviator, arrived on board the steamship Sachem from Liverpool on April 11, bringing the Martinsyde aeroplane with which he will attempt a transatlantic flight. Accompanying him was Lieutenant F. P. Raynham, who is to act as pilot. His plane has already been assembled. The Martinsyde plane is smaller than the Sopwith and carries no boat or other life-saving equipment.

The naval transatlantic flying boat NC-2 broke records on April 11 by carrying a dead weight of 28,500 pounds in a flight lasting twenty minutes. She rose from the waters of Jamaica Bay with comparative ease, despite the great load, and attained an altitude of 1,500 feet. After circling around for twenty minutes she returned to her landing stage. Officers in charge of the navy's transatlantic fight arrangements expressed themselves as "highly pleased' 'over the performance.

Assistant Secretary of War Franklin D. Roosevelt was a passenger aboard the NC-2 on April 13, on his visit to Rockaway Naval Air Station to inspect the transatlantic planes.

According to a press dispatch dated April 13, owing to weather conditions—wind with rain and hail storms—Major Woods was unable to make his start from Limerick, Ireland, in the attempt to fly across the Atlantic. It is stated that he will start from East Church on the following day. Major Woods is using a Rolls-Royce motored short biplane.

The Handley Page Company has officially entered one of its aeroplanes which had been built for a bombing expedition to Berlin in the transatlantic flight. The machine has four 350-horse power engines and a capacity of 2,000 gallons of gasoline for a twenty-five-hour flight. Two small air tanks will keep the plane afloat if it falls into the sea. The crew will consist of three pilots and a wireless operator.

The Handley Page machine will be taken to Newfoundland and will fly from there to the British Isles.

Lieutenant J. P. Fontan, who started on April 8 on the first leg of a flight which he intended should take him across the Atlantic from the Cape Verde Islands, was compelled to land near Bourges, 110 miles from his starting place near Versailles.

Aviators Aid Liberty Loan

New York, N. Y.—Sixteen aviators, five of them "Aces," left Hazelhurst field shortly before 2 o'clock on April 11, for New York, where they bombed the city with literature advertising the Liberty loan.

Major Henry Miller, in command of the squadron, was the first to leave the ground. He piloted a Handley Page machine.

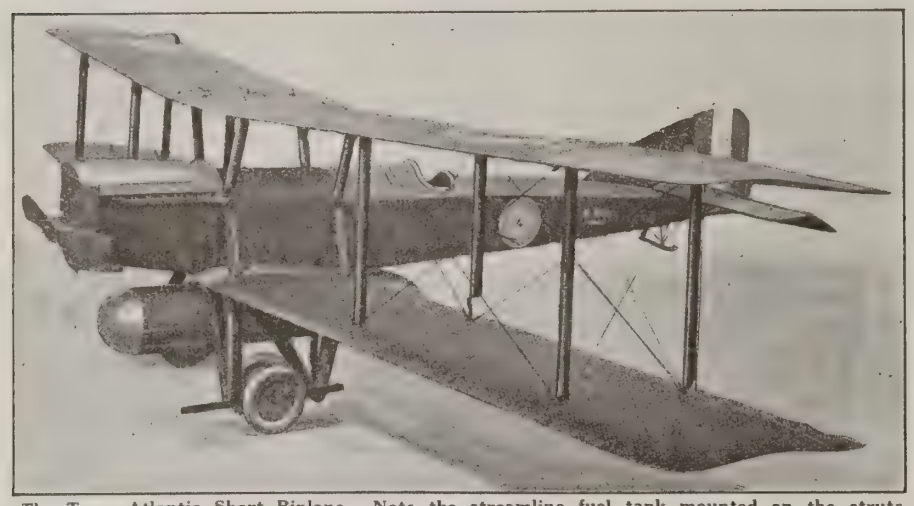
The chief interest was centered on two of the seven planes which flew over the city. These were Fokker biplanes captured from the Germans. They were flown by Capt. A. D. Simonin and Lieut. Guy Stewart.

New York Police Aviators to Train at Atlantic City

Atlantic City, N. J., April 11.—Atlantic City's municipal aviation field will be the training quarters for the aerial police squadron of New York through arrangements made by Captain Granville Pollock, commander of the First aero squadron of the New York Police Department with the Aero Club of Atlantic City. According to plans announced through President A. T. Bell, of the local club, it is the intention of Captain Pollock to open the school within the next few days, after Colonel Jefferson De Mont Thompson, head of the aviation section of the New York Police Department, comes here to inspect the field, which is being placed in readiness for the Pan-American Aeronautic Exposition during the month of May.

Captain Pollock and his squadron will send details to police the flying routes here during the aviation meet and to act as guides to aerial strangers who may drop in to participate in the various events that have been arranged. This will be the first time in the history of aviation that a racing course has been regularly policed by aeroplanes.

Lafayette National Park to Have Memorial for Airmen Lost in War



Boston, Mass.—According to H. W. Gleason, before the National Geographic Society, there will soon be placed in Lafayette National Park a bronze eagle in memory of all the aviators of America who lost their lives in the world war, and below will be a bronze tablet recording their names. It is to be known as "Honor Crag."

Governor Edge Vetoes Bill Prohibiting Aerial Hunting

Trenton, N. J.—Governor Edge vetoed the Hyland bill prohibiting shooting of game from aeroplanes. He declared against burdening the statute books unnecessarily, and thought that the noise of aeroplanes was in itself adequate protection for game.

Admiral William L. Sims was escorted into New York Harbor by seaplanes and blimps, when he returned aboard the Mauretania recently

The Trans-Atlantic Short Biplane. Note the streamline fuel tank mounted on the struts of the undercarriage

Army Inspects Atlantic City Aero Field

Atlantic City, N. J.—Major L. B. Lent was sent to Atlantic City by the aerial division of the Department of the East to inspect the aerial landing field in process of construction here for the coming Pan-American aeronautical meet. He expressed himself as pleased with the site selected.

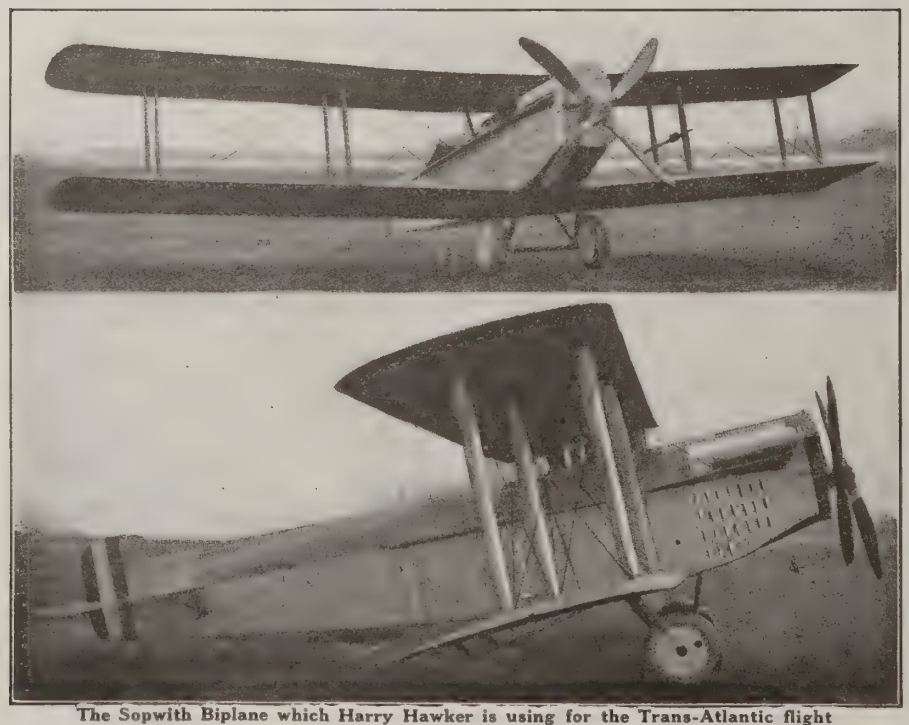
Major Lent made the trip from Brindley Field, L. I., to Atlantic City in less than two hours. After leaving Red Bank at quarter-past twelve o'clock he made the last leg of the journey at a speed of 100 miles an hour.

Will Carry Bale of Cotton to Atlantic City in Flight for Pulitzer Trophy

One of the entrants for the long-distance, non-stop flight for the Pulitzer Trophy will represent the Chamber of Commerce of the City of Americus, Ga., when the contest is held in May, during the second Pan-American Aeronautic Conference and Exposition at Atlantic City.

The Americus aviator who is yet to be chosen will not fly "light," but will carry northward with him from Americus to Atlantic City a bale of cotton. This will be auctioned on the boardwalk and the proceeds donated to the Red Cross.

International Air Regulations Framed



Paris, April 13.—The proposed convention regarding international aerial navigation has been completed by the judicial and military sub-committees of the aeronautical commission of the peace conference, on which Brigadier-General Benjamin D. Foulois, Major Pollock and Captain Bacon represent the United States.

The convention is composed of forty-one articles, which establish an international agreement on sovereignty of the air, provide for the concession of inoffensive voyages between the contracting states and deal with forbidden zones and international aerial routes.

140 American Aviators Presented with Banners Made by French Women

Paris, France, April 12.—Stephen Lausanne, editor of the *Matin*, greeted 140 American aviators of the First and Second Divisions at a meeting held in Paris in their honor. Mrs. Woodrow Wilson, General A. Y. E. Dubail, formerly Military Governor of Paris; Colonel House and Mrs. House, Admiral William S. Benson and Mrs. Benson and Josephus Daniels, Secretary of the American Navy, and Mrs. Daniels were present.

Brig.-Gen. Mason L. Patrick replied for the American aviators, his speech being translated by Col. E. L. Gros, founder of the Lafayette Escadrille. Banners made by the women of France for the aviators were presented in turn by the famous French airmen, Captains Heurteaux Nungesser and Madon.

The Sopwith Biplane which Harry Hawker is using for the Trans-Atlantic flight

National Aeronautic Committee To Build Air Service Clubhouse

New York, N. Y.—The National Aeronautic Committee of 7 East 36th Street, of which Mrs. Charles A. Van Rensselaer is Chairman is collecting funds to build a clubhouse for the Air Service Association. The clubhouse will be a memorial and will probably be built in New York, as sites here have already been considered, and plans have been drawn up by F. Burrall Hoffman, Jr., the architect.

Mrs. Newton D. Baker is Honorary Chairman of the committee, and Mrs. E. H. Harriman, Mrs. Benjamin Thaw, Mrs. Henry A. Wise Wood, Mrs. Clinton Gilbert, Mrs. Charles S. Whitman, Mrs. William H. Crocker and Mrs. French Vanderbilt Fitzsimons are among the active workers.

Utica Establishing Aerodrome

Utica, N. Y.—A company to be known as the Mohawk Valley Aeroplane Company has been incorporated with a capitalization of $30,000 for the purpose of establishing a municipal aerodrome in Utica.

The officers of the company are: President John M. Ross; vice-president, Arthur B. Maynard; treasurer, Newton F. Hand; secretary, Stuart J. Davies.

The company will offer the public pleasure flights at rates to be announced later. Two Curtiss JN4D aeroplanes have been purchased for this purpose. Stuart J. Davies, an ex-Air Service aviator, will act as pilot.

The company will also maintain a service agency for the sale of the better known types of planes costing from $2,500 to $20,000.

Smithsonian Institute Exhibiting Many Aeroplanes of Historic Interest

Washington, D. C.—The United States National Museum, which is part of the Smithsonian Institute, has already placed extensive exhibits of aeroplanes and other aeronautical material on permanent exhibition. It has in its possession the small planes built and flown by Professor Langley in 1893-1896, and the large plane built under government order, which was launched in 1903, but failed to fly on account of unsatisfactory launching gear. A successful flight has since been made by Glenn H. Curtiss at Hammondsport with this model.

The Museum also has the first government owned machine built by the Wright Brothers, training planes used by the United States Army and bombing and reconnaissance planes used by the French Air Service. The first American built battleplane, made by the Dayton-Wright people, equipped with the original 12 cylinder Liberty motor, with a record of 1,078 hours in the air, having covered a distance of 111,000 miles, is another feature of the Smithsonian exhibit. When

the work of collection is completed, there will be models of all planes, engines and accessories in production at the close of the war.

The aircraft exhibit is part of a complete permanent exhibition of all types of war equipment, including tanks, field equipment and guns, mementos of events, naval and military decorations and insignia, books, paintings and photographs.

Curtiss Will Start New York-Atlantic City Passenger Service

Philadelphia, Pa.—America's first passenger- carrying aeroplane system will be established on May 1, when the Curtiss Aeroplane Company places in service four specially constructed seaplanes to fly between New York and Atlantic City. Should the plan prove a success, a similar line will be established between Philadelphia and Atlantic City.

The system will probably be known as the New York-Atlantic City Air Line. Flights will be made on a regular schedule, two planes flying from either terminus and return. The New York landing place is now being arranged at Port Washington, and the seaplanes will alight on the water opposite the inlet at Atlantic City, "taxying" up the inlet to a specially constructed landing pier.

The four seaplanes to be used in this service are now under construction in the plant of the Curtis Company at Garden City, L. I. They are of a special design and will carry from four to six passengers, besides the pilot and a mechanician.

National Advisory Committee for Aeronautics to Erect Laboratory

At a meeting of the National Advisory Committee for Aeronautics, on April 10, the construction of an engine dynamometer laboratory was authorized. The laboratory will be erected on the committee's plot at Langley Field and will cost approximately $15,000.

The purpose of the laboratory is to test internal combustion engines, conduct researches and advance the development in aircraft engines. The study of related problems, including the co-relation of engine performance in free flight with the results obtained on the test stand, will also be made.

DH-4s Fly Across Sierra Nevadas

A report from Mather Field states that on March 22 three De Haviland-4 aeroplanes flew from Mather Field to Sacramento, Calif., thence to Carson City, Nevada, crossing the Sierra-Nevada mountains en route. The distance covered in the flight was 120 miles and the average time was 85 minutes. It was stated that this was the first time the mountains have been crossed by heavier-than-air machines.

The return trip was started from Reno about noon on March 23. A stop was made at Carson City for gas and oil, and at this point, Governor Boyle of Nevada took the place of Lieut. Ruggles in one of the ships, and was carried from the Capital of Nevada to the Capital of California, and thence to Mather Field. Governor Boyle has the distinction of being the first civilian to make the flight across this range of mountains.

An interesting feature of the trip is the time saved in transit between these two cities. Eight hours and five minutes was saved on railroad travel. The average train time between the two capitals is 9½ hours, while the aeroplane averaged 85 minutes. The mountains were crossed at an altitude of 14,000 feet.

Civilian Licenses Issued to Forty Aviators

The Office of the Joint Army and Navy Board of Aeronautical Cognizance, charged with the issuance of civilian Flying licenses, is now located in Room 232, Building D, 6th and B Sts., Washington, D. C. Since the discharge of Lieutenant Haugen, Lieut. A. J. Clayton, A.S.,M.A. has been acting secretary The membership of the Board otherwise remains unchanged.

Applicants for civilian licenses should apply to the Board, addressing the acting secretary, Lieut. Clayton.

There have been issued 40 licenses since February 25, as follows:

License No.	Issued to	Address
339	Alfred S. Koch	Washington, D. C.
340	John Domenjos	New York City
341	James A. Roe, Jr.	New York City
342	Merrill K. Riddick	New York City
344	Penrose B. Metcalfe	San Angelo, Texas
345	John H. Hughes	Macon, Georgia
345a	Harry Richard Kashe	Anacostia, D. C.
346	A. J. Brubaker	New York City
347	Homer M. Berry	Okmulgee, Oklahoma
348	Julian Sykes	Chicago, Ill.
349	Paul W. Peterson	Underwood, Iowa
350	L. S. Ryan	Underwood, Iowa
351	David L. Behncke	Chicago, Ill.
352	Joseph L. Cato	New Haven, Conn.
353	Edgar F. Waters	Milltown, N. J.
354	Louis M. Merrick	Washington, D. C.
355	George Perkins	Washington, D. C.
356	Ellis S. Middleton	Anacostia, D. C.
357	Lyman Patterson	Anacostia, D. C.
358	J. B. Struble	San Francisco, Calif.
359	Stuart J. Davies	Utica, N. Y.
360	Herbert M. Schick	San Mateo, Calif.
361	Charles Henry Kinzie	Philadelphia, Pa.
362	Romer G. Weyant	Lincoln, Nebraska
363	Cortlandt S. Johnson	Washington, D. C.
364	Aircraft Service Corp.	Detroit, Mich.
365	Stuart A. Morgan	New York City
366	James Ward	Houston, Texas
367	Ray A. Dunn	Lynbrook, N. Y.
368	Wesley L. Smith	New York City
369	Earl F. Beers	Essington, Pa.
370	Edward A. Stinson	San Antonio, Texas
371	Paul W. Ward	New York City
372	W. J. Falvey	Brookline, Mass.
373	Hubert E. Phenicie	Manchester, Iowa
374	I. B. Humphreys	Denver, Colo.
375	Lucielle Belmont Baldwin	Chicago, Ill.
376	Charles Theodore	Dallas, Texas
377	Not issued.	
378	Barney Benes	Cleveland, Ohio
379	Frank G. Seyfang	New York City

Albany Has Aeroplane Landing Field

Albany, N. Y., April 9.—The Albany Chamber of Commerce announced that the city is prepared to receive aerial visitors at the municipal landing field, known as Quentin Roosevelt Field, in Beverwyck Park. The tract selected is ready for the use of transient aviators or aerial mail carriers.

Van Rensselaer Island south of the city is suggested by the Mayor as a good landing place for hydroaeroplanes to land and anchor.

Albany is the second city in the United States to have established a municipal landing place, Atlantic City having preceded it only by a few days.

Two captured Fokkers being prepared for a Liberty Loan Flight over New York City

The AIRCRAFT TRADE REVIEW

N. E. J.

Aero Export Plans

American manufacturers of aircraft are taking steps to inaugurate an export business with foreign countries, especially in South America. The commercial adaptation of the aeroplane has been the subject of consular reports and magazine articles in South American republics and many inquiries have been received here from business interests.

Encouraged by these inquiries, the Curtiss Aeroplane and Motor Corporation is sending a special representative to Buenos Aires to confer with business men and sportsmen with a view of starting an export trade.

Like the Curtiss Company, the Aeromarine Plane and Motor Corporation is figuring on a South American trade. This concern has developed a sporting type of flying boat which appealed to a delegation of wealthy South Americans who visited the recent Aeronautical Exposition in this city. Both the Aeromarine and the Curtiss companies have been asked to estimate for a flying boat service on several South American rivers, by means of which those back of the project hope to tap rubber districts hitherto difficult to reach.

The Thomas-Morse Aircraft Company, builders of the Thomas-Morse scout plane used so successfully in combat work, is sending representatives abroad. The latter has developed a two-passenger plane which it believes will appeal to ranch owners living great distances from the cities.

The Packard Motor Car Company, which recently announced its entrance into the aircraft industry, is preparing to export both flying machines and aeroplane motors. The Wright-Martin Corporation has announced that it has been urged to place its Hispano-Suiza engine on the market for export trade. The Glenn L. Martin Company of Cleveland, builder of the wartime Martin bomber, is understood to have concluded plans for an export business.

Curtiss Company Organizes Distributing Agencies

Seven distributing companies have been organized in various parts of the country for the purpose of selling aeroplanes by retail. The companies are incorporated by the Curtiss Corporation.

With the establishment of these companies, a vigorous campaign has been inaugurated for the sale of aeroplanes for commercial purposes. The first showroom to open will be the Curtiss Eastern Aeroplane Company, at Philadelphia. G. S. Ireland, a former army aviator, is president and general manager of this concern. The America Trans-Oceanic Company will be the distributing agent in New York City and Florida.

The other concerns are: the Curtiss Southwest Aeroplane Company, at Tulsa, Okla.; the Curtiss Northwest Aeroplane Company, at Minneapolis, the Curtiss Aircraft Company, at Atlantic City, and the Curtiss-Humphreys Aeroplane Company, at Denver.

The America Trans-Oceanic Company is headed by Rodman Wanamaker. It has double hangars at Port Washington, and will conduct a school there. It will also engage in carrying passengers shortly by inaugurating an air line between New York and Atlantic City.

The Vertimeter, a New Instrument Indicating Rate of Climb

The utility of an instrument which indicates rate of ascent or descent of a plane in flight is obvious to the practical aviator. Therefore the appearance of the Vertimeter was greeted with enthusiasm by those aviators who have had the opportunity of using the device.

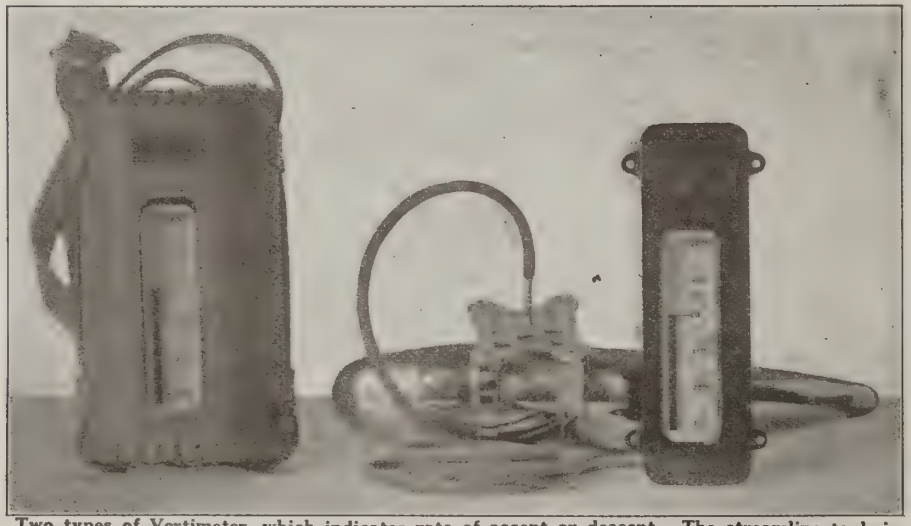
In fog and night flying the only guide the aviator has had in determining whether he is maintaining his altitude has been the altimeter. But minutes of flying time and hundreds of feet of unnecessary climb and drop are lost in cross-country flying when the altimeter is depended on. The Vertimeter records rate of ascent or descent in 2/5 of a second.

When the pilot desires to gain altitude he can do so at the machine's most efficient climbing speed. He can maintain the plane at its most efficient flying speed without numerous corrections. He cannot be "lost" in clouds or find himself diving if he is trying to climb through them.

Nor will the aviator put his machine in a stall accidentally, for the Vertimeter will indicate to him the moment he has arrived at his maximum climbing rate.

The instrument consists of a case containing the indicating device connected to a small streamline nickle-plated tank by a rubber tube. The tank is mounted on the under side of the fuselage or along the side or top of a boat hull. The balloon type instruments are self-contained, i. e., the tank and instrument head are placed in a leather case with straps for hanging it to the load-ring.

The instrument is comprised of a glass "U" tube with a trap at each end. One end of the tube is connected to the tank and the other end is open to the atmosphere. The "U" tube is half filled with a thin carbon oil colored red to give contrast with the white scale. On the back of the instrument case is a valve which connects into the line from the tank.



In ascending, the outer air becoming less in barometric pressure causes the air in the tank to pass out through the valve on the back of the instrument. Since the valve opening is smaller than that necessary to provide easy egress, a back pressure builds up sufficiently to cause the oil to rise in the "U" tube toward the end open to the atmosphere. If the rise is kept constant the oil will remain at a level corresponding to a given marking on the scale indicating the feet per minute of motion vertically. In descending all operations are reversed. The instruments are calibrated and adjusted by regulating the size of the escapement valve.

By placing the tank exposed to the outside air it is kept at the same relative temperature, thereby preventing the warm ground level air from continuing to register ascend after a climb has been stopped at any altitude. In practice the air in the tank attains the temperature of the air through which the machine is passing so quickly that no action takes place other than that of registering the rate of change of barometric pressure. The readings taken from a series of flights show accuracy within two-fifths of a second per one thousand feet.

Instruments are provided with scales reading 3,000 feet per minute ascend and 4,000 feet per minute descend or 2,000 feet per minute ascend and 3,000 feet per minute descend, depending on the machine to which the instrument is attached.

Either type of instrument weighs 28 ounces complete.

The Vertimeter is manufactured by the Aeronautic Instrument Co. of New York City.

Two types of Vertimeter, which indicates rate of ascent or descent. The streamline tank is mounted on the fuselage

Cleveland-Chicago Aero Mail Trial Flight Soon

Chicago.—Oliver J. Sproul, chief of the Air Mail Service in Chicago, announced that two aeroplanes carrying mail will fly from Cleveland to Chicago about April 11. The pilots are Michael Ebersole and T. C. Frye.

Another plane is scheduled to make the trip for the Air Mail Service about April 15, piloted by Lester Bishop of Cleveland.

Post Office Department Has Remodelled DH-4s

It was learned recently that the first of an order of remodelled De Haviland planes has been turned over to the Post Office Department. It is said that sixty such planes are to be remodelled to serve as aerial mail carriers, they no longer being required for war purposes.

These planes will be able to carry 500 pounds of mail. The Army has turned over a number of Hispano-Suiza motors manufactured by the Wright-Martin Co.

Trial Flight of France-Morocco Air Route Successful

In connection with the proposed postal service between France and Morocco, Lieutenant Lemaitre, accompanied by M. Letecoere, has made a successful flight from Toulouse to Casablanca. He left Toulouse at mid-day on March 8 and reached his destination at 5 o'clock on the following afternoon, his flying time for the 1,900 kilometres being 11 hours, and the route being *via* Pervignan, Barcelona, Tarragona, Carthagena, Malaga, Gibraltar and Tangiers. The dispatch bag carried contained correspondence between General Lyantey, Military Governor of Morocco, and the Ministry of Foreign Affairs.

British Post Office to Seek Bids for Aerial Mail Carrying

London.—It is stated that the Postmaster-General will shortly invite bids from private firms for the carriage of mails both in England and to foreign countries.

Folkestone-Cologne Mail Plane Makes 100 M.P.H. With 24 Bags of Mail

An R.A.F. pilot in a D.H. 9 machine has made the journey from Folkestone to Cologne with 24 bags of mail in a flying time of 2 h. 14 min. The distance is 225 miles, and the flying speed was therefore a fraction over 100 miles an hour.

New Aero Mail Speed Record for New York-Washington Route

Washington, April 11.—Pilot Leon D. Smith, carrying the mail from Washington to New York, made the fastest flight ever made with a 150 h.p. Hispano-Suiza motor and a Curtiss mail plane. The average speed for the entire distance was 111 miles an hour. He carried, in addition to a full load of gas, 157 pounds of letter mail. The trip, Washington to New York, 218 miles, was made in 1 hour and 58 minutes. The time from Washington to Philadelphia, 128 miles, being 1 hour and 11 minutes, and Philadelphia to Belmont Park (New York) 47 minutes. Visibility was very low.

To Use Photographic Reduction to Lighten Aerial Mails

A British contemporary publication suggests a means of reducing the bulk and cost of transportation of aerial mail which, if adopted, should make it possible for aerial mail to compete with railway mail.

All letters for air post are to be typed or written on a standard size of paper, and the sheets then photographed down to postage-stamp size. The photographs would cross by aeroplane or airship, and be magnified at the other side back to standard sheet size. Under such a system letters could be either posted open by the public and photographed by post office officials sworn to secrecy, and enlarged by officials at the other side before delivery; or, in the case of the correspondence of big firms, they could be posted in midget photograph form. It would pay a big firm with branches in America and Great Britain to have the necessary photographic apparatus at each side of the ocean. With the help of photography what is now a 300-ton mail could be cut down to 30 tons or less.

A British Aerial Mail plane being loaded for a flight to Cologne at the Hawkings Aerodrome near Folkestone

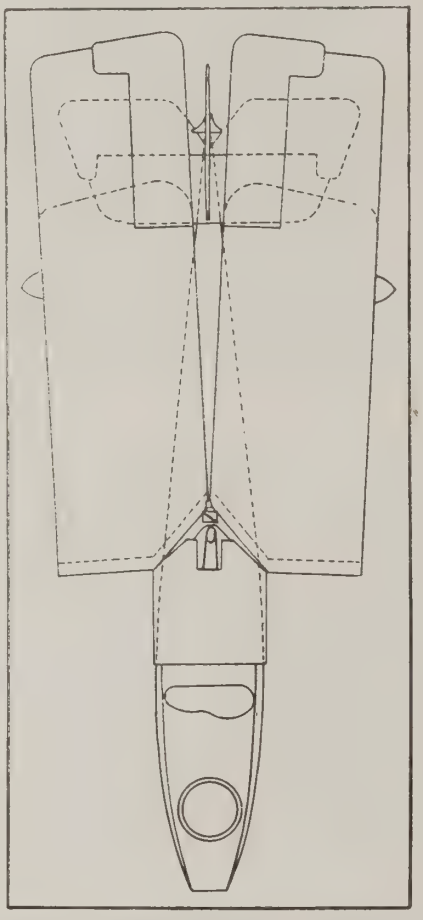
THE GEORGES LÉVY TYPE R FLYING BOAT

SOME of the fastest boats are built in France by the Georges Levy Company, who during the last months of the war were turning out quantities of two and three-place flying boats at a remarkable rate. The type of flying boat illustrated by the accompanying line drawing is a three-place boat with a 280 H.P. Renault engine. The wings are hinged at the inner rear struts and can be folded back so as to take up but little room for storage purposes. The general characteristics are as follows:

Span, upper plane	18 m. 50
Span, lower plane	12 m.
Total length	12 m. 40
Overall height	3 m. 85
Lifting surface	68 sq. m.
Stagger	138 mm. 5
Weight, empty	1,450 kg.
Useful load	1,000 kg.
Speed per hour	145 km.

The following is a general description, directions for rigging and mounting Type R Flying Boat, as supplied by the Georges Levy Company:

Mounting



The mounting of the engine frame is accomplished by putting in place six supports; since this mounting has already been done in the factory, the holes have been pierced and their location predetermined. Next the upper plane center section is attached; this should be given the same incidence angle as the short wing sections which are built integral with the hull; that is to say, 37 m. 5. The engine bed should be horizontal. The central panel is staggered about 138 mm. 5 in advance of the lower plane.

Make the connections with the engine controls and of the piping from the engine to the hull.

A pump of the Astra type pumps the gas in the exhaust collector joined to the three tanks and carries it to the small gravity tank located in the upper plane. Two tubes run from the gravity tank, one feeding the carburetor upon which is mounted the stop-cock and a by-pass for the injection pump. The other tube is for the overflow; it is intersected in the center of the strut by a glass sight designed to make visible the working of the pump; this overflow is connected in the hull to the overflow tank adjoining the three fuel tanks. The oil tank is carried in front of the engine between the engine bearers.

The crankcase of the engine contains a quantity of oil sufficient for a duration of 2½ hours, but at the end of 1½ hours, and every half hour thereafter, it is well to open the stop-cock which connects the oil tank to the engine. It is essential, of course, to see that the cap of the tank is perforated to admit the air, as otherwise the vacuum would prevent its proper functioning.

A radiator thermometer is provided to make known at all times the temperature of the radiator water. A sufficient space should be left in the radiator to hold three liters of water to permit of expansion. Radiator water should be free from all limy substances and preference should be given to distilled or rain water.

Method of folding the wings of the Georges Lévy type R flying boat

Mounting Aeroplane Without Engine

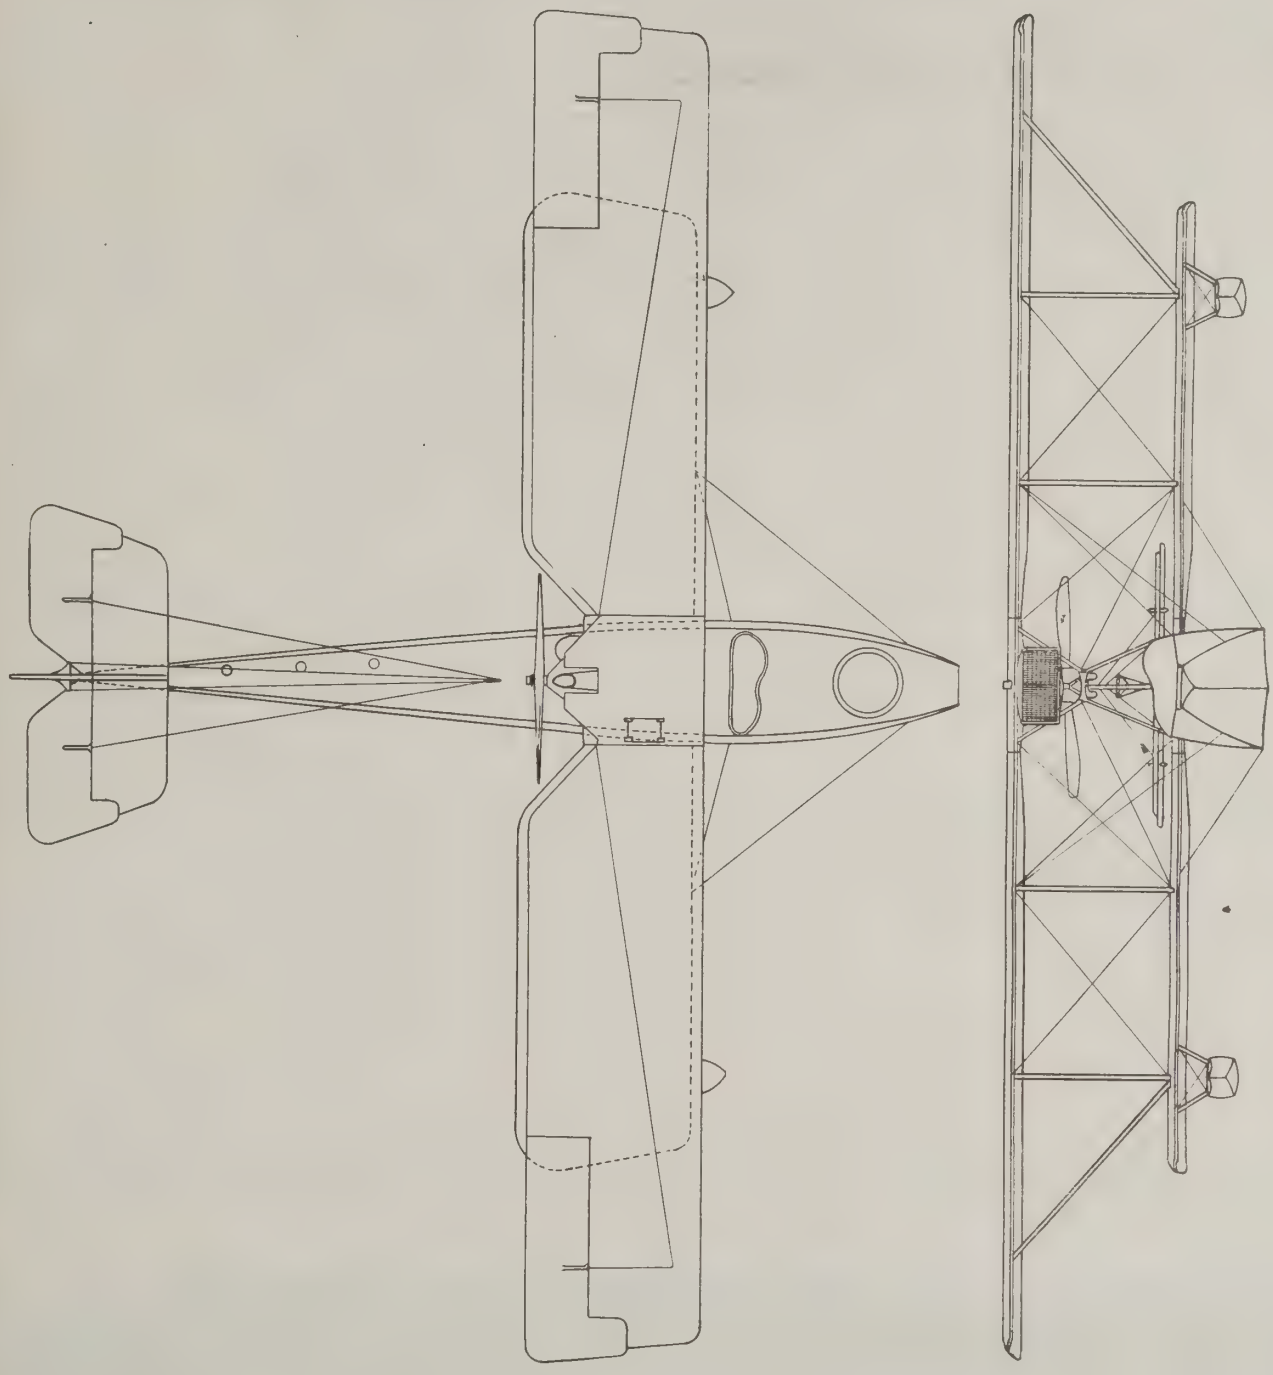
In mounting the machine without the engine, the wings are first assembled on the ground. The struts are marked on the lower extremities, M for those in the middle and E for the outer wings. The marks are made to be seen by an observer in the hull when the machine is all assembled. Front struts have on the rear ends several grooves which permit passage of cross aligning longitudinal cables. The bracing is as follows:

Four mm. cables for the first crossing; 3.5 mm. for the second crossing; 2.8 mm. for the last crossing.

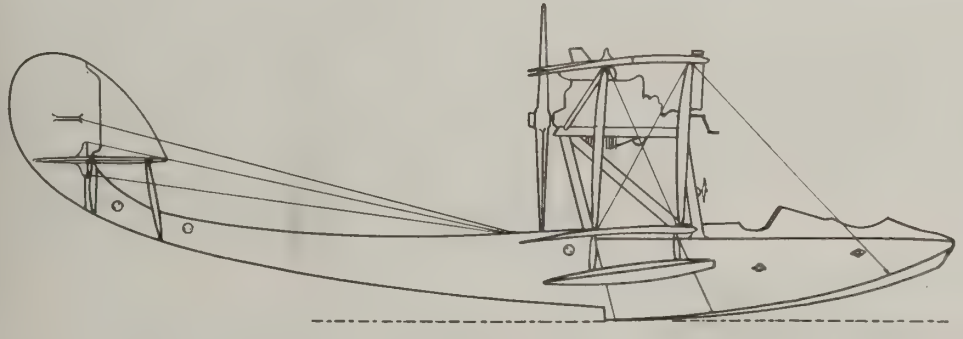
Oblique struts are marked at the lower ends with the number of the outer struts which they adjoin. The two wings are assembled so that planes are placed vertically with the leading edge resting on the ground. Without tightening the cables they are raised and put in position on the center plane and hull. Complete the rigging and adjustment of the planes in such a fashion as to have about 37 mm. 5 incidence taken from front wing beam to rear wing beam, a stagger of 138 mm. 5, and a dihedral on the lower plane of 100 mm. (height taken from the level of the outer strut); at this moment the upper plane should be horizontal.

Floats

All wires of the float rigging are loosened and bolts introduced into holes in the wing beams. A draining cap is provided in bottom of floats.



Tail Group



The stabilizer is first put in place supported by five struts; it should be horizontal to line of flight. The elevators are a continuation of the stabilizer. The rudder and fin should be vertical and in line with the longitudinal axis of the machine.

BELLANCA C E TWO-SEATER BIPLANE

AFTER having had such success in the production of the 35 H.P. light tractor, Mr. Bellanca has designed a machine of greater power with which very excellent performances are promised. The Type C E Machine is equipped with a 6-cylinder 55 H.P. Anzani engine, whereas the first machine, which was fully described in the February 17th issue of AERIAL AGE, was powered with a 35 H.P. Anzani.

The installation of the 55 H.P. engine has necessitated slightly greater wing area and weight has been increased by only 70 lbs. The useful load in the first machine was 375 pounds, whereas the 55 H.P. machine can carry a useful load of 510 pounds.

The wing section employed is a modification of Eiffel 32. Wings are not of the warping type, as in the lighter machine, but lateral control obtained by the use of the more universally employed ailerons. The machine has a safety factor of 12 throughout.

The six cylinder air cooled Anzani type 6-C is used. Rated horsepower, 55; weight, 154 pounds; propeller, 7 feet in diameter.

Fuel sufficient for three hours at full power can be made to last for an additional hour if the engine is throttled down to 40 H.P. This should be taken into consideration when the fuel weight is considered to be sufficient for three to four hours.

General Specifications

Span, upper plane....28'-0"
Span, lower plane....21'-5"
Chord, upper plane....4'-6"
Chord, lower plane....2'-9"
Total area....184 sq. ft.
Length over all....18'-6"
Weight, machine empty....470 lbs.
Useful load....510 lbs.

Useful load 510 pounds

2 passengers....300
Fuel for 3 hours....110
Load or additional fuel....100

(*Performances*)

Speed range, M.P.H....97-41
Minimum H.P. required for horizontal flight....14
Rate of climb, first minute....600 ft. per min.

Useful load 400 pounds

2 passengers....300
Fuel for 3 hours....100

(*Performances*)

Speed range, M.P.H....99-38
Minimum H.P. required for horizontal flight....11
Rate of climb, first minute....780 ft. per min.
Climb in 10 minutes....6,000 ft.
Climb in 15 minutes....7,500 ft.
Climb in 27 minutes....10,000 ft.

Useful load 250 pounds

Pilot....150
Fuel for 3 hours....100

(*Performances*)

Speed range, miles per hour....101-34

(*Continued on page* 304)

THE GEORGES LÉVY FLYING BOAT

(*Continued from page* 286)

Hull

The hull is braced by light wooden members which are quite fragile and it has been necessary to put in a floor to protect the most used parts; that is to say, those parts occupied by the pilot and observer. The flooring is removable for the purpose of inspecting the bottom of the hull. In the compartment to the rear of the pilot's cockpit is found a 4 mm. 7 bracing cable which must be kept in careful adjustment.

Controls

The aileron control cables run to the rear center section strut. This is made necessary by the fact that the wings fold back at this point. Elevator and rudder controls run from a single outlet in the top deck of hull just aft of the propeller. None of the control wires should be allowed to slacken, as loose cables are liable to become jammed. All parts of the control system should be well greased to obtain ease of control.

Engine Controls

The triple quadrant placed to the right of the pilot is the throttle. The largest handle to the left is that controlling the gasolene supplied to the engine. The second controls the air correction by altimeter. The third is the ignition switch and used only at the beginning of a flight.

An auto lock on the lower left-hand side controls the oil tank shut-off; another at the right controls the gasolene tank.

The five-point switch, type S. F. A., is fixed on a small board designed to receive the instrument board.

All engine controls passed through bowden sheathes and it is well to pour a little heavy oil into the sheathes from time to time.

Piping

Gasolene is contained in three tanks of 140 liters each, fixed to the inside of the hull and supported as high as possible by means of wooden supports and steel spring rings. A small trap in the hull gives access to the filled cap.

Each reservoir has two outlets, the upper one for the overflow and the other for the gasolene which is pumped up. Each outlet and collecting tubes are furnished with a shut-off valve located upon the bridge of the hull.

Shunting from the automatic gasolene pump is arranged a pipe passing to a hand pump designed to fill the small gravity tank at departure. The small tank will supply the engine in case the automatic pump fails.

Special rubber joints are used, for it is necessary to have the ends of copper tubes touch in such a way as to avoid the obstructions caused by the inflation which takes place when rubber comes in contact with gasoline.

General Maintenance

The varnish of the hull, floats and struts should be cleaned without injury by means of a cloth saturated in flaxseed oil, with which is mixed several drops of ammonia. Cables should be rubbed with pure flaxseed oil or with fresh grease. Wings should be lightly washed with a sponge and soapy water.

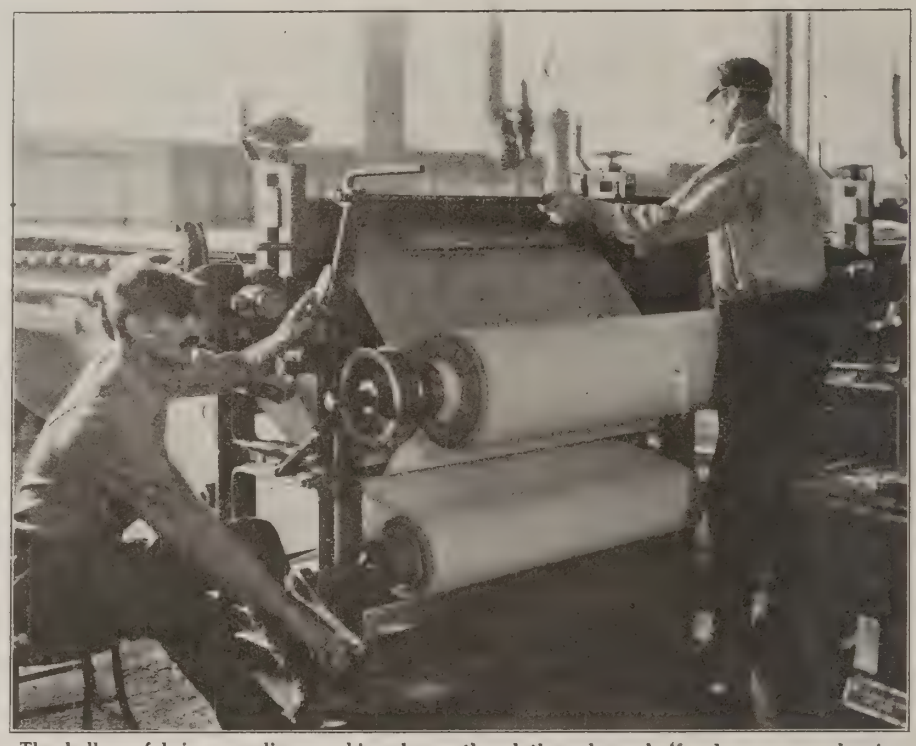
THE MANUFACTURE OF GOODYEAR FABRIC AND BALLOONS

By HERMAN T. KRAFT



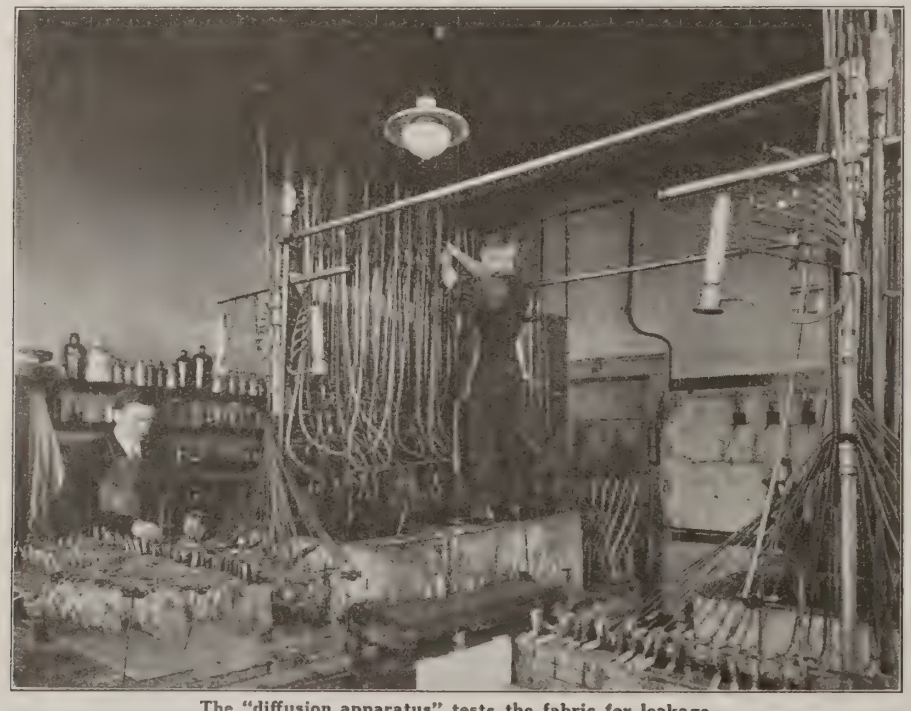
Asst. Aeronautical Engineer, the Goodyear Tire & Rubber Company, Akron, Ohio

HOW is a balloon made? From the average group of people, the answers to this question would be many and varied. Many—because almost everyone is interested in a general way in aviation (there is a romance about it that appeals to the imagination); varied—because so few people have any real conception of the various processes and steps necessary in the manufacture of a balloon.

The first step of all is to secure a very high grade of cotton cloth necessary to make a perfect balloon fabric. This cloth must be very finely woven and must be very strong for its weight. In the case of Goodyear balloons, this cloth is made of the best grade of long, staple sea island cotton procurable and is furnished in two weights, 2½ oz. per square yard and 4¼ oz. per square yard. These two special balloon cloths are the last word in high grade cotton materials, and are subject to numerous and rigid inspections in order to keep their standard at the highest.

The cloth comes in rolls of 150 yards each and is placed upon inspection tables having a plate glass top highly illuminated on the under side by large electric lamps. The material passes over these tables at a very slow speed which permits the inspector to detect any slugs, heavy places in the cloth, or other irregularities that may cause a leakage in the gas bag. These are cut out and such material is either scrapped or used for producing small parts that do not require gas tightness or strength. The inspection is kept very rigid in order to eliminate the possibility of any even slightly defective material reaching the Spreading Department and ultimately the Production Department.

The next operation is the spreading of the fabric. This is done by a machine which draws the cloth under a knife edge scraper. Piled up against the front side of this scraper or knife is a mass of plastic rubber or dough. The knife is arranged to press down on the cloth at a great pressure, so as to allow only a very small portion of the gum to scrape through and remain deposited on the cloth; in fact, so small a deposit is made that it is necessary to pass a cloth under the knife as many as thirty-two times before the amount of rubber deposited reaches a final total of only 4 oz. per square yard. The reason for this tedious proces is that by spreading onto cloth a given weight of rubber in as many thin films or layers as is possible, a more gas-tight fabric is obtained than by putting the rubber on in four or five thicker layers.



The balloon fabric spreading machine draws the cloth under a knife-edge scraper, leaving only a small proportion of gum in the fabric

Next in sequence is the doubling operation—that is, putting the two plies together. To prepare for this operation, the outside ply has to be cut into 45° angle blocks of such a width that when they are swung around and cemented together on their selvage edges, a standard width roll of cloth is again formed. Only now the threads in the cloth run at an angle of 45° to the edge whereas before they ran parallel and perpendicular to the edge. Now by doubling together this bias ply with a regular straight ply, a balloon fabric is obtained having threads running in eight different directions instead of four. This gives a beter average strength in all directions and, more important still, prevents ripping in any one direction. For if a tear starts along the warp of one ply, it is stopped by both the warp and fill of the other ply.

The fabric is now ready to be cured. This is done by wrapping the freshly spread balloon fabric on a large iron drum and placing it in a large cistern-like steel containers into which steam can be turned so as to obtain any temperature desired. Cures of this material vary up to one and one-half hours at various temperatures.

Upon withdrawing the fabric from the heater, it is ready for another inspection and is passed through a dusting operation which deposits a powder on the surface of the fabric to eliminate any tendency the surface plies may have to stick together. Disks 12″ in diameter are then cut from

The "diffusion apparatus" tests the fabric for leakage

the roll at various points and sent to the Chemical Laboratory for diffusion tests. This test consists in placing a disk of fabric in a gas-tight drum so as to form a complete partition across the interior of the drum. Hydrogen is passed into the drum on one side of this partition and the leakage through the sample disk is measured after a given period to determine the exact leakage per square meter. At 30 millimeters pressure, this runs approximately at 12 liters per square meter every 24 hours. This means that with a full size balloon, the leakage due to diffusion is less than ½% per day of the total volume of the balloon. Having satisfactorily passed the diffusion tests, the material is again thoroughly inspected both by Government inspectors and by our own inspectors, and is then passed on to the Production Department to be cut up into patterns and made into balloons.

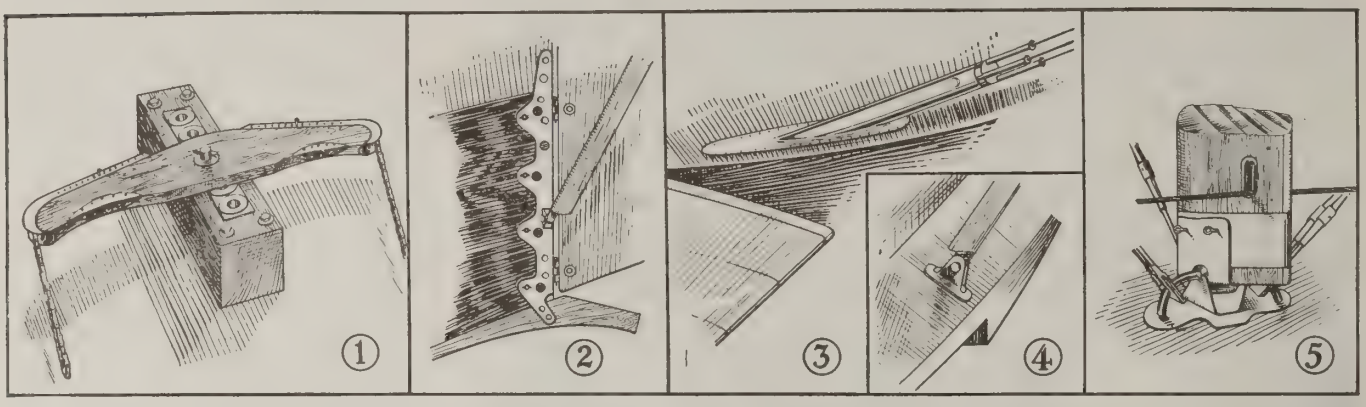
The cloth inspection racks are equipped with brilliant electric lights which show up any defect

It is here that the importance of the Design Department is first seen. No two panels or rings of fabric in a dirigible balloon are the same. The dimensions and the shape of the patterns for these panels have to be figured out to the utmost mathematical precision. This is done by the Design Department and the patterns are then furnished the Production Department in paste board form. The fabric to be cut is laid out on long tables, and marked according to the size and shape of these forms. When a large number of balloons of the same size are being built, as many as thirty-two duplicate patterns can be cut at one time by laying up thirty-two layers of fabric one above the other and marking on the top layer the pattern desired and cutting the entire thickness of fabric in one operation with an electric cutting machine.

After the patterns have been cut, the next step is to cement them together. The cementing operation takes place first where two patterns or pieces of fabric are cemented together on a ¾" lap, after which the twin needle sewing machine unites these pieces together firmly. The seams thus formed are then cemented on both sides and covered by balloon tape. In this way, the holes made by the sewing operation are sealed and hydrogen leakage through the seam is reduced to a minimum. All these operations are carefully inspected, and in no case do we permit careless sewing or unsatisfactory cementing, as these are the most important operations in the manufacture of a balloon. A defective seam in a balloon may be likened to a weak link in a chain. Speaking non-technically for the sake of comparison, we may say, "No balloon is stronger than its weakest seam." That our seam workmanship has been perfect is borne out by the fact that we have never had a sewed and taped balloon burst at a seam.

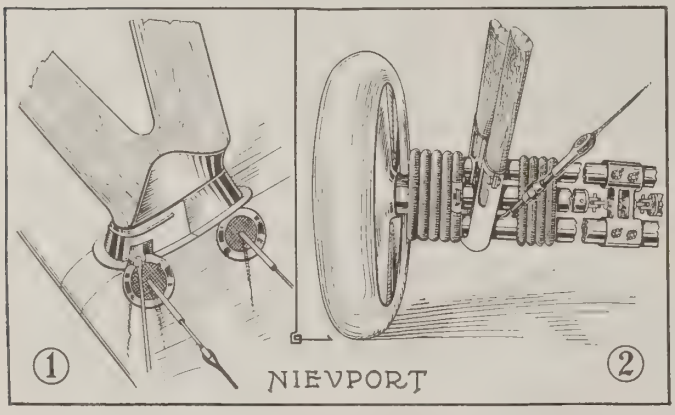
The balloonets or air bags of the balloon are inserted before the final assembly is made. It is quite a trick to insert a balloonet and we experienced considerable difficulty in doing so on some of our first balloons. However, we have long since overcome this difficulty for we have been producing up to five kite balloons per day and two dirigible gas bags per week without experiencing any trouble from this source.

Upon final assembly of the gas bag, all suspension ropes and cables are attached. These are for the support of the basket in the case of kite balloons, and for the support of the car in the case of dirigibles. The balloon is then sent to the Final Inspection Building which is 200 feet long and 100 feet wide, and has a vertical clearance of approximately 60 feet, being large enough to enable six kite balloons or three dirigibles to be fully inflated at one time. Here men crawl into the balloon through a manhole to make the final inspection and attach such small accessories as may be more readily inserted in this manner. The balloon is given a thorough inspection which often takes several men ten to twelve hours. All small pin holes or light places of small proportion in the fabric are reinforced with a patch, even though no leakage may be apparent, so as to assure that after constant use no weak places will develop. On completing this inspection, the balloon is deflated, rolled up and placed in a large canvas packing case which in turn is placed in a shipping trunk for domestic or overseas delivery. In the case of dirigibles, after the final air inspection, the gas bag is usually sent out to the Air Station ten miles from our factory, where the largest hangar in the United States is located. Here the gas bag is inflated with hydrogen, the car is suspended under the gas bag and all flying adjustments are made. In about a week, the dirigible is ready to fly, at which time Government officials are called from Washington to act as a Board of Acceptance in passing upon the performance of the dirigible in its trial flights.



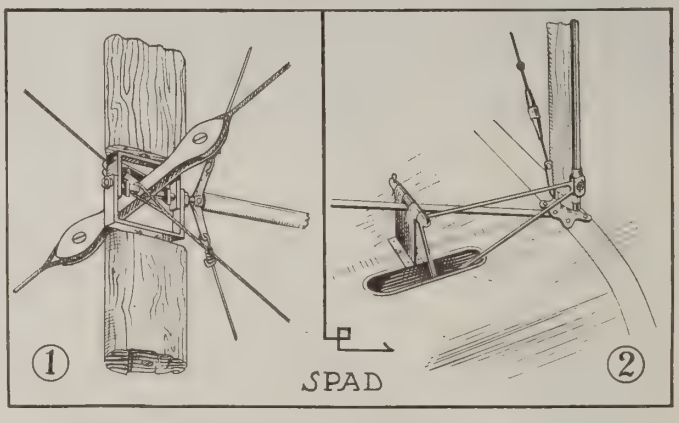
Thus we have followed the manufacture of balloons from the receipt of the raw cloth to the demonstration of the completed balloon. Due to the balloon industry being really in its infancy, radical changes in design are being made from time to time, but the production procedure outlined in this article may be said to be standard. The development of the balloon is more a question of design than production. So far, the largest dirigibles produced have been ships of 2,500,000 cubic foot capacity, with an estimated endurance at 45 miles per hour of slightly over two hundred hours. However, we have information to the effect that a 10,000,000 cubic foot ship is being designed that will be 1,200 feet long, 150 feet in over-all height, which will have a cruising range of 20,000 miles and be able to stay aloft for three weeks without requiring refilling. This gives a forecast of what the future holds in the way of aerial transportation by dirigible.

The assembling room, where balloons are put together



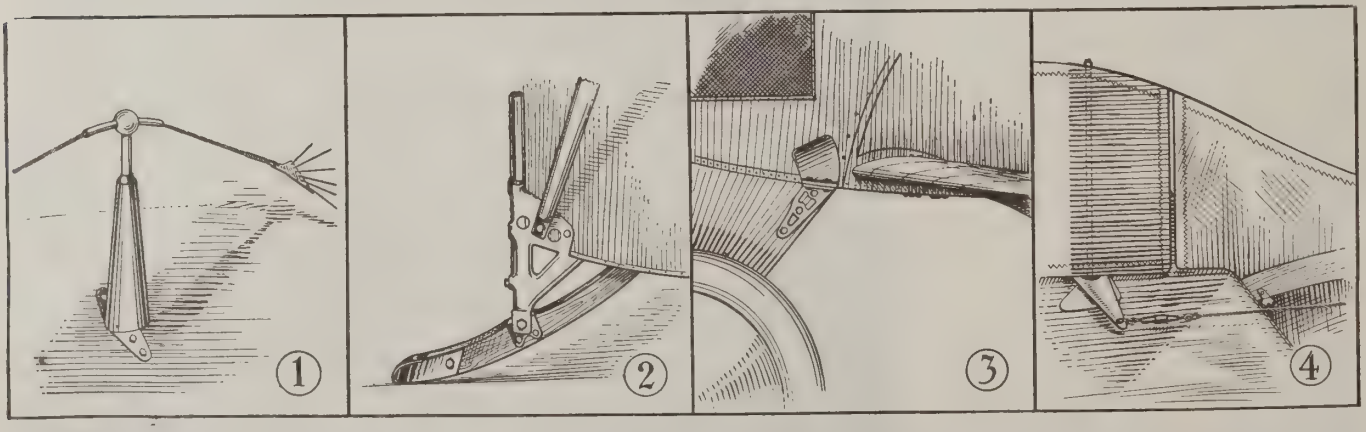
SOME DETAILS OF MODERN AEROPLANES

THE CURTISS M-F SPORTSMAN'S FLYING BOAT



1—One of the foot rudder bars, showing the adjustable pivot and means for taking up the slack by means of the bicycle chain terminal for the control cables. 2—Termination of the boat hull, showing the stern plate, stabilizer brace, keel skid, etc. 3—The aluminum tube outlet for control cables in the top side of hull. Two of the cables are for the left elevator and the third for left side of the rudder. A similar outlet is placed on the right side of the hull with a corresponding set of cables. 4—Socket fitting on the planing fin for brace to the lower wing. 5—The lower end of an inner interplane strut. The strut is attached to the fitting by means of a pair of cotter pins. The aileron cable is run through the strut, a metal bushing protecting the strut from wear.

NIEUPORT SCOUT



1—The attachment of the landing and drift cables at the bottom of right interplane V strut. The socket is covered in by an aluminum casing and rubber disks provided where cables go through the plane. 2—Landing gear shock absorber arrangement. Streamline aluminum tubing is used for the landing gear struts. The axle is hinged at the center

THE SPAD SCOUT

1—Cable crossing at middle of intermediate interplane strut. A steel rod faired with spruce runs from front to rear strut with solid steel wire bracing between. 2—The walking-beam lever arrangement for actuating the aileron of the upper right plane. A transverse rod running from the plane works a light vertical strut, the section of which is continuous with the interplane strut

THE CHRISTMAS "BULLET" STRUTLESS BIPLANE

1—Cable guide post on stabilizer. The post is fixed and the rear end of the stabilizer is flexible, the separate elevator being done away with. 2—Stern post and tail skid. The tail skid post is continuous with the fuselage stern. The metal fitting is of sheet steel, nickle plated. 3—Attachment of landing chassis and lower main plane to the fuselage. The main beams of the lower plane run over the fuselage longerons and are clamped thereto by means of a pair of 4-bolt 2-plate fittings. 4—Rudder tiller and pivot arrangement. The rudder is balanced and the top of pivot rod supported by a flat metal strap, which is screwed to the vertical fin

SECOND PAN-AMERICAN AERONAUTIC CONVENTION AND EXHIBITION

To Be Held Under the Auspices of The Aero Club of America, The Aerial League of America and the Pan-American Aeronautic Federation.

From Thursday, May 1st, 1919,
to
June 1st, inclusive,
at
Atlantic City, N. J.

Intercollegiate Contests Throughout the Summer

CONTESTS TO BE HELD EACH SATURDAY

(1) Seaplane Contests (general),
(2) Curtiss Marine Flying Trophy and Prizes,
(3) Intercollegiate Seaplane Contests,
(4) Land Aeroplane Contests,
(5) Dirigible Contests,
(6) Kite Balloon Speed in Ascending and Descending, and Maneuvering Contests,
(7) Parachute Competition,
(8) Aviette (bicycles and motorcycles with wings) Contests.

EVERY DAY ACTIVITIES

(1) Exhibits of Aeroplanes, Motors and Accessories on the Steel Pier,
(2) Demonstrations and tests of Seaplanes, Land Aeroplanes, Motors, Dirigibles, Kite Balloons, to prospective purchasers and representatives of different governments,
(3) Aerial Passenger Carrying by seaplanes and dirigibles, and kite balloon ascensions,
(4) Moving pictures and Addresses by leading authorities on most important phases of aeronautics.
(5) Competition for the Pulitzer Trophy.
(6) Competition for the Atlanta Journal Trophy.
(7) Competition for the Curtiss Marine Flying Trophy.

The Governments and Aeronautic, Sporting, Scientific, Industrial and Civic organizations of the United States and all the countries in the world, excepting Germany and her allies, are invited to send representatives to attend this great aeronautic event. On arrival in the United States these representatives should call at the Headquarters of the Convention Committee at No. 297 Madison Avenue, New York City, to register and receive their official badges and the official program.

In the event that it is more convenient for them to go directly to Atlantic City they will register at the offices of the Convention located at the following Atlantic City hotels: Hotel Traymore, Hotel Chalfonte, The Breakers Hotel, Hotel St. Charles, Hotel Marlborough-Blenheim, Hotel Chelsea, Hotel Alamac, Hotel Dennis and Hotel Haddon Hall.

Representatives of the Convention Committee will be at the Bureaus of the Aeronautic Convention at the above-named hotels and will issue the official badges which admit the bearer to the Aeronautic Hall, as well as the Aero Exhibition on the Steel Pier, the judges' enclosure during contests, and to the Aerodrome and seaplane stations where the aircraft and motors will be demonstrated.

All communications until May 1st should be addressed to Rear Admiral Peary, Chairman, Aeronautic Convention, Aero Club of America, 297 Madison Avenue, New York City.

Entries for the contests should be addressed to the Contest Committee, Aero Club of America, 297 Madison Avenue, New York City.

DAILY PROGRAM FOR PAN-AMERICAN AERONAUTIC CONVENTION, EXHIBITION AND CONTESTS

THURSDAY, MAY 1ST

Opening of Convention and Exhibit.

AFTERNOON—Reception at Aeronautic Hall on the Steel Pier. Addresses by United States Government State and aeronautic authorities.

EVENING—Aero Show and addresses by officials.

FRIDAY, MAY 2ND

AFTERNOON—Aero Show. Preliminary tests of seaplanes, dirigibles and kite balloons.

EVENING—Moving pictures and address on flying for sport and pleasure.

SATURDAY, MAY 3RD

AFTERNOON—Seaplane and dirigible races, and kite balloon ascending and descending contest.

EVENING—Ball.

SUNDAY, MAY 4TH

MORNING—Memorial service by eminent Divine for the dead airmen.

AFTERNOON AND EVENING—Reception to allied aces and heroes of the air and their parents, and announcement of the award of the Aero Club of America Medal of Valor, and the Aerial League of America Diploma of Honor.

MONDAY, MAY 5TH

AFTERNOON—First parachute contest for $500 Bennett Prize.

EVENING—"The Large Dirigible and Its Value for Transportation." Representatives of railroads, express, steamship and other transportation organizations invited to attend.

TUESDAY, MAY 6TH

AFTERNOON—Illustrated addresses on "Aerial Forest Patrol." Forestry Department of every State invited.

EVENING—"Work of Aerial Police Squadrons, and Why Every City Should Have One."

WEDNESDAY, MAY 7TH

AFTERNOON AND EVENING—Aerial Mail Day. Illustrated address on, and consideration of, "Aerial Mail Planes." Chairman of Post Office and Post Roads Committees of House of Representatives and Senate, and Postmaster General Burleson invited to deliver addresses. (26,000 United States Postmasters, and Chambers of Commerce of 13,000 cities invited to attend.)

THURSDAY, MAY 8TH

AFTERNOON AND EVENING—Illustrated addresses on the "Need of Municipal Aerodromes, and the Part to be Played by Aircraft in City Planning." Chambers of Commerce and City Planning Commissions of 13,000 cities invited to attend.

FRIDAY, MAY 9TH

AFTERNOON—Arrival of seaplanes and army planes from Army and Navy Air Stations. Second parachute competition for the $500 Bennett Prize.

EVENING—Illustrated addresses on "Latest Developments in Aerial Warfare and Adventures in Aerial Warfare," told by famous aces.

SATURDAY, MAY 10TH

AFTERNOON—Army, Navy and Marine Corps Day. Aerial contests and tournament.

EVENING—United States Army and Navy Officers' Reception. Reception and addresses at Aeronautic Exhibition Hall on the Steel Pier.

SUNDAY, MAY 11TH

AFTERNOON AND EVENING—Presentation of the flags by each State of the United States to the Aero Squadrons representing the States. Each State will present a flag to each Aero Squadron, the members of which were overwhelmingly natives of that State. The presentation will be made by representatives from the State and the Aero Club and Aerial League branch of that State. All States and cities invited to send delegates, and Army, Navy and Marine Corps to send representatives.

MONDAY, MAY 12TH

AFTERNOON—Demonstrations and illustrated addresses on the "Value of Aircraft for Advertising by Day and by Night." All national advertisers and advertising agents invited to attend.

EVENING—"Pan-American Aerial Transport Over Land." Addresses by members of the commissions of the 20 Latin-American Republics.

TUESDAY, MAY 13TH

AFTERNOON AND EVENING—"Pan-American Aerial Transport Over Water." Addresses by members of the 20 Latin-American Republics' Commissions.

WEDNESDAY AND THURSDAY, MAY 14TH AND 15TH

AFTERNOONS AND EVENINGS—"The Airways and Aerial Transport in Europe, Canada, Africa, Australia and Asia."

FRIDAY, MAY 16TH

AFTERNOON AND EVENING—"Aerial Navigation Instruments for Flying Over Land and Water." Aviators, navigators, scientific instrument makers and aeronautic experts invited.

SATURDAY, MAY 17TH

AFTERNOON—Aerial races and contests. Illustrated addresses on Aerial Photography.

EVENING—Extensive exhibit of aerial photographs and photographic apparatus. All photographers, professional and amateur, and makers of photographic apparatus invited.

SUNDAY, MAY 18TH

AFTERNOON AND EVENING—Illustrated addresses on "Aerial Exploration and the Use of Aircraft for Coast and Geodetic Survey."

MONDAY, MAY 19TH

AFTERNOON—Addresses on "Need of Broader Attitude Regarding Insurance for Aircraft and Aviators."

EVENING—Illustrated address on "How Army Medical Standards and Inspection Lessen Accidents." Insurance companies and agents invited.

TUESDAY, MAY 20TH

AFTERNOON AND EVENING—Illustrated addresses showing different ways of crossing Atlantic by air and the problems to be solved to accomplish same successfully.

WEDNESDAY, MAY 21ST

AFTERNOON—Aero Safety Day. Discussion of aero safety provisions made; improvements in aeroplane construction; increased reliability of aero motors; devices which make for safety in flying.

EVENING—"Progress Made in the Art of Piloting Aeroplanes." Illustrated.

THURSDAY, MAY 22nd

AFTERNOON AND EVENING—Addresses and discussions of meteorology—"How the Weather Forecasts Can be Extended and Made More Efficient by the Use of Aircraft in Exploring the Upper Air," also "How the Weather Forecasts Help Aerial Navigation," and "Telegraphic and Climatic Factors in Relation to Aeronautics.

FRIDAY, MAY 23RD

AFTERNOON AND EVENING—Addresses on "Aerial Jurisprudence—Aerial Laws and Regulation of Air Traffic." (First day.) Lawyers, traffic commissioners and police authorities of different countries invited.

SATURDAY, MAY 24TH

AFTERNOON—Races and contests.

EVENING—Illustrated address on "Need of Establishing Altitude Levels for International, Interstate and Interurban Air Travel."

SUNDAY, MAY 25TH

AFTERNOON AND EVENING—Aeronautic Art Day. Address on "Aerial Painting and Sculpture of Different Countries, and Exhibition of Aerial Paintings," by Lieut. Farre, Lieut. Ruttan and others. All prominent artists, managers of art galleries and art patrons invited to attend.

ENGINEERING WEEK.

MONDAY, MAY 26TH

AFTERNOON—"Aeronautic Engineering Problems and Their Prospective Solution."

EVENING—Opening of contests for designs and ideas for large aeroplanes.

TUESDAY, MAY 27TH

AFTERNOON—"Factors That Increase the Efficiency for Large Dirigibles."

EVENING—"Advantages of Veneer and Plywood for Aircraft Construction."

WEDNESDAY, MAY 28TH

AFTERNOON—Address on "Problems of Flying at 35,000 Feet and Over, and Their Prospective Solution."

EVENING—"Present Day Aero Engines."

THURSDAY, MAY 29TH

AFTERNOON—"Flying Boats Versus Hydroaeroplanes for Sport and Transportation."

EVENING—Contest for designs and ideas for large aeroplanes.

FRIDAY, MAY 30TH (Memorial Day)

AFTERNOON—Dirigible races, kite balloon speed ascending contest; parachute contest.

EVENING—Reception at the Aeronautic Hall, Steel Pier.

SATURDAY, MAY 31ST

AFTERNOON—Seaplanes, land planes and dirigible contests. Aviette competition at which all cyclists and makers of bicycles and motorcycles will be invited.

EVENING—"International Medical Standards for Aviators in War and Peace." Reports from different countries illustrated with attractive films. 50,000 medical men invited.

SUNDAY, JUNE 1ST

AFTERNOON AND EVENING—Award of prizes and diplomas for all events.

Aircraft Advertising Agency, Inc.

280 Madison Avenue
New York

Telephone 1556 Vanderbilt
Cable Address: "Aero-Ads"

"AERO-ADS"
by
"AERO EXPERTS"

THE members of the *Aircraft Advertising Agency, Inc.* are all ex-officers of the United States Army Air Service, with both theoretical and practical knowledge in the Aeronautic Field, assuring expert service for clients.

GRANVILLE A. POLLOCK, President of the *Aircraft Advertising Agency, Inc.*, previously to his release from the Army with the rank of Captain, served in the war from its beginning and was a member of the famous "Lafayette Escadrille." In addition to this war aviation service, Captain Pollock is by profession an aeronautical engineer.

S. HERBERT MAPES, Vice-President of the *Aircraft Advertising Agency, Inc.*, is another Air Service Captain who has recently laid aside his uniform after having served in important capacities at various aviation training fields in this country. He is well known as an automobile racer, an exhibitor of saddle horses and a winner of Horse Show Blue ribbons, as well as being a member of many prominent clubs.

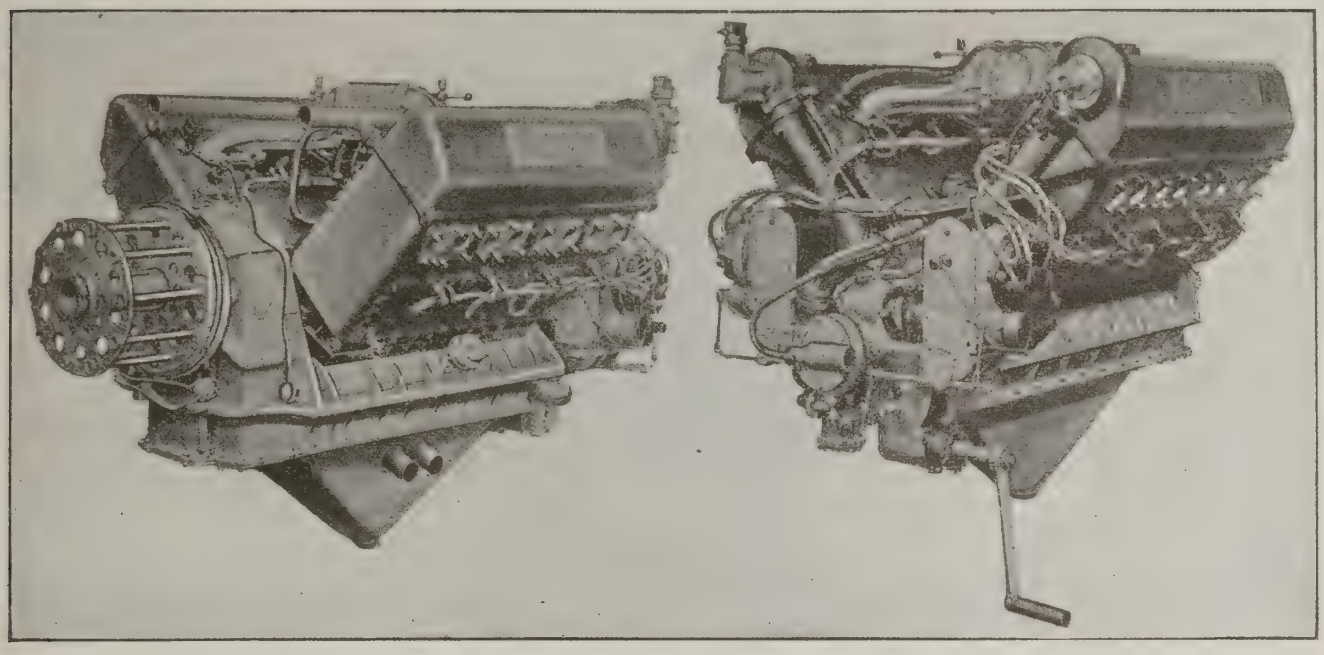
REED GRESHAM LANDIS, of Chicago, son of Judge Kenesaw M. Landis, is also a Vice-President of the *Aircraft Advertising Agency, Inc.* Besides having been a Major in the American Air Service, he has the added distinction of being the second ranking American "Ace" with 12 Air Victories to his credit.

WILLIAM MENKEL, Secretary of the *Aircraft Advertising Agency, Inc.*, also served as a Captain in the Air Service, holding various positions at Washington and in the field, including that of Commanding Officer of the Aviation Repair Depot at the Speedway, Indianapolis, Ind. Previously to entering the service, Captain Menkel was for more than 15 years associated with the American Review of Reviews.

The AIRCRAFT ADVERTISING AGENCY, INC. aims to cover the advertising field for aeronautics, including:

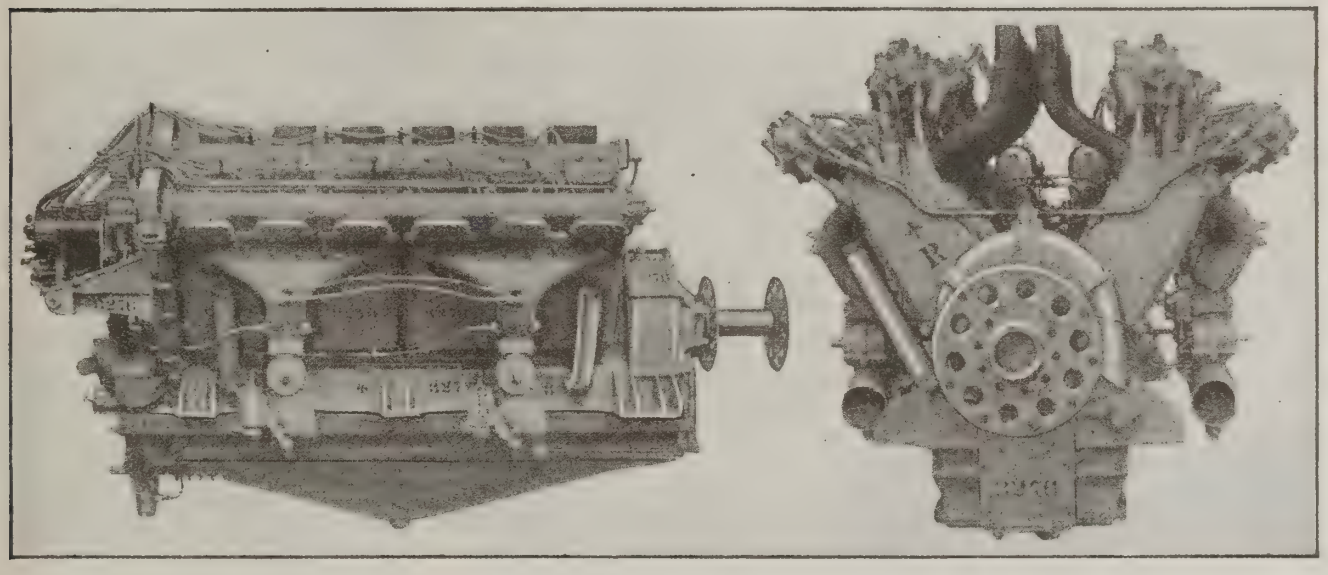
DISPLAY ADVERTISING for General Advertisers on Dirigible, Kite, and Spherical Balloons, Aeroplanes, Streamers from Aircraft, and by the dropping of Souvenirs and Handbills from the Air;

PREPARATION of COPY and SKETCHES and the PLACING of ADVERTISING for manufacturers of Aircraft, Accessories, and Aviators' equipment in aircraft and other periodicals.



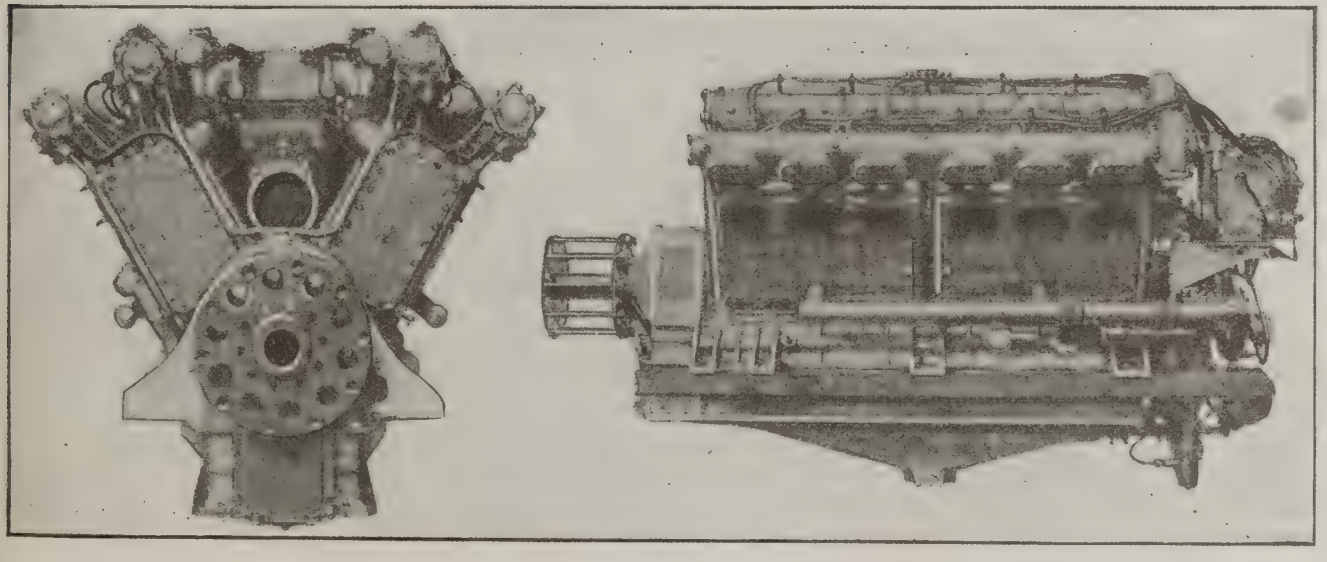
AERIAL PHOTOGRAPHS of Cities, Summer Resorts, Country Places, Real Estate Developments, Etc.

RATES ON APPLICATION.



The Aircraft Advertising Agency, Inc. is now booking the space for exhibitors at the **Second Pan-American Aeronautic Convention and Exposition at Atlantic City, N. J., May 1 to June 1, 1919,** and also has charge of the preparation of the elaborate souvenir Program, advertising rates for which may be had on application.

The Aircraft Advertising Agency, Inc. also controls advertising space on Aeroplanes, and kite and Spherical Balloons operating from the permanent Aviation Field at Atlantic City, N. J., and on the 36,000 square feet of Bill Board space on the fence of this Aviation Field.



THE SUNBEAM AERO ENGINES

The Sunbeam "Arab" which is rated at 200 h.p.

The Sunbeam "Cossack" 12 cylinder engine rated at 320 h.p.

The Sunbeam "Manitou" engine rated at 300 h.p.

Recent Naval Orders

Lieutenant (junior grade) John O. Strickland, to Chatham, Mass., report to commanding officer Naval Air Station for ground duty.

Lieutenant (junior grade) Edward Webb to Hampton Roads for ground duty U. S. Naval Air Station.

Lieutenant Frank Simpson, to duty naval air station, Key West, Fla.

Commander Robert W. Cabaniss, to duty in command naval air station, Rockaway Beach, L. I.

Lieutenant (junior grade) Henry Frederick Henley to duty commandant Naval Air Station, Pensacola, Fla., for duty as commanding officer the S. C. No. 112.

Captain Thomas T. Craven, to office of operations (aviation), Navy Department.

Lieutenant (junior grade) Burr L. Moulthrop, to duty navy air station, Montauk, L. I.

Lieutenant (junior grade) Ralph H. Norris, to duty navy air station, Rockaway, L. I.

Navy Flyers Credited With Twelve U Boats

Boston.—French records credited United States naval flyers with having damaged and possibly destroyed twelve German submarines, according to Captain Thomas C. Craven, U. S. N., commander of all the United States naval aviation forces in France, who returned on the transport Agamemnon on April 7. His department, he said, took a more conservative view and conceded the sinking of two and the damaging of eight enemy craft. Captain Craven described the rapid growth of the United States air forces in France from nine small seaplanes to a great fleet, operating from a port near Brest with more than 200 battle seaplanes of the best type.

Colonel Kenly in Charge of All Army Recruiting

Col. William L. Kenly, formerly Major-General in command of the nation's air forces, and later reduced to his present grade and restored to the artillery service, has been appointed commanding officer of all the recruiting camps and offices in the United States. Col. Kenly's immediate duties will consist of bringing the regular army of the country up to the prescribed strength of 156,000.

In order to accomplish his mission, Col. Kenly will visit the twenty-six camps scattered about the country within the next six weeks.

Naval Fliers on Second Lap of Panama-Key West Flight

Panama, April 13.—Lieutenants Otto and Barker and Mechanician Hornby, attached to the United States Naval Air Station at Colon, landed on April 12 at Bluefields, Nicaragua, after completing the first lap of their flight from Panama to Key West in five hours in a Curtiss flying boat. The distance already covered is 365 miles.

A start was made later for Havana, the second scheduled stop, which lies 800 miles north of Bluefields. The distance from Havana to Key West is 100 miles.

New Reserve Military Aviators Designated

The following named officers, having completed the required tests, are rated as Reserve Military Aviators:

Major Samuel M. Strong, Captain Albert M. Wilcox.

First Lieutenants: Rex E. Field, Charles W. Martin, George K. Thomas, George W. Rogers, Frank W. Cawthon, George B. Fredell, Andrew J. Yarrell, John P. Stone.

Second Lieutenants: Benjamin D. Harrison, Lawrence F. Kraft, Thornton C. Morrow, Richard F. Shaw, Lewis R. Trezona, Alfred R. Coningsby, Anthony J. Kerin, Elmer C. De Montel, Charles R. Rowland, Robert W. Patterson, Harvey C. Waugh, Roderick N. Ott, Richard P. Minor, Isadore Robinson, Jesse J. Gee, Matthew M. Sullivan, Howard N. Tandy, Louis T. Barry, John Preston Richards.

Few Fliers Accident Victims in War

Washington, D. C.—An examination of official figures reveals that only 8 per cent of Air Service casualties were the result of accidents.

Casualties during the period of the war in the U. S. Air Service flying personnel with the American, British, French and Italian armies are shown by types in the following table:

	Number	Per cent of Total
Killed in combat	171	31
Prisoners	135	24
Wounded	129	23
Missing	73	13
Killed in accident	42	8
Miscellaneous	4	1
Total	554	

Navy Tests New Devices for Running Down "Subs" from Planes

Atlantic City, April 5.—The Government, through Navy aviators and submarine specialists, is trying out some new devices for spotting submersibles from the air and for communicating between two types of craft at Fenwick Island Light, near Cape May, according to reports received recently.

Experiments are kept under cover, patrols carefully watching against interruption of observation by outsiders. New uses of wireless in maneuvers, including guiding of submarines by operators in seaplanes, is said to be one of the experiments with which Navy men have had great success during the past week. There are two high ranking officers in the party.

Figures Prove Allied Pursuit Planes More Efficiently Designed

The following comparison shows the average performance of the five best known types of Allied pursuit planes in use at the front during the last months of the war, with the average performance of the five leading types of German pursuit planes:

Average Horsepower	
Allied	186
Enemy	160
Average Pounds Weight per Horsepower	
Allied	9.3
Enemy	12.5
Average Feet per Minute Climb to 6,500 Feet	
Allied	1140
Enemy	705
Average Miles per Hour at 6,500 Feet	
Allied	126
Enemy	109

Transport Otsego Brings Five Balloon Companies

The transport Otsego sailed from Bordeaux April 4 and is due at New York with the following troops: Detachment 19th Balloon Company, 4 officers, 88 men; 20th Balloon Company, 5 officers, 168 men; 30th Balloon Company, 5 officers, 170 men; 35th Balloon Company, 2 officers, 165 men; 36th Balloon Company, 4 officers, 170 men, and 45th Balloon Company, 5 officers, 163 men.

Pershing Commends Balloon Companies

The new list includes a letter of commendation to the Balloon Companies of the First Army, A.E.F., from the Commanding Officer of the First Pursuit Group, Major H. E. Hartney, who thanked the Balloon Companies for the valuable assistance in operations and in confirming victories of the First Pursuit Group.

The Commanding General of the Fifth Army Corps commended the Corps Balloon Wing, advising that Balloon Companies Nos. 6, 7, 8 and 12 of the Fifth Army Corps are commended for their work, beginning November 1, by Major General C. P. Summerall.

The 2d, 7th, 8th and 12th, 24th, 25th and 44th Balloon Companies and the Balloon Schools at Meucon and Souge have also been commended for their service.

Demobilization of Air Service

(Prepared by Statistics Branch, General Staff, War Department.)

Department of Military Aeronautics

According to reports received from the Division of Military Aeronautics the net decrease in the total commissioned and enlisted strength, from the date of the armistice to March 6 was 48 per cent.

The following table shows the distribution and per cent of net decerase to March 6. The strength figures include only officers and men not yet ordered discharged; they do not include men at demobilization camps awaiting discharge.

	Nov. 11	Mar. 6	Per cent of net decrease
Cadets	5,775	1,285	78
Officers	18,688	7,078	62
Enlisted men	133,644	73,223	45
Total	158,107	81,586	48

Lieut. Fred A. Tillman, son of Representative Tillman, has returned to Washington, wearing the medal of the Legion of Honor, the Croix de Guerre and the Distinguished Service Medal

Aeroplanes in Recruiting Service

As part of the whirlwind campaign inaugurated by the army for enlisting its new peace forces, from air stations all over the country recruiting parties are to sally forth in aeroplanes. Practically every town of any size in each territory will be thus visited, and residents may expect at any time from now on to be visited by bird men dropping from the skies to lay army opportunities before the young men of the locality.

Col. Miller, commanding the air service station at Hazelhurst Field, Mineola, L. I., is planning, with the aid of local recruiting officers, to give New Yorkers some spectacular demonstrations of recruiting by aeroplane.

Lieutenant Bernheimer to Get Belgian Order of Crown

Lieutenant Louis G. Bernheimer, son of Mr. and Mrs. Sidney Bernheimer, No. 138 East Seventy-second Street, New York, already possessor of the Distinguished Service Cross with two oak leaves, has received word that King Albert has conferred the Order of the Crown, with the rank of chevalier, for his daring and skill as flight commander of the Eighty-eighth Aero Squadron. He took part in many daring raids in bombing planes along the Verdun front in October. Lieutenant Bernheimer is twenty-four years old. He returned from France several weeks ago.

Automobile Club of America Presents Rickenbacker with Gold Medal

New York, N. Y.—Captain Edward V. Rickenbacker, the Ace of Aces, was presented a gold medal at a dinner held in his honor at the Automobile Club of America on April 5. Addresses were made by Colonel Jefferson De Mont Thompson, of the Police Department; Captain Granville A. Pollock, head of the Police Aero Squadron, and Captain Mapes. Colonel Thompson announced that Captain Rickenbacker had not only accepted the lieutenant-colonelcy in the police air service, but had contributed two aeroplanes.

Bolling Field Notes

Capt. Miller V. Bishop of the Senate Committee on Military Affairs, recently returned from France, has been appointed adjutant at Bolling Field. Capt. Bishop went to France in command of the 341st Aero Squadron.

Lieut. George Perkins, army aviator at Bolling Field, who received the Croix de Guerre with a palm for distinguished service overseas, has received his discharge. Lieut. C. A. Smith, who had been stationed at Bolling Field, also received his discharge from the service last week.

Lt. Col. Wm. C. Sherman, Corps of Eng., who is a flier and has been connected with the Air Service for some years, has been detailed as Chief of Air Service Training, which will include heavier-than-air training at the ground schools and flying fields under General Mitchell.

The Medical Division is now a branch of the Administrative Group.

The aviator's view of March Field, Riverside, Cal., showing the twelve hangars

FOREIGN NEWS

Aeroplane Averts General Strike

By making a hurried flight to Paris to consult Lloyd George, Mr. J. H. Thomas was able to avert a general strike of the railways throughout England.

Royal Naval Military and Air Force Tournament in June and July

The Royal Naval, Military and Air Force Tournament will be held at Olympia from June 26 to July 12, inclusive.

Still Larger Dirigibles for England Ordered

It is stated that the Admiralty has just placed orders for four new rigid airships with Messrs. Beardmore & Co., Messrs Armstrong, Whitworth & Co., and Messrs Short of Bedford. The last-named firm will build two of these aircraft, which are to be bigger than the R-33 and R-34, which have recently made trial flights.

The cost of the vessels will be about a million sterling, and they are expected to surpass any rigid craft yet built in England. They will be 700 feet in length, have a capacity of 2,500,000 cubic feet, and a lifting power of about 70 tons. They will have a speed of 80 miles an hour.

Berlin Leipzig Airship Line Operating

According to a message from Berlin, a German airship company has started a twice-daily service between Leipzig and Berlin for passengers and mails.

From the same source comes a report that the inaugural flight on the new air route between Berlin and Warnemunde, whence there is a ferry to Copenhagen, has been carried out. The time taken for the flight, in spite of the squally weather, was one hour and twenty minutes.

Australian Government Offers $50,000 Prize for First England-to-Australia Flight

The Australian Government has voted a prize of $50,000 for the first flight of aeroplane or airship from England to Australia.

Five Italian Deputies Fly 120 Miles to Session

The Rome-Naples aeroplane service continues successfully. Five deputies left Rome for Naples on board a Caproni machine.

$20,000 in Prizes for French Aerial Touring Contest in June and July

In *L'Avenir*, M. Frantz-Reichel announces that a Tour de France is being organized to take place in June and July next. It is proposed that the competition shall be limited to large touring machines, and prizes amounting to 100,000 francs will be awarded. The start and finish are to be in the neighborhood of Paris.

Lieut. Roget Flies from Lyons to Rome in Seven Hours

Lieutenant Roget, a French aviator, arrived here at 4 o'clock on April 6th after a non-stop flight of 1,100 kilometres (684 miles) from Lyons, France. He left Lyons at 9:15 o'clock in the morning.

Chilean Aviator Flies Over Andes at Height of 19,600 Feet

Santiago, Chile.—Lieutenant Cortines, in a British aeroplane, flew over the Andes on April 5 at a height of 6,000 metres (19,600 feet).

King Albert Flies from Paris to Brussels

Paris.—King Albert, who has been in conference with the peace delegates here, left for Brussels by aeroplane on April 5. His trip from Brussels to Paris had also been made by aeroplane some days previous.

Offers $20,000 Prize for South Pole Flight

Milan.—While plans are being laid for a dash to the North Pole by aeroplane, interest here centers in a proposed flight to the South Pole. To encourage aviators to attempt the flight Count Adama Ostaszewski has offered a prize of $20,000 for the aviator making the flight to the South Pole.

Aerial Passenger Service for Tourists in Switzerland

An aerial passenger service between Zurich and St. Moritz, in Switzerland, is planned, a company being formed with capital stock of $96,500. The Swiss legislature announces itself in favor of the scheme. A flight between the two cities can be made in an hour and the fare will be $96.50 per person. These two towns are well known resorts frequented by tourists, and it is expected that they will patronize the air route.

Aeroplane Engine Competition in France Will Help Industry

Paris.—A big aeroplane and aeroplane engine competition will be organized by the French Government next year. It has been decided that there will be three types of engines: (a) 125 to 150 H.P.; (b) 250 to 300 H.P.; (c) 500 to 600 H.P.

Each engine will have to run 300 consecutive hours at 80 per cent. of its maximum power.

The maximum weight for the complete engine with water, gasoline and oil for five hours' running is 6.6 lbs. Propeller speed is limited to 800 R.P.M. It has been decided that in order to allow present engines to compete, they can be used with geared-down propellers, in order to obtain the limited number of 800 R.P.M.

The aeroplane conditions are: (a) Solidity with a coefficient of 6. (b) Excess power; theoretical ceiling 5,000 ft. (c) Minimum speed at 3,280 ft.; 93 M.P.H. (d) Landing ability; practical conditions corresponding to a weight of 38 kgs. per square metre maximum (this is based on the fact that the lower the wind for a given area, the easier it is for the plane to land). (e) Security; Multi-engines. When three or four used, a single engine should be capable of maintaining the machine in the air.

A Conservatoire of Aviation

The proposal for a Conservatoire of Aviation emanates from the French State Aeronautical Department. It is only waiting the official approbation from the competent authorities. It is proposed to erect the Conservatoire near an aerodrome, which is described as the cradle of French Aviation—very likely at Issy. The main hall is to shelter the remains of all historic machines.

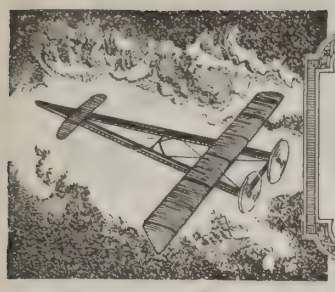
French School of Aerial Navigation

The school for Aerial Navigation will be the creation of the French Aeronautical League, and was unanimously decided upon as a result of Captain Colis' recent address describing how he and Roget flew the Mediterranean under adverse climatic conditions. The school will be open to all civilian pilots, and courses will be commenced immediately.

Tarrant Super-Triplane Will Carry 100 Passengers

London. (Cable to *N. Y. Times*).—The *Daily News* gives further particulars of the Tarrant super-triplane which Major Gen. Seely referred to in the House of Commons on March 13 and which is being assembled at the royal aircraft factory at Farnborough.

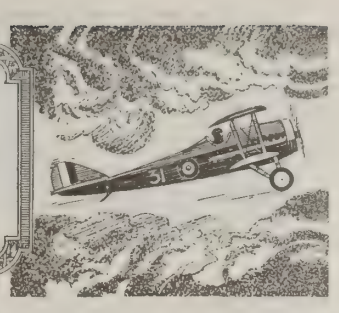
A striking feature is its long cigar shaped fuselage, similar in appearance to the body of the Zeppelin machine. It was originally designed to bomb Berlin, carrying 10,000 pounds of bombs and, a crew of eight over a distance of 1,200 miles. It has a span of 141 feet, the fuselage is 85 feet and is fitted with six Napier Lion 506 engines.



When the aircraft industry began preparations for commercial flying the makers of the super-triplane followed suit, with the result that this type will be capable of carrying over 100 passengers, or cargo weighing nine tons, for a distance of 1,200 miles. The speed for the converted machine will be anything from 80 to 100 miles per hour. It possesses enormous possibilities in continuous flying, and by extra tankage it would be possible to make a nonstop flight lasting twenty-four hours.

The fuselage is built of wood and strengthened by a patent system of girders not unlike the masts of an American warship, and this obviates the use of tracing wires and other fittings common to the ordinary aeroplane. There is freeway right down the center of the fuselage permitting anyone to walk to the tail. Three rows of glass windows, giving the appearance of portholes, will be fitted inside of the triplane, and tiers of seats will be provided for passengers.

In addition to the staff of pilots there will be on board two or three engineers and mechanics, a navigator, and a wireless operator.



The new Grahame-White "Bantam," with its span of 20 feet, next to a 30 passenger biplane having a span of 89 feet

Three Cylinder Motorcycle Engine

THE Three Cylinder Motorcycle Engine that was recently mentioned in connection with a small biplane which I described on this page is shown in the accompanying drawing.

The reader will note that I have used Harley Davidson cylinders, but a good aeronautical engine can be made up from almost any motorcycle cylinders.

Most motorcycle engines have what is known as left and right cylinders. I have used one kind only in this case, the right hand cylinder.

The exhaust pipe is short and bent back to allow free exhaust, and when the machine is traveling forward the air helps to suck the burnt gas out of the pipes.

The intake manifolds are long, and I would advise making them of aluminum tubing, connecting them to the exhaust parts at one end by the special unions used for motorcycle work, and having all three meeting at some point about the crankshaft center line, where they are attached to the carburetor.

A three-cylinder magneto of a good make should be used. The order of firing is one, three, two, etc., starting with the vertical cylinder.

The crankshaft can be the same as is used in the ordinary motorcycle, but the crank pin will have to be longer to allow placing another connecting rod in place. This could be accomplished by making two of the rods thin and placing them inside of the forked rod, which could be made wider at the bottom to allow placing the other rods inside of it.

To accomplish all of this, the crankcase might have to be made a trifle wider than would be necessary. The above engine if made right would develop easily 27 or 30 H.P. at 2000 R.P.M.

The propeller to use with this engine would be 5½ feet diameter by 3½ feet pitch.

This engine is described simply to give more advanced aeronautic enthusiasts an idea of what can be done with a little work, but for those who cannot build a motor of this kind I would refer to any of the small, air-cooled motor which are advertised in the columns of AERIAL AGE.

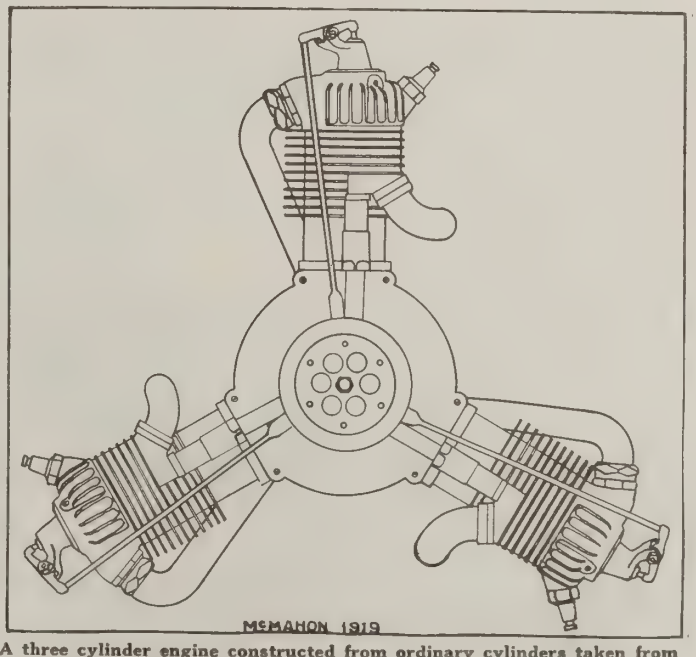
Model Aeroplane Contests

It has been decided to start the first contest for hand-launched models for distance on June 1st. This is to allow the young men in the service time to get back to civilian life and to get their models ready for competition.

The Illinois Model Aero Club have been the best long-distance model aeroplane builders for the past few years, but from the latest reports the San Francisco Model Aero Club and a few Eastern Clubs will be in the running when the final results are posted in AERIAL AGE.

In the next issue I will give a list of events, and the prizes attached to each. The Villard Cup will be offered again for the champion long distance club contest. The Illinois Model Aero Club must win it, but once more to have permanent possession, as thy have won it twice since it was offered by Mr. Villard of the Aero Club of America.

Most of the models will be driven by twisted rubber bands. These bands are sold by model aeroplane supply houses, and are made up especially for this purpose. Wood, bamboo, bearings, and propellers, as well as small fittings for this particular work are also carried by these people.



The simple "A" frame twin propeller model is generally used for long distance racing, and well designed models have been known to travel distances up to one mile in a single flight.

The reader need not think that long distance model flying is confined to schoolboys only; many men are enthusiastic fliers of these light models, and it is an interesting sight to see men young and old winding their rubber motors up in preparation for a model flight at one of the big meets.

In the next issue of this paper I will give a drawing of a successful long distance flying model.

What is the Best Power for Model Aeroplanes?

Many inquiries come to me from readers as to the best power to use in model aeroplanes. Up to the present time nothing has been found to act better than twisted rubber strands and as they are the simplest and most efficient I would advise the less experienced reader to use rubber in preference to all other forms of power plants. It is a known fact that twisted rubber strands, give more power per pound than any other form of power. Then again, the cost is another reason why rubber is better than steam or compressed air motors, for simple models. I would not put rubber before the other kind of plants for scale or more advanced models.

A three cylinder engine constructed from ordinary cylinders taken from a Harley-Davidson Engine, and a special three cylinder crankcase. See above description

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

"IF I HAD KNOWN"

(To Her Ace)

If I had known or had I guessed at springtime—
That day which now to me seems but a dream,
A rosy dream when down the path we rambled
Just you and I 'longside the silver stream.
That day when all the wood glowed bright and teemful,
Full lovely then the flowers, clear the sky,
The wild birds on the hill their love lays chanted—
Apart from all the world—just you and I.

If I had known what now I know since parting,
That yon white cloud-ships slowly moving by
Would bear you on their bosom through the ether
Away from me—to pilot God's blue sky—
I would have then, ah then, clasped hands, the tighter,
And made the farewells longer, Lover Mine:
But, oh! the rapture and the joy now knowing
That soon anew we worship at our shrine!

FLORENCE TUCKER OSMUN.

Extract from new air novel (pilot heroes are of course all the rage with the young lady authors): "To his horror Hubert found that the engine of his seaplane was at fault. He decided to taxi, but to add to his trouble the land was afar off and not a single taxi-cab in sight."

Aviation Tactics Win

"Fighting aeroplanes and the common house fly practice the same arts of self-preservation," said the aviation lieutenant. "Mark the little fly which arrives on your nose.

"Heavily your hand cleaves the air to swat the difficult fly. Instantly the fly departs, easily coming back with impunity as it wishes. Chase it off your nose—lo, it circles, dodges, spirals and dives to your chin. Off your chin to your wrist. Off your wrist to your cheek—never further from its objective than an inch or two.

"All created things have their limited zones and habitats. Not so the common house fly. Every climate and corner of the earth is its home. Thus we know the aeroplane has a numerous future, because the house fly is an ace."

Aeronautics in Biblical Times

"Ever read your Bible, Bill?"

"Yes, sometimes. Why?"

"Do you think the prodigal son came home in a 'plane like some of them you and I know?"

"Out with it. I'll buy it. What's the answer?"

"Well, the Bible says that when his father came out to welcome him, he fell on his neck."—*Aircraft.*

Demobilized

You can take away his chevrons
And his uniform so neat;
You can put him into civvies,
Thrust him out into the street;
You can grind him 'twixt the millstones
Of your modern business schemes,
But his soul—you'll never crush it,
And you'll ne'er destroy his dreams.

He has seen the radiant glory
In the Eastern morning sky,
He has paced the aerial pathways
Through the fleecy clouds on high;
He has braved the lightning flashes,
Faced the tempest and the rain
And he'll fight his mighty battles
Daily o'er and o'er again.

He has known the joys of battle,
And has conquered 'mid the strife.
Yea! The things that he accomplished
Shall endure throughout his life.
You can send him from the Air Force,
You can scheme and you can plan.
Try to make a business asset—
He'll remain a flying man.

—*B. G. A. in Aircraft.*

"Gee, I wish I had my time to start over again," said old man Columbus. I'd fly the Atlantic with the same crew, and not a single dago would want to mutiny so long as I'd my hands on the joy-stick."—*Aircraft.*

PERCY AND FERDIE---Their Transatlantic Trip Has Been Indefinitely Postponed - - By H. A. MacGILL

Creator of the Hall-Room Boys.

—From the N. Y. Evening Sun.

and Washington cabled Paris -- ---- "AC"

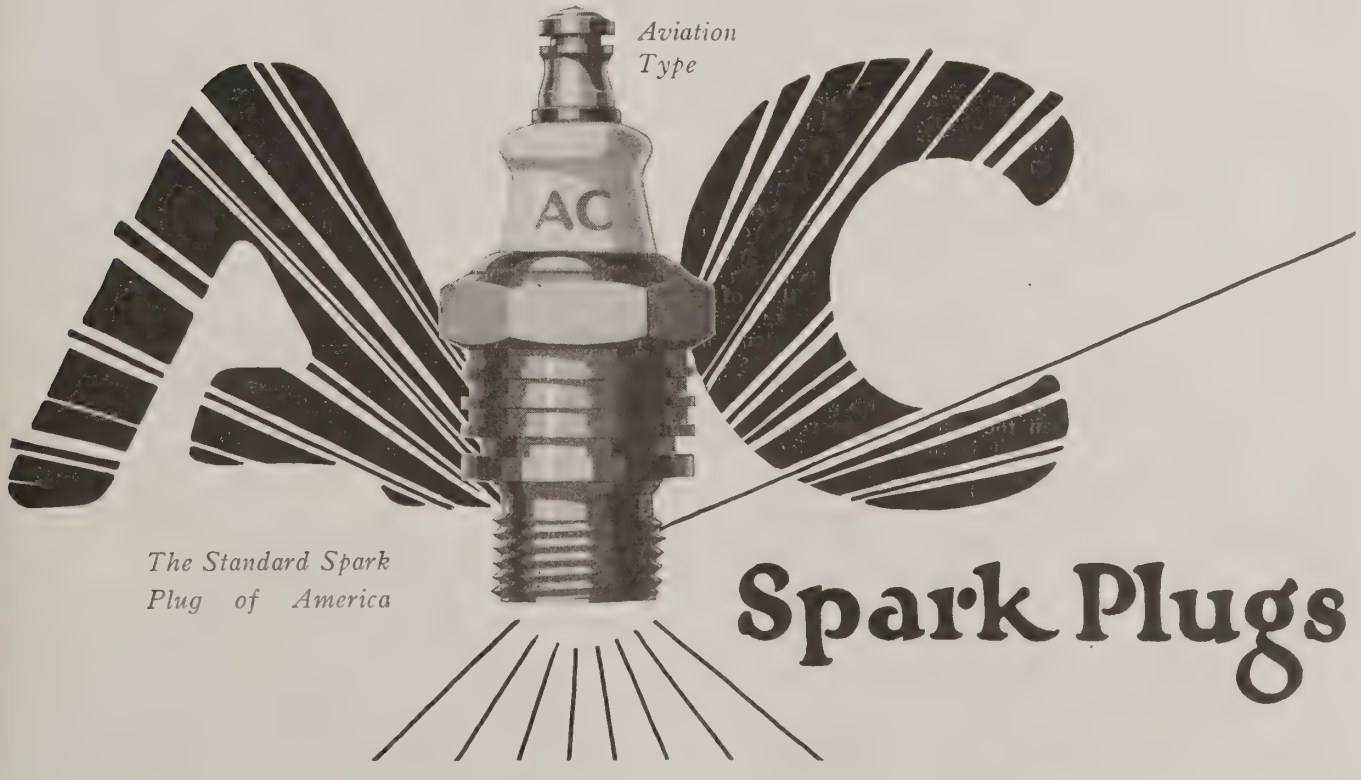
AT Cleveland, Ohio, in official test before an Allied commission, the first Liberty motor ran fifty hours without a change of spark plugs.

That motor was AC-equipped.

Not one of the French, English or Italian engineers who witnessed this performance had before seen a high-powered airplane engine operate fifty hours with a single set of spark plugs.

Eighty to ninety of the best European spark plugs were commonly required for a fifty hour test.

When the United States began her gigantic aircraft program, Washington cabled Paris for advice on spark plugs. Paris answered: "It requires eighty to ninety of the best airplane plugs we can produce to run an aviation engine fifty hours. What have you?"



Then came the battleplane test, mentioned above, where all spark plugs were given the opportunity to qualify, and Washington cabled Paris "The best is AC."

So it was that AC Spark Plugs were selected for standard equipment on all Liberty and Hispano-Suiza airplane motors.

During the war, aircraft plugs for the government had first call in our factories. We are now ready to supply AC Aviation Plugs for private use.

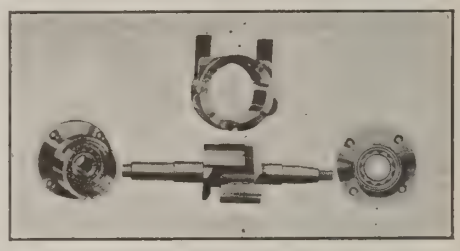
The New Splitdorf Magneto

IN the production of its new series of Aero type magnetos for passenger cars and motor trucks, the Splitdorf Electrical Co. has incorporated certain changes that will interest alike the engineering fraternity and laymen connected with the automotive industry. The new instrument makes its appearance in a jacket of khaki, as is appropriate for one born during the stress of war and a most effective participant in the conflict on the allied side.

Aside from this change of color there are a number of interesting constructional innovations. One of these is the use of a single square carbon brush. The new instrument shows a decided increase in sturdiness, the interrupter points, for instance, being noticeably heavier. Micarta gears are used and the distributor board

The Splitdorf Aero Magneto with cover removed

is made of a new composition known as Americanite. The Mason principle of stationary windings and revolving poles is retained in the new instrument, which is unidirectional.



While no radical change has been made, still the importance of the unidirectional feature will at once be realized and appreciated by everyone interested in this class of equipment.

Since a magneto is an alternating current generator, it produces its current in the form of positive and negative waves. It has been found in experimenting with instruments of this kind that one can wave series always is stronger than the other and in the Aero type magneto it is the negative wave series which is the stronger. The aero instrument is so designed that the negative waves are utilized as the spark producing waves. These flow always in the one direction through the instrument and the spark plugs, hence the designation unidirectional waves as the spark producing ones. In the Aero magneto the breaker operating cam has two lobes and the revolving field or rotor has four wings.

When the rotor wings on the distributer end of the magneto leave the poles, the cam separates the platinum points. A spark is now produced. When the rotor wings on the drive end of the magneto leave the poles, the cam holds the platinum points open; no spark is produced at this function, but the stray magnetic lines and eddy currents in the field poles and coil are scavenged, leaving the core and poles free from magnetic interference for the next spark producing reversal. The above is for a magneto of right hand direction. In the left type the cam opens the platinum points when the rotor wings on the drive end leave the poles. In this case the position of the magnets is reversed. This is done to maintain a spark of the same polarity in both bases.

Americanite is a new insulating material which the Splitdorf company has discovered for use in electrical instruments and which the company manufactures in its own plant. It is moulded similar to products of this nature and in the case of the distributor block the contacts are moulded in with the Americanite. Mircata is the pressed material which is now used for the gears in Aero magnetos. The Mircata not only is very quiet, but is long lived as compared with metal.

The principle employed in Aero magnetos is that of using a so-called rotor (which is supported by the magnet) constituting extensions of the magnet poles. This rotor has two wings insulated from each other and each in continual contact with one of the poles, so that the polarity of the revolving members never changes. These wings revolve with the shaft, naturally, and as they do so they brush field pieces which are in contact with the core of the winding the latter houses in the arch of the magnet. Thus, the revolving pole extensions cut the lines of force and produce a low tension current in the primary. The production of the secondary is the same as that of the usual design of magneto. It may be seen that the one big disadvantage of the revolving armature type is overcome. This disadvantage is best illustrated by mentioning that in the armature type the tendency of the armature core is to maintain its polarity, thus having a reluctance to reverse which produces a deficiency in current generation. The revolving pole instrument has fewer parts than the ordinary type magnets; there is no change of polarity of the revolving members and the spark strength is the same regardless of timing lever position. Other advantages claimed for the Aero magneto are the simplicity of

Details of Splitdorf Aero Magneto contact breaker

construction, its provision for protection of the windings and condenser in the arch of the magnet, its very quick break and the great ease of adjustment even though the instrument be in operation.

Work of Marine Aeronautic Corps

Washington, D. C.—The Navy Department authorizes the following:

The first aviation unit organized in America and sent abroad using American-made material was the First Marine Aeronautic Company, equipped for water flying only, which is now stationed abroad at a naval base. This information is given in an announcement of the progress of Marine Corps aviation which has just been made public at Marine Corps headquarters.

In addition to the flying field maintained at Miami, Fla., where all training in actual flying is given, the Aviation Section of the Marine Corps gives candidates instruction in ground work at the Massachusetts Institute of Technology, Boston, Mass., and has two schools for instruction in aviation mechanics.

The standard of the Marine Reserve Flying Corps is very high. No men are accepted for entrance into its ground school with the prospect of becoming officers unless they are as nearly physically perfect as possible. Applicants must weigh not less than 135 pounds and not over 165 pounds. The enlisted personnel has been selected from the very best in the Marine Corps. They are highly trained and given every opportunity for promotion to a commission.

OXYGEN AND THE TRANS-ATLANTIC FLIGHT

By MAJOR T. S. RIPPON, R.A.F. Medical Service

ONE of the most important articles that should be carried on the machines attempting the flight across the Atlantic is an oxygen outfit for the pilot. It may be suggested that the extra weight is a handicap, but a consideration of the following facts should satisfy anyone of its value. (1) Oxygen increases the staying power and decreases the symptoms of

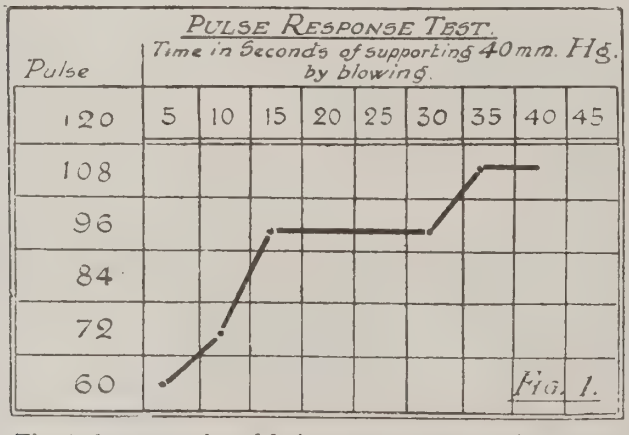

Fig. 1 shows results of fatigue test by supporting 40 mm. Hg. by blowing. Before test.

fatigue when given to athletes. I have seen it given during boxing contests with excellent results. It was administered to a cross-Channel swimmer when he was exhausted, and he was stimulated to renewed vitality and strength. (2) I have examined pilots after altitude flights with and without oxygen, and I can vouch for the fact that those pilots who did not use oxygen were profoundly fatigued, whilst those who used it were practically normal when they landed. The following figures demonstrate the accuracy of this statement. They show the physical condition of two officers before and after a flight using a liquid oxygen apparatus.

The test was absolutely successful in demonstrating that by the use of oxygen the pilot can be maintained at altitudes in a normal physical condition instead of being mentally sluggish and physically fatigued.

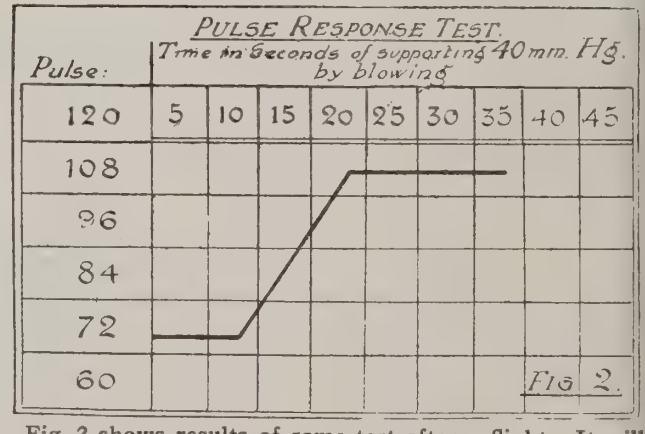

Fig. 2 shows results of same test after a flight. It will be seen that there is little or no difference.

1. The examination of Major S. for respiratory fatigue with the mercury manometer was as follows: Before flight the expiratory force was 60 mm. Hg. After flight it was 65 mm. Hg. The pilot felt invigorated instead of tired.

2. The breath holding test gave 46 minutes before flight, 55 minutes after flight.

3. Fatigue test by supporting 40 mm. Hg. by blowing. (See chart.)

Fig. 1.—Before flight.....40 secs.

Fig. 2.—After flight.....35 secs.
Showing practically no difference.

1. *Pulse*—

Circulatory System

Before flight.....70
At 5,000 ft.....75
At 10,000 ft.....82
At 15,000 ft.....70

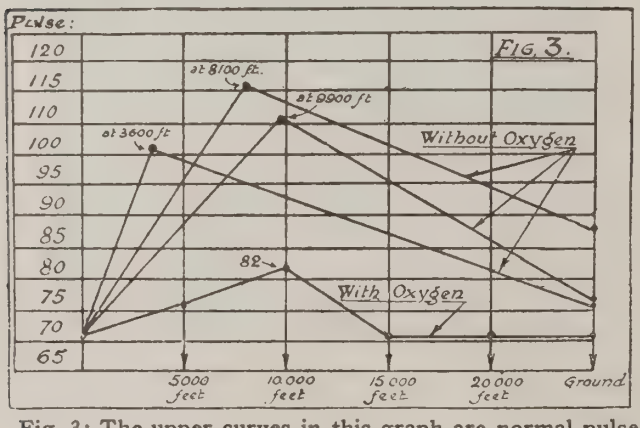

Fig. 3: The upper curves in this graph are normal pulse curves during a flight without oxygen, while the lower curve shows Major S.'s pulse during a flight in which he used oxygen. It will be noticed that the increase is very small for the first 10,000 ft., after which it drops to normal again.

At 20,000 ft.....70
After flight.....70
Showing that at 20,000 ft. his condition was normal.

2. *Blood-pressure*—

	Before flight	Afterflight
Systolic	120 mm. Hg.	125 mm. Hg.
Diastolic	80 mm. Hg.	90 mm. Hg.
Pulse pressure	40 mm. Hg.	35 mm. Hg.

Condition improved rather than depressed.

Symptoms.—No symptoms of distress. Slight discomfort at 15,000 ft. owing to expansion of gas in intestines due to lowering of atmospheric pressure.

Examination for decreased efficiency by estimating the visual reaction time by means of the pendulum myograph.

Major B.—Before flight—Visual reaction time, .221 secs. After flight.—.220, showing no appreciable loss of reflex speed.

In 1917 I examined a number of test pilots at Hendon after altitude flights with oxygen, and in every case there was marked fatigue.

Amongst others, I examined the late Capt. B. C. Hucks, and the actual figures were as follows:

	Before Flight	After Flight	Remarks
Pulse	84	96	
Breath held	65	48	Fatigue
Sustained 40 mm. mercury by blowing	54	35	Fatigue

The Atlantic flight is a test for the endurance of the pilots as well as the engines, and the value of oxygen at even low altitudes on long flights, is of the greatest importance.

—Courtesy Flight.

Dr. Bell Developed "Flying Fish" to Prey on Submarines

Washington.—Dr. Alexander Graham Bell, inventor of the telephone microphone and member of the Advisory War Board of the Navy Department, disclosed the invention of a device which threatened to make still more precarious the existence of submarines. The device is a mechanical flying fish, experiments and tests having been carried out at Braddeck, Nova Scotia.

The principle of the contrivance is that of the aeroplane. It has two aeroplane engines and propellers, but the wings are small, and are submerged. They were placed like the rungs of a ladder, one ladder being beneath the bow and one under each engine. They were tilted at an angle and made of hardened metal to resist wear.

The water pressing on both sides of the tilted planes caused the boat to rise when a speed of fifteen miles an hour had been attained, but the downward pressure of the water prevented it from rising clear of the water.

VOL. IX NEW YORK, APRIL 28, 1919 NO. 7

OPENING OF ATLANTIC CITY CONVENTION TO BE GREAT VICTORY LOAN RALLY

New York Herald Adds $3000 to Long List of Trophies and Prizes for Competition and Atlanta Journal Adds $1750

THE opening of the Second Pan-American Aeronautic Convention and Exposition is to be a Great Liberty Loan Rally.

Two more important prizes have been added to the long list. The New York *Herald* has offered a series of prizes amounting to $3000 for the best records made with aeroplanes of different horse power, from 100 h.p. to 1500 h.p. The Atlanta *Journal* has added prizes totalling $1750 to be awarded to the three aviators who make the best records in flying from Atlanta to New York carrying copies of the Atlanta *Journal*.

$1,000 Additional Cash Prizes for Intercollegiate Races

$1000 additional cash prizes have been offered for the Intercollegiate races, the prizes to go to defray the expenses of the Collegiate clubs competing.

The second Pan-American Aeronautical Convention, to be held at Atlantic City throughout the month of May, gives every promise of developing into the ace of aviation meets in the world's history. Featured by many notable contests that will try the war-won skill of scores of young men who winged the Hun under all sorts of battle conditions, the big objective of the meet will be to demonstrate the peace possibilities of the aircraft under war's pressure.

Great interest will be attached to the five Saturdays included in the month's programme when the spectacular stunts of competition, in which many aces of the Allied nations are entered, will be staged, while every day activities of the convention will be interesting because of the tests of all types of winged ships and the lectures by aviators and other aviation experts at the convention headquarters on the Steel Pier.

Aviation Field Ready

Preparations for the meet are now nearing completion. The big Municipal Aviation Field on the west side of the resort has been graded down and full facilities installed for aircraft about the field, which measures almost a mile square. Clubhouse features are ready just across the Meadow Boulevard opposite the field for the fliers, while just beyond along one of the protected reaches of the inside waters parking spaces for seaplanes have been arranged so that the birdmen who arrive here next week to tune up their ships and acquaint themselves with the atmospheric conditions of this section of the coast will have everything they need for their trial spins.

Included among the Saturday features will be seaplane contests over measured courses for both straightaway and altitude work, and the special intercollegiate race, in which Harvard, Yale, Columbia, Pennsylvania and several other of the leading universities will be represented. Land aeroplane contests, dirigible races, kite balloon speed events in ascending, descending and manœuvring, parachute competition and a novelty event for the "aviettes"—bicycles and motorcycles equipped with wings—are on the programme for the week ends, while on the daily list are exhibits of aeroplanes, motors, accessories, demonstrations and tests of sea and land planes, motors, dirigibles, balloons, passenger and lifting tests, showing the commercial possibilities of the lighter and heavier-than-air machines.

Interest in Pulitzer Trophy

It is expected that not less than a million people will witness the contest for the Pulitzer Trophy, offered by *The World* and the St. Louis *Post-Dispatch*. The keen interest which has been displayed in this long-distance event, and the number of expressions of intentions to enter, give assurance of spirited rivalry, making it almost certain that the month will see all American records broken.

Sixteen prize contests have already been arranged by the management of the convention. The promise is given that there will be a large number of others, many of first-class importance.

The Pulitzer Trophy, valued at $5,000, will go to the aviator making the longest flight to or from Atlantic City. Following th offer by *The World* and the *Post-Dispatch*, the *Boston Globe*, Cleveland *Plain Dealer* and Detroit *News* also offered trophies, with first, second and third cash prizes of $1,000, $500 and $250 respectively for the best flights between the city in which those newspapers are published and Atlantic City. The Atlanta *Journal* also has offered cash prizes of $1,000, $500 and $250 for the best flights in one day from Atlanta to Atlantic City, the contestants to carry and deliver copies of the *Journal* of current date.

Money awards so far total over $50,000, and it is expected that this amount will be doubled before the meet officially opens. Every effort is being made to have some flyer start or finish a transatlantic flight on Atlantic City's beach, the Aero Club of Atlantic City offering $25,000 to the successful aviator.

ARMY AVIATOR MAKES FIRST CHICAGO-NEW YORK NON-STOP FLIGHT

THE first non-stop aeroplane flight from Chicago to New York was made April 19 by Captain E. F. White, an American Army aviator, who flew 727 miles in a De Haviland Four army reconnaissance plane at an average speed of about 106 miles an hour. He ascended from the Ashburn Aviation Field, Chicago, at 9:50 o'clock, central time, and descended at Hazelhurst Field at Mineola, L. I., at 5:40 o'clock in the afternoon, the actual flying time being 6 hours and 50 minutes.

Officials of the Aero Club of America said they believed

that Captain White would have not only the honor of making the first non-stop flight between Chicago and New York City, but that he might also have the honor, for a while at least, of holding the American, and perhaps the world's record, for continuous flight.

In beginning the flight that Victor Carlstrom, Ruth Law, Katherine Stinson and many other aviators have attempted with only a short margin of distance cutting them from success, Captain White had great difficulty in taking to the air on the soft ground of Ashburn Field, the take-off grounds approved by the Aero Club of Illinois. The ground there was soft and the heavy army plane, with her load of more than 190 gallons of gasoline, cut into it deeply, but after the aviator had had his plane dragged to a drier and harder spot in the field he managed to take to the air.

Circling over Chicago, Captain White ascended to a height of more than 10,000 feet and throughout his flight he did not go below this level until he was ready to land, and at intervals he flew as high as 12,000 feet. He followed the route of the New York Central Railroad for the greater part of the distance, and cities along the route reported seeing him flying at great height and at high speed.

Colonel Archibald Miller, Director of Aviation in the Department of the East and one of the commanders of the Hazelhurst Field, was waiting there to meet Captain White and his mechanician, H. M. Schaffer, and they were taken to the field headquarters, where an informal reception was held.

The biplane used by Captain White in his flight was one of the standard De Haviland Four machines constructed for the use of the army in France, equipped with a twelve-cylinder Liberty motor of about 400 horsepower.

The machine was prepared for the trip at McCook Field, near Dayton, Ohio, and tested thoroughly in several flights. As one of the last tests, Captain White flew the machine from Dayton to Detroit. On Friday he flew it from Detroit to Chicago, and the motors and plane behaved so well on that test flight that Captain White decided to try to fly to New York without delay.

In making his landing at Ashburn Field upon his arrival there from Detroit the aviator had difficulty in landing because of the muddy condition of the field.

Get News of the Start

Shortly after 10 o'clock in the morning Henry Woodhouse of the Board of Governors of the Aero Club of America, received a telegram from James S. Stephens, President of the Aero Club of Illinois, saying that the Board of Governors of that organization had received notice from Captain White that the record flight would be attempted. The telegram added that the start had been made at 9:40 o'clock, central time, and asked that a representative of the Aero Club of America, with the army officers of the Eastern Department and of the army aviation fields at Mineola, set the actual time of the arrival of the plane in this city.

Hours before the plane was due to arrive at Mineola a group of officers had gathered at the landing place to wait the ending of the flight. Telegrams were received from towns in Indiana, from Cleveland, Ohio, and other places in this State advising them that Captain White was still in the air. Officials of the Aero Club were on the watch in this city and they caught sight of the dark blue machine about 5:30 o'clock as she circled high overhead on her way to the landing place.

Captain White would not discuss the details of the flight when he landed, and the army officers did not press him to talk because of the manifestation of weariness both by him and his mechanic. He said that the winds and all other atmospheric conditions had been perfect throughout the flight and that this, with the perfect functioning of the motor and the good behavior of the plane, enabled him to make the continuous flight. He said that he felt no more tired than he would have felt had he ridden three hours in an automobile, but it was plain to the officers that the long nervous strain had had its effect upon him and his mechanic.

Give Aviation Its Chance

THE news that the military aviation program of the War Department is to be sharply curtailed at once should not greatly startle any one who is in touch with the general scheme of our demobilization plan. An army of a little more than 500,000 men, such as is proposed for the United States obviously does not need the aviation equipment of an army of 4,000,000. Whether the demotion of Major-General William L. Kenly, director of military aeronautics, to a position as colonel of artillery is or is not inspired by official hostility to his plan for a permanent aviation organization distinct from the army, navy and marine corps is beside the question. We were certain to hear before long of a reduction in the size of the service.

Much more seriously to be regretted is the apparent governmental inclination to turn its back on all aviation, military or commercial, and leave the infant industry to struggle along as best it may under the guidance and in the hands of private citizens. After the fabulous sums that have been spent in furtherance of our air program the country will certainly resent the scrapping of our vast resources of aeroplanes and equipment, which are apparently to be thrown on the market in casual manner as salvage. Aviation undoubtedly has a wonderful future both commercially and as a sport, but it will need careful fostering for months and years to come, and this fostering only the government is in a position to supply. Great Britain and several continental countries have already learned this lesson and are putting state resources behind the development of commercial aviation; but so far only the Post Office Department seems to be showing an equal interest over here.—Editorial in New York *Globe*.

Congress Should Establish an Aeronautical Policy

ALTHOUGH the aeroplane is an American invention, the United States was hopelessly outclassed at the beginning of the European struggle in the development and application of what has proved a sensationally successful weapon of war and is sure to play an increasingly important part in peace.

When we entered the conflict in 1917 we had no aeroplanes worth talking about, no aeroplane factories of consequence, no aeroplane motors. We had to begin at the bottom of the industry and learn its processes step by step. We had generous helpers in the nations that had been fighting Germany. They laid their experience before us and gave us the advantage of their researches, their errors and their triumphs.

The United States made many blunders, costly mistakes and futile experiments in its aeroplane endeavor. But after a time we began to produce aeroplanes as good as any other nation could turn out, with pilots and observers second to those of no other country. To do this cost us hundreds of millions of dollars, which nobody begrudges, and scores of promising lives, which all regret.

As the armistice was signed the United States was prepared to take and told its proper place as the leading nation in aeroplane production and in the military use of aeroplanes. A sane and intelligent public policy would keep it in that leadership, war or no war.

Has the Administration adopted such a policy? Has it sought to encourage experiment, to encourage improvement, to encourage national enterprise in airships?

It has not.

Instead, as the facts and figures disclosed by Senator New of Indiana in *The Sun* yesterday show, the Administration has set out to wreck the costly structure of production built up during the war, to scrap the material on hand, to disband the organization of experts laboriously gathered together, and to discourage continued efforts in the field of incalculable importance to America as a nation and to Americans as individuals. The Administration is abandoning all that has been gained, and unless its purpose can be frustrated it will reduce us to the humiliating situation we were in before the war.

This folly can be avoided. The United States can be kept where it belongs in aeronautics. America's achievements in the air can be utilized as the foundation for greater successes in the future. And these things can be done immediately by the calling of Congress in special session, so that the representatives of the American people can adopt and put in force a military and naval aeronautical policy which shall protect the nation and promote its interests in a great industry of the future.—Editorial in New York *Sun*.

The News of the Week

Major Macauley Flies 2,400 Miles in 17 Hours

Americaus, Ga., April 17.—Major T. C. Macauley arrived at Souther Field on April 16 from San Diego, Cal., making the flight of 2,400 miles in nineteen hours, with one stop at Fort Worth, Tex. His speed averaged 137 miles an hour.

He had been closely following a storm moving to the east, and overtook it on the Florida-Georgia line, turned about and came back to Souther Field.

He made four stops, at Tucson, Sweetwater, Fort Worth and Americus.

Newark Firm Announces Aerial Merchandise Delivery Service to Asbury Park

The L. S. Plaut & Co. department store of Newark announced on April 19 that, beginning next Monday, it would make aeroplane deliveries of merchandise to customers at Asbury Park. It was announced that a Newark-built Wittemann-Lewis Aircraft Corporation aeroplane would be used, and that the pilot would, at the beginning of the flight, circle Military Park in Newark, dropping Victory Loan leaflets and an envelope containing a $50 Victory bond.

Brazil Appropriates $500,000 for Civil and Military Aeronautics

Brazil will spend half a million dollars this year for advancing aviation, a Rio de Janeiro dispatch announced recently.

The ministry of war will use the sum in organizing an aviation service, buying aeroplanes, establishing aviation schools and purchasing necessary supplies, it was stated.

The service will be operated for civil needs, but will be ready for war purposes.

Aeroplane Used to Locate Home Site

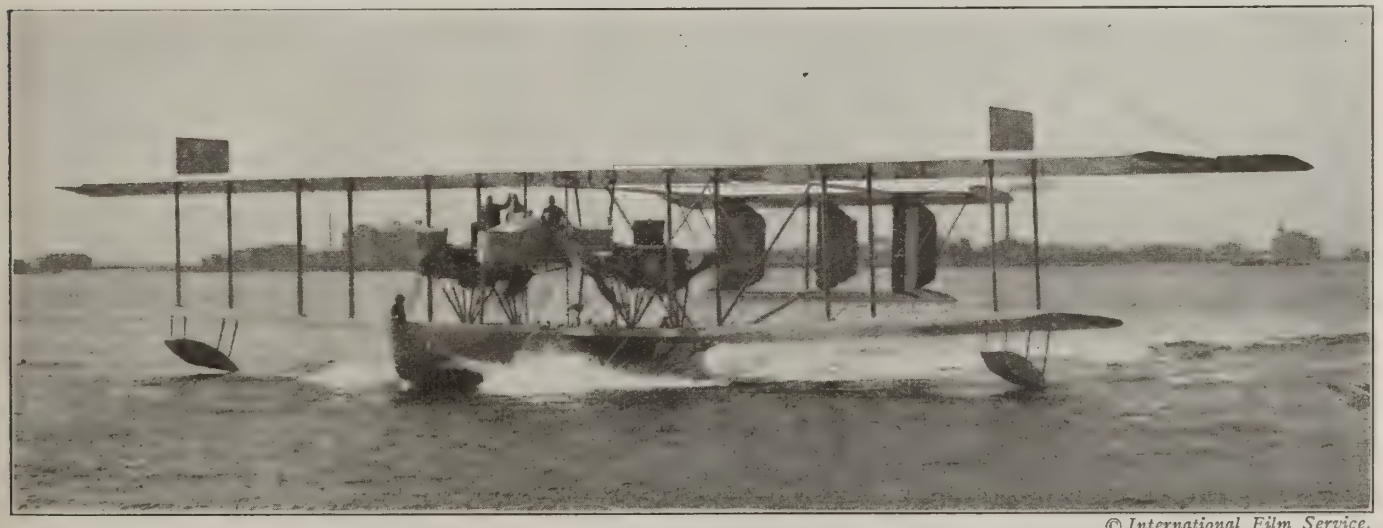
Palm Beach, Fla.—William Van Alen, of Severance & Van Alen, architects, rerently was called upon by a client to select the most advantageous position for the location of a new villa. The property extends from the ocean to Lake Worth and comprises about twenty acres. At the present time it is practically impenetrable on account of the jungle which runs through it, connecting up some low land containing water, which requires filling in. The central road bisecting the property did not afford a sufficient point of vantage to determine the contour of the property. The advantage of using an aeroplane for the obtaining of this information appealed to Mr. Van Alen at once. He therefore hired a pilot from an aerodrome to take him up and they flew together over the property until Mr. Van Alen had obtained the information he sought.

B. C. Boulton, formerly of the Research Department, Department of Military Aeronautics, Authority on Stress Analysis of Aeroplanes and design of structural parts, is now Special Contributing Editor to Aerial Age

B. C. Boulton Joins Aerial Age Contributing Staff

Aerial Age is gratified to be able to announce to its readers this week that it has secured the services of B. C. Boulton, of the Engineering Staff at McCook Field as a Special Contributing Technical Editor.

Mr. Boulton's work has been in the Research Department, renamed this year the Structures and Aerodynamics Section of the Aeroplane Department, Engineering Division. His work has been on the stress analysis of aeroplanes, both those designed at the Field and the very numerous ones submitted for sand test, including the analysis of the wing cell, chassis, fuselage and miscellaneous parts. He designed and proportioned the structural members of the aeroplanes built at the field, and criticized and made recommendations for others that were submitted by manufacturers to the Government. One of the most important phases of his work was the development of the present Government methods of analysis.



Mr. Boulton has done a good deal in devising and developing new forms of construction and in adopting new materials to aeroplane work. He has, also, been very closely in touch with the Testing Department, and has frequently been called upon to write the more important and difficult reports issued by the Testing Department.

Mr. Boulton graduated in 1916 from the Massachusetts Institute of Technology in Civil Engineering, and until going to McCook Field in November, 1917, he practiced that profession, specializing in structural work.

From the wide experience which Mr. Boulton has had, the material which he will prepare for Aerial Age will be authoritative and thoroughly up-to-date in character.

The Trans-Atlantic Flight

Three contenders in the competition for the *Daily Mail* prize have been ready for the past week to undertake the trans-Atlantic flight, but have been prevented from starting by severe weather prevailing in the North Atlantic. One of these, Major J. C. P. Wood, who will fly westward from Limerick, Ireland, came to grief on April 18 in the first step of his flight by falling into the Irish Sea en route from Eastchurch to Ireland. The forced descent resulted from a surplus flow of fuel causing carburetor trouble. Repairs, however, will be completed as rapidly as possible.

The NC-2, powered by four Liberty motors is undergoing exhaustive tests at Rockaway Naval Air Station, in preparation for the attempt to fly across the Atlantic

On April 16 Captain C. W. F. Morgan made the first trial flight at St. John's, N. F., of the Martinsyde aeroplane, the Rymore. The test showed that the motor and radio were in good working order. Owing to the very unfavorable weather existing since that date, no further tests were made prior to April 21.

Harry G. Hawker and Lieutenant Commander Grieve are also impatiently awaiting the advent of favorable weather. Every test has been made of their Short aeroplane and its equipment, and nothing remains to be done in preparation for the flight.

The tests of the NC planes being groomed for the big flight continue. The NC-4 has been delivered by the Curtiss Company and is being assembled at Rockaway. The NC-3 will be ready for trials within a few days. It is not known how soon the NC-1 will be ready for further trials.

A trial flight of the NC-2 was made under full load on April 17, but she failed to rise from the water. No explanation was made of the failure of the trial, but a redistribution of weights is expected to remedy the trouble.

Lieutenant Commander P. N. L. Bellinger has reported to Commander Towers regarding the selection of a "jumping-off" place for the Navy fliers. It is said a site has been selected on the shores of the Bay of Biscay, on the south coast of Newfoundland.

The ninth entry for the *Daily Mail* Prize has been made by J. A. Peters, representing the Alliance Aeroplane Company. Mr. Peters is to act as pilot, and will be accompanied by Captain N. R. Curtiss as navigator and assistant pilot. The plane is a 450 horse power biplane.

Lieut. Fontan made another start on April 19 for Casablanca, on the west coast of Morocco, from where he will attempt to fly to South America, but no information has been received confirming his safe arrival at that point.

It is reported that the Handley Page biplane, which has been entered by the manufacturers, has been prepared for transport, and will be ready for the flight by the middle of May.

Mr. Sydney Pickles (retired Flight-Lieutenant, R.N.A.S.) has handed in his entry for the Atlantic flight at the Aero Club.

He will, says the Central News, make an attempt to fly from St. John's, Newfoundland, early this month in a Fairey patent variable wing aeroplane, and he hopes to accomplish the journey to Southampton in fourteen hours. Mr. Pickles is a young Australian, who took part in many bombing raids on Ostend and Zeebrugge.

First American-Built Battle Plane De H. 4, Shown By U. S. National Museum

Washington, D. C.—The U. S. National Museum now has on exhibition the first American-built battle plane constructed in this country for the U. S. Government. This plane was constructed in Dayton, Ohio, by the Dayton-Wright Aeroplane Company, and was completed on October 29, 1917. It is the first plane flown with a Liberty 12 motor. The De H. 4 was adopted by the United States Government in 1917 for use by the American Expeditionary Forces as a day-bomber and observation plane. It was first flown on the day of its completion at the South Field of the Dayton-Wright Company in Ohio. Since that time it has been used for all military tests and experiments intended to improve the De H. 4. In all, more than 2,600 experiments, ranging from motor tests and different propellers to slight changes in control surfaces, have been made on this machine.

The machine carries full military equipment, including ten No. 25 bombs, camera, wireless telegraph and generator, oxygen bottles and helmets, intercommunicating telephone, heated clothing and generator, and armament consisting of two Lewis and two Marlin machine guns.

About eighteen hundred of these aeroplanes were delivered to the Army in France and they were used extensively on the front for day bombing and observation work.

Bleriot-Spad at Indianapolis Speedway During International Race

Andre Boillot will fly the latest type of French battleplane at the Indianapolis race meeting on May 31. Boillot was given a Croix de Guerre for his service at the front. For the last twelve months he has been chief test and experimental pilot for the Bleriot Company.

The first American-built battleplane—a De Haviland made by the Dayton-Wright Company—on display at the permanent exhibit in the U. S. National Museum at Washington

Civilian Flying Licenses Issued By Joint Army and Navy Board of Aeronautic Cognizance

The following licenses have recently been issued:

License No.	Issued to	Address
334	C. J. Zimmerman,	Keyport, N. J.
343	J. B. Porter,	Wabash, Indiana
377	Leon D. Smith,	Millterton, Pa.
380	Pomilio Bros. Corporation,	New York City.
381	Fort Worth Aerial Transportation Co.,	Fort Worth, Texas.
382	Morse D. Levitt,	New York City.
383	William L. Lamkin,	Porterville, Calif.
384	Northeastern Balloon Co.,	Newburyport, Mass.
385	Lamont A. McDowell,	Elizabeth, N. J.
386	Robert Bruce McGill,	San Francisco, Calif.
387	Harold C. Brooks,	Wabash, Ind.
388	V. P. Hollingsworth,	Wabash, Ind.
389	Henry F. Fawcett,	Wabash, Ind.
390	The Cameron Aerial Co.,	Cameron, Missouri.
391	Joseph M. Pallissard,	Dayton, Ohio.
392	The Curtiss Eastern Airplane Corp.,	Philadelphia, Pa.
393	George H. Watkins,	Cambridge, Mass.
394	Carl H. Duede,	Stuart, Iowa.
395	S. A. Purcell,	San Francisco, Calif.
396	James Dazill McKee,	Pittsburgh, Pa.
397	David R. Baker,	New York City.
398	Alexander Seversky,	New York City.
399	E. Clark Harter,	Wenona, Ill.
400	Arthur W. Fox,	Rockaway, N. J.
401	Everett K. Davey,	Rockaway, N. J.
402	John H. Hughes,	Macon, Georgia.

Aerial League of West Virginia to Aid Loan Campaign

Charleston, W. Va.—A group of citizens, some of whom served as aviators in France during the war, have formed the Aerial League of West Virginia for the purpose of fostering aviation in that state.

The League has offered to supply aviators for the Liberty Loan Committee during the campaign, when it was learned that the arrangement for exhibition flights for large cities could not be effected by the committee for West Virginia, it being considered too inaccessible for transportation of the equipment.

The League's organization embraces the entire state. Lieutenant L. W. Frankley is president of the League, Lieutenant W. Beall vice president, Mr. O. R. Bush treasurer, and Mr. E. M. Arbuckle secretary.

Doctor Orders Curtiss Plane for Making Professional Calls

Beaver City, Neb.—Dr. F. A. Brewster, of this city, is going to make his long professional calls in the future by aeroplane. The aeroplane has been ordered from the Curtiss Aeroplane and Motor Co. It will be piloted by Wade Stevens, of this place, a former lieutenant and instructor in the aviation branch of the army.

Dr. Brewster holds the distinction of being the first physician to purchase a plane for this use. He has a wide practice in Nebraska, and many of his calls make necessary long trips by automobile or train. He believes that the aeroplane will solve for him the question of bad roads and inconvenient train schedules.

Government Building Helium Plant Near Fort Worth

Washington.—A helium plant is being constructed by the Government at North Fort Worth, Tex., to provide helium gas for airships. The plant will cost $900,000. The products of certain natural gas wells in Clay County, Tex., have been found best suited for the extraction of helium, and pipe lines will be arranged to Fort Worth.

Japanese Air Commission Visiting Army Fields

Mineola, L. I., April 21.—Admiral K. Yoshida, Lieutenant Commander Y. Yeyeda, Lieutenant Commanders Kono and Sugi, Professor Subara and Engineer T. Iwaski, members of a Japanese mission who have been visiting army and navy aeronautical stations throughout the country, were at Hazelhurst Field on April 21. Colonel B. M. Atkinson put a squadron of aviators through a series of stunts.

Aero Club Organized in Grand Rapids

Grand Rapids, Mich.—An aeronautical association with a purpose of promoting aerial activity was organized in Grand Rapids recently with a charter membership of thirty-two. It is hoped to arrange for the establishment of a municipal aerial landing place in Grand Rapids in the near future.

B. A. Hathaway was chosen temporary president. R. I. White and Howard Baxter were elected vice presidents; M. Jewell Clark, treasurer; Fred E. Goodall, secretary, and Francis D. Campau, counsel.

Army Balloons Start On Metereological Test Flight

Omaha, Neb., April 17.—Two United States army balloons started at midnight on an experimental flight in high altitudes, with a view to testing meteorological instruments.

Lieutenant Colonel W. S. Wuest, commanding officer at Fort Omaha, and Lieutenant Ralph A. Reynolds accompanied the balloon, which was consigned to an altitude of 5,000 feet. Captain F. W. Goodale and Lieutenant C. L. Leroy Meisinger were in the craft selected to register 10,000 feet.

After being aloft for from forty-eight to seventy-two hours at the selected levels, the airships reported safe landings, one at Cabot, Ark., and the other at Orola, Miss.

Howard E. Coffin Returns

Washington, D. C.—Howard E. Coffin, former chairman of the Aircraft Board, returned to Washington from a trip to Europe, taken to examine aircraft developments and tendencies. He was much impressed by the extensive plans of the European governments for direction and encouragement of aerial transit along both military and commercial lines. Every encouragement is being offered to commercial developments, says Mr. Coffin, and Britain intends, evidently, to seek both the military and commercial supremacy of the air. The elaborateness of the plans being laid for the encouragement and regulation of aviation is quite beyond comprehension on this side of the ocean.

Lieut. S. B. Vrooman, Named in Hughes' Report Exonerated by Attorney General

Washington, D. C.—Attorney General Palmer announced here that there will be no prosecution of Lieutenant S. B. Vrooman, who was declared by the Hughes report on aircraft production to have been regarded as having violated a section of the Criminal Code prohibiting any person acting for the Government in transacting business with a corporation in which he is interested. The Attorney General explains that his action in refusing to prosecute the officer is based on new testimony which entirely satisfies him that Lieutenant Vrooman was in no way responsible for the inspection at the Vrooman plant, and that he is not even technically guilty of having violated the Criminal Code.

"I am quite sure," says the Attorney General's statement, "that if the testimony now before me had been before Justice Hughes and Attorney General Gregory, they would not have reached the conclusion they did.

"Lieutenant Vrooman was in charge of the inspection of propeller lumber, including mahogany. The S. B. Vrooman Company, in which he was financially interested, was one of the companies which furnished such lumber to the Government. It was not claimed that he actually inspected any of the lumber furnished by that company. He did, however, select inspectors, or, at least, the managers of the district offices, who, in turn, selected the inspectors.

"Judge Hughes reported that, because those who did the actual inspection at the Vrooman plant, as well as others, were responsible to him for the efficiency of the inspection, he was the agent of the Government directly responsible for the proper inspection of the mahogany delivered by the S. B. Vrooman Company to the Government, and that acting in the capacity he violated the law. Attorney General Gregory, in transmitting Judge Hughes' report to the President, concurred in the conclusion.

"It appears, however, that Lieutenant Vrooman, after the publication of the report, claimed that neither he nor the men under him were responsible for the inspection at the Vrooman plant. He had testified that all the lumber furnished by this company was furnished under contracts originally made with the British Government, and taken over by our Government, and that the inspection was under the original British contracts, and not under aircraft specifications.

"His claim was that he meant to say that inspection was not only under different specifications, but that it was itself made not by the organization of which he was in charge, but by Inspectors of the National Hardwood Lumber Association, over which he had no jurisdiction. This, evidently, was not what either Judge Hughes or Attorney General Gregory understood from the statements made.

"After Lieutenant Vrooman made his complaint, Attorney General Gregory ordered a further investigation to be made to ascertain whether, in fact, either Lieutenant Vrooman or the men under him had any responsibility for the inspection at the Vrooman plant. This investigation, consisting of the taking of testimony of several witnesses under oath, was not completed in time for Attorney General Gregory to pass on the matter before retiring from office. It is now my duty to institute prosecution against Lieutenant Vrooman unless this additional investigation shows that the claim made by him after the publication of Judge Hughes' report is true.

"I have carefully examined the testimony on this point, and it leaves no doubt that the inspection of the lumber furnished by the Vrooman company to our Government under the British contracts was not made either by Lieutenant Vrooman or by the men under him. It was made by inspectors of the National Hardwood Lumber Association, who were entirely independent of him. The utmost that any man under him did was to receive the inspectors' reports and transmit them to authorities at Washington other than Lieutenant Vrooman.

"Under these circumstances, I am quite sure that if the testimony now before me had been before Judge Hughes and Attorney General Gregory they would not have reached the conclusion they did. The testimony entirely satisfies me that Lieutenant Vrooman was in no way responsible for the inspection at the Vrooman plant, and that he is not even technically guilty of having violated Section 41 of the Criminal Code. This completely vindicates him, and there will be no prosecution."

Curtiss Plane Aids Actors' Fund

Mrs. George McManus, wife of the cartoonist and star in "The Newlyweds" when it was staged, rode over the Polo Grounds during the field day for the Actors' Fund of America on April 13. She accompanied Roland Rohlfs, Curtiss test pilot, in an army training plane, which was donated for the occasion by the Curtiss company. When over the field and from an altitude of 300 feet, Mrs. McManus dropped an autographed baseball which was auctioned off.

Book Review

"How to Build a Scout Monoplane." Compiled by George D. White.

A scout monoplane built in the home workshop. This comprehensive pamphlet is written without use of technical terms so that any young aeronautical enthusiast can readily understand its contents. It treats of wing construction, covering of the wings, streamlining the fuselage, controls, power plant and assembly.

This valuable publication can be purchased at The Aeronautic Library, Inc., 299 Madison Avenue, New York City, at a price of 30 cents, including postage.

© International Film Service

The latest addition to the police force of Venice, California, is an aeroplane. A member of the force has been sworn in as pilot

The AIRCRAFT TRADE REVIEW

Curtiss Company Delivers Planes Under Own Power

Inaugurating a policy which will be followed by the Curtiss Aeroplane and Motor Corp., in delivering aeroplanes to purchasers under their own power, the first MF flying boat was flown to Atlantic City recently. Lawrence Leon, Curtiss pilot, who was instructor in cross-country work and acrobatics for two years at Call Field, piloted the boat. He was accompanied by Ensign James L. Wheeler of the United States Naval Flying Corps.

The start was made from Rockaway at 1 o'clock in the face of a stiff head wind and, after losing their way in the fog, the two pilots arrived at Atlantic City at 3 o'clock.

The boat will be used by the Curtiss Aeroplane Company in carrying passengers. Ensign Wheeler has been engaged by Earle Ovington, president of the Curtiss Aeroplane Company, as pilot.

Standard Parts Officials Back From Service

Capt E. R. Finkenstaedt, formerly active in the production of the Liberty truck for the government at Washington, has resumed his duties as assistant to President Christian Girl. Major Lewis P. Kalb, until recently in charge of designing, testing and specification work in the engineering division of the Motor Transport Corps, has joined the engineering staff of the company as assistant director of engineering, and Capt. A. L. Watts, in charge of the specification and record section of the engineering division of the Motor Transport Corps, has also joined the engineering staff. Both Lieut. Rex Gosling, who before entering service was purchasing agent of the Standard Welding division, and Lieut. Ray Jones, who gave up his position as production manager of the Perfection Spring divisions to enlist in the navy, have returned to their respective plants.

Czecho-Slovaks Purchase $1,000,000 Worth of American Planes

Washington, D. C.—It is reported here that the sale of $319,000 worth of planes and $600,000 worth of equipment recently announced was made to a representative of the Czecho-Slovak government.

Central School of Aviation Has New $100,000 Building

Pittsburg, Kansas.—The Central School of Aviation, at Pittsburg, Kansas, has recently occupied its new $100,000 building. The school is affiliated with the Pittsburg Automobile and Tractor School and incorporated in the State of Kansas.

Two army aviators, Lieutenants Water and Montgomery, have been added to the faculty. Two new planes are being added to the present equipment.

New Detroit Warehouse for Aluminum Company

Detroit.—The Aluminum Co. of America, which leases a warehouse here, is about to build one of its own. A 5-acre site in the northeastern factory district has been purchased and building will start soon.

F. R. Porter, Former Chief Engineer at McCook Field, Now With Curtiss

New York.—F. R. Porter has been appointed chief motor engineer of the Curtiss Engineering Corp., Garden City, L. I., where the experimental work of the Curtiss company is carried on. He has also been appointed chief engineer of the Curtiss Aeroplane & Motor Corp., Buffalo. His headquarters will be at Garden City. For the past year Mr. Porter was chief engineer at McCook Field for the Government, and in that capacity had to handle all new inventions in connection with engines and accessories.

Motor Truck Service and Spare Parts Delivered By Aeroplane

Aerial distribution of repair parts to distributers and service stations for Service trucks has been instituted by the Service Motor Truck Co. of Wabash, Indiana. It will be handled under contract with the Service Aviation Training & Transportation Co., a separate organization formed by stockholders of the Service Motor Truck Co. J. P. Porter, chief pilot, was formerly of the Royal Flying Corps and was one of the instructors at Love Field Aviation Camp, Texas. Assistant pilots are Harold C. Brooks and V. P. Hollingsworth. Oscar Bricker, formerly of Love Field, is in charge of the hangars and landing field. A 44-acre field has been prepared for landing. Curtiss JN-4 planes will be used.

Status of Outstanding Orders and Principal Items of Equipment Issued for Air Service

(Prepared by Statistics Branch, General Staff, War Department, April 12, 1919.)

Includes all articles of equipment on outstanding contracts on March 28, 1919, except aeroplane bombs and clothing.

DELIVERIES OVER 90 PER CENT OF ORDERS

	Orders	Deliveries	Per Cent
De Havilland 4 planes	4,846	4,842	99.9
Compasses	12,650	12,644	99.9

The Curtiss Eastern Aeroplane Company has opened the first aeroplane sales room in Philadelphia. The plane on view is a Curtiss JN-HD-2

U. S. Rubber Profits $16,072,042

New York, N. Y.—The U. S. Rubber Co. announced a record-breaking net profit of $16,072,042 for 1918. Sales increased from $176,159,694 to $215,398,425.

New Standard Parts Factory at Flint

Cleveland.—A new spring factory is under construction for the Standard Parts Co. at Flint. It will replace the company's present Flint plant, long since outgrown. The new factory will have an immediate capacity four times greater than that of the old plant.

Air Service Contracts Concelled and Suspended, Over $500,000,000

(Prepared by Statistics Branch, General Staff, War Department, April 12, 1919.)

During the week ended April 5, 1919, the total Bureau of Aircraft Production obligations were reduced over $4,000,000, making a total of cancelled and suspended contracts of $500,679,617 since the armistice. The following is a summary of the value of cancellations and suspensions of contracts through April 5, 1919:

	Value	*Per cent of total*
Engines and spare parts	$275,616,187	55
Aeroplanes and spare parts	166,081,004	33
Chemicals and chem. plants	18,334,715	4
Instruments and accessories	10,868,841	2
Balloons and supplies	9,314,963	2
Fabrics, lumber and metals	7,228,778	1
Miscellaneous	13,235,129	3
Total	$500,679,617	

Aeronautical Instrument Co. to Make Claudel Carburetors

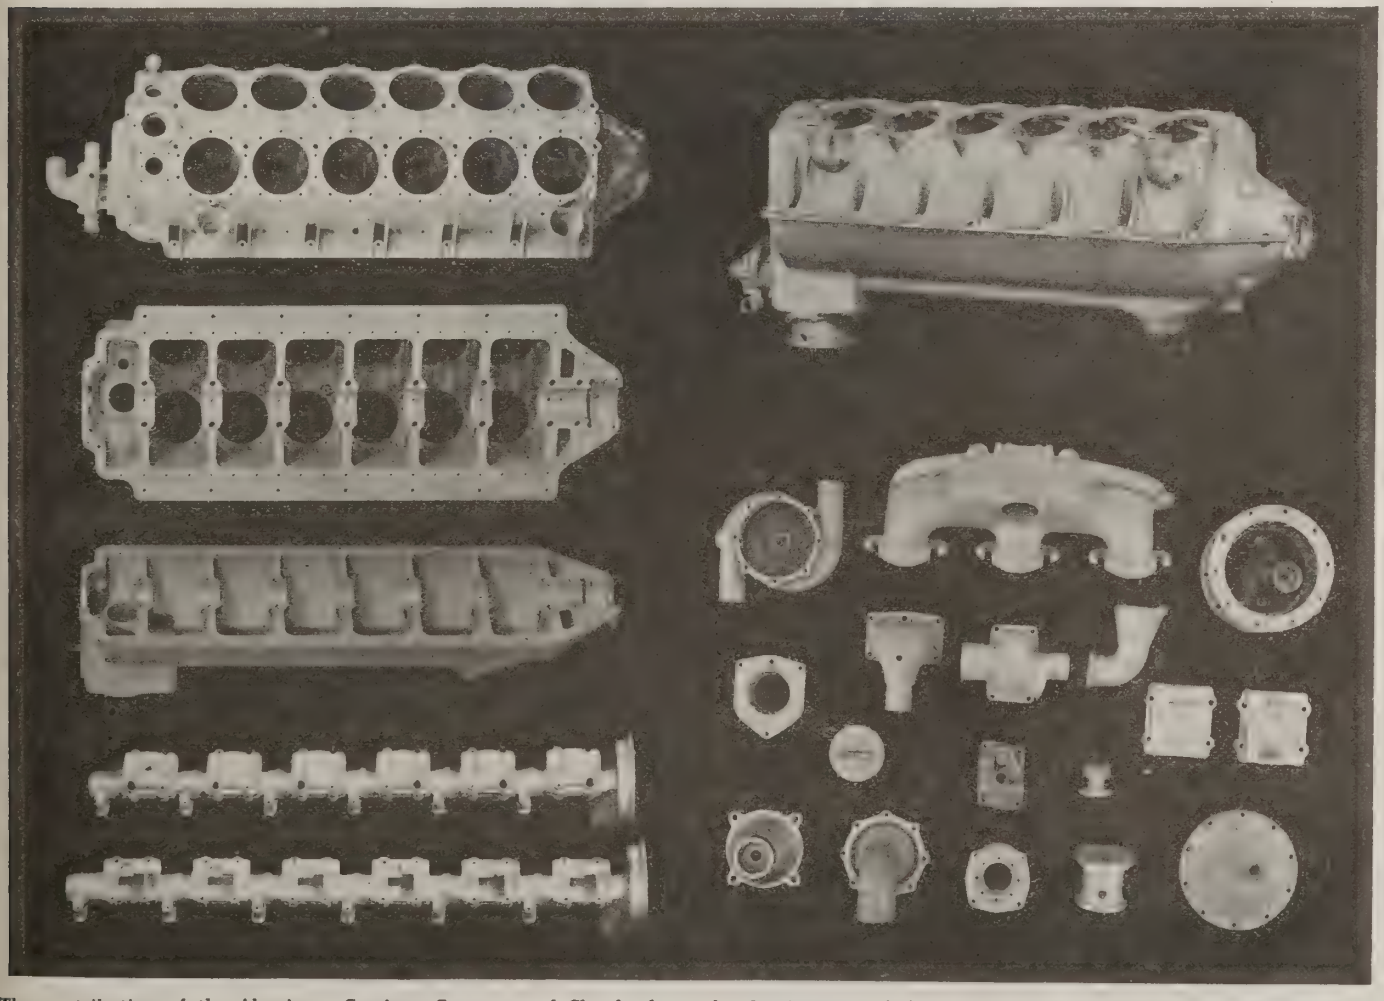
The Aeronautical Equipment Co. has contracted with the Claudel Co. of France for the American rights to manufacture the Claudel carburetor. The contract calls for a minimum of 20,000 carburetors for the first year, progressing through a minimum of 100,000 carburetors in the sixth year. The company expects to exceed these figures very considerably.

Personal Pars

Amel R. Carlson, who has completed his government service on the purchasing staff of the Wright-Martin Aircraft Corp., New Brunswick, N. J., has returned as assistant general manager to the Commonwealth Motors Co., Chicago.

LeRoy A. Hillman will be in charge of the branch of the Detroit Pressed Steel Co., which has been opened here for Disteel wheels. Mr. Hillman has been in civilian service with the Bureau of Aircraft Production, and before that operated The Bearings Shop, interest in which he still retains.

M. W. Bartlett, for the past five years secretary of the Splitdorf Electrical Co., has joined the Wire Wheel Corp., of America as Eastern District representative, with headquarters in New York at 835 Eleventh Avenue. Service direction and export matters are also under his supervision.



E. O. Bennett, formerly stationed at the research laboratory, National Advisory Committee for Aeronautics, Langley Field, Hampton, Va., is now associated with the engineering department of the Standard Oil Co., San Francisco, Cal.

Walter O. Adams has resigned as plant manager of the Erie Specialty Co., Erie, Pa., and has opened an office at 1038 Dime Bank Building, Detroit, Mich., as mechanical-chemical engineer, specializing in production and sales.

A. L. Clayden has resigned as consulting engineer of the Wright-Martin Aircraft Corporation, New Brunswick, N. J., and will sail shortly for London, where he will open an office as consulting engineer. He plans to specialize in European investigations for American companies in the automotive field, and will spend a portion of each year in this country.

Lee C. Carlton has resigned as Chicago branch manager of the American Bosch Magneto Corporation, and has been appointed mid-West manager of the Ericsson Mfg. Co., with offices in the Century Building, that city.

Charles E. Barton is now associated with the engineering department of the Lincoln Motor Co, Detroit, Mich. He was formerly in the service of the Government, in the Bureau of Aircraft Production, and was stationed at McCook Field, Dayton, Ohio.

The contribution of the Aluminum Castings Company, of Cleveland, to the development of the Liberty Motor. Excellent examples of the castings which this company made

Hon. Albert S. Burleson, Postmaster General
Hon. Otto Praeger, Second Assistant Postmaster General
J. B. Corridon, Superintendent, Division of Aerial Mail Service
Louis T. Bussler, Chief of Maintenance and Equipment

J. Clark Edgerton, Chief of Flying Operations
George L. Conner, Chief Clerk, Division of Aerial Mail Service
Eugene J. Scanlon, Chief of Supplies
Charles N. Kight, Special Representative

Edward V. Gardner

Edward V. Gardner was one of the first civilian pilots in the Postal Aero Mail Service and has served on the Washington, Philadelphia and New York route since the military were replaced by civilian pilots. He has never missed a single trip since entering the service. Though he has flown in all sorts of weather, battling fierce storms and winter gales which at times retarded his flight, he has not once failed to deliver the mail on the New York-Washington route. Piloting a postal aeroplane, he was the first to make a cross-country flight from Chicago to New York in one day. This flight he made in seven hours and forty-six minutes.

Mr. Gardner's home is at Plainfield, Illinois. He began his career of speeding in auto races during 1911, taking part in races on all of the principal tracks in the United States, as a driver of National and Mercer cars, and giving exhibitions until 1915. That year he took up flying, receiving his instruction at the Curtiss School at Hampton, Va. When the war was declared he was employed as civilian flying instructor at Chanute Field, Rantoul, Ill. Until 1917 he was student instructor, and was then promoted to junior instructor and was transferred to Love Field, Dallas, Texas, December 15, 1917. In February, 1918, he was promoted to senior instructor, giving advanced instructions in cross-country flying. Resigning as instructor on August 1, 1918, he was employed as aerial mail pilot by the Post Office Department.

Post Office Department Issues Specifications for 10 Mail Planes

Washington, D. C.—The Post Office Department has asked bids for ten mail planes to be built according to specifications, which follow. The minimum capacity is to be 1,500 pounds, but preference will be given to planes having from 2,000 to 3,000 pounds capacity. Bids will be opened June 2, and deliveries to be made within six months after letting contracts. Bidders are to agree to furnish planes in lots of six at the price specified up to June 30, 1920.

The specifications are as follows:

General Requirements

1. *Fundamental Requirements.* Should be a radical departure from military designing, making the following qualities of primary importance:
   a. Inherent stability in power and glides.
   b. Machine to be balanced for cruising speed, altitude 6,000 ft.
   c. Controllability and wide vision.

Edward V. Gardner, who has been a mail service pilot since the Post Office Department has employed civilian aviators

2. *Performance* (Normal Load).
   a. Efficient cruising speed of 90-100 m.p h. at 6,000 ft.
   b. Cruising radius of 5 to 6 hours.
   c. Buoyancy speed of 50 m.p.h. *or less.*
   d. Low landing speed either inherent or mechanical.
   e. Ceiling of about 15,000 ft.
   f. Capable of horizontal flight or climb on one-half normal maximum power.
3. *General Requirements.*
   a. Two or more motors.
   b. Mail load of 1,500-3,000 lb. at 17½ lb. per cu. ft.
   c. Crew of one pilot and one mechanic on two-motored planes, and two pilots and one mechanic on three-motored planes.
   d. A method of retracting or hinging wings for storage with wing spans over 80 ft. Optional.
   e. Overall height of 18 ft.
   f. To be capable of easy assembly and disassembly.

Detailed Construction

1. *Power Plants.*
   a. To be independent power plants.
   b. Accessible for major repairs or removal.
   c. Accessibility for minor repairs during flight.
   d. An approved motor starter system.
   e. Complete radiator shutters adjustable from pilot's seat.
   f. A compression release to be provided for each motor.
2. *Fuselage.*
   a. Preferably a removable mail cage which may be drawn up into fuselage recess.
   b. Steerable tail skid to be optional with builder.
   c. Two tail skids to be provided in tandem; that is, one behind the other, with universal joints, if practicable.
   d. In flight, fuselage to withstand a loading of 30 lb. per sq. ft. on horizontal tail surfaces and 20 lbs. per sq. ft. on vertical tail surfaces.
   e. Fuselage to have landing factor of safety of 12-15.
   f. Accessibility of all tanks, leads, controls, etc., during flight.
   g. Variable loads at center of gravity.
3. *Wings.*
   a. Approved construction.
   b. Factor of safety of 6.
   c. Extra strength wing skids hinged with shock absorber of rubber.
4. *Landing Gear.*
   a. To have a factor of safety of 15 in all members.
   b. Center of gravity to be as far back of landing gear as possible.
   c. Elimination of any tendency to nose over.
   d. Landing gear to give adequate support to motors.
5. *Controls and Control Surfaces.*
   a. "Dep."
   b. All controls to be readily accessible for maintenance and repair.
   c. All control surfaces to be balanced where necessary for easy handling.
   d. Emergency control to be provided with removable stick.
   e. Variable horizontal stabilizer to be provided and balanced at neutral point with standard load.
   f. Internal controls designed to be free from danger of ice.
6. *Gas and Oil.*
   a. An independent gas and oil supply for each motor, with intercommunication leads.
   b. An absolutely reliable gas feed system such as provided by mechanical vane pumps and central hand pump as auxiliary.
   c. Accessibility to all valves and leads, both oil and gas, for repairs while in flight.
   d. Strongly anchored tanks.
   e. All leads to be protected against vibration.
7. *Safety and Comfort of Crew.*
   a. Pilot and pilot mechanic to be placed behind main leads, or preferably to be placed oved loads in streamline at top of fuselage.
   b. That provisions be made for protection against bad weather.
   c. A passage way to be provided, so that vital parts are accessible to mechanic in flight.
   d. That suitable slideways and eyes be provided for belt and snap hook to be worn by mechanic in making repairs in exposed places.
   e. Suggested that streamlining on exposed power plants be hinged at front and of sufficient width and length to provide shelter for mechanic while working on motor. To be held out by suitable, adjustable strut.
   f. That room be available in control cockpit for map boards, instruments and radio controls.
   g. That a good fire extinguisher system be provided, such as Pyrene or equal, tubed by suitable leads to gasoline tanks and all other motor compartments, to be operated from control cockpit.
   h. That pilot's seat be adjustable in relation to controls.

Atlantic City Hotels Co-operating to Make Convention and Contests Great Success

THE leading Atlantic City hotels are co-operating with the management of the Second Pan-American Aeronautic Exposition and Convention to make a huge success of this international event.

The Hotels listed are co-operating in many ways to make the Convention a success, and have contributed to the $50,000 Trans-Atlantic Flight prizes. We ask those who attend to recognize the assistance of these Hotels by patronizing them. Correspond with them about your accommodations.

By special arrangement AERIAL AGE is privileged to present to its readers a coupon which will entitle them to free admittance to all the aeronautic events to be held at Atlantic City from May First, to June First, including admission to the Steel Pier, where the Convention and Exposition will be held and the Atlantic City Air Port where the Aerial Contests for the sixteen prizes and trophies will start and end.

The Atlantic City Publicity Bureau has quoted and guaranteed the Hotel Rates for this Convention as herein printed.

In order to obtain an "Official Button" which admits to everything, attenders must have both (a) a Hotel or a Privilege Certificate and (b) a Membership in one of the organizations or credentials as described, or the AERIAL AGE Coupon printed below. Those who do not have the "Official Button" will be admitted to the Pier and Field upon payment of the prevailing Fees to the Public.

On arrival at a co-operating Hotel ask for your "Hotel Certificate" which will be given you without charge. If not stopping at a co-operating Hotel, you may secure a "Privilege Certificate" at the Steel Pier for Five Dollars ($5.00) which may be surrendered in lieu of the "Hotel Certificate". Present the "Hotel Certificate" (or a Privilege Certificate) at the Registration Bureau on the Steel Pier, together with your card of membership in either the Aero Club of America, The Aerial League of America, The Pan-American Aeronautic Federation, or the Atlantic City Aero Club, and receive your "Official Button". Army and Navy Officers and members of Military and Naval and Civil Commissions, and holders of the AERIAL AGE Coupon, will present the Hotel (or Privilege Certificate) to receive the "Official Button". Others not already members should pay the Annual Dues of Five Dollars ($5.00) and thus become members of The Aerial League of America. Members must present a "Hotel Certificate" (or a "Privilege Certificate") in order to secure an "Official Button". The "Official Button" will admit to the Steel Pier and the Atlantic City Aviation Field at Chelsea Heights at all times and to other affairs as may be announced.

Apply direct to hotels for reservations. State rate you prefer.

(Tear this coupon off and present to hotel manager)

AERIAL AGE FREE ADMISSION COUPON

The Bearer .....

Name .....

Address .....

is a reader of AERIAL AGE WEEKLY and is entitled to a Hotel Certificate which, when presented at the Registration Office on the Steel Pier, entitles holder to secure an Official Button. This Official Button will secure admission to all aeronautic events to be held on the Steel Pier at the Alantic City Air Port during the month of May, 1919.

G. DOUGLAS WARDROP,
Managing Editor.

THE BRITISH A. B. C. AERO ENGINES

IT is now possible to publish preliminary descriptions and photographs of the three different A.B.C. aircraft engines. The whole of these have been developed during the war, although it is not believed that the Gnat was originally intended for the propulsion of aircraft. The outstanding feature of the A.B.C. models is the copper coating of the cooling fins. It was not believed possible at one time to construct an efficient, air-cooled engine of greater cylinder bore than 4½ in., owing to the difficulties of cooling which were encountered. Judging, however, from practical results, the A.B.C. will eventually enable the economical use of much larger air-cooled cylinders than have previously been possible.

The Gnat (Mark 2) engine is of the two-cylinder, horizontally opposed type of 4¾ in. bore by 5½ in. stroke. Operating at the normal speed of 1,800 r.p.m., an output of 45 h.p. is obtained, 50 h.p. being possible at the maximum speed of 2,000 r.p.m. Running at its normal speed, the engine consumes

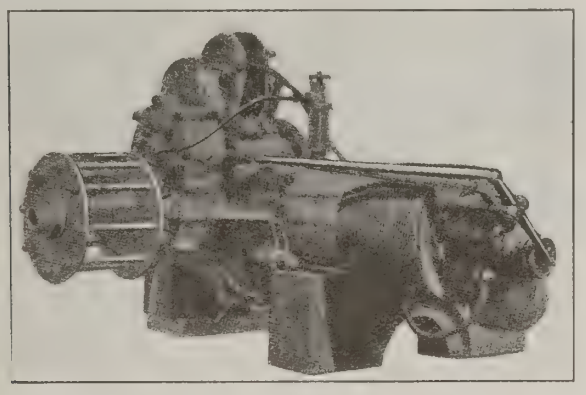

Fig. 1. Three-quarter side view of 45 H.P. "Gnat II"

0·56 pints of petrol per b.h.p. per hour, and 0·037 pints of oil per b.h.p. per hour—a very satisfactory performance for an air-cooled engine. The weight of this engine, complete, is 115 lb., corresponding to a specific weight of 2·3 lb. per b.h.p.

The Wasp (Mark 2) engine is of the seven-cylinder fixed radial type of 4¾ in bore by 6¼ in. stroke, developing a normal output of 200 h.p. at 18,000 r.p.m. Two carburetors

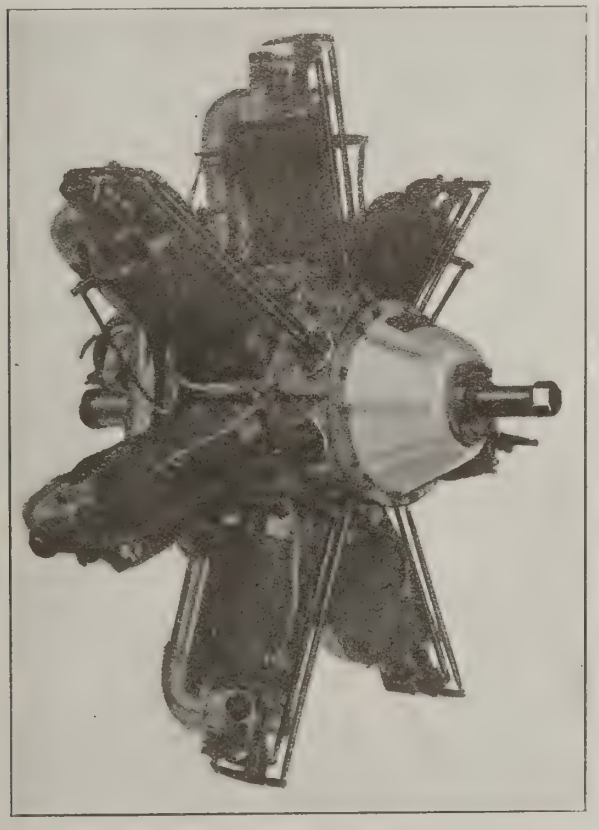

Fig. 2. 170 H.P. "Wasp I"

are fitted, feeding into a circular induction manifold from which separate radial pipes lead to each cylinder. The weight of this engine is 320 lb., giving 1·6 lb. per b.h.p.

The A.B.C. Dragon Fly (Mark A1) is also of the fixed radial air-cooled type, but of nine cylinders, each 5½ in. in

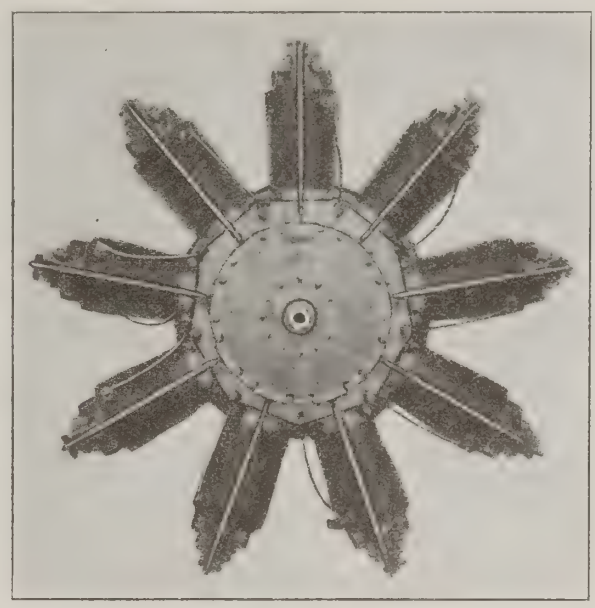

Fig. 3. Front view of 350 H.P. "Dragon Fly"

bore by 6½ in. stroke, and normally developing 340 b.h.p., at 1,650 r.p.m. The weight of this model is 600 lb., corresponding to approximately 1¾ lb. b.h.p. The fuel consumption of both the Dragon Fly and the Wasp are substantially the same as for the Gnat, given above.

Very little information is, so far, available concerning the detailed construction of the A.B.C. engines. The copper coating of the steel cylinders has already been referred to. Beyond

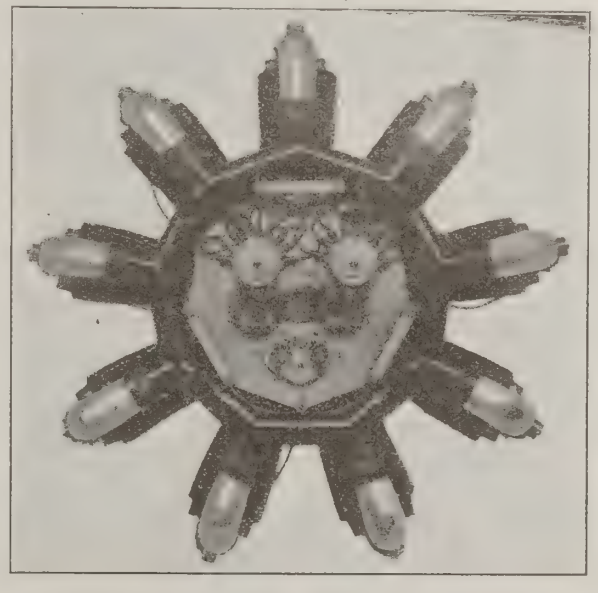

Fig. 4. Rear view of 350 H.P. "Dragon Fly"

this it is possible to say that each cylinder carries three valves in the head—two small valves for the exhaust, one large for the inlet—the exhaust valves communicating directly with the open air, no arrangements for exhaust manifolds being provided. Lubrication in the Wasp and the Dragon Fly is by forced feed through the hollow crankshaft to the crankpin, and thence by combined centrifugal force and splash. Circulation of the oil is maintained by a special type of rotary plunger pump, two pumps being used in the two larger models and one pump in the Gnat (in this model lubrication is by splash throughout). The construction of these engines will be rendered somewhat more clear by reference to the illustrations.

MAINTAINING CONSTANT PRESSURE BEFORE THE CARBURETORS OF AERO ENGINES REGARDLESS OF THE ALTITUDE

By LESLIE V. SPENCER, M.E.

Formerly Editor of Technical Publications, Experimental Department, Aeroplane Engineering Division, Bureau of Aircraft Production at the McCook Field, Dayton

AS mentioned in last week's general discussion of the problem of supercharging the aero engine so as to maintain a practically constant induction pressure regardless of the altitude, and therefore nearly uniform power output, the United States government soon after our entry into the war secured the services of Mr. E. H. Sherbondy and Dr. Sanford A. Moss to carry on independent investigations along this line, and to design super-compression machines which would be especially adapted to the Liberty twelve-cylinder engine.

It is doubtful if this line of experimental work would have been inaugurated so early in our aircraft experimental program if it had not been for the fact that the promising results which Prof. Rateau and other European experimenters had secured during the two or three years previous had not been followed closely by our National Advisory Committee for Aeronautics and by the government engineers.

Having at hand the results of previous experimentation abroad, neither Sherbondy nor Moss had to strike out blindly, but in the main concentrated upon ways and means of developing thoroughly practical

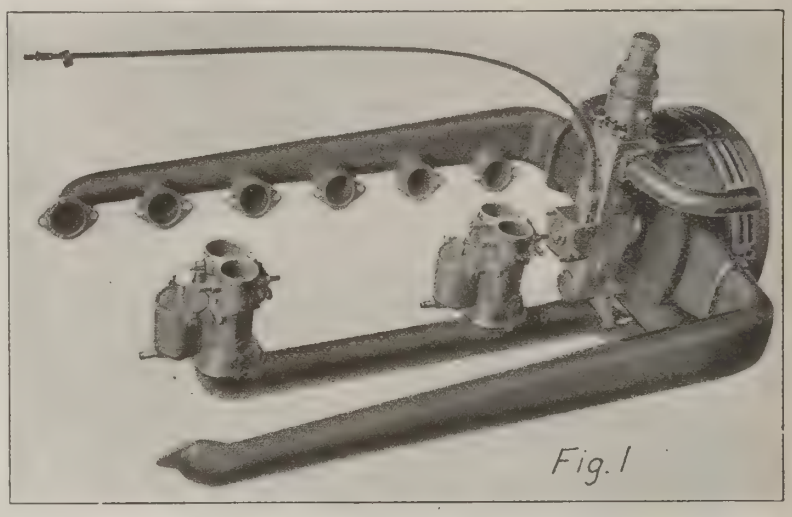

Fig. 1

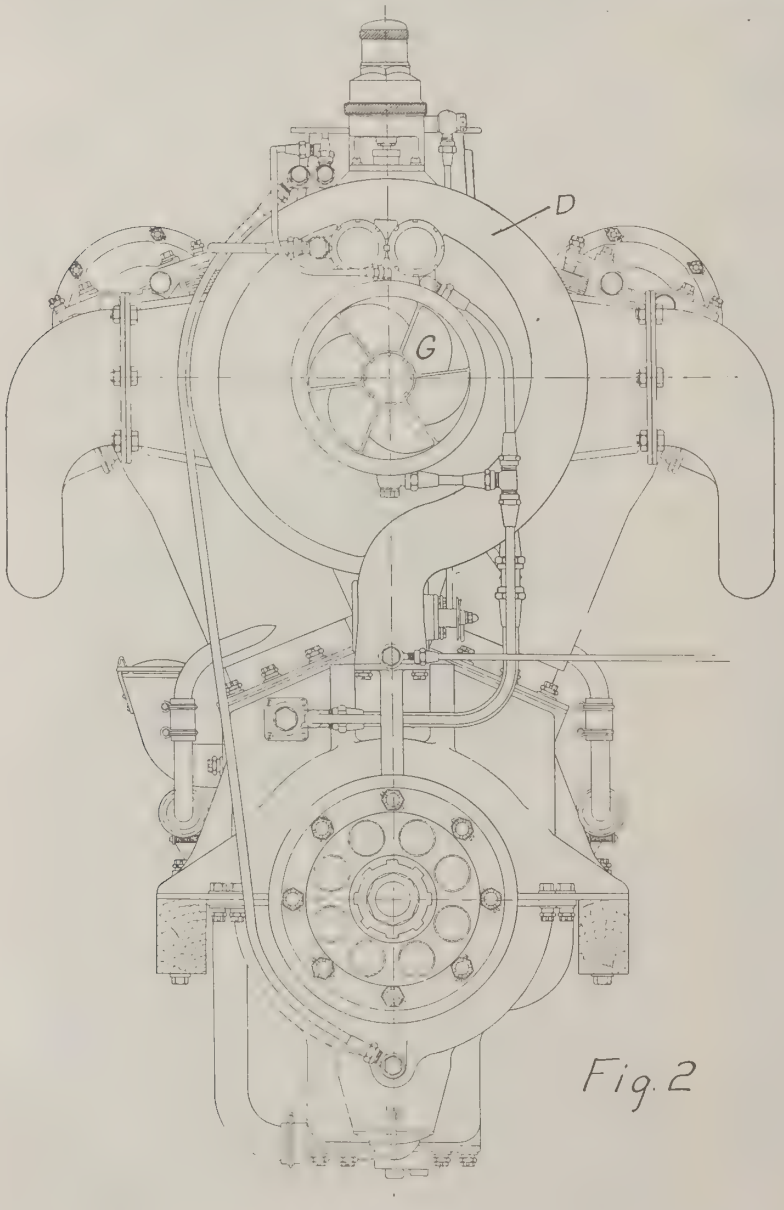

Fig. 2

machines or systems based primarily on the scheme of supercharging originated by Prof. Rateau, that is, a system in which the power for driving the compressor is furnished by an exhaust-gas-driven turbine. Moss clung strictly to the one line of action, whereas Sherbondy studied the problem also from the angle of driving the compressor by a shaft from the engine through the intermediary of a set of gears which served to step up the speed to that required for the operation of the compressor impeller. Thus he not only designed several supercharging apparatuses utilizing the Rateau principle, but he also laid out geared designs. Only the former were built, however, as Sherbondy soon became convinced that the utilization of the exhaust gas energy for driving the impeller was to be preferred, for reasons which have already been pointed out.

Although neither Sherbondy's nor Moss's machine was ready for actual flight tests at the time the armistice surprised the world, the work had so far progressed that it remained only to alter certain of the mechanical details so as to overcome weaknesses which the extensive ground tests had brought to light, when either machine would undoubtedly have been ready for preliminary trial in the air. This is particularly true of the Moss supercharger, which has been subjected to gratifying altitude tests on a portable dynamometer at the summit of Pike's Peak—a little over 14,000 feet above sea level.

If the work of European experimenters had not already convinced the aeroplane engineering world that there is great advantage to be gained by maintaining a constant pressure before the carburetor regardless of the altitude—within limits, of course—these altitude tests of the Moss device would have proved it. The advantages being already fully appreciated, due to the earlier tests in England, France and Italy, the results obtained with the Moss apparatus served to further strengthen the validity of the theories back of the idea.

The Sherbondy Superchargers

Fig. 1 gives a very clear idea of the general arrangement of the apparatus of the Sherbondy turbo-compressors as laid out for the Liberty twelve-cylinder engine. The two carburetors are carried on the one induction pipe, which has air-tight joints to the carburetor air intakes and also to the compressor discharge. The specially-designed exhaust manifolds which lead the exhaust gases to the turbine are also illustrated clearly. The compactness of the turbine and compressor unit proper is seen, this main part being designed to attach to the front of the engine without interfering with the normal position of the propeller. Installation of the turbo-compressor here

means that the radiator must be put elsewhere than at the front, most probably in the wings.

At the rear of the turbine housing is the automatic control mechanism, which serves to maintain the turbine speed at the right value to supply the correct supercharge under any atmospheric conditions up to the limit of about 20,000 feet, which is the maximum height for which the Sherbondy machine is intended to be effective.

As already explained, the turbine rotor and the air impeller

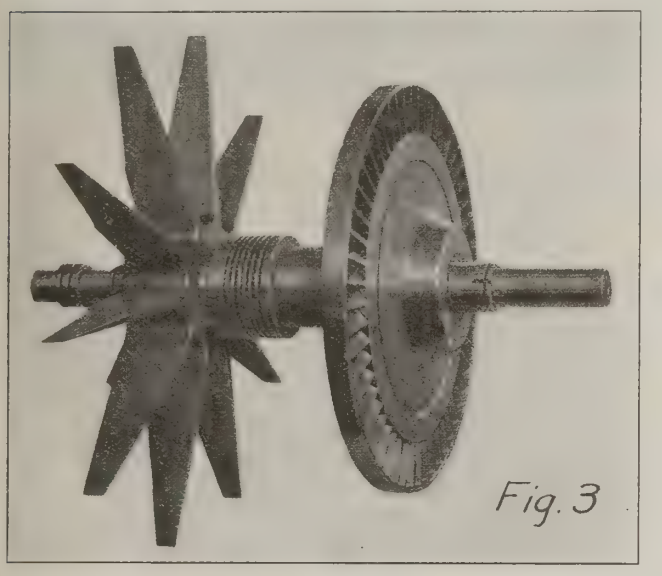

Fig. 3

are direct-connected on the same shaft, a labyrinth arrangement being constructed on the shaft between the two rotating members to prevent pressure leakage between the compressor chamber and the turbine. The rotating part of the device is shown in Fig. 3.

Fig. 4 is a sectional drawing of Mr. Sherbondy's last supercharger, in which a number of minor changes were made over the two previous designs in order principally to overcome the troubles due to the warping of the thin-gage parts of the two earlier constructions. The impeller A is inclosed in an aluminum housing H, which, throughout the length of the impeller blades follows the same taper, and is carefully machined inside to maintain a constant clearance between blades and housing of only twenty-five thousandths of an inch. The housing has the same taper as the blades out to a diameter a little larger than that of the impeller, where its sides become parallel for about another inch. This space acts as a diffusion chamber, after which the housing opens into an outer chamber C of circular section. This outer chamber is of constantly increasing diameter, tapering from an area of almost nothing until it finally reaches the area of the induction pipe. This may perhaps be better understood by referring to the front elevation drawing in Fig. 2 which shows the outer chamber D very clearly. The point of juncture with the induction pipe is shown at J in Fig. 4.

The impeller has ten blades and is 9 inches in diameter. The blades are tapered from a point a little over half way out on the air intake side, and converge to a relatively narrow tip width, as seen in the drawing The entering edge of the blades is rounded off to prevent air shocks.

A most interesting feature is the turbine rotor, which in the latest Sherbondy design is fitted with seventy-two buckets cut by a special process to the greatest accuracy. As will be readily appreciated, the buckets all had to be of exactly the same weight so as to prevent unbalance of the rotor—a condition which would be very serious at the high speeds which the device is designed to attain. These buckets are assembled into sockets accurately machined in the periphery of the rotor proper, and expansion under the heat of operation serves to hold them in place most securely.

Much research and experimentation was carried on by Mr. Sherbondy before he was able to fix upon an alloy which would be sufficiently strong and of a high enough heat-resistant quality to withstand the very high temperatures and stresses encountered in operation of the device.

The turbine rotor was designed for an angular velocity of 780 feet per second, which means a rotative speed of 31,050 revolutions per minute. The turbine nozzle angle is 21° 45′, and that of the buckets, 35° 15′, with a gas velocity at entrance designed to be about 1950 feet per second, and that at exit from the buckets, 750 feet per second. This is a ratio of a little over 2.5 to 1.

In designing the air inlet, it was desired to prevent all air shock so far as possible, and therefore the conical air inlet G, Figs. 2 and 4, was provided with radial guide vanes which impart a certain velocity to the air and give it direction also before it comes in contact with the rapidly-rotating impeller blades.

The designing of the bearings was also a tough problem, for they must withstand a variety of severe conditions in service, especially when the device is operating at or near its maximum effective speed. Reference to L and L_1 in Fig. 4 will give an idea of the details of their construction. The rear bearing L_1 is subjected to most serious conditions in this design, in that it is in the path of the exhaust gases, whereas the front bearing L is in the center of the air inlet part and is under no severe heat conditions. Both bearings are constructed with spherical seats, which allow them to compensate automatically for any misalignment of the assembly, a possibility should the castings warp to any extent under the high temperatures. They are in effect small self-aligning bearings. The bearing proper between shaft and housing is of plain babbitt. At the front there is, in addition to the bearing just mentioned, a marine type thrust bearing which holds the rotating member against end thrust caused by the pressure of the gages going through the nozzles against the buckets of the rotor.

Pressure feed is used for efficient lubrication of both bearings, which are provided with an excess over actual requirements for obvious reasons. This oil is intended to be forced

(*Continued on page* 356)

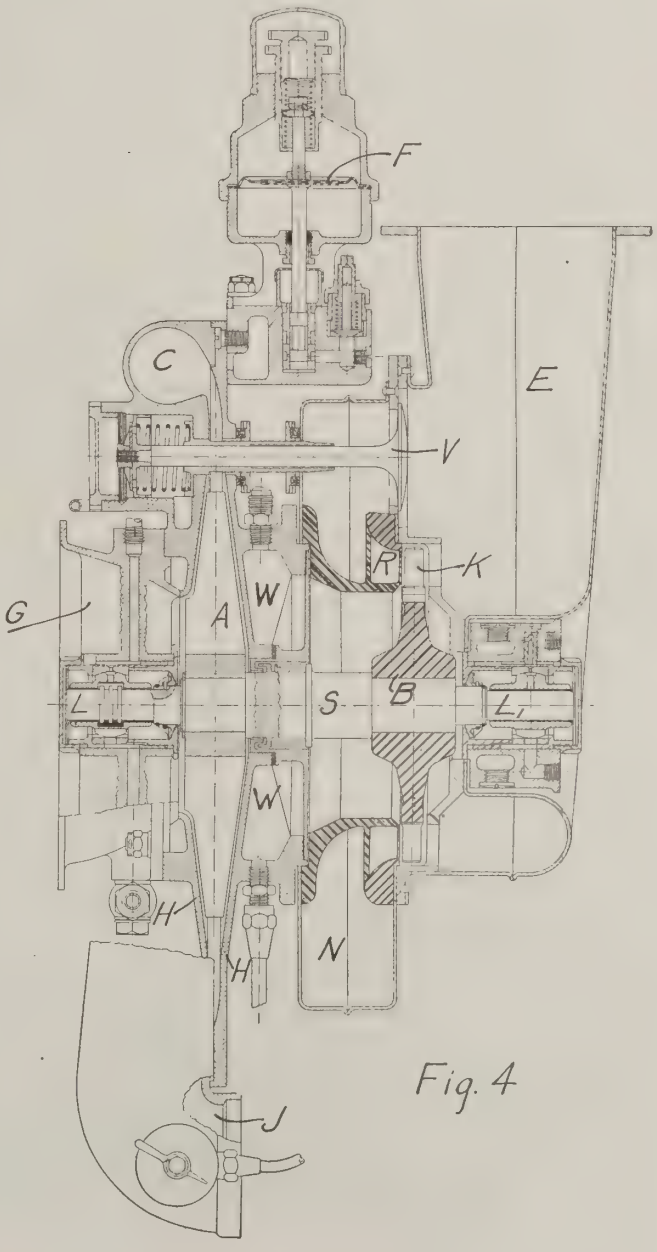

Fig. 4

THE NAVY HS-1L AND 2L FLYING BOATS

FOR coastal patrol duties, the HS-1L and 2L Flying Boats were put in quantity production by the United States Navy Department. Both types are equipped with a single Liberty engine; the HS-2L is 12 feet greater in span than the 1L, but otherwise the machines are similar.

Data and drawing of the HS-1L as built by the Standard Aero Corporation applies to the other machine, with the exceptions noted. At the end of this description data is given relating to the HS-2L, supplied by the Curtiss Aeroplane and Motor Corporation.

THE HS-1L

One of the Curtiss HS-2L Flying Boats at the Rockaway Point Naval Air Station

NAVY TYPE HS 2L
330 HP LIBERTY
FLYING BOAT

Scale of feet

2 4 6 8 10 12 14

McLaughlin

	(*Pounds*)
Personnel and fuel	1,090
Miscellaneous	112
Total	5,900

Performances

Maximum speed (horizontal flight)	91 M.P.H.
Minimum speed (horizontal flight)	53 M.P.H.
Climb in 3 minutes	500 feet
Weight per horsepower	17.9 lbs.
Weight per square foot	9.03 lbs.

Main Planes

Wing section, R. A. F. No. 6; aspect ratio of upper plane, 11; aspect ratio of lower plane, 10.

Planes have no stagger nor sweepback. Dihedral of outer panels, 2°. Decalage, 1.5°. Angle of lower wing chord to propeller axis, 5.5°.

Wing chord, 6′ 3 5/32″. Leading edge to center line front beam, 9″. Main beams centered 48″ apart. Center line rear beam to trailing edge, 18″.

Upper plane in three sections; lower plane in four sections (two each side of hull). Sidewalk sections integral with hull. Ailerons are balanced. Upper ailerons 2′ 2″ maximum width and 17′ 8½″ long. Lower ailerons 1′ 10″ maximum width, 12′ 9″ long.

All fabric sewed to panels, seams laid diagonally or normal to leading edge. Fabric finished with two coats of cellulose acetate; two to four coats of cellulose nitrate; two coats of anti-actinic gray wing enamel on top fabric surfaces and vertical fabric surfaces; one coat of anti-actinic gray wing enamel on bottom fabric surfaces.

Strut fittings are of steel stampings and forgings. Wing spars of spruce. Trailing edge of steel tube flattened to oval shape. Wing-post fittings enameled gray over copper plating. Intermediate ribs of lightened pine. Compression ribs of solid pine.

Hull

Overall length of hull, 34′ 5″; width, 4′ 0″ width over planing fins, 8′ 0″.

Pine or cedar is used for planking, 3/16″ for outer and 5/32″ for inner, with fabric between glued to planking. Planking on top and sides, 5″ wide, 5/32″ thick.

Frames, keel and sternpost are of ash. Keelson, deck stringers and floors are of pine or cedar. Chine stringers are of pine or Port Orford cedar. Seam strips of Spanish cedar. Bulkheads, 3-ply waterproof veneer. Engine beds of ash-spruce-ash.

The engine bracing system is composed of streamlined steel tubing, braced with non-flexible tension cables.

Hull is finished with low visibility gray wing enamel or navy gray pontoon enamel. All metal parts enameled.

Controls

Double wheel control. Control bridge is of the inverted "U" type, ash frame, equipped with two 4-spoke bronze spider, black walnut rim, 16″ hand control wheels.

Bronze sheaves for guiding cables. Elevator control lines attached to bridge by steel fittings. Bridge ends reinforced by lightened steel fittings.

Rudder foot-bars of ash, mounted on bronze blocks.

Throttle and spark advance control levers mounted in operator's cockpit located between the two seats on diagonal bridge. Cutout switch located within reach of pilot.

Bracing Cables

All cables galvanized, non-flexible. Front and rear engine section and intermediate cables are 3/16″; outer, 5/32″. Flying cables doubled. Stagger cables, single, ⅛″. Engine bed to top inner post, and also engine bed to hull sidewalk section, 3/16″. King post brace wires, ⅛″.

A change made in the sizes of some of the above cables was incorporated in all but a few of the boats, which had been shipped before the change was deemed advisable. In the front, the engine section and intermediate cables are now ¼″, outer, 3/16″ and overhang decreased to 7/64″. In the rear, the engine section cables are now increased to 7/32″ and the overhang decreased to 3/32″.

Power Plant

The power plant consists of a 12-cylinder, low-compression Navy type Liberty engine, developing 330 h.p. at 1700 r.p.m. Cylinders arranged at a 45° V. Bore, 5″; stroke, 7″.

Two Zenith duplex carburetors are used. For the ignition system, a storage battery and induction coil are provided, and a distributor on each cam shaft.

Fuel tanks at the center of gravity have a capacity of 110 gallons. Oil capacity, 6 gallons. Fuel consumption, .55 lbs. per horsepower per hour; oil, .03 lbs. per horsepower per hour.

The Curtis Co.'s specifications call for 3 main fuel tanks (at 41.6 gal. each) 124.8 gals. Gravity tank at 29 gals.

Total capacity 152.8 gals., weight 917.50 lbs. Oil, 13.34 gals., weight 93.38 lbs.

THE HS-2L FLYING BOAT

The HS-2L, which is a modification of the HS-1L, consists essentially in the addition to the wing surface and an increase in rudder area. The additional wing surface is obtained by adding four 6-foot panels, one on each side in both lower and upper planes adjacent to the outboard extension panels.

All the parts required to convert the HS-1L to the HS-2L are duplicates of other parts already on the HS-1L, excepting the four 6-foot panels and the larger rudder.

The wing beams in the upper engine section of the HS-2L are made without routing, and provision has been made to supply an upper engine section panel having unrouted beams with the other parts necessary to convert the HS-1L to the HS-2L.

The following represents the parts necessary to convert the HS-1L service machine into the HS2L:

(a) Upper engine section wing panel beams unrouted.

(b) Front engine section lift wires changed from two 3/16-inch to two ¼-inch non-flexible cable.

(c) Rear engine section lift wires changed from two 3/16-inch to two 7/32-inch non-flexible cable.

(d) Four 6-foot panels supplied complete with hinges and standard HS-1L wing-post fittings, including bolts, strut pins and cotters.

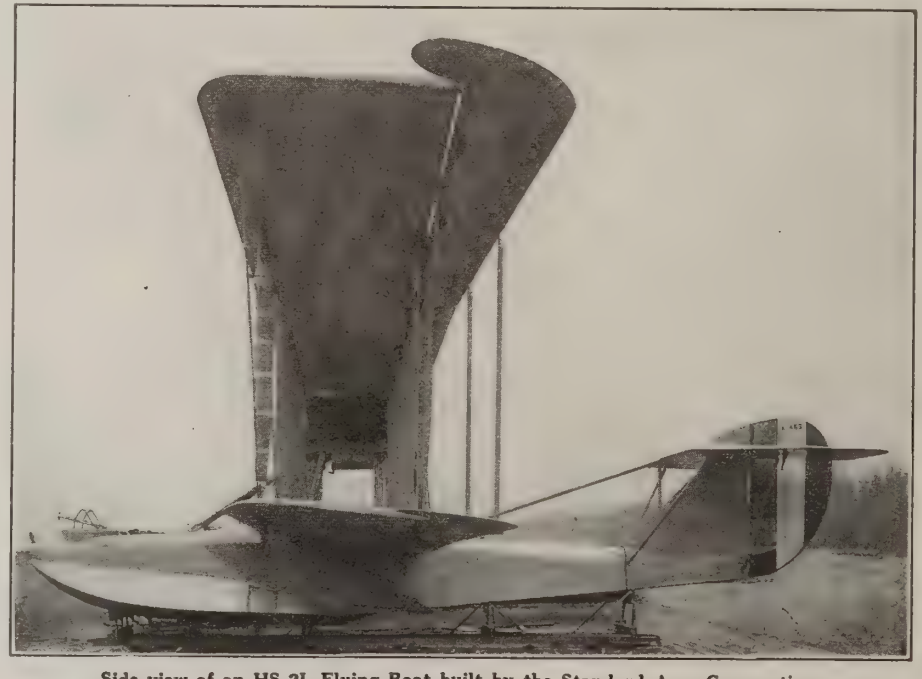
(e) Four front-lift and four rear-lift non-flexible cables supplied ¼ inch and 7/32 inch respectively. Also single drop wires front and rear of the same size. These are for the added panels on each side.

(f) Two front interplane struts 2⅝ by 6⅝ by 84 inches supplied.

(g) Two rear interplane struts 2 3/16 by 5½ by 84 inches supplied.

(h) Four ⅛-inch stagger wires with turnbuckles and end connections supplied.

(i) One rudder supplied having an area of 26 square feet instead of HS-1L rudder having an area of approximately 20 square feet.



(j) Aileron control wires lengthened and changed to accommodate increased span.

The following general specifications of the HS-2L. Flying Boat, supplied by the Curtiss Company, show the differences in the two models:

General Dimensions

Span, upper plane	74′ 0 19/32″
Span, lower plane	64′ 1 21/32″
Chord, both planes	6′ 3 5/32″
Gap (front)	7′ 7 1/8″
Gap (rear)	7′ 5 29/32″
Length of machine overall	40′ 0″
Height of machine overall	14′ 7¼″
Angle of incidence, upper plane	5½ degrees
Angle of incidence, lower plane	4 degrees

SECOND PAN-AMERICAN AERONAUTIC CONVENTION AND EXHIBITION

To Be Held Under the Auspices of The Aero Club of America, The Aerial League of America and the Pan-American Aeronautic Federation.

From Thursday, May 1st, 1919,
to
June 1st, inclusive,
at
Atlantic City, N. J.

Intercollegiate Contests Throughout the Summer

CONTESTS TO BE HELD EACH SATURDAY

(1) Seaplane Contests (general),
(2) Curtiss Marine Flying Trophy and Prizes,
(3) Intercollegiate Seaplane Contests,
(4) Land Aeroplane Contests,
(5) Dirigible Contests,
(6) Kite Balloon Speed in Ascending and Descending, and Maneuvering Contests,
(7) Parachute Competition,
(8) Aviette (bicycles and motorcycles with wings) Contests.

EVERY DAY ACTIVITIES

(1) Exhibits of Aeroplanes, Motors and Accessories on the Steel Pier,
(2) Demonstrations and tests of Seaplanes, Land Aeroplanes, Motors, Dirigibles, Kite Balloons, to prospective purchasers and representatives of different governments,
(3) Aerial Passenger Carrying by seaplanes and dirigibles, and kite balloon ascensions,
(4) Moving pictures and Addresses by leading authorities on most important phases of aeronautics.
(5) Competition for the Pulitzer Trophy.
(6) Competition for the Atlanta Journal Trophy.
(7) Competition for the Curtiss Marine Flying Trophy.

The Governments and Aeronautic, Sporting, Scientific, Industrial and Civic organizations of the United States and all the countries in the world, excepting Germany and her allies, are invited to send representatives to attend this great aeronautic event. On arrival in the United States these representatives should call at the Headquarters of the Convention Committee at No. 297 Madison Avenue, New York City, to register and receive their official badges and the official program.

In the event that it is more convenient for them to go directly to Atlantic City they will register at the offices of the Convention located at the following Atlantic City hotels: Hotel Traymore, Hotel Chalfonte, The Breakers Hotel, Hotel St. Charles, Hotel Marlborough-Blenheim, Hotel Chelsea, Hotel Alamac, Hotel Dennis and Hotel Haddon Hall.

Representatives of the Convention Committee will be at the Bureaus of the Aeronautic Convention at the above-named hotels and will issue the official badges which admit the bearer to the Aeronautic Hall, as well as the Aero Exhibition on the Steel Pier, the judges' enclosure during contests, and to the Aerodrome and seaplane stations where the aircraft and motors will be demonstrated.

All communications until May 1st should be addressed to Rear Admiral Peary, Chairman, Aeronautic Convention, Aero Club of America, 297 Madison Avenue, New York City.

Entries for the contests should be addressed to the Contest Committee, Aero Club of America, 297 Madison Avenue, New York City.

DAILY PROGRAM FOR PAN-AMERICAN AERONAUTIC CONVENTION, EXHIBITION AND CONTESTS

THURSDAY, MAY 1ST

Opening of Convention and Exhibit.

AFTERNOON—Reception at Aeronautic Hall on the Steel Pier. Addresses by United States Government State and aeronautic authorities.

EVENING—Aero Show and addresses by officials.

FRIDAY, MAY 2ND

AFTERNOON—Aero Show. Preliminary tests of seaplanes, dirigibles and kite balloons.

EVENING—Moving pictures and address on flying for sport and pleasure.

SATURDAY, MAY 3RD

AFTERNOON—Seaplane and dirigible races, and kite balloon ascending and descending contest.

EVENING—Ball.

SUNDAY, MAY 4TH

MORNING—Memorial service by eminent Divine for the dead airmen.

AFTERNOON AND EVENING—Reception to allied aces and heroes of the air and their parents, and announcement of the award of the Aero Club of America Medal of Valor, and the Aerial League of America Diploma of Honor.

MONDAY, MAY 5TH

AFTERNOON—First parachute contest for $500 Bennett Prize.

EVENING—"The Large Dirigible and Its Value for Transportation." Representatives of railroads, express, steamship and other transportation organizations invited to attend.

TUESDAY, MAY 6TH

AFTERNOON—Illustrated addresses on "Aerial Forest Patrol." Forestry Department of every State invited.

EVENING—"Work of Aerial Police Squadrons, and Why Every City Should Have One."

WEDNESDAY, MAY 7TH

AFTERNOON AND EVENING—Aerial Mail Day. Illustrated address on, and consideration of, "Aerial Mail Planes." Chairman of Post Office and Post Roads Committees of House of Representatives and Senate, and Postmaster General Burleson invited to deliver addresses. (26,000 United States Postmasters, and Chambers of Commerce of 13,000 cities invited to attend.)

THURSDAY, MAY 8TH

AFTERNOON AND EVENING—Illustrated addresses on the "Need of Municipal Aerodromes, and the Part to be Played by Aircraft in City Planning." Chambers of Commerce and City Planning Commissions of 13,000 cities invited to attend.

FRIDAY, MAY 9TH

AFTERNOON—Arrival of seaplanes and army planes from Army and Navy Air Stations. Second parachute competition for the $500 Bennett Prize.

EVENING—Illustrated addresses on "Latest Developments in Aerial Warfare and Adventures in Aerial Warfare," told by famous aces.

SATURDAY, MAY 10TH

AFTERNOON—Army, Navy and Marine Corps Day. Aerial contests and tournament.

EVENING—United States Army and Navy Officers' Reception. Reception and addresses at Aeronautic Exhibition Hall on the Steel Pier.

SUNDAY, MAY 11TH

AFTERNOON AND EVENING—Presentation of the flags by each State of the United States to the Aero Squadrons representing the States. Each State will present a flag to each Aero Squadron, the members of which were overwhelmingly natives of that State. The presentation will be made by representatives from the State and the Aero Club and Aerial League branch of that State. All States and cities invited to send delegates, and Army, Navy and Marine Corps to send representatives.

MONDAY, MAY 12TH

AFTERNOON—Demonstrations and illustrated addresses on the "Value of Aircraft for Advertising by Day and by Night." All national advertisers and advertising agents invited to attend.

EVENING—"Pan-American Aerial Transport Over Land." Addresses by members of the commissions of the 20 Latin-American Republics.

TUESDAY, MAY 13TH

AFTERNOON AND EVENING—"Pan-American Aerial Transport Over Water." Addresses by members of the 20 Latin-American Republics' Commissions.

WEDNESDAY AND THURSDAY, MAY 14TH AND 15TH

AFTERNOONS AND EVENINGS—"The Airways and Aerial Transport in Europe, Canada, Africa, Australia and Asia."

FRIDAY, MAY 16TH

AFTERNOON AND EVENING—"Aerial Navigation Instruments for Flying Over Land and Water." Aviators, navigators, scientific instrument makers and aeronautic experts invited.

SATURDAY, MAY 17TH

AFTERNOON—Aerial races and contests. Illustrated addresses on Aerial Photography.

EVENING—Extensive exhibit of aerial photographs and photographic apparatus. All photographers, professional and amateur, and makers of photographic apparatus invited.

SUNDAY, MAY 18TH

AFTERNOON AND EVENING—Illustrated addresses on "Aerial Exploration and the Use of Aircraft for Coast and Geodetic Survey."

MONDAY, MAY 19TH

AFTERNOON—Addresses on "Need of Broader Attitude Regarding Insurance for Aircraft and Aviators."

EVENING—Illustrated address on "How Army Medical Standards and Inspection Lessen Accidents." Insurance companies and agents invited.

TUESDAY, MAY 20TH

AFTERNOON AND EVENING—Illustrated addresses showing different ways of crossing Atlantic by air and the problems to be solved to accomplish same successfully.

WEDNESDAY, MAY 21ST

AFTERNOON—Aero Safety Day. Discussion of aero safety provisions made; improvements in aeroplane construction; increased reliability of aero motors; devices which make for safety in flying.

EVENING—"Progress Made in the Art of Piloting Aeroplanes." Illustrated.

THURSDAY, MAY 22nd

AFTERNOON AND EVENING—Addresses and discussions of meteorology—"How the Weather Forecasts Can be Extended and Made More Efficient by the Use of Aircraft in Exploring the Upper Air," also "How the Weather Forecasts Help Aerial Navigation," and "Telegraphic and Climatic Factors in Relation to Aeronautics.

FRIDAY, MAY 23RD

AFTERNOON AND EVENING—Addresses on "Aerial Jurisprudence—Aerial Laws and Regulation of Air Traffic." (First day.) Lawyers, traffic commissioners and police authorities of different countries invited.

SATURDAY, MAY 24TH

AFTERNOON—Races and contests.

EVENING—Illustrated address on "Need of Establishing Altitude Levels for International, Interstate and Interurban Air Travel."

SUNDAY, MAY 25TH

AFTERNOON AND EVENING—Aeronautic Art Day. Address on "Aerial Painting and Sculpture of Different Countries, and Exhibition of Aerial Paintings," by Lieut. Farre, Lieut. Ruttan and others. All prominent artists, managers of art galleries and art patrons invited to attend.

ENGINEERING WEEK.

MONDAY, MAY 26TH

AFTERNOON—"Aeronautic Engineering Problems and Their Prospective Solution."

EVENING—Opening of contests for designs and ideas for large aeroplanes.

TUESDAY, MAY 27TH

AFTERNOON—"Factors That Increase the Efficiency for Large Dirigibles."

EVENING—"Advantages of Veneer and Plywood for Aircraft Construction."

WEDNESDAY, MAY 28TH

AFTERNOON—Address on "Problems of Flying at 35,000 Feet and Over, and Their Prospective Solution."

EVENING—"Present Day Aero Engines."

THURSDAY, MAY 29TH

AFTERNOON—"Flying Boats Versus Hydroaeroplanes for Sport and Transportation."

EVENING—Contest for designs and ideas for large aeroplanes.

FRIDAY, MAY 30TH (Memorial Day)

AFTERNOON—Dirigible races, kite balloon speed ascending contest; parachute contest.

EVENING—Reception at the Aeronautic Hall, Steel Pier.

SATURDAY, MAY 31ST

AFTERNOON—Seaplanes, land planes and dirigible contests. Aviette competition at which all cyclists and makers of bicycles and motorcycles will be invited.

EVENING—"International Medical Standards for Aviators in War and Peace." Reports from different countries illustrated with attractive films. 50,000 medical men invited.

SUNDAY, JUNE 1ST

AFTERNOON AND EVENING—Award of prizes and diplomas for all events.

Air Service Demobilization

Commercial Aerial Transportation Concerns will find it to their advantage to write to

The Aerial Register

(To appear shortly under the auspices of AERIAL AGE WEEKLY)

For NAMES and QUALIFICATIONS of

Pilots
Meteorologists
Aerial Navigators
Aerial Surveyors
Aerodrome Managers
Engine Specialists
Aerial Photographers
Aeronautical Chemists
Aerial Traffic Managers
Aircraft Inspectors
Wireless Experts
Instructors
Airship Pilots
Rigging Specialists
Aerial Statisticians
Equipment Experts

And for INFORMATION CONCERNING COMMERCIAL AERONAUTICS IN ANY PART OF THE WORLD

If **YOU** hold any of the above qualifications, but have not yet registered, you are invited to communicate with the Editor (Air Service Demobilization Department) AT ONCE.

280 MADISON AVE., NEW YORK

AEROPLANE PROPELLER WASTAGE REDUCED

By ROLF THELEN

of the Forest Products Laboratory, United States Department of Agriculture

THROUGHOUT the war the development of the best practice in propeller manufacture, which is a highly specialized art requiring a thorough knowledge of wood technology and wood gluing as well as the greatest degree of skill in woodworking and gluing, has been the goal of constant co-operative effort by the Forest Products Laboratory of the Forest Service and the War and Navy Departments. As a result of this joint work, methods have been perfected which insure the production of the highest type of propeller, with the minimum wastage due to rejection on account of poor manufacture or improper handling before, during, or after manufacture. These methods have been adopted in the manufacture of American training and combat propellers, and have contributed their share to the well-known excellence of these propellers. In this connection it is interesting to note that, in the case of the Allies, it is reported that 80 per cent of the propellers received at the front were rejected on account of improper methods in handling and manufacture.

The regular researches of the Forest Products Laboratory on wood technology have been under way for many years. Its activities in connection with propeller investigations, which are in addition to these, may be grouped under four general heads, as follows: (1) Drying and storing of propeller stock; (2) Selection of laminations with proper regard for direction of grain, and density and moisture condition; (3) Glues and gluing; (4) Protection and storage of finished propellers.

Propeller lumber, as it comes from the sawmill, is usually 1 inch thick, 6 inches or more wide, and 8 feet or more long. This lumber is green when cut, and must be seasoned before it can be used in propeller manufacture.

While it is quite possible to air-season propeller lumber satisfactorily, the time required is excessive when war is in progress and speed is essential. Hence it became necessary to develop a method of artificial seasoning which would not injure the properties of the wood. The Forest Products Laboratory, which already possesed a great deal of experience in kiln-drying wood, attacked the specific problem of the proper artificial drying of propeller woods, and developed a method whereby the stock could be perfectly dried in a week or two. This method was adopted as standard by both Army and Navy and used for all propeller stock with the exception of certain relatively small amounts which had been cut before the declaration of war and which were available in the air-seasoned conditon. The Laboratory had already developed a dry-kiln in which this method of drying could be carried out, and a number of batteries of kilns of this type were built for drying aircraft lumber. Among these is the battery at Vancouver, Wash., one of the largest batteries of dry-kilns in the world. This battery was erected especially for drying spruce and Douglas fir aeroplane stock.

In developing this process, many experimental drying runs were made upon the various woods used for propellers, and the properties of the kiln-dried material were compared with those of similar material carefully air-dried. This comparison was reached through the medium of many thousand strength tests made both upon the kiln-dried material and upon that which had been air-dried. As a check, strength tests were also made upon green material. The conslusion drawn from this work is that properly kiln-dried material is appreciably better than the best air-dried stock. This had been forecast by the Laboratory's engineers, who based their judgment upon the fundamental principles involved.

After the stock has been dried, it must be stored under proper conditions of atmospheric temperature and humidity, in order that final adjustment of the moisture in the wood may take place, and that it may contain just the right degree of moisture when it is finally made up into propellers. This degree of moisture depends upon the atmospheric conditions of the locality where the propellers are to be used. Thus, training propellers for the southern fields required drier wood than was needed for battle propellers to be used on the battle lines in France. The Laboratory conducted researches to determine the relation between atmospheric conditions and the amount of moisture contained in the wood when exposed to these conditions, and it furnished the data upon which are based the specifications for atmospheric temperature and humidity in propeller factories and store-rooms.

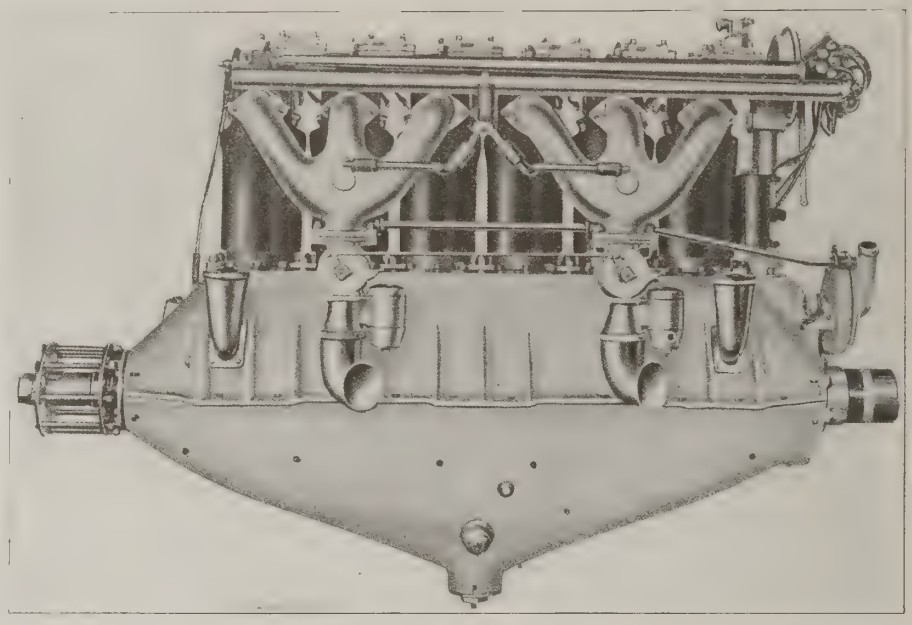
Propellers are almost sure to swell and shrink during storage and use unless they are manufactured with the greatest possible care and specially treated to prevent changes in moisture when changes in atmospheric conditions take place. The problem of reducing this swelling and shrinking to a minimum and of leaving the remainder as uniform as possible received the most serious attention of the Laboratory. It was determined that the amount and character of swelling and shrinking was, in general, due to three factors, namely, grain, density, and moisture. The shrinkage and swelling of wood with changing moisture content is not uniform in all directions. The shrinkage lengthwise is practically negligible, while that measured in a direction corresponding to the circumference of the tree is about 1½ times that measured in a direction corresponding to the diameter of the tree. Shrinkage depends also upon the weight or density of the specimen, dense pieces having a greater shrinkage than light ones.

Shrinkage or swelling, when the wood changes from one moisture condition to another, varies with the amount of the change—the greater the change in moisture, the greater the change in the volume of the piece. Bearing these three points in mind, it is evident that, to obviate trouble from shrinkage and swelling in the finished propellers, all the laminations should be as nearly alike as possible in direction of grain (on the end faces), density, and moisture content. Further, proportion of the moisture should correspond, as nearly as possible, to that of the atmosphere in the locality where the propeller is to be used. These facts have all been taken advantage of in the manufacture of American propellers, and their application has done much to enable us to reach the present high standard in propeller construction.

All modern propellers, with one or two minor exceptions, are made by gluing together a number of boards or laminations which are usually from ½ to ⅞ of an inch thick. From five to nine laminations are ordinarily used in each propeller. In order to secure satisfactory service, it is essential that only the best grades of glue be used. When the United States entered the war, none of the government agencies had had enough experience with glues for a proper glue specification to be prepared or the necessary inspection work to be carried out. The Forest Products Laboratory immediately started the necessary investigations, and drafted a satisfactory propeller-glue specification under which practically all propeller glues for the Army and Navy have been purchased. It also developed methods of making tests and instructed Army inspectors in the proper inspection of glues. The great bulk of glue used in manufacturing propellers was inspected and certified by Army inspectors stationed at the Laboratory.

As has already been pointed out, propellers exposed to varying atmospheric conditions, even when varnished, will absorb or give off moisture, swelling or shrinking in the process. Unless the propellers are made with the greatest possible skill and care, the shrinking and swelling are apt to produce injurious warping and set up stresses which may cause the propeller to fail in service. The need for a coating practically impervious to the transmission of moisture was evident, and the Laboratory conducted several long series of experiments upon many types of coatings, including various shellacs, varnishes, enamels, electroplated metal coverings, vulcanite, and several kinds of metal-leaf coatings. A coating was finally devised, which was many times more effective than varnish coatings in preventing moisture transmission, and this coating has been approved for use by the Army. This coating consists of a layer of very thin aluminum leaf laid on over a layer of partially dry varnish, and then protected with several layers of enamel and varnish. While the coating has no greater resistance to wear than that offered by the varnish and enamel coats over the leaf, it does insure perfect protection to the propeller during storage and shipment, and in service until sand or spray wears it off. Since the greater portion of the existence of the average propeller is passed either in storage or shipment, the usefulness of the coating is apparent.

There are many phases of propeller manufacture which warrant further investigation, and the Laboratory now has under way a comprehensive study of propeller construction. As part of this research, several hundred propellers of various species have been made up under varying circumstances. These are being stored under controlled conditions of temperature and humidity in order that a study may be made of the exact effect of the manufacturing conditions upon the value of the finished propeller.



HALL-SCOTT TYPE L-6a AERO ENGINE

IN view of the rapid advances and improvements made in aircraft and power plant designs, the Hall-Scott Company, in keeping with recent development and progress have designed and perfected a new six-cylinder engine, which not only embodies all the superior qualities of the A-5 and A-5a Types, but also contain new and superior features.

The L-6a engine conforms in general appearance and design to the A-5 engine, as well as in general dimensions.

The general characteristics are as follows:

Number of Cylinders.....6
Bore 5-inch
Stroke 7-inch
Rated H.P. 200
Speed 1700
Propeller Dia.....9 feet
Pitch .....6 feet
Carburetor .....Miller
Normal B.H.P.....215
Method of Cooling—Water—Centrifugal Pump.
Ignition .....Delco
Piston Displacement—824.670 cu. in. 137.445 cu. in. per cylinder)
Piston Speed at Normal R.P.M. (1700)—1983 feet per minute
Compression Volume.....24.74 cu. in.
Compression Ratio.....6.555
Weight of Engine dry, including Carburetor and Ignition System—495 pounds
Weight dry, per Normal B.H.P.—2.30 pounds
Weight Temperature Inlet—150 degrees Fehrenheit
Water Temperature Outlet—165 degrees Fehrenheit
Water Circulation.18.5 gallons per minute

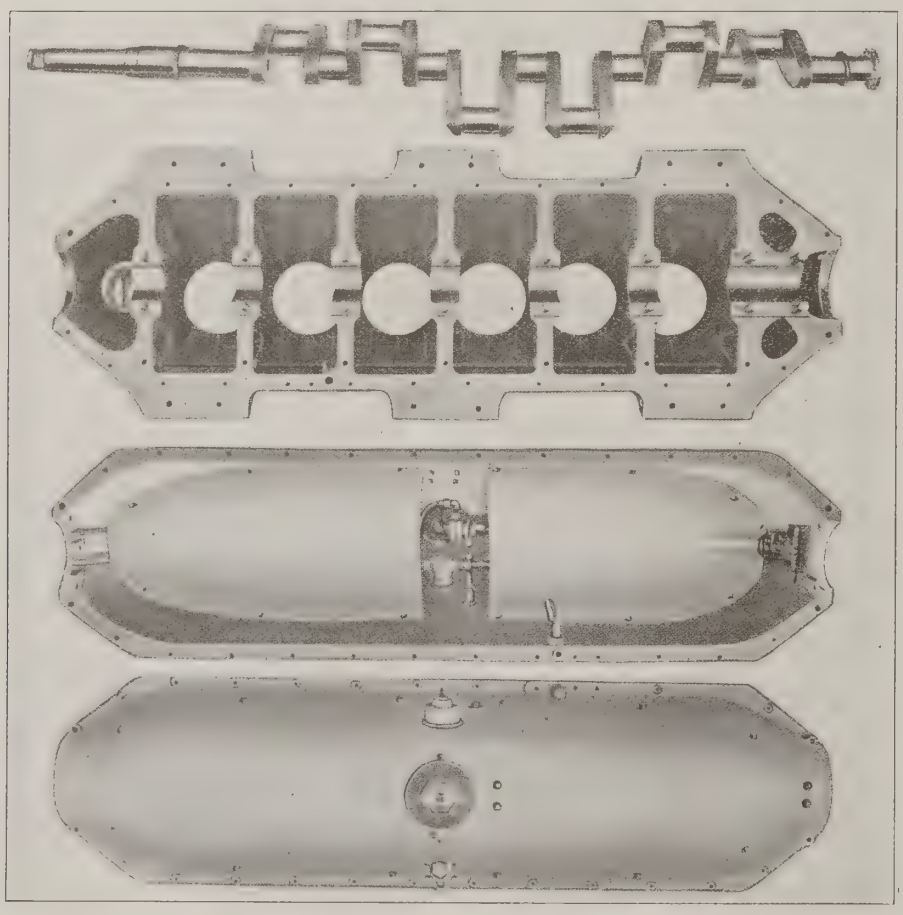
The Hall-Scott Type L-6a Aero Engine

The L-6a engine is of the vertical type with overhead cam shaft.

The cylinders are machined from steel forgings with steel jackets welded on similar to those used on the Liberty 12 engine.

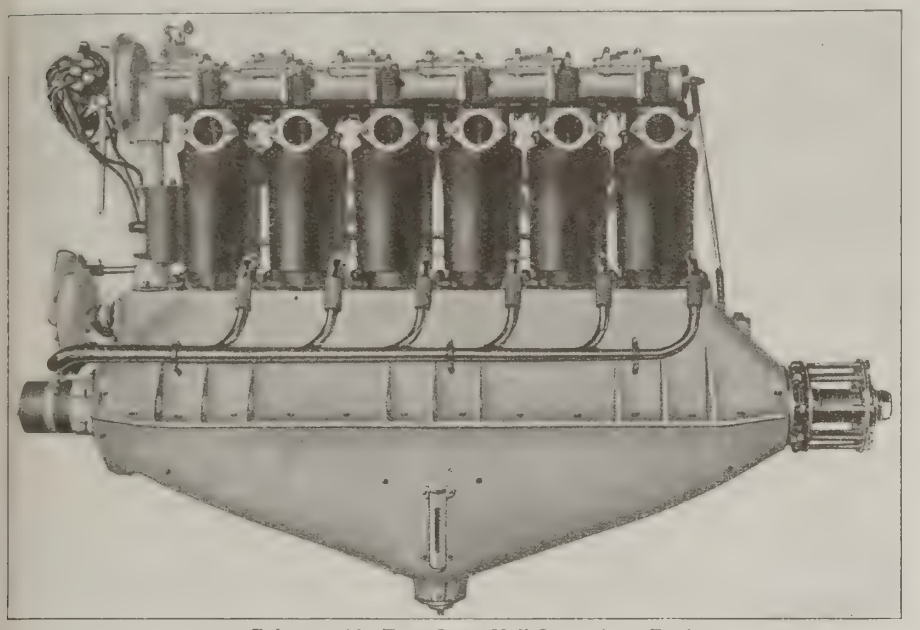
The cooling system is of the circulating pump design and is very simple and efficient. Welded steel manifolds are used exclusively, obviating the necessity of any flexible pipes or tubing which is more or less liable to breakage. The connections are made with specially constructed rubber hose connections held on with clamps, permitting the easy removal of parts.

The connecting rods are of the I beam or H section, similar to all Hall-Scott rods, except that at the crank pin end the cap is bolted on with four bolts, instead of two, as heretofore used.



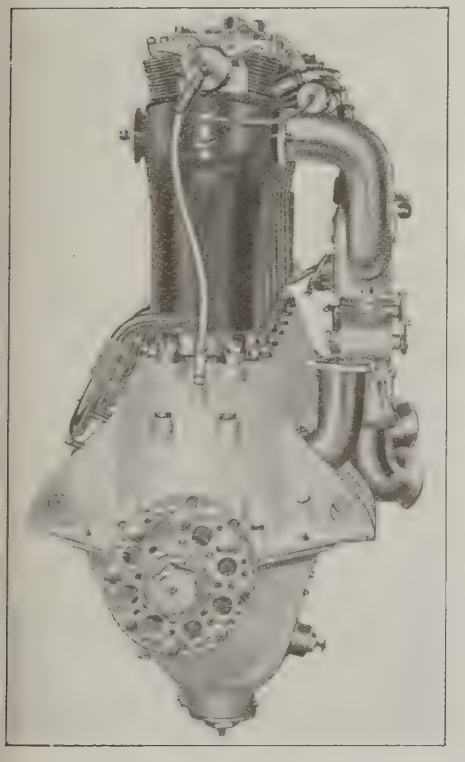
The crank shaft is the same as the A-5a type, with the exception of the cheeks, which are designed to withstand the extra stresses, resulting from a higher powered engine.

The propeller end of shaft is designed so the crank shaft flange can be removed with the propeller, permitting a quick installation of a new propeller if necessary. The crank is of the seven-bearing type with ball-thrust bearings at the propeller end.



The cam shaft is of the one-piece type, cams and flange being integral, machined from a drop forging. The cam shaft is contained in an oil-proof housing, mounted on the cylinders, and is driven through bevel gears on a vertical shaft. The cam shaft and vertical shaft and all working parts are oiled under pressure from main bearing in the crank case. Surplus oil is returned to oil sump through the vertical shaft housing.

The crank cases are of aluminum. The lower case or oil sump can be removed without breaking any pipe connections. In the lower case are located the oil strainer and dirt trap oilsight gauge and a twin oil pump; one pump circulates oil through the engine from oil held in the sump, the other acting as a supply pump to oil sump, pumping oil into it from an external oil tank in a regulated quantity.



In the lower oil sump is a very sensitive and rugged oil relief valve, which can be adjusted externally so the oil pressure can be regulated to any pressure

Crankshaft; upper crank case, illustrating the seven main bearings with bolts; inside view of lower crank case, showing splash pan, oil pump, strainer and pressure relief valve; and outside view of lower crank case

Exhaust side Type L-6a Hall-Scott Aero Engine

Propeller end, Hall-Scott Engine

from zero to thirty-five pounds. Splash plates are also put in the lower case to prevent excessive splash from the dipper action of the connecting rods and crank.

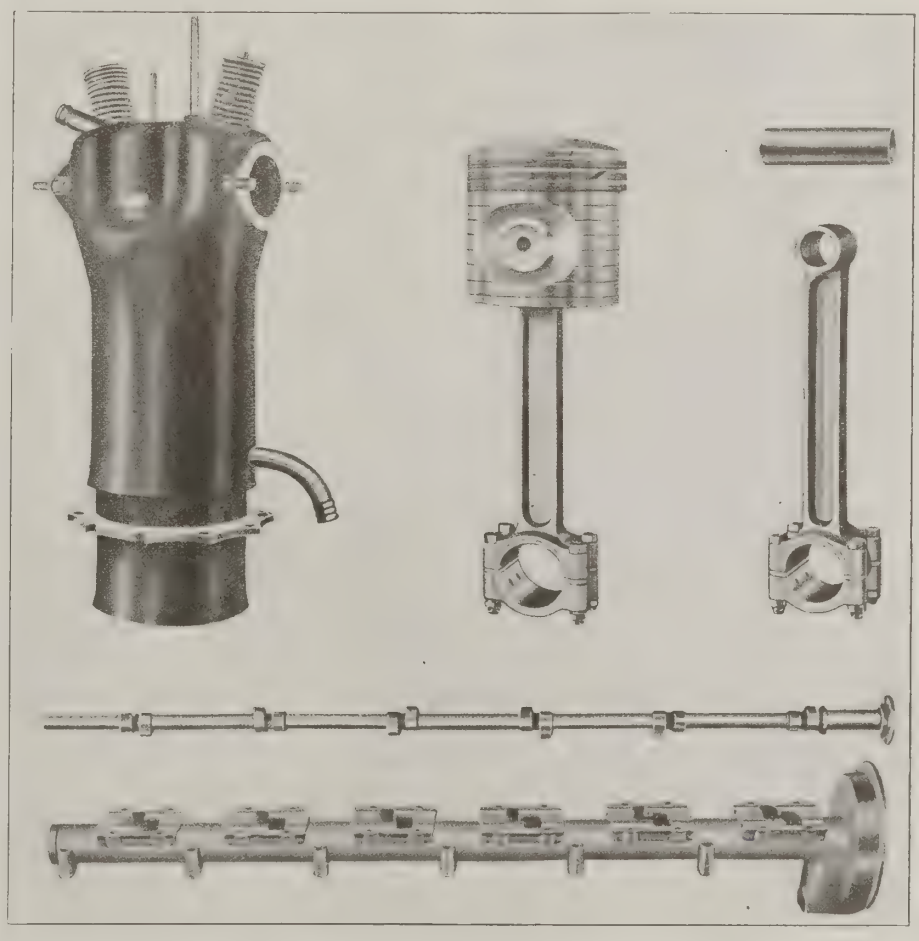
Carburetion is secured through two specially designed carburetors and twin manifolds, which are of the hot-spot water-jacketed design. The carburetors are inter-connected through the controls.

The ignition is secured through a specially designed Delco Unit. The twin distributors are mounted on the end of the cam shaft housing and driven off the cam shaft. The coils are mounted directly underneath the distributors on the vertical shaft housing. The generator is driven off the end of the crank shaft and is bolted to the crank cases.

The oiling system is of the force feed or pressure type, oil being pumped to main bearings from which it is conducted through annular and radial drilled holes in crank shaft to connecting rod bearings.

The upper end of connecting rod and the pistons are oiled from splash and crank case fog. Large oil fillers are located on the intake side of the crank case, which also act as breathers.

The main bearing caps are bedded into the upper crank case and are bolted through the case by through bolts, which on the upper end act as cylinder hold-down bolts. Bronze-backed bushings are used in both the case and caps, shims being eliminated entirely with the exception of a few thousandths which permit the bedding of the crank shaft.



The valves are extremely large and located in the cylinder head, actuated through a rocker arm and tappet action. Double coil springs are used on both the intake and exhaust valves for the return action.

The pistons are of the design perfected by the Hall-Scott Company, and are of aluminum alloy, extremely simple in design and remarkably efficient. No clamping devices or set screws are used to hold the piston pin, which is permitted to float in both the rod and pistons.

Increasing Climbing Rate By Greater Friction on Lower Side of Fabric

Writing in the Zeitschrift für Flugtechnik und Motor-Luftschiffahrt, H. von Burberg states that when the wings of an aeroplane are being covered the fabric on the lower surface is sprinkled lightly with sand. Although the friction is thereby increased, the climbing power is considerably improved. This result is associated with the production of innumerable small eddies all in close proximity to each other on the undersurface of the wing, forming a species of air cushion. A fact closely associated with this is the phenomenon that when a machine flies directly into a head wind it climbs better than when flying in still air with the same relative speed. The author considers that this effect is directly connected with the eddying air encountered by the machine.

Experiments are being conducted to test the effects of roughening different parts of the surface of propellers and streamline bodies, and these have so far given satisfactory results. They have shown that roughening the under-surface of the wing is favorable to the production of a cushion of supporting eddies.

Assembly of details of the Hall-Scott Type L-6a engine

Latest Naval Orders

Lieutenant (junior grade) Norman J. Learned, to duty naval air station, Cape May, N. J.

Lieutenant (junior grade) Homer R. Geedes to duty naval aviation detachment, Akron, Ohio.

Air Service Officers Honorably Discharged

The following officers are honorably discharged from the Service of the United States: Second Lieut. Howard W. Heintz, Captain A. S. Leon Richardson, First Lieut. George Perkins, First Lieut. William H. Vollmer, First Lieut Charles H. Shook, Second Lieut. Clarence A. Smith, First Lieut David S. Johnson, First Lieut. Frank A. Pence, Second Lieut. Benjamin F. Fiery, First Lieut. Elias H. Kron, First Lieut. Edward D. Babcock, First Lieut. Emil F. Schwab, First Lieut. Percy H. Willis.

Aero Squadrons Assigned to Early Convoy

Washington, D. C.—The War Department announces that the following organizations have been assigned to early convoy: 50th Aero Squadron; 637th Aero Squadron; 650th Aero Squadron; 660th Aero Squadron; 1108th Aero Squadron.

The 351st Aero Squadron is en route to the United States.

Air Service Demobilization

Progress in Demobilization

According to reports received from the Air Service, the net decrease in the total commissioned and enlisted strength from the date of the armistice to April 3 was 69 per cent.

The following table shows the distribution and per cent of net decrease to April 3. The strength figures include only officers and men not yet ordered discharged; they do not include men at demobilization camps awaiting discharge.

	Nov. 11	*April* 3	*Per cent net decrease*
Cadets	5,775	763	87
Officers	20,586	3,237	84
Enlisted men	164,266	55,550	66
Total	190,627	59,550	69

Demobilization of Air Service Personnel Overseas

During the week ending April 3, 1919, the Air Service personnel overseas decreased 193 men as against a weekly average of 2,780 during the seven preceding weeks. The strength of the Air Service in the United and overseas is shown for various dates in the following table:

	U. S.	*Overseas*
Nov. 11	111,846	78,786
Dec. 2	115,216	78,061
Dec. 26	99,010	59,917
Jan. 30	46,919	57,527
Feb. 27	33,649	53,087
Mar. 28	25,347	41,800
April 3	17,943	41,607

Colonel Kenly Honored By King George

Washington, D. C.—Colonel William L. Kenly, until recently Director of Military Aeronautics, has been conferred the honor of Companion of the Order of the Bath by King George of England. This tribute is the result of Colonel Kenly's brilliant work as Director of Military Aeronautics and, prior to that, as officer in charge of all flying at the battlefront. Colonel Kenly was recently reduced to his present rank in connection with the demobilization of the Army and has not so far been awarded any decorations from the American Government.

Army Expenditures Reducing

Washington, D. C.—According to an official statement prepared by the Statistics Branch of the General Staff, March is the first month to show a decided decrease in Army expenditures, with 58 per cent of the previous monthly average. In comparison, February expenditures were 96 per cent of the average.

The Bureau of Aircraft Production withdrew $11,082,000 from the Treasury during March, and the Department of Military Aeronautics drew $2,518,000. These two combined form 4 per cent of the War Department's total March expenditures.

The average withdrawals between July 1, 1918, and January 31, 1919, were $18,000,000 and $5,230,000 for the Bureau of Aircraft Production and Department of Military Aeronautics, respectively, and these two formed 9 per cent of the total War Department expenses. The March withdrawals formed 62 per cent of the average withdrawals for the eight month period for the Bureau of Aircraft Production and 48 per cent for the Department of Military Aeronautics.

Congressional Medal of Honor Awarded to Frank Luke

The Congressional Medal of Honor, America's highest award for valor, has just been awarded to Lieut. Frank Luke, Jr., Air Service, of Phœnix, Arizona, America's second ace, who was killed in action September 29, 1918, after bringing down two enemy planes, three balloons and about a dozen German soldiers.

Frank Luke, Jr., a Second Lieutenant in the Air Service, operating as a pursuit pilot of the 27th Aero Squadron, had, according to all accounts, the most vividly brilliant and yet meteoric career of any fighting pilot in the Air Service of the Army.

Frank Luke is credited with having brought down 18 enemy planes in 17 days. He had previously been awarded the Distinguished Service Cross and later received a second citation entitling him to wear an additional bar.

Colonel Milling Decorated By King of Belgium

Colonel Thomas de W. Milling, Air Service, Military Aviator, has been advised through the Adjutant-General that King Albert of Belgium has bestowed upon him the Order de Leopold, with rank of "Officier." This honorary distinction was conferred upon Colonel Milling as a token of the esteem of the King and in recognition of the valuable services rendered the common cause. Col. Milling served under General Mitchell while he was commander of the Air Service, First Army, and succeeded him when he was promoted.

Air Service to Co-operate With Forestry Service

Major-General Charles T. Menoher, Director of Air Service, has advised the Forest Service of the Department of Agriculture that the Air Service will co-operate with the Forest Service in order to carry out certain experimental work desired by that bureau on fire patrol. Mr. Henry S. Graves, the Forester, has been advised that he should communicate with the commanding officers of Rockwell Field, San Diego; March Field, Riverside, and Army Balloon School near Los Angeles, California, who will co-operate with the Forester in order to carry out the experimental work which he desires done during the coming summer. It is possible later that further work may be carried out at Mather Field. Conferences between Air Service officers and representatives of the Forest Service have been held for the purpose of determining further co-operation between these two bureaus in assisting in fire patrol of National Parks.

Figures for Active, Obsolescent, and Obsolete Planes and Engine on Hand Announced

(Prepared by Statistics Branch, General Staff, War Department, April 12, 1919.)

The Air Service has divided all planes and engines into three classes—"Active," "Obsolescent," and "Obsolete." The following table shows the number of engines and planes on hand for each class, according to revised figures:

	New	Used, but in flying condition	Out of Comm'	Total	Per Cent		
					New	Useable	Not Useable
Active							
Service engines....	9,725	412	277	10,414	93	4	3
Service planes....	2,264	198	150	2,612	86	8	6
Training Engines	1,997	491	155	2,643	76	18	6
Training planes....	740	1,019	344	2,103	35	48	17
Obsolescent							
Training engines....	4,541	4,417	1,900	10,858	42	41	17
Training planes....	498	1,854	552	2,904	17	64	19
Obsolete							
Engines...	1,638	116	1,009	2,763	59	4	37
Planes....	1,037	68	913	2,018	51	4	45

After completing a tour of inspection of French and British Aviation Camps, a Japanese naval delegation, consisting of Rear-Admiral K. Yosheida, Lieut.-Commander S. Kono, T. Ohzoki and S. Shayashi, and Engineering Commander K. Vitajima. This photograph was taken on their visit to the Curtiss plant on Long Island, where they were accompanied by the Japanese Naval Attaché and several naval officers

FOREIGN NEWS

Plane Quells Riot in India

Simla, India, April 17.—Aeroplanes were used to-day in coping with the disorders that have broken out in the Punjab. A mob attacked a passenger train in this district and wrecked the railroad station at Gujranwala. Aeroplanes were sent from Lahore to machine gun fire from the air.

Aerial Survey Reveals Sahara Route

Some interesting information about the regions of the Wadi Saura, Tidikelt, and the Mid-Sahara was collected during a recent reconnaissance carried out by aeroplane and motor-car under the orders of General Nivelle.

The fact is firmly established that it is possible to begin an aerial and motor-car service between the southern posts of the Algerian Sahara and the coast, via Colom Bechar, Insalah and Tuggurt. This would create a basis of revictualment for penetration across the Sahara towards the Niger.

Fokker Building Improved Planes in Holland

Two army o..cers, Colonel Earl McFarland of the Ordnance Department and Major Robert March, Jr., have been ordered to report to the American Military Attache at the Hague and from there to visit the Fokker factory in Holland.

Herr Fokker is a Dutchman and has continued his research work following the collapse of the German military machine. He is said to be considering the sale of his exclusive rights to other governments.

Danish Aeronautical Exposition Opens

Copenhagen, Denmark.—The largest exposition of flying machines ever held in Europe opened on April 12 in Copenhagen at the Tivoli. The President is Prince Axel, well known as an airman.

Vickers Announce Trans-Atlantic Service Rates

London.—Vickers, Ltd., are about to start a transatlantic air service with airships which the company was building for the British navy when the armistice was signed, and which are no longer needed. *The Pall Mall Gazette* says. The passenger rate will be £48 ($240), and mail will be carried at the rate of £405 ($2,025) a ton.

The pioneer ship will have a gas capacity of 1,200,000 cubic feet, and engines of 1,000 horsepower. Larger ships are being designed to carry 200 passengers.

Aeroplanes and Accessories to Be Feature of Birmingham Fair

A feature of the British Industries Fair for 1920, beginning late in February, will be a display of aeroplanes, aeroplane accessories and aeroplane engines. The Birmingham Industries Fair dates back to medæval times.

Prince Albert Now Royal Air Force Staff Officer

Captain H.R.H. Prince Albert, K.G., R.A.F., second son of the King, has been appointed from Staff Officer to be Captain in the Administrative Branch of the Royal Air Force.

Brazil Appropriates $500,000 for Military Aeronautics

The sum of $500,000 has been appropriated by Brazil for organization of an aviation service, purchase of aeroplanes, establishment of aviation schools and the buying of various accessories.

A German Rumpler biplane now in the hands of the French Air Service

England Organizing Extensive Aerial Police

It is stated in the "Daily Mail" that the post of "Chief Constable" and other ranks in the new British Aerial Police will shortly be open to young flying men with military experience.

The "Force," which will work in close conjunction with the existing Customs and Police Services, will be directed by Major General Sir F. H. Sykes, the Controller of Civil Aviation, and will be divided into two branches—a number of pursuit scouts and a larger body of aerodrome police. A distinctive uniform will be worn.

The police will be stationed at various points around the coast to be known as "arrival stations," at which all machines coming from overseas will be compelled to land. It will be the duty of the ground branch of the Air Police to examine the machines for contraband, concealed cameras, and arms, and to ascertain from the pilot, whose papers will be examined, the course which he intends to follow in the British Isles.

Prohibited areas, such as powder factories, arsenals, dockyards, and the like, will be pointed out to him, and aerodromes notified in advance of the registration mark of his machine.

The chief duty of the pursuit scouts will be the heading off of negligent aviators from prohibited areas. An orange or other small object dropped from an aeroplane through the roof of a powder-mill is considered by experts to be sufficient to cause an explosion, and regulations in this respect are likely to be very drastic.

The scouts, in all probability, will be armed with machine guns, from which tracer bullets will be fired as a warning or to shoot down air pirates, as no other means of dealing with fugitive lawbreakers in the air at present suggests itself.

Many ground and other signals are at present being devised by a special branch of the Air Ministry.

National Aircraft Factory Bought By Straker-Squire

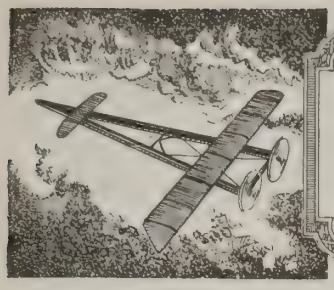
London.—The National Aircraft Factory at Edmonton, England, has been sold to the Straker-Squire Company for $700,000 to be used for the manufacture of motor cars.

Commercial Aerial Routes Being Established Throughout England

The Tynemouth Corporation, having received an offer from a company to run pleasure trips with four-seater biplanes, has referred it to a sub-committee with plenary powers to act on the understanding (*a*) that sole permission will not be granted; and (*b*) that the proposed service shall not interfere with the free enjoyment of the foreshore.

A project is on foot to establish an air service between Leicester and Hunstanton with the object of conveying business people between the two places daily.

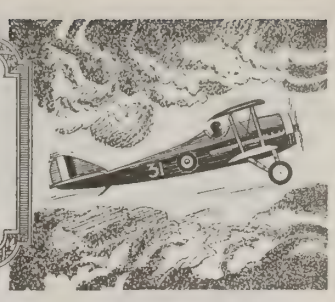
At the last meeting of the Leeds Chamber of Commerce, Sir John McLaren, who presided, moved a resolution expressing the opinion of the Council that the commercial use of aircraft in the transit of passengers, mails and goods had become a question of immense moment, and calling the attention of the City Council to the desirability of placing before the Government the claims of Leeds as an aeroplane centre and clearing-house for the West Riding of Yorkshire. The resolution was carried.



The Great Northern Aerial Company propose to make one of their stations at Bray, and have applied to the Bray Urban Council for permission to build hangars for six large machines.

Two companies are seeking the permission of Folkstone Corporation to provide flying facilities. The Blackburn Aeroplane and Motor Company (of Leeds) wrote asking if the corporation would consider a scheme to include a service between Folkestone and adjoining towns and short pleasure trips for the amusement of residents and visitors.

The Central Aircraft Company (of Kilburn) wrote that they would be prepared to arrange a regular passenger service between Kolkestone and London, besides circular tours by aircraft and aerial exhibitions of all kinds.



British Insurance Companies Fix Premiums

Insurance companies are already fixing the premiums for insurance against personal accidents for flying passengers and for goods sent by air. It is stated that the rates for personal risk will probably work out as follows per £100: London-Paris, 3s.; England-Italy, 5s.; England-Bombay, 25s. Rates will vary according to the nature of the journey. For a journey overland from North Africa to India, for instance, the premium will be about 10s. per cent., whereas the oversea route to India from South Africa will be 17s. 6d. per cent. Inside the United Kingdom the premium for passengers is provisionally fixed at 2s. 6d. per cent. The percentage rates for goods-carrying have already been fixed as follows: United Kingdom, 7s, 6d.; England to N. France, Belgium, and Holland, 15s.; England to N. Italy and Scandinavia, 80s.; England to Egypt, 120s.; England to India, 300s.

ELEMENTARY AERONAUTICS *and* MODEL NOTES

By John F. McMahon

The Long Distance Racing Model

THE accompanying drawing shows a long distance type of racing model such as aeromodelists use for hand launched long distance work, and is a good model for use in the coming contests.

The best models of today have a wing of the shape shown in the drawing, and this is the most efficient from an aerodynamic standpoint.

A model of this kind will give pleasure to the builder besides winning prizes in model aeroplane contests, and the sight of one of these long distance models high in the air is truly an interesting sight, and the exercise derived from following these models for long distances is worth the time spent in building one.

While the construction is simple, a good many points must be taken into consideration when building or designing a model of this kind. One of the principal points is to have the model clean cut so it can pass through the air easily as the motor is cut down until the minimum of power needed to propel the model through the air is reached. This is accomplished by covering the wings top and bottom with some sort of thin skin, fine silk or tissue paper, doped with a solution to shrink the covering and also fill the pores.

The proper method of determining the correct amount of rubber to use is to put on a large amount of rubber and gradually cut it down until the minimum is reached that the model will fly with. The correct amount will just keep the model in the air until the rubber winds out completely. Flat rubber about 3/16" wide and 1/32" thick is the best for models.

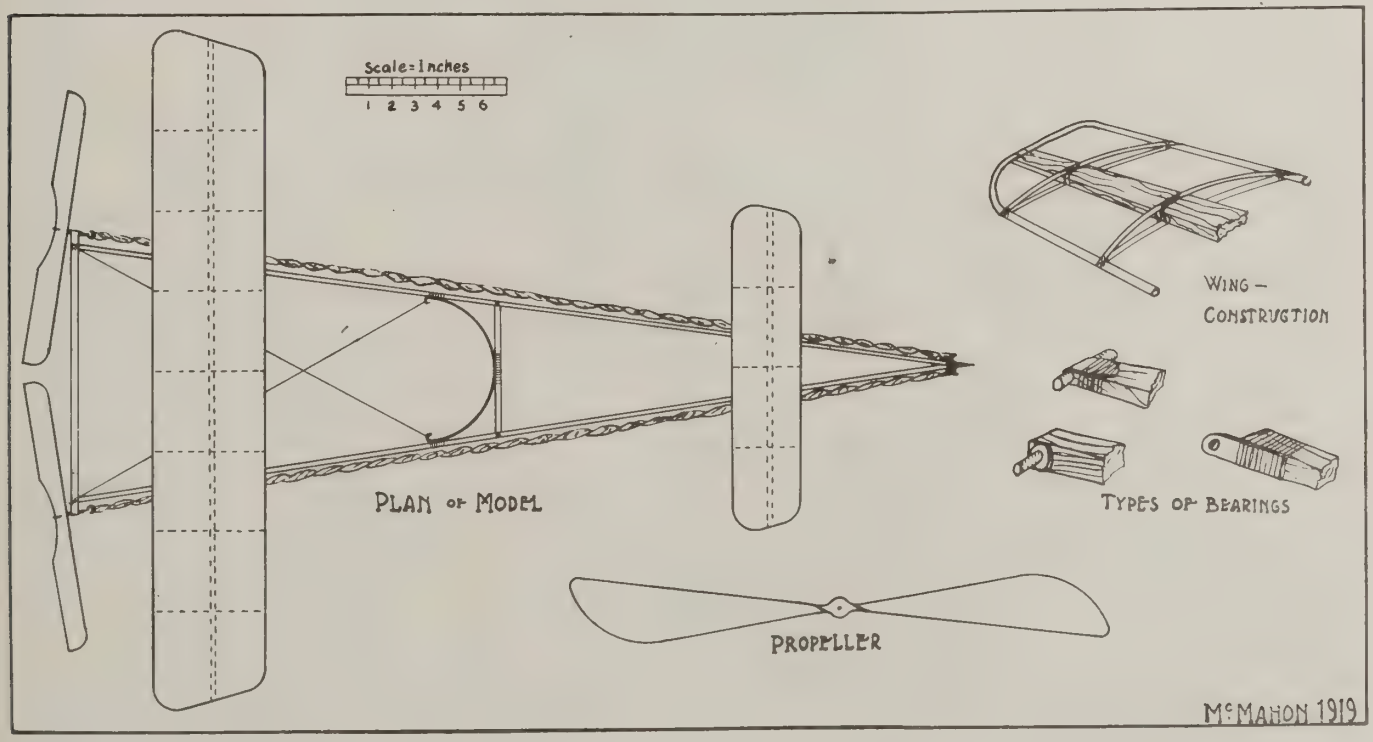
Although the model shown is for hand launched flights, a simple landing chassis can be designed to attach to the "A" frame and for use in R.O.G. (rising off ground) contests.

To construct the model the frame should be made first. The main spars are made of spruce 5/16" x 3/16" and 40¼" long. The spars are joined together at one end to form the apex of the frame. It is necessary to taper the spars slightly and bind with thread and glue. The other ends of the spars are notched and a strip of streamline spruce 12¼" long and ⅜" x ⅛" thick is fastened with thread and glue also. To strengthen the frame, a cross piece is fastened to the spars about midway and a piece of steel wire is bent to a half circle with loops at each end and fastened to the spars. This wire acts as a brace and a terminal for the bracing wires as well. The bracing wire is the thinnest of steel piano wire, and is fastened to the loops, pulled taut as possible and fastened at a point where the rear spar and the main spars are fastened together. A frame of this shape is called an "A" frame on account of its shape.

Bearings for the propellers are fastened to the ends of the rear spar. These bearings are for allowing the propeller shaft to turn without friction, and are made of 1/32" I. D. copper tubing. The propeller shaft on steel piano wire just small enough to pass through the hole in the tubing and still turn freely. These bearings can be made in different styles, as shown in the drawing to the right.

A piece of steel wire is bent to a "V" shape, and the ends bent back to form a hook. This is used at the apex of the frame to fasten the wires to, and is also bound with thread and glue.

The propellers are made to the shape shown at the bottom of the drawing and should be 12" long and are carved out of a block of white pine 1" thick. If the model builder does not think himself capable of making the propellers correctly he can purchase them from any model supply house, as well as bearings, wood, bamboo, etc.



The wings are made up of bamboo and spruce, the spruce piece running through as a sort of back-bone. The spar is 3/32" x 1/16" and the ribs, trailing edge and entering edges are bamboo.

The construction of the wing is clearly shown at the right of the drawing. All dimensions can be ascertained by using the scale at the top of the drawing.

The wings should be covered with what is known as "Gold Beaters Skin." This can be purchased at model supply houses or from wholesale druggists. The skin is applied by heating over a fire and then fastened to the frame of the wings with Amberoid glue and doping with a mixture of Ambroid glue diluted with acetone and banana oil.

When covering the wings cover one side then dope it, after which the other side can be applied and doped.

If constructed properly this model will make flights of 3,000 feet and over. One thing must be remembered and that is, the ribs of the wings as well as the edges must be only 1/16" round bamboo, if made thicker the model will be too heavy.

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

Mr. Suburbia: "I think it's perfectly wonderful to think aviation has reached such a high stage that an aeroplane can land on the deck of a warship."

Aviator: "That's nothing, I once landed my 'plane on the roof of a railway signal-box in France."

When President Wilson was driving through London he glanced up at the Aerial Squadron sent to escort him on his triumphant way.

"Hum!" he mused. "No need to add a fifteenth point to my Peace Terms. They've got plenty of Freedom of the Air."

Old Gent on the allotment, as aviator crawls from his machine: "Excuse me, sir, but from a psychological point of view, I am interested in accidents."

Aviator: "Thanks, old Top" (sarcastically). "Anything I can do for you will be a pleasure."

Old Gent: "How good of you! Well, would you mind telling me the actual words you used when you collided with the other machine?"

Aviator: "By all means. When I saw old Jones coming for me in his 'bus, I turned to Bill, my observer, and I said: 'What the blithering deuce does he want here?' And Bill shook his head quietly and replied—'I'm bunkered if I know.'"

"You say you love my daughter?"

"Love her, my dear sir, I would die for her. For one soft glance from her eyes, I would jump out of my aeroplane to get down to her quickly."

"Indeed. Well, I'm something of a liar myself, and I fancy one is enough in a small family like mine."

One of our aviators took a Highland soldier up for a flip, and when he descended he thought he would astonish him by his knowledge of the Scottish language.

"I suppose, Jock," he said, "you're nearly kilt wi' the cauld (killed with the cold) in the air?"

"No, mon," remarked Jock, "but I'm cauld wi' the kilt in the air."

British Want Weir

Airmen are not happy over the rumored change at the Air Board. They are singing, "Oh, Weir, tell me weir has our Highland laddie gone."—From *Aircraft* (London).

1940

Twenty Years After: "Get out your 'plane, old thing, and fly across with me to join the East Kent Hounds."

"Thanks, old bean, but I'm fixed up. Just flipping off to the Pole to attach myself to the whaling fleet. Grand sport. What?"

The Adventures of "Cyril" in the Aviation World. In the Drawing Office

(From *Flight*)

WALNUT PROPELLERS WILL WIN

We are sure you can profit by the information and advice which we are able to give you by reason of our experience in propeller designing. If you will give us an opportunity to fit your motor and plane with the proper propeller, we are quite confident we can extract every ounce of thrust your motor will develop and all the speed of which your plane is capable.

We are able to back up the above statements by the performance records of planes designed by some of the best Aeronautical Engineers in this country.

to these bearings through connection into the regular pressure feed line of the Liberty engine. Thus the Liberty oil pump supplies them, avoiding an added complication of having a special oil pump in the turbo-compressor unit itself. An oil seal is made against oil leakage around the shaft by providing a washer that is a loose fit on the shaft, and which has a spherical shape on one side. This side fits against a seat in the bearing chamber, against which it is held by a spring. This construction is very effective in preventing oil escapage into the turbine casing or blower housing, as the case may be.

In several of the earlier Sherbondy designs, trouble was experienced with the gas casing, which had a tendency to warp and thus throw the turbine nozzles out of place to such an extent that they touched the turbine wheel in several instances. Other troubles were encountered due to warping of the nozzle ring and the misshaping of the nozzles themselves. In the last design, as seen in Fig. 4, however, these difficulties were overcome in large measure by bolting the nozzle ring to the compressor casing and permitting the gas casing to deflect as much as it pleased with no ill effect upon the running of the device. It is just such problems as these that Sherbondy has had to overcome throughout, for the intense heats encountered, the restricted space available for the unit and the necessity for extreme lightness are three diametrically opposed factors which must be compromised into the best possible assembly.

At F in Fig. 4 is seen the diaphragm, which is the controlling unit for operation automatically of the by-pass valves V which allow escape of exhaust in proportion to the supercharger speed required for efficient working of the turbo-compressor at any given altitude. Obviously, at ground level, these by-passes are open, whereas, at the maximum height, they should be entirely closed so that all exhaust energy is given to the turbine to operate it at top speed. In effect, the automatic control works upon the principle of differential pressure on the two sides of the diaphragm, which opens and closes a piston valve in the casting. This, in turn, operates a system of oil ports through which oil flows under pressure to open or close ports that govern the action of the small pistons of the by-pass valves. The action is thus devoid of shocks and any movement of the by-passes is gradual and lacking in jerkiness that would tend to produce undesirable shocks to the mechanism as a whole. In other words, the control system has been arranged to have a more or less damping action, making any changes in the amount of gases passing to the turbine gradual rather than sudden enough to cause trouble.

In operation of the supercharges, the air is drawn in through the passage G, is carried around by the impeller A and in its compressed state is sent to the carburetors through the outlet J. The exhaust gases are led to the gas chamber N, whence they are directed through the nozzles R to the buckets K of the turbine wheel B. The exhaust gases, after giving up their energy, are discharged through the exhaust outlet E, into which the valves V also send any gases which are not sent through the turbine, due to the automatic control feature already mentioned. There is in reality no connection between the turbine and the compressor, except through the common shaft S, which is fitted with a labyrinth between the two rotors to prevent pressure escape from the turbine to the blower casting. As a means of cooling, water is circulated through the space W between the two parts, a provision which was quite essential to assist in keeping down the excessive temperatures.

The Sherbondy machine was designed to have an air discharge capacity of 692 cubic feet per minute, when the Liberty engine is operating at 1700 revolutions per minute. Under these conditions, it is intended to handle any pressure requirements of the engine from nothing at sea level to approximately 7.5 pounds per square inch at 20,000 feet, at which altitude the atmospheric pressure is about half that at sea level.

It is computed that the theoretical horsepower available in the exhaust gas of the Liberty engine is about 80, whereas, with a compressor efficiency of around 60 per cent, the horsepower required to compress the air is about 32, indicating that the overall efficiency of the system is somewhere in the neighborhood of 40 per cent.

In the next article, the Moss turbo-supercharger will be touched upon, and consideration will be given to some of the arguments advanced for and against the turbine system of compression.

Treatment of Special Steels and Metals by Means of Baths of Metallic Salts

The success of modern industry is intimately linked with the development of the physical qualities of the metals with which the engineer must construct his machines and high-speed tools.

Just as the manufacture of steel made more rapid strides than the scientific production of steel alloys, it is only recently that attention was turned to the important effect that scientific heat treatment has on the physical qualities and endurance of steel and special metals.

One of the great obstacles which the engineer has to surmount in heat treatment is the oxidation which follows and the defects which appear in the finished and polished pieces. In many cases a new sand-blast treatment and repolishing makes possible the removal of the exterior carbonization and oxidation.

Mr. Fuller, of H. Fuller & Company, Ltd., of Sheffield, England, undertook researches for the purpose of overcoming these difficulties and after several years of research discovered a process by means of which the engineer and manufacturer of steel can prevent frequent difficulties. Mr. Fuller's method consisted of plunging all parts of the machine which requires the heat treatment (such as high-speed steels, steel alloys, carbon and non-ferrous steels) in a transparent bath of metallic salts composed of a special new composition. The Fuller treatment claims the following advantages:

(1) It completely obviates oxidation, carbonization, chipping or pitting of surfaces and produces a surface of uniform durability.

(2) It reduces working and deformity to a minimum.

(3) It greatly reduces the possibility of damage of the quality of the steel or metal as a result of too long an immersion, because this metal is a complete protection against noxious gases.

(4) It permits the employment of inexperienced workers in the foundry.

(5) It reduces the number of furnaces necessary because of the very high rate of speed with which the work can be accomplished.

(6) The number of defective hardening treatments is reduced to a minimum.

(7) It is suited to all purposes. The salts being transparent and the piece under treatment is visible during the entire heating process up to the moment it reaches the exact temperature desired.

(8) It is possible to register the temperature much more exactly than in an entirely enclosed furnace. Every practical workman will appreciate the tremendous advantage which there is in the possibility of approaching within a few degrees of a desired temperature when it comes to special metals. The immersed article must acquire at the proper rate the same temperature as the molten mass which surrounds it.

(9) The salts are not toxic; they are consequently harmless and without noxious effect on the immersed metal or the worker himself; there is no noxious gas emitted and in consequence the furnaces require neither cover nor pneumatic device for conducting noxious gases.

The transparent non-oxidizing "Fuller" salts are already in use by the most important mechanical construction firms and everywhere they have been furnished they have resulted in new orders. This discovery is considered to have great possibilities if, as contended by the inventor, it gives infallible results.

VOL. IX NEW YORK, MAY 5, 1919 NO. 8

SECRETARY OF WAR BAKER OPENS SECOND PAN-AMERICAN AERONAUTIC CONVENTION, EXPOSITION AND CONTESTS BY WIRELESS

THE opening of the Second Pan-American Convention, Exposition and Contests at Atlantic City on May 1st was an even greater event than the memorable First Convention which was held in New York two years ago and was opened by President Wilson by wireless from the White House.

The opening ceremony at Atlantic City on Thursday was a most impressive event. Thousands of representatives of different countries, government, state, civic and aeronautical authorities and famous airmen were present on the Steel Pier and the Atlantic City Municipal Air Port on Albany Avenue, Atlantic City.

Secretary Baker Opens Event by Wireless

Secretary of War Newton D. Baker opened the event by a wireless addressed to Mr. Alan R. Hawley, president of the Aero Club of America. His message read in part:

"I send greetings to the Second Pan-American Aeronautic Convention. Here in France, one sees the great triumph which has been achieved in aeronautics during the war and American contribution is valuable and significant.

"(Signed) BAKER, Secretary of War."

* * *

Other messages were received by wireless, cable and mail from over one hundred authorities throughout the world. A few of the messages follow:

The Second Pan-American Aeronautic Convention and Exposition comes at a time when it cannot fail to be of vast benefit to the course of aeronautics in North and South America. The Aero Club of America, the Aerial League of America and the Pan-American Aeronautic Federation are doing an excellent work in staging this important event and deserve the support of a progressive people of North and South America.

REAR ADMIRAL BRADLEY A. FISKE, U.S.N. (Retired).

* * *

Not since the ending of the war has there been anything so auspicious for the cause of aviation as this Pan-American Aeronautical Convention and Exposition. Substantial results making for the progress of aeronautics in the new world are bound to come from this important gathering.

MAJOR THOMAS S. BALDWIN.

* * *

North and South America again joins hands for the advance of aeronautics in the Second Pan-American Aeronautical Convention and Exposition being held at Atlantic City. The three organizations under whose auspices this important event is taking place are to be congratulated on the warm spirit of co-operation existing between them that makes possible the grand success of such an immense undertaking. May the same fine spirit of co-operation animate the people of all the countries of Pan-America until all these countries are knit by airways and these airways teem with planes and dirigibles, so that not only the industry itself will be on a basis of stable and steady development with all the peoples of the Western Hemisphere more closely knit in mind and heart and deed for the advancement and protection of our common civilization.

SANTOS-DUMONT.

Atlantic City is destined to become the Aeroplane City of America. Everything is pointing in that direction.

SAMUEL P. LEEDS,
President of the Chamber of Commerce, Atlantic City.

* * *

It gives me pleasure to extend a hearty greeting to the thousands in attendance at the Second Pan-American Exposition and Convention. This event marks another epoch in Pan-American Aeronautics and makes for the continued co-operation of Latin America and North America in the advancement of the great art of aviation.

The recent war has shown the necessity of aerial preparation, and nothing will do more for the protection of the Western Hemisphere in future wars than a strong and united effort in the upbuilding of every phase of aviation in all the countries of North and South America. This Exposition and Convention are bound to be of far-reaching benefit in the furthering of the cause of aeronautics.

ALAN R. HAWLEY,
President of the Aero Club of America.

* * *

The atmosphere is the greatest thing on earth. It is a great ocean, sweeping unbroken around the entire globe. Aeronautics and aviation mean the conquest and utilization of this great ocean, for travel and transportation of all kinds. The establishment of great aerial highways and of an aerial Coast Patrol taking in all the countries and the coasts of the Western World is a great end to be achieved. Such events as this Pan-American Exposition and Convention will greatly aid in furthering these desirable ends.

REAR ADMIRAL ROBERT A. PEARY, U.S.N.

* * *

Good Start for Contests

Ten aviators were ready to participate in the contests on the first day and a number started in different parts of the country, and the flights are in progress as AERIAL AGE goes to press, complete reports of which will be given in the next number of AERIAL AGE. The Atlantic City Municipal Air Port is a regular beehive.

Remarkable Exhibits on the Pier

The governments of all the Allied and Latin-American countries and their aeronautic, sporting, scientific, industrial and educational organizations have sent commissions to the convention. Five hundred thousand people have been invited to attend. Aeroplanes constructed on bird lines and painted in color resembling birds is one of the striking new developments in aeronautics which will be witnessed at the Second Pan-American Exposition on the Steel Pier and at the Atlantic City Air Port on Albany Avenue, Atlantic City. This will be the first demonstration of the construction and painting of aircraft to look like birds.

The Curtiss Company will exhibit an aeroplane that is a reproduction of the oriole, and the Cantilever Company may have a reproduction of several birds, one being the sea gull and the swallow, but the "Arrow" and the "Bullet" will predominate. Captain Ugo d'Annunzio, the son of the poet-aviator, has built a stunning aerial runabout, which is to be named "The Hummingbird."

There will also be exhibited models of all the types of aeroplanes and seaplanes used by the Allies in winning the war in the air. Each model is made on scale and bears the insignia of the country which originated it.

Eighteen special films of aeronautic events taken overseas and in the United States, illustrating every phase of aeronautics, will be shown. These include French and American official films of military and naval aeronautic activities.

Among the scientific exhibits will be the exhibits of new scientific instruments for aerial navigation. The announcement and description of these is held as a surprise. Two of the instruments to be exhibited were built especially to solve the most difficult problem of aerial navigation in connection with trans-Atlantic and trans-Pacific flying.

A most magnificent exhibit will be the photographic exhibit, showing every type of aircraft of every nation and aerial views of cities and places in every part of the world.

This last exhibit is entitled "Around the World by Air" and shows aerial views of all the capitals of the world, the most important cities of the world and such far-off places and historic landmarks as the Tower of Babel, the Pyramids, the Black Sea, Mount Atlas, the Alps, Pekin, China, and other views all photographed recently from the air.

The complete set of French Aerial Warfare paintings of Lieut. Henri Farre, official painter for the French War and Navy Departments, which includes the portrait of all the famous French Aces and of Major Lufberry and Lieut. Col. William Thaw.

In the reception rooms will be the first showing of the thrilling and historic paintings of aerial events dealing with America's participation in the aerial side of the war, painted in Europe by Lieut. Charles E. Ruttan, U. S. N.

The Aero Club of America is exhibiting the magnificent International Aeronautic Trophy, the Curtiss Marine Flying Trophy, the Collier Trophy, and the Michelin Trophy. All together there will be ten trophies exhibited representing the highest expressions of aeronautic art.

First Aeronautics Convention to Discuss Every Aspect of Aeronautics

The Convention which is to be held on the magnificent Steel Pier is to be the first convention where every aspect of aeronautics has been discussed. The program, which is most thorough and extensive, is as follows:

Aero Parade in Aeronautic Exhibit

Panorama of Air Service Section of Liberty Loan Parade of May 3d, as planned to date:

1. Three men dressed as aviators marching abreast, center man carrying the American flag, both end men carrying banner reading, "Help us to keep flying together."
2. Curtiss aeroplane to be taxied in parade, prominent overseas pilot driving, observer in rear seat, with two Lewis guns, etc.
3. Motor float containing four of best aeroplane engines—Curtiss, Hall Scott, Gnome (rotary), and Hispano-Suiza.
4. Motor float containing stripped aeroplane fuselage showing interior construction.
5. Penguin (aeroplane which will not fly, used for preliminary instructions) to be taxied in parade.
6. Float containing aerial photographic exhibit (with one enlarged photo of trenches, cameras, etc., and portable dark room on trailer).
7. Liberty motor in operation on float. (Lieut. Maynard, who will accompany this float, has flown the Liberty engine in France over 321 hours, and has never had an accident or been forced to land through engine trouble. Lieut. Maynard holds the world's record for looping the loop, having performed 318 consecutive loops in 67 minutes at Romorantin, France.)
8. Fully assembled Morane Parasol (Monoplane) mounted on float, with famous overseas pilot accompanying it (probably Lieut. Paul Beaer).
9. Float containing medical research exhibit, revolving chair, rebreather, etc. Two nurses in attendance, showing men taking actual tests.
10. Float of aerial bombs and machine guns, four kinds of each.
11. Float carrying Ruggles "Orientor," showing it in taking actual test. Man with signs will show what student is doing, when learning acrobatics, such as loop the loop, tail spin, etc.
12. Float containing hospital plane, used to carry disabled men to hospital.
13. Float containing portable field machine repair shop, showing lathe, forge, etc., in actual operation.
14. Float with portable field lighting apparatus, showing dynamo, searchlights, etc., for night landings.
15. Float containing fully assembled Spad biplane with famous overseas ace accompanying it (probably Capt. Rickenbacker). Sign will read, "Capt. Rickenbacker enlisted as a chauffeur; one year later he became America's premier Ace." (Indefinite: Small boy on same float shooting small paper aeroplanes into crowd with Victory Loan printed on their wings.)
16. Truck with cable drum, towing observation balloon sausage, 90 feet long, with trailer following.
17. Six touring cars of men dressed as aviators.
18. Indefinite—Float showing cadets at their ground school, training, showing them assembling machine gun and working on wing.

Flying above parade will be an acrobatic team doing stunts, a formation of five to seven planes, a large Handley Page following, and a large dirigible balloon. A balloon company will also have a balloon in Van Courtland Park, showing men leaping in parachutes, if weather permits (April 26 to May 3).

A view up the Boardwalk at Atlantic City, with the Traymore in the foreground, as it will appear to the aerial visitors at the Pan-American Convention

TROPHIES AND PRIZES TO BE COMPETED FOR AT ATLANTIC CITY IN MAY

THE following Trophies and Prizes have been offered for competition at Atlantic City, and from other points to Atlantic City from May 1st to May 31st. All contests are open to Army, Navy, Aerial Mail and Civilian aviators.

(1) **$6,000 Curtiss Marine Flying Trophy.** Mr. Glenn H. Curtiss has offered a prize of $1,000 to go to the first entrant for the Curtiss Marine Flying Trophy who covers the distance of 1,000 miles without stopping. The contest for this prize will open on May 1st, and continue until it has been accomplished.

The entrants who wish to compete for this prize during the Convention can fly over the 60-mile course between the Steel Pier and Cape May Air Station. This magnificent trophy is exhibited at the Art Salon on the Steel Pier.

The entrant's record will be counted as a flight for the Curtiss Marine Flying Trophy under the rules for the 1919 competition for this trophy.

(2) **The $5,000 Pulitzer Trophy,** offered for annual competition, to be awarded this year to the aviator who makes the best record in flying land or water planes from anywhere to Atlantic City, and from Atlantic City to anywhere during the month of May.

Competitors for this trophy will start from or end at the Atlantic City Air Port, on Albany Avenue, Atlantic City, which affords unsurpassed facilities for both land and water aeroplanes.

(3) **The Boston Globe Trophy and $1,750** cash prizes to be awarded as follows: $1,000 and the trophy to the aviator who makes the best record in flying from Atlantic City to Boston, or from Boston to Atlantic City during the month of May; $500 and $250 to the aviators who make the second and third best records, respectively.

Start or ending will be on the Atlantic City Air Port.

(4) **The Cleveland Plain Dealer Trophy and $1,750** cash prizes to be awarded as follows: $1,000 and the trophy to the aviator who makes the best record flying from Atlantic City to Cleveland, or from Cleveland to Atlantic City during the month of May; $500 and $250 to the aviators who make the best records, respectively.

Start or ending will be on the Atlantic City Air Port.

(5) **The Detroit News Trophy and $1,750** cash prizes to be awarded as follows: $1,000 and the trophy to the aviator who makes the best record flying from Atlantic City to Detroit, or vice versa, during the month of May; $500 and $250 to the aviators who make the best records, respectively.

Start or ending will be on Atlantic City Air Port.

(6) **The Atlanta Journal $1,750 prizes,** to be awarded to the three aviators who make the best record flying from Atlantic City to Atlanta, Georgia, carrying the Journal.

Start or ending will be on Atlantic City Air Port.

(7) **Colonel William A. Bishop's "Ace of Aces Trophy,"** to be awarded to the aviator who makes the best record in flying from Toronto to Atlantic City, or vice versa, during the month of May.

Start or ending will be on Atlantic City Air Port.

Looking toward the ocean at the upper end of the Boardwalk. The Marlboro-Blenheim is in the foreground

(8) **The $3,000 New York Herald Aero Efficiency Prizes,** to be awarded as follows: $1,000 to the aviator who covers the greatest distance in a non-stop cross country flight, starting from or ending at Atlantic City between May 1st and May 30th with an aeroplane of any horsepower.

$250 to each of the aviators who cover the greatest distance in a non-stop flight from or ending at Atlantic City between May 1st and May 30th with aeroplanes of:

(a) not over 100 h.p.
(b) not less than 100 h.p. and not over 200 h.p.
(c) not less than 200 h.p. and not over 400 h.p.
(d) not less than 400 h.p. and not over 600 h.p.
(e) not less than 600 h.p. and not over 800 h.p.
(f) not less than 800 h.p. and not over 1000 h.p.
(g) not less than 1000 h.p., and over without limit.

Start or end of flight will be on Atlantic City Air Port.

(9) **$2,000 Intercollegiate Seaplane Speed Trophy,** for annual competition, to be awarded to the college whose representative makes the best record in flying twenty times over a five-kilometer course at Atlantic City each Saturday off the Steel Pier during the month of May.

This trophy is to become the property of the college that wins it three years in succession.

(10) **$2,000 Intercollegiate Aeroplane Trophy,** for annual competition, to be awarded to the college whose representative makes the best record in flying twenty times over a five-kilometer course at Atlantic City each Saturday during the month of May. To be held at the Atlantic City Air Port.

This trophy is to become the property of the college that wins it three years in succession.

(11) **$2,750 Cash Prizes for Intercollegiate Weekly Seaplane Races,** offered under the terms of the will of Mr. Samuel H. Valentine. These "Expense Money" prizes are to be awarded in connection with the races for the Intercollegiate Seaplane Trophy described above. They are offered to assist the collegiate aero clubs and individuals making the entries to defray the expenses connected with entering a team. Competing for same will not, therefore, endanger the amateur status of the competitor.

There will be four prizes awarded each Saturday for the best speed made in competition for the annual Intercollegiate Seaplane Trophy as follows:

First prize	$250
Second prize	150
Third Prize	100
Fourth Prize	50

Colleges are permitted to appoint new entries and enter different machines for each race. The name of the entrant and type of machine need not be announced until half hour before the race.

(12) **$2,750 Cash Prizes for Intercollegiate Weekly Aeroplane Races,** offered under the terms of the will of Mr. Samuel H. Valentine, are to be awarded in connection with the weekly races for the Intercollegiate Aeroplane Trophy described above. They are offered to assist the collegiate aero clubs and individuals making the entries to defray the expenses connected with entering a team. Competition for same will not endanger the amateur status of the competitors.

There will, therefore, be four prizes awarded each Saturday for the best speed made in competition for the Annual Intercollegiate Aeroplane Trophy, as follows:

First Prize	$250
Second Prize	150
Third Prize	100
Fourth Prize	50

Colleges are permitted to appoint new entries and enter different machines for each race. The name of the entrant and the type of the machine need not be announced until half an hour before the race.

(13) **The Intercollegiate Dirigible Trophy.**
This may not be held until later in the season.

(14) **The Intercollegiate Balloon Trophy.**
This may not be held until later in the season.

All of these contests, except the intercollegiate, are open to Army, Navy, Marine Corps, intercollegiate and civilian aviators. The rules are similar, so that a competitor can compete for more than one trophy in one flight.

The intercollegiate contests are open to both graduates and undergraduates.

(15) **Open Seaplane Speed Contests** (with handicap) for twelve laps of five miles each. To be held on Decoration Day. Prizes to be awarded under the terms of the will of Samuel H. Valentine.

First Prize	$1,000
Second Prize	500
Third Prize	250

(16) **Aerial Commuting Prizes.**

1. To be awarded to entrants who cover the greatest total distance in commuting by air from anywhere to Atlantic City during the period of the Convention.

First Prize	Gold Medal
Second Prize	Silver Medal
Third Prize	Bronze Medal

(Distance to be measured in straight line.)

2. To be awarded to entrants who make the greatest number of trips in commuting by air from anywhere to Atlantic City during the period of the Convention.

First Prize	Gold Medal
Second Prize	Silver Medal
Third Prize	Bronze Medal

3. To be awarded to entrants who make the longest flight in commuting from anywhere to Atlantic City during the period of the Convention. (Distance to be measured in straight line.)

First Prize	Gold Medal
Second Prize	Silver Medal
Third Prize	Bronze Medal

(17) **$1,000 Opening Day Prize,** offered under the terms of the will of Samuel H. Valentine for land aeroplanes and seaplanes. To be awarded to the aviators making the best records in competing for any of the trophies and prizes on May 1st, flying from Atlantic City to anywhere, and from anywhere to Atlantic City. Competitors starting from Atlantic City will start from the Municipal Air Port at Albany Avenue, Atlantic City. Competitors from other points will end their flights at the Air Port.

(18) **$1,000 Aerial Runabout Races,** offered under the will of Mr. Samuel H. Valentine for speed competition between one-seater aeroplanes of not over 75 h.p. Two races are to be held as follows:

First race, Saturday, May 10th, at the Atlantic City Air Port, Albany Avenue, Atlantic City:

First Prize	$250
Second Prize	150
Third Prize	100
Fourth Prize	50

Second race, Saturday, May 17th, at the Atlantic City Air Port:

First Prize	$250
Second Prize	150
Third Prize	100
Fourth Prize	50

These races are to be held at the Atlantic City Municipal Air Port.

(19) **The Akron Trophy,** presented by Major Thomas S. Baldwin, to be presented to the pilot who makes the best time with any type of aircraft in flying from Akron to Atlantic City, or Atlantic City to Akron, during the month of May.

Start or landing must be made on the Atlantic City Air Port.

(20) **$100 West Point Merchants' Association Prize,** to competitor of Pulitzer Trophy who starts from or ends at West Point, Mississippi.

(21) **Atlantic City Aero Club $25,000 Trans-Atlantic Prize.**
The Atlantic City Aero Club is offering a cash prize of $25,000 to be awarded to the pilot of the first aircraft to fly over the Atlantic, which starts from or terminates at Atlantic City during the month of May. Entry blanks giving the conditions can be obtained from the Secretary of the Aero Club of America, 297 Madison Avenue, New York, or from President Albert T.

Bell, of the Aero Club of Atlantic City, Atlantic City, New Jersey.

Start or landing must be made on the Atlantic City Municipal Air Port

Other prizes offered since date of writing will be announced at Atlantic City at the opening of the Convention and Exposition.

Stops and repairs are permitted during the cross-country races, but the pilots will be penalized five per cent. of the total distance they cover for every stop under one hour, and ten per cent. for stops over one hour and under six hours.

The aviators may make as many attempts as they wish for the Trophies and Prizes. The distance covered in each case will be measured in straight line flight from the point of departure to the point of landing.

Flights made for any of the above mentioned Trophies and Prizes will count for the Pulitzer Trophy.

DAILY PROGRAM FOR PAN-AMERICAN AERONAUTIC CONVENTION, EXHIBITION AND CONTESTS

THURSDAY, MAY 1ST
Opening of Convention and Exhibit.
AFTERNOON—Reception at Aeronautic Hall on the Steel Pier. Addresses by United States Government, State and aeronautic authorities.
EVENING—Aero Show and addresses by officials.

FRIDAY, MAY 2ND
AFTERNOON—Aero Show. Preliminary tests of aircraft.
EVENING—Moving pictures and address on Flying For Sport and Pleasure.

SATURDAY, MAY 3RD
AFTERNOON—Aerial contests.
EVENING—Ball.

SUNDAY, MAY 4TH
MORNING—Memorial service by eminent Divine for the dead airmen.
AFTERNOON AND EVENING—Reception to allied aces and heroes of the air and their parents and announcement of the award of the Aero Club of America Medal of Valor, and the Aerial League of America Diploma of Honor.

MONDAY, MAY 5TH
AFTERNOON—First parachute contest for $500 Bennett Prize.
EVENING—"The Large Dirigible and Its Value for Transportation." Representatives of railroads, express, steamship and other transportation organizations invited to attend.

TUESDAY' MAY 6TH
AFTERNOON—Illustrated addresses on "Aerial Forest Patrol." Forestry Department of every State invited.
EVENING—"Work of Aerial Police Squadrons, and Why Every City Should Have One."

WEDNESDAY, MAY 7TH
AFTERNOON—Aerial Mail Day. Illustrated address on, and consideration of, "Aerial Mail Planes." Chairman of Post Office and Post Roads Committees of House of Representatives and Senate, and Postmaster General Burleson invited to deliver address. 26,000 United States Postmasters, and Chambers of Commerce of 13,000 cities invited to attend. (To be held in Convention Hall.)
EVENING—Illustrated addresses on the "Need of Municipal Aerodromes, and the Part to be Played by Aircraft in City Planning." Chambers of Commerce and City Planning Commissions of 13,000 cities invited to attend. (To be held at Curtiss Hall.) Meeting of Federation of Women's Clubs to be held in Convention Hall.

FRIDAY, MAY 9TH
AFTERNOON—Tests of Aircraft for Saturday's Races. Second parachute competition for the $500 Bennett Prize.
EVENING—Illustrated addresses on "Latest Developments in Aerial Warfare and Adventures in Aerial Warfare," told by famous aces.

SATURDAY, MAY 10TH
AFTERNOON—Army, Navy and Marine Corps Day. Aerial contests and tournament.
EVENING—United States Army and Navy Officers' Reception. Reception and addresses at Aeronautic Exhibition Hall of the Steel Pier.

SUNDAY, MAY 11TH
AFTERNOON AND EVENING—Presentation of the flags by different States of the United States to the Aero Squadrons representing the States. Each State will present a flag to each Aero Squadron, the members of which were overwhelmingly natives of that State. The presentation will be made by representatives from the State and the Aero Club and Aerial League branch of that State. All States and cities are invited to send delegates, and the Army, Navy and Marine Corps to send representatives.

MONDAY, MAY 12TH
AFTERNOON—Demonstrations and illustrated addresses on the "Value of Aircraft for Advertising by Day and by Night." All national advertisers and advertising agents invited to attend.
EVENING—"Pan-American Aerial Transport Over Land." Addresses by members of the commissions of the 20 Latin-American Republics.

TUESDAY, MAY 13TH
AFTERNOON AND EVENING—"Pan-American Aerial Transport Over Water." Addresses by members of the 20 Latin-American Republics' Commissions.

WEDNESDAY AND THURSDAY, MAY 14TH AND 15TH
AFTERNOONS AND EVENINGS—"The Airways and Aerial Transport in Europe, Canada, Africa, Australia and Asia."

FRIDAY, MAY 16TH
AFTERNOON AND EVENING—"Aerial Navigation Instruments for Flying Over Land and Water." Aviators, navigators, scientific instrument makers and aeronautic experts invited.

SATURDAY, MAY 17TH
AFTERNOON—Aerial races and contests. Illustrated addresses on Aerial Photography.
EVENING—Ball.

SUNDAY, MAY 18TH
AFTERNOON AND EVENING—Illustrated addresses on "Aerial Exploration and the Use of Aircraft for Coast and Geodetic Survey."

MONDAY, MAY 19TH
AFTERNOON—Addresses on "Need of Broader Attitude Regarding Insurance for Aircraft and Aviators."
EVENING—Illustrated address on "How Army Medical Standards and Inspection Lessen Accidents." Insurance companies and agents invited.

TUESDAY, MAY 20TH
AFTERNOON AND EVENING—Illustrated addresses showing different ways of crossing Atlantic by air and the problems to be solved to accomplish same successfully.

WEDNESDAY, MAY 21ST
AFTERNOON—Aero Safety Day. Discussion of aero safety provisions made; improvements in aeroplane construction; increased reliability of aero motors; devices which make for safety in flying.
EVENING—"Progress Made in the Art of Piloting Aeroplanes." Illustrated.

THURSDAY, MAY 22ND
AFTERNOON AND EVENING—Addresses and discussions of meteorology—"How the Weather Forecasts Can Be Extended and Made More Efficient by the Use of Aircraft in Exploring the Upper Air," also "How the Weather Forecasts Help Aerial Navigation," and "Topographic and Climatic Factors in Relation to Aeronautics."

FRIDAY, MAY 23RD
AFTERNOON AND EVENING—Addresses on "Aerial Jurisprudence—Aerial Laws and Regulations of Air Traffic." (First day). Lawyers, traffic commissioners and police authorities of different countries invited.

SATURDAY, MAY 24TH
AFTERNOON—Races and contests.
EVENING—Illustrated address on "Need of Establishing Altitude Levels for International, Interstate and Interurban Air Travel."

SUNDAY, MAY 25TH
EVENING—Aeronautic Art Day. Address on "Aerial Painting and Sculpture of Different Countries, and Exhibition of Aerial Paintings," by Lieut. Farre, Lieut. Ruttan and others. All prominent artists, managers of art galleries and art patrons invited to attend.

ENGINEERING WEEK

MONDAY, MAY 26TH
EVENING—"Aeronautic Engineering Problems and Their Prospective Solution." Opening of contests for designs and ideas for large aeroplanes.

TUESDAY, MAY 27TH
EVENING—"Factors That Increase the Efficiency for Large Dirigibles." "Advantages of Veneer and Plywood for Aircraft Construction."

WEDNESDAY, MAY 28TH
AFTERNOON—Address on "Problems of Flying at 35,000 Feet and Over, and Their Prospective Solution."
EVENING—"Present Day Aero Engines."

THURSDAY, MAY 29TH
AFTERNOON—"Flying Boats Versus Hydroaeroplanes for Sport and Transportation."
EVENING—Contest for designs and ideas for large aeroplanes.

FRIDAY, MAY 30TH (Memorial Day)
AFTERNOON—Aircraft contests.
EVENING—Reception at the Aeronautic Hall, Steel Pier.

SATURDAY, MAY 31ST
AFTERNOON—Aircraft contests.
EVENING—"International Medical Standards for Aviators in War and Peace." Reports from different countries illustrated with attractive films. 50,000 medical men invited.

SUNDAY, JUNE 1ST
AFTERNOON AND EVENING—Award of prizes and diplomas for all events.

THE NEWS OF THE WEEK

Navy Flying Boat of F-5 Type Flies 1,250 Miles in 20 Hours

Norfolk, Va., April 26.—Four naval aviators, in a seaplane of the F-5 type, Serial No. 3589, made a new world's record for an endurance flight when they flew, officially, 1,250 miles in twenty hours and ten minutes. The record was made during a continuous flight from 11:42 A. M. April 25 until 7:52 A. M. April 26. Throughout the entire afternoon and night, and often bucking a strong breeze over the Chesapeake Bay and the Virginia Capes, the F-5 described a great circle, extending northward to the mouth of the Potomac River and then eastward to the Atlantic Ocean, sweeping over the Capes and then inland to the naval station.

Those in the machine were Lieutenant Commander H. B. Grow, Ensign Delos Thomas, Ensign R. F. Souther and Ensign Irvine. The men took turns at piloting the machine, but Commander Grow was at the wheel most of the time.

The men in the machine ate three meals during the flight. These consisted of coffee and sandwiches, with a plentiful supply of water. Coffee was carried in vacuum bottles, but they did not retain the heat as well in the air as they do on the ground, according to reports from the air station.

When the machine left the naval base it carried 850 gallons of gasoline. When it landed there was scarcely two gallons in its tanks.

The F-5 is an improved type of flying boat that the Navy Department intended using in patrol duty for war purposes. It is much different from the ordinary fliers that were used during the war for coast patrol. It has a wing spread of 105 feet, is much faster than the old type, and has larger gasoline tanks. The machine was built by Curtiss, and is known as a "kite boat." It is equipped with twin Liberty motors.

While the official records claim only 1,250 miles covered by the machine, naval officers say this does not include the distance it traveled during the first few hours it was in the air, when most of the flying was over Hampton Roads and Norfolk. It was stated by one officer that the actual distance covered was considerably more than given in the official figures. Only exhaustion of the fuel supply forced the ship to land, as the motors were functioning perfectly.

Sidney Chaplin has established commercial air lines on the Pacific Coast

National Advisory Committee for Aeronautics to Report on Civil Aerial Transport

Washington, D. C.—A report on civil aerial transport is soon to be issued by the National Advisory Committee for Aeronautics. The report will embody specific recommendations looking toward the development of commercial flying.

Passenger Carrying Service Established in Kansas City

Kansas City, Mo., April 21.—The Central Aircraft Corporation announced inauguration of a passenger-carrying service aeroplane.

Rates for passengers were quoted at $10 and up for any distance within 150 miles of the city, dependent on weather conditions.

Lieut. James H. Smith, former instructor at Richfield, Tex., will pilot a Curtiss two-passenger machine as a starter for the company.

Sidney Chaplin Announces Commercial Air Lines for Pacific Coast

Los Angeles, Cal.—Considerable interest has been aroused here because of the announcement, this week, by Sidney Chaplin, brother of the world-famous Charlie, of a commercial transportation air line which will link the principal cities of the Pacific coast together in close communication.

The Chaplin Company will undertake to operate a passenger carrying service, using both hydro-aeroplanes and aeroplanes. Initial operations will be those between the mainland of the local harbor and Catalina Island, the famous resort recently purchased by William Wrigley, Jr., millionaire sportsman. Chaplin has been given a ten-year franchise for exclusive aerial activities on the island.

Planes carrying five and ten passengers will be operated between the two points, the first flight being scheduled for June 1st. The distance between Catalina and the mainland is twenty-six miles.

The principal cities of the Pacific coast will also be included in the Chaplin plan, depots to be established at Pasadena, Hollywood, Long Beach, San Diego, Coronado Beach, Del Monte and San Francisco.

Although not generally known, Sidney Chaplin has been interested in aviation since the early days and was on the inside of the game in the days of Bleriot, Farman, Fournier and Paulhan.

The Martinsyde "Raymor" in which Captain W. Morgan will attempt the trans-Atlantic flight from St. John's, N. F., as soon as favorable weather prevails

Business Men to Use New York-Atlantic City Airline

From present indications, the passenger carrying service to start on May first between New York and Atlantic City will be extensively used by business men during the Pan-American Aeronautic Convention, which starts on that date. Mr. Stewart, of the James Stewart Company, has booked a passage.

Flying Boat Makes Duration of 9 Hours 37 Minutes

What is believed to be the best duration record for a flying boat carrying a full load and five men was made by Ensign M. J. Dwyer, U. S. N. R. F., and four others in the crew. The flight was made at Queenstown, U. S. N. Air Station, Ireland, November 9, 1918, two days before the armistice was signed, and details of the record have not before been given out to the general public

The flying boat was a twin Liberty-motored Curtiss H-16 (No. 1048). The crew was composed of First Pilot Ensign M. J. Dwyer, Second Pilot Ensign G. L. Compo, Observer Ensign Tobin, Second-Class Radio Electrician Walcott, and Engineer Shea, C. M. M.

Three hundred and thirty gallons of fuel were carried, of which 315 gallons were consumed. Thirty gallons of oil were consumed. Water temperature 152°. Revolutions of the engines: starboard, 1200 R.P.M.; port, 1100 R.P.M. "Marble" propellers used. Oil temperature: starboard, 27; port, 22.

The weight carried was made up of 165 pounds extra fuel in case of a forced landing at sea; two 230-pound R.F.C. bombs (which were not used, but carried throughout the flight), a radio set weighing 150 pounds; machine gun mounts, etc.

Model H-16 Flying Boat has the following general specifications: Span, upper plane, 96′ 6″; span, lower plane, 58′ 11″; overall length, 26′ 1″ chord, both planes, 7′ 1″; total supporting surface, 1164 sq. ft.; gap between planes, 8′ 1″; weight without engines, 4313 lbs.; power plant, 2632 lbs.; live load, including three men, 3216 lbs.; total weight, 10,172 lbs. The loading is calculated $\frac{10{,}172.00}{1164.33} = 8.74$ lbs. per sq. ft.

Load lifted per horsepower $\frac{10{,}172}{550} = 18.5$.

The machine ascended at 7.29 in the morning and landed at 5.06 P. M., a total duration of 9 hours and 37 minutes. Average air speed, 80 knots.

On the preceding day the same machine and crew, with the addition of one more apprentice radio operator, remained in the air continuously for seven hours and ten minutes.

These flights were witnessed by Commander J. C. Townsend, U. S. N., commandant of U. S. N. Air Base, Queenstown, Ireland, and Commander F. R. McCrary, U. S. N., Naval Aviator, commander of U. S. N. Air Stations in Ireland.

Ensign Dwyer is at present stationed at Experimental Squadron, U. S. N. Air Station, Hampton Roads, Virginia.

The Transatlantic Flight

While the aviators at St. Johns, Newfoundland, are being delayed day by day by adverse weather conditions, the Navy flying boats are being rapidly put into shape for the transatlantic flight.

The NC-1, the NC-3 and the NC-4 are now practically prepared to start on the first lap of the flight, from Rockaway Beach, L. I., to St. Johns, N. F.

The Martinsyde "Raymor," powered by a 285 H.P. Rolls Royce motor, being assembled at St. John's, N. F. This plane has completed its final tests

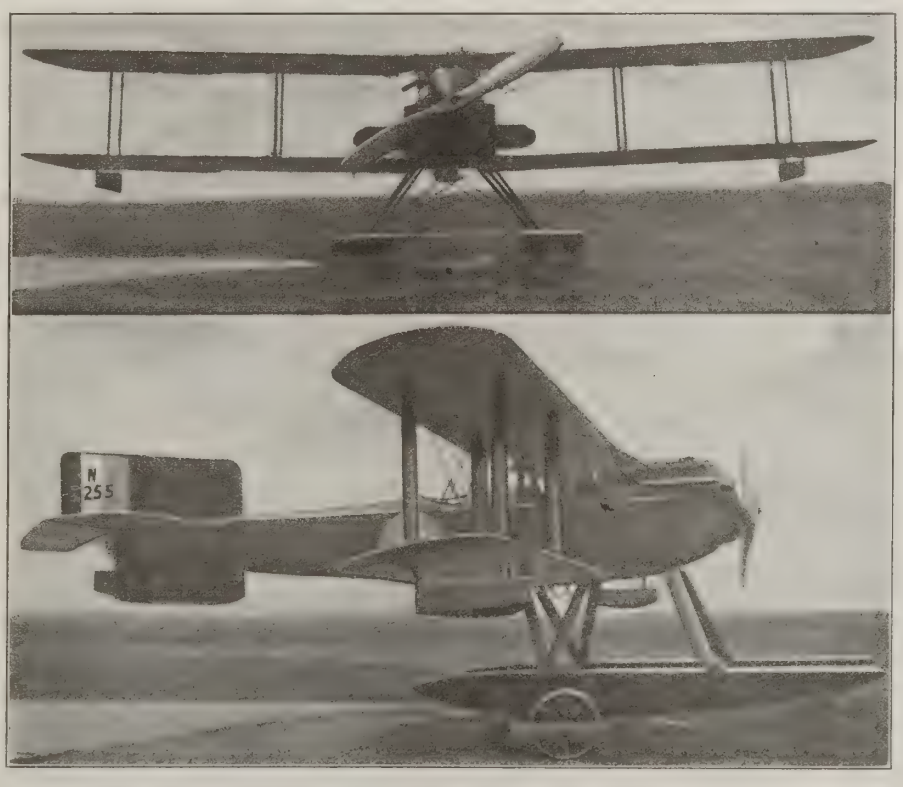
A test of the NC-3 on April 23 proved that the ship could not rise from the water with but three of her four motors in operation. It was hoped that this feat could be accomplished, as it would permit of a great range of endurance. On another test, with four motors, she carried ten passengers and a load of 29,500 pounds in a two-hour flight.

The route which naval officers are said to have decided upon is by way of the Azores. A direct flight to the British Isles is not considered possible with the NC type of flying boat equipped with four motors, owing to the amount of fuel required for these motors.

The cruiser Baltimore, with mechanics and sailors from the Rockaway Naval Station who have handled NC flying boats, sailed on April 25 for Halifax. It is understood she will land the crew from Rockaway at Broyle Harbor, Newfoundland, which will be the jumping off place for the transatlantic flight.

Other destroyers are ready to get under way at once in order to patrol the selected route.

A cable message from the British Air Ministry, asking reasons for the failure of Harry G. Hawker, Australian aviator, and Capt. Frederick P. Raynham, his British rival, to start their transatlantic flights was received at St. Johns on April 23. Unfavorable conditions, however, persist, and present prospects do not point to an early start. Hawker and Raynham are therefore marking time, impatiently waiting for a change in the situation.



Meanwhile, more rivals are getting their planes into shape. The four-motored Handley Page biplane is en route to St. Johns on the Furness liner, Digby. She is expected to stop at Harbor Grace, where the Handley Page hangar has been completed.

With the plane is Major Trygue Gran, a Dane, who was the first man to fly across the North Sea, receiving the Military Cross as a reward for that exploit in August, 1914. Major Gran is assistant pilot and navigator.

The pilot, also on the Digby, is Major Brackley. The observer is Rear Admiral Mark Kerr and the fourth man of the crew is a wireless operator whose name is not announced.

A dispatch from Berlin states that Baron Gemingen, nephew and successor of Count Zeppelin, intends to attempt to cross the Atlantic in the Zeppelin dirigible known as the Z-72. The armistice conditions prevent the completion of the airship, on which about two weeks' work is required.

The cruiser is 715 feet long with a diameter of more than sixty feet. She

Front and side view of the Fairey III-C biplane equipped with a 360 H.P. Rolls Royce motor. This plane is very similar to the Fairey plane, which will soon attempt to fly across the Atlantic

will have seven motors of 240 horsepower each. Her gas capacity will approximate 2,000,000 cubic feet. Baron Gemingen estimates that the distance from Friedrichshaven to Washington can be covered in sixty-eight hours, depending upon the weather. It is asserted in Zeppelin circles that under favorable conditions the new airship could make the round trip without landing.

Aero Club of Syracuse Formed

Syracuse, N. Y.—Several prominent business men of Syracuse have organized an aero club here. Pressure will be brought to bear to secure a municipal landing field, and several of the members propose to purchase aeroplanes. Affiliattion with the Aero Club of America is to be arranged.

Curtiss Aeroplane Makes Delivery Despite Harbor Strike

Newark, N. J.—The first consignment of merchandise transported by air from New York to Newark was received in that place on April 19. It was brought in a 100 horsepower Curtiss biplane, by Joseph Bennet, an aviator employed by the Curtiss Company, and consisted of a shipment of women's wearing apparel weighing 175 pounds.

The clothing was "shipped" by Bamberger & Co., of Newark, and it was explained that this method of transportation had been decided upon to escape the delay that would be caused in the event that New York harbor were tied up by the threatened strike.

The International Aeronautical Commission Draws Up Regulations

The work of the International Aeronautical Commission, appointed by the Peace Conference to formulate regulations for the operation of aircraft, has practically completed its work. A tentative draft of the regulations has been issued, which is awaiting the approval of the Peace Conference.

Provision is made for the licensing of aircraft under the nationality to which they belong. Tests for the licensing of pilots are prescribed in detail; these include not only flying tests, but examinations to determine the applicant's knowledge of the theory of aeronautics and aerodynamics, of motors and instruments, of aeroplanes.

All aeroplanes must carry a route book, containing information as to the nature of the airship, its registry number, and ownership; for each journey, name, nationality and residence of the pilot, the place, date, time of departure and landings, route covered, and incidents of trip.

Each nation is given the right to prohibit flying of planes of all nationalities over prescribed areas. Planes are not permitted to carry camera, war appliances and ammunition without special permission. Military planes are not to fly over foreign countries.

The registry number, to be painted on the under side of the lower wing, the upper side of the upper wing and on both sides of the helm, or on each side, in the case of aeroplanes, on the top part of the balloon under the car and on both vertical sides of the car, in the case of dirigibles and balloons, is to be assigned, as follows:

First, capital letters to indicate owner's nationality, as follows:

Belgium, B; United States, US; France, F; Great Britain, GB; Italy, I; Portugal, P.; Rumania, R.; Serbia, SB.

Second, small letters, characteristic of the nature of the airship: A, for aeroplanes; B, for free balloons; D, for dirigibles.

Third, figures and numbers to indicate the identity of the craft.

The registry numbers are to be circulated for the use of all nations.

A certificate of competence is required for all members of the crew, as well as the pilot.

Specific regulations for the arrangement and number of lights on all types of aircraft have been drawn up. For free balloons and dirigibles not under power, regulations are provided for indicating that they are at anchor, and cannot manoeuver.

Whistle signals are provided as follows:

In fog, rain or snow: 3 short blasts at intervals of 3 seconds.

Over landing point: Alternate blasts of 3 and 9 seconds duration at intervals of 3 seconds.

In case of distress: Blasts of 9 seconds duration at intervals of 3 seconds.

It is considered that the regulations drawn up will be accepted without amendment.

Chief Instructor Billy Parker, Harry Colburn, Bernard T. Daly, Peter Inglebritsen, Elizabeth Modeer, and Fidel Vela of the Dewey Aviation School

One Hour Flight from Springfield to Boston Wins Liberty Cup

Boston, Mass., April 26. — Lieut. Brownie Dallas today won the Hamilton-Coolidge cup offered by the New England Liberty Loan Committee for the aeroplane race from Springfield to this city. The flight occupied approximately one hour. Three of the four planes which started were forced by weather conditions to land in Worcester.

Lieut. Dallas reported that he came through areas of snow and rain, but had fair weather after passing Worcester. He was accompanied by Sergeant J. St. Croix, who acted as mechanician.

Aeroplanes and the Liberty Loan

An important phase of Liberty Loan demonstrations throughout the country is aeronautics. In New York, for instance, daily flights of all types of planes have been arranged. "Victory Way," the chief center for loan speeches and campaigning, is equipped with radio receiving apparatus and amplifiers, so that conversations on planes in flight are made audible through a large number of loud speaking megaphones. By this means, crowds have heard conversations between pilots flying at different altitudes over the city, as well as phonograph music played aboard dirigibles and submarines.

The work of the air circuses performing over various cities has won the encomium of the loan organizations.

Captain White, Chicago-New York Record Holder, Flies from New York to Washington in Good Time

Capt. E. F. White, U. S. Army, who made the record-breaking non-stop flight from Chicago to New York on April 19th, flew from New York to Washington in one hour and fifty minutes on April 21st. Captain White left Hazelhurst Field, L. I., at 11:30 a. m., and landed at Bolling Field, Washington, at 1:20 p. m. With him went H. M. Shafer, the civilian mechanic, who accompanied him on the Chicago to New York flight.

Book Reviews

KEEPING FIT ALL THE WAY. Compiled by Walter Camp.

The author preaches the gospel of health, strength, efficiency and happiness to men. He points out the danger to health and the economic loss consequent upon a man allowing himself to get out of good physical condition and he tells him how he may recover his impaired vitality and begin again to enjoy life—yes—and to do big things in life. The exercises given in this volume are founded upon those used by every man (or woman) between the ages of fifteen and sixty, or even beyond. This book is illustrated by many photographs explanatory of the exercises recommended. The U. S. Air Service is thinking seriously of adopting Walter Camp's method in keeping our Army and Naval aviators in trim.

Copies can be purchased at The Aeronautic Library, Inc., 299 Madison Avenue, New York City, at the price of $1.50 post paid.

Motion Picture Film Distribution by Aeroplane

New York, N. Y.—According to an airman recently returned from overseas, an enterprising motion picture corporation has engaged the services of Lieut. Georges L. Vezine, late of the Royal Air Force, to deliver films to the twenty-three film distributing points operated by the company. A Curtiss aeroplane is to be used. In emergency cases, officials of the company will be transported by this means.

The AIRCRAFT TRADE REVIEW

Salvage Section to Sell 1,000 Liberty Motors

The War Department authorizes publication of the following statement from the office of the Director of Sales:

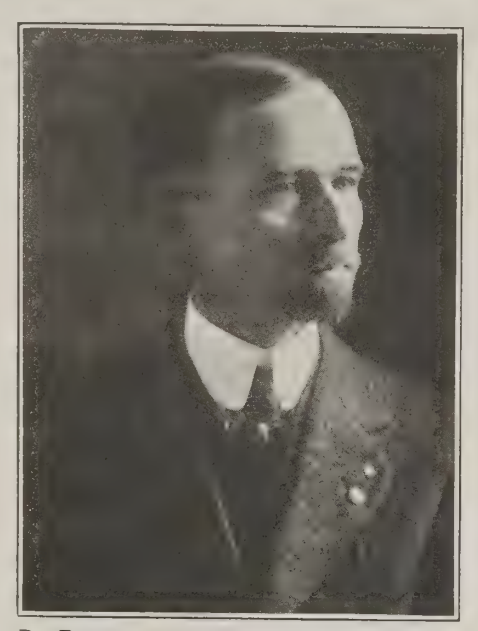
The Sales and Salvage Section of the Army Air Service will shortly place on sale approximately 1,000 Liberty motors. The motors are 12-cylinder Vee type, 5-inch bore, 7-inch stroke, of 400 H.P. at 1700 revolutions per minute. They are equipped with a Delco generator, battery type ignition, 2 complete distributing units working independently, and with Zenith Duplex carburetors of the Special Liberty design.

All motors are new and represent a surplus over and above the anticipated requirements of the Air Service. Additional technical data and instructions to bidders may be obtained from the Sales and Salvage Section of the Army Air Service, Building "D," 6th and Missouri Avenue, Washington, D. C.

SKF and Hess-Bright Companies Combine

New York—The SKF Administrative Co., which was formed in May, 1917, to consolidate the interests of the SKF Ball Bearing Co. and the Hess-Bright Mfg. Co., has been merged with the Atlas Steel Ball Co. into a new company to be known as SKF Industries, Inc. The Atlas Company has for some time been controlled by the SKF Company.

The immediate purpose of the merger, which brings together the sales and executive departments of the three companies, is to facilitate the carrying on of important research work. For this purpose ground is being broken adjacent to the Hess-Bright plant in Philadelphia.



Major Halford in America in Interest of English Patents

New York—Major F. B. Halford, representing Engine Patents, Ltd., of England, which developed the Ricardo crosshead piston type engine used in the British tanks, and also the slipper design of piston, arrived in New York recently in the interest of American patents on these products, and also the possible development of them in America.

Major Halford was closely identified with the development of the B.H.P. aviation engine which were used on British bombing planes.

Goodyear Organizes Council of Industrial Relations

Akron, O.—In order to promote better mutual understanding between employer and employee, the Goodyear Tire and Rubber Co. have established a Council of Industrial Relations. Representation will be given to all employees who are American citizens, who have been with the company for six months continuously or a total service of one year. An executive council will be formed to handle all questions arising between employers and employees.

Dr. Brewster, First Physician to Use Aero Transport, Enthusiastic

Beaver City, Neb.—Dr. Frank A. Brewster, the first physician to employ an aeroplane for making professional calls, is enthusiastic regarding the future of aerial transport.

Beaver City, Neb., is a town of less than a thousand inhabitants. It boasts of one railroad. During the summer the dirt roads are excellent, but in the spring, only the old-fashioned horse and buggy can travel them. An automobile is useful for a few months during the year.

Dr. Brewster, one of the best-known physicians in southern Nebraska, is obliged to do a great deal of traveling, for his calls take him to Hendley, Wilsonville, Stamford, Oxford, Edison, Arapahoe, Holbrook and Cambridge in Furnas county, and also to the larger cities in neighboring counties—McCook, Stockville, Elwood, Alma and Holdredge.

When Lieut. Stevens returned from the service, he was so optimistic over the future of air travel that he persuaded Dr. Brewster to purchase a Curtiss JN-4D-2 plane from the Curtiss Company. Lieut. Stevens will act as pilot and he will also teach Dr. Brewster how to fly.

Aluminum Goods Spending $1,250,000 on Plant Additions

Manitowoc, Wis.—The Aluminum Goods Mfg. Co., with branch factories in Two Rivers, Wis., and Newark, N. J., will this year invest approximately $1,250,000 in the enlargement of the Two Rivers and Manitowoc plants.

M. A. M. A. Rules Suspended to Permit Members Exhibits at Atlantic City

New York, April 21.—The Motor and Accessory Manufacturers' Association rule with regard to shows was suspended insofar as the aeroplane exhibition at Atlantic City is concerned, at the monthly directors' meeting, so that members of the M. A. M. A. may exhibit.

Status of War Department Aircraft Contracts

Washington, D. C.—An official statement recently issued reports that 74 per cent. of the Bureau of Aircraft Productions's contracts have been cancelled, 25 per cent. delivered, and 1 per cent. remaining of those in force on November 9, 1918.

Production and Delivery of Aircraft Guns

Washington, D. C.—At the date of the signing of the armistice there were 54,436 Browning guns on order. Ninety-eight per cent. of the contracts were cancelled. The remaining 2 per cent., 1,030, have been delivered.

31,969 Lewis guns were on order on November 11. Seventy-five per cent. of the contracts were cancelled, and 8,085 guns delivered since that time, in completion of the remainder of the contracts.

As to Vickers aircraft guns, 66 per cent. of the contracts, which called for 11,779 guns, were cancelled. The remaining 4,049 guns have been delivered.

Bureau of Aircraft Production Withdraws Contract Cancellations

Washington, D. C.—Dring the week ended April 12, 1919, the Bureau of Aircraft Production withdrew cancellations and suspensions of contracts to the amount of $2,640,879, thus reducing the total of cancellations and suspensions of contracts since the armistice from $500,679,617 to $498,308,738. These withdrawals of cancellations and suspensions are practicaly all for spare parts and accessories. Following is a summary of the value of cancellations and suspensions of contracts to date:

	Value	*Pct. of total*
Engines and spare parts	$275,929,088	55

American Veneer Co. Soon Ready for Production

Hayward, Wis.—A concern manufacturing veneers, veneer panels and other select hardwood products, is being established here by the American Veneer Co., incorporated last year with a capital stock of $150,000. Work will start at once on a factory, 180 x 250 ft., to be ready about June 15, and to employ from 100 to 150 men.

Small Electric Drill Brought Out By Baltimore Manufacturer

Black & Decker Mfg. Co. of Baltimore have brought out two new models of electric drills possessing the pistol grip and trigger switch in common with the larger sizes of drills ranging from ⅜" to ⅞" size and the electric valve grinder.

The new 3/16" and ¼" models are one-

hand drills, which is made possible by the pistol grip and trigger switch. The tool is handled like an automatic pistol, the current being controlled by pulling the trigger without the necessity for changing the position of the hand holding the drill. In addition to the advantage of convenience, this control saves the breakage of drill bitts so often caused by the drill sagging on the bit when the operator changes the position of his hands to switch off the current.

These two models have 1/6 horsepower motors with series compensated windings, and operate on any current from direct to 60 cycle alternating. Cooling is by means of a vane impeller mounted on the armature shaft, which causes a forced circulation of air all through the housing. Gears run in grease in a grease tight compartment like an automobile transmission.

No load speed of the 3/16" drill is 1600 R.P.M. Energy consumption, 175 watts. No load speed of the ¼" drill is 1200 R.P.M. Energy consumption, 175 watts.

The automatic valve grinder is driven by a 1/6 horsepower electric motor which operates an oscillating spindle in a long, steady sweep similar to the motion obtained in hand grinding, but many times more rapid. The photo shows the trigger control which this device possesses, as well as the drills.

Aeroplane Delivery for Bamberger Co.

The first sale of an aeroplane for use in delivering merchandise to suburban customers has been made by the Curtiss Aeroplane and Motor Corporation to L. Bamberger & Company, in Newark, N. J. Within the next few weeks the company will inaugurate a regular aeroplane delivery service between their main store in Newark and the Oranges, Montclair, Trenton and Asbury Park. They will use a Curtiss JN-4D training plane with an especially constructed body for package carrying.

The purchase of the plane came as the result of experiments which the company carried on during the time of the New York harbor strike, when great difficulty was experienced in getting deliveries from the New York branch to the main store.

Goods intended for the Newark store were sent to Garden City, L. I., via motor truck, loaded into the Curtiss machine and, 40 minutes later, Pilot A. Livingston Allan landed the plane, carrying 175 pounds of merchandise, in Ballentine Parkway, from where the transfer to the store was made.

The experiment proved so successful in the emergency test that the company immediately ordered an aeroplane to be used in making deliveries during the summer months to the cities along the New Jersey coast.

Personal Pars

J. K. Cravens has been appointed sales manager of the Duplex Engine Governor Co. He was formerly connected with the Excelsior Motor & Mfg. Co., Chicago, the F. A. Ames Co., Owensboro, Ky., and more recently with the Wright-Martin Aircraft Co., New Brunswick, N. J.

George L. Ritter, who has been with the company for several years, has been promoted to assistant sales manager. J. N. Ryan, recently discharged from the Air Service as a pilot, will cover New York, New Jersey and New England. R. Weston Doherty, who, it was recently announced, would cover this territory, will not be connected with the company.

H. S. Lyons, who for two years prior to his entry into the Aviation service had charge of the sales of C-H electric devices in the territory covered by the Chicago office of the Cutler-Hammer Mfg. Co., Milwaukee, has received his discharge and returned to the employ of the company, doing sales work in the magnetic shift department.

Dynamometer at Langley Field for Advisory Committee on Aeronautics

Washington.—The National Advisory Committee of Aeronautics will erect an aeroplane engine dynamometer at Langley Field for the purpose of testing aeroplane engines.

Air Service Orders 36 Free Balloons

Washington.—The Air Service has ordered 36 free balloons to be made out of the surplus kite balloon fabric. These will be used for early training of fliers, and especially to instruct them in meteorological phenomena.

Massachusetts Legislature Asked to Provide Aerial Landing Places

Boston, April 18.—The Massachusetts legislature has been asked to provide suitable aerodromes and landing places throughout the State in order that aviation may be developed in this territory. A bill designed to give the Highway Commission power to license aviators, and also to pick out places on which to land has been introduced.

Bamberger & Company, of Newark, N. J., have employed Pilot A. Livingston for their Curtiss JN-4D delivery aeroplane

Personal Pars

Leon W. Rosenthal, formerly a consulting electrical engineer and patent solicitor of New York, has been elected a vice-president of the American Bosch Magneto Corp., which upon the sale by the alien property custodian acquired the interests of the Bosch Magneto Co. Mr. Rosenthal will make his headquarters at the factory in Springfield, Mass., but will also have an office in New York City, at 223 West 46th street.

Mr. L. M. Bradley has resigned as manager of the Motor and Accessory Manufacturers, and has been succeeded by Mr. M. L. Heminway.

The Long Island Aviation Flying School

The Long Island Aviation Company, Inc., which maintains its Flying Field near Central Park, L. I., has facilities for giving complete courses in flying instruction, including a 400-minute course, followed by instruction in stunt flying, after which the pupil is qualified for a pilot's license.

At the present time the school is giving instruction to fifteen students under the flying tuition of Lieutenant Eytinge and John Petre. Mr. Petre has been flying at Central Park for three seasons and is well acquainted with Long Island flying territory.

The two Curtiss JN machines used have dual control and are ideally suited for short straightaway flying, stunting, altitude or distance flights, exhibition flights and flying for film producers. The flying field is 26 miles from New York. The roads are good and the field easily reached by automobile, or by train on the Long Island Railroad from either Penn Station or Flatbush Station, Brooklyn.

The officers of the company are Mr. R. Snowden Andrews, President; Mr. E. O. Downs, Vice-President, and Mr. E. W. Conkling, Secretary and Treasurer.

Machines are to be seen in the air every day except when stormy weather prevents. On Saturday and Sunday afternoons, especially, numerous passengers are carried. During the rest of the week most of the time is devoted to practical instruction and the care and operation of an aeroplane.

National Foreign Trade Council Urges Aerial Commerce

Chicago, April 26.—Demands that the United States establish overseas routes for speedy mail and express service, were made in the general report of the sixth convention of the National Foreign Trade Council, which came to a close today. The report was read by James A. Farrell, President of the United States Steel Corporation.

"This convention urges Congressional consideration of suitable plans for developing aerial navigation," reads the report. "The establishment of the necessary aids to such navigation, the investigation and development of the fundamental principles of commercial aeronautics, the promotion of airship service to overseas countries, are matters which demand the present establishment of a separate department of the Government.

"The convention suggests to local Chambers of Commerce the advisability of having public aerodromes in all centres that expect to develop large foreign markets."

One Year of Aerial Mail Proves Efficiency of Service

On the 15th of May the Postal Air Mail Service will have been in operation one year. The public will be invited by the Post Office Department to witness the flights on that day from New York and Washington. The same six planes with which the service was inaugurated, equipped with the same engines, will be in these flights. Lieut. J. C. Edgerton, who piloted the first air mail plane into Washington from New York, and who is now chief of flying operations of the Post Office Department, will take the mail from Washington to New York in the same aeroplane propelled by the same engine in which he flew to Washington with the mail just one year before.

When the air mail service was inaugurated it was predicted that the service would be the seven-days wonder, and it was declared that the maximum life of any of the planes would be 140 hours actual flying time.

The postal air mail service will close its first year's operation with the record of 200 flying hours in the life of several of its planes, 14,000 miles of flying per plane, and it transported by air a grand total of over 200,000 pounds of mail or about 8,000,000 letters. The fact that the six original planes, with their engines, have survived this year's service, flying through all sorts of weather, snow storms and wind gales, with sometimes forced landings, has demonstrated the feasibility of commercial air service, and that commercial flying is entirely a different proposition from flying in the military service.

Leon D. Smith, Aerial Mail Pilot, Holds Washington-New York Mail Flight Speed Record

Mr. Leon D. Smith is one of the thoroughly reliable pilots of the Air Mail Service of the Post Office Department. Like all the pilots in the air mail service, who are required to fly, if at all possible, in all kinds of weather, he has had his share of unfavorable weather during his flying trips over the air mail route.

Recently he made an exceptionally fast flight, for one of the smaller machines, from Washington to New York with low visibility. He carried 157 pounds of mail in a plane equipped with a 150 h.p. Hispano-Suiza engine and made the entire trip of 218 miles at an average speed of 111 miles an hour. The actual flying time was 1 hour and 58 minutes.

He entered the Air Mail Service and made his first flight December 19, 1918, and since has made regular trips on the air mail route between Washington and New York.

Aerial Mail Pilot Leon D. Smith holds the Washington-New York Postal Plane record

He graduated in the hydroaeroplane, flying boat and land courses of flying at the Curtiss School of Aviation, Hammondsport, N. Y., in 1913. His instructors were the celebrated Frances Wildman and Lansing Callahan, who have probably taught flying to more men than any other instructors in the country.

During 1913, 1914, and 1915, Mr. Smith gave exhibition flights in the Eastern and New England States, using both a Curtiss biplane and a Bleriot monoplane.

He was one of the first aviators to offer his services to the Government as an instructor in aviation after the declaration of war against Germany. He was assigned first to the Ashburn Field, Chicago, and then to the Chanute Flying Field, Rantoul, Illinois. In December, 1917, he was transferred to the Park Field, Memphis, Tenn.

At this field he taught every stage of flying, including acrobatics, cross-country and dual. He had charge of photographing the aerial highway 260 miles long and 20 miles wide through Tennessee from a height of 5,000 feet.

He was a Senior Flying instructor in the Army previous to his connection with the Air Mail Service.

He has had a total up to date of 2,500 hours in the air with very little breakage or accidents.

Padua-Vienna Aerial Mail Route the Longest in Europe

The Padua Vienna aerial mail service, which was inaugurated on March 2d, is the longest regular aerial mail route in operation, the distance being 300 miles. Four caproni biplanes, piloted by service aviators, in charge of Colonel La Polla, are the initial equipment of the service. Two machines leave Padua and two Vienna every third day.

Another French Aerial Mail Service Started

Paris.—An aerial post serving Nancy-Briey-Longwy was inaugurated on April 1st. The first trip took 3 hours; four mail bags were carried. It is said that passengers will be taken on this route shortly.

There is also to be a lateral postal service across France soon, from Nancy to Bordeaux, via Dijon and Chateauroux, thus obviating the useless transference of mails at Paris. The approximate distance, return, is 1,500 kilometers.

Aerial Mail for Warships on Target Practice in Operation

San Diego, Cal.—Seaplane delivery of mail for officers and men on all warships at target practice on the southern drill grounds off San Diego was announced today by Commander E. W. Spencer, of the naval air station at North Island. It was started on April 22 with the sending of mail to the cruiser Minneapolis, twenty miles at sea.

German Aero Mail Services Extended

A Berlin telegraph states that the regular aerial postal service, which has hitherto been carried on by a German aircraft company, between Berlin, Leipzig, and Weimar, and Berlin and Hamburg, will be extended during April to Hanover, the Rhineland, Westphalia, Frankfort, Breslau and Warnemünde. The service to Warnemünde will be particularly important for passenger and postal traffic to Scandinavian countries. Warnemünde will also be the starting point for oversea traffic by seaplane.

CURTISS M-F FLYING BOAT

THE Curtiss M-F Flying Boat meets the need for a substantial sporting boat which is suitable also for commercial flying where waterways present the best landing places.

The Curtiss F Boat, of which the M-F is an evolution, has won well-merited renown. Keeping up with the modern requirements, the new M-F Flying Boat occupies a prominent place in marine aeronautical development.

The number of parts have been reduced to a minimum, and simple fittings make possible easy rigging and convenient maintenance. Exposed metal fittings are nickle-plated, the hull is finished after the fashion of the best pianos, and the comfortable seating accommodations are noteworthy.

Control surfaces are rather large in area, making control effective and easy of operation.

An advantage in the placing of the engine is that it allows of minor adjustments while the machine is in flight, an advantage that cannot be claimed for the tractor seaplane.

One of the M-F Boats was recently flown to Atlantic City, and another shipped to Denmark for demonstration purposes. The shipping weight of the exported boat was 5,160 pounds. The weights and cubical contents of the three boxes were as follows:

Contents	*Dimensions*	*Weights (lbs.)*	*Cubic feet*
Hull	26'5" x 6'6" x 6'4"	2,550	1,088
Panels	22'3" x 3'9" x 5'11"	1,730	494
Engine	5'10" x 4'3" x 2'8"	880	66

The above plane was equipped with a Curtiss K-6 engine instead of the OXX, accounting for the difference in shipping weight as compared with the shipping data given later.

General Dimensions

Span, upper plane	49'- 9-3/8"
Span, lower plane	38'- 7-3/16"
Wing Chord, both planes	5'- 0"
Gap (at engine section)	6'- 4-5/64"
Length overall	28'-10-3/16"
Height overall	11'- 9-3/8"
Dihedral, lower plane	2°
Incidence	6°

Areas

	Square feet
Upper plane	187.54
Lower plane	169.10
Ailerons (each 22.43 sq. ft.)	44.86
Horizontal Stabilizer	33.36
Vertical Stabilizer	15.74
Elevators (each 15.165 sq. ft.)	30.33
Rudder	20.42
Total supporting surface	401.50

Weights (General)

Shipping Data (Foreign Shipment)

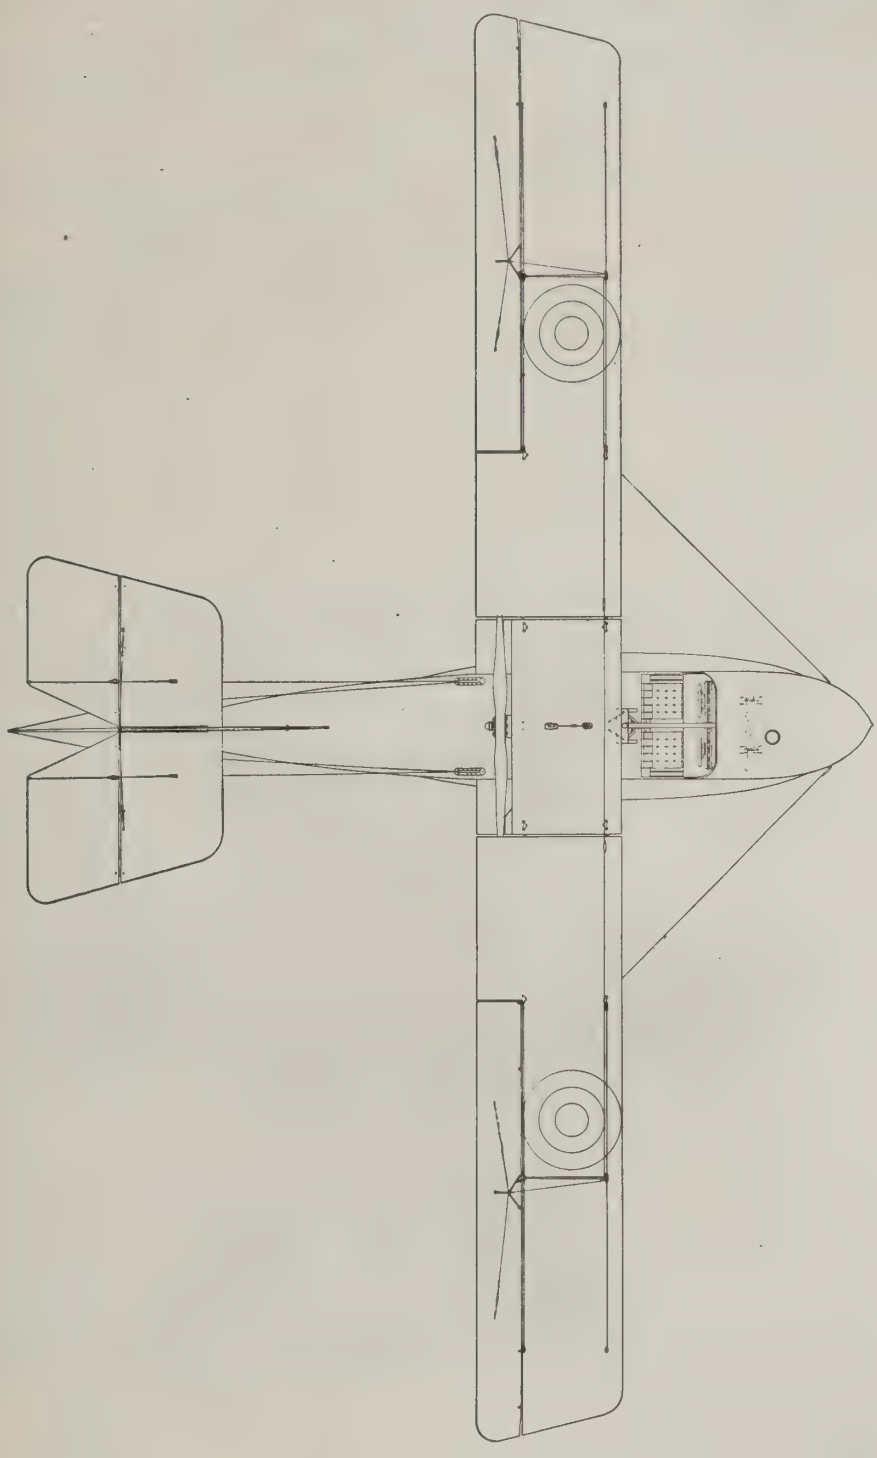
	Dimensions	*Pounds*
Contents: Hull	26'6" x 6' 3" x 4'11"	2,390
Panels	22'3" x 5'11" x 3' 9"	730
Engine	5'4" x 3' 3" x 2' 9"	680

For domestic shipment, sidewalks and engine section are crated with hull; gross weight, 2,680 pounds.

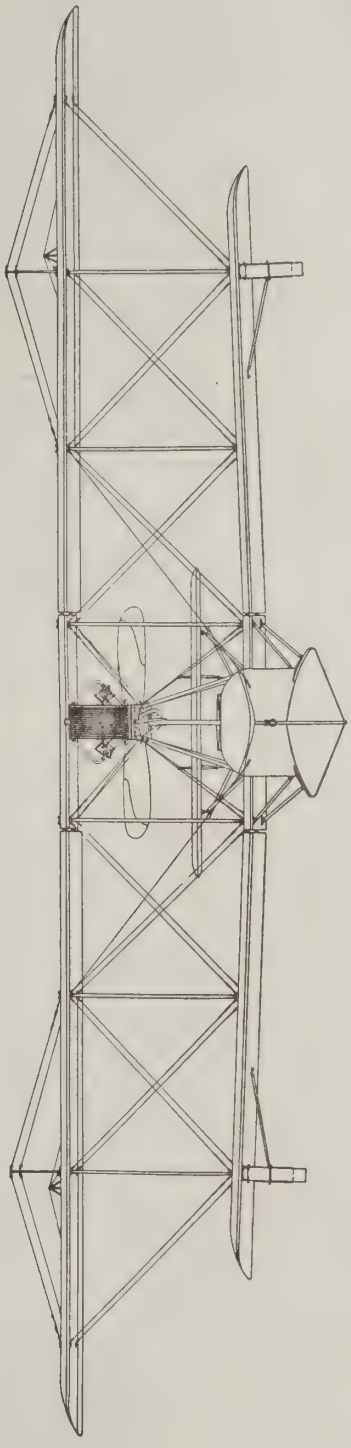
Side View of the Curtiss M-F Flying Boat

Engine

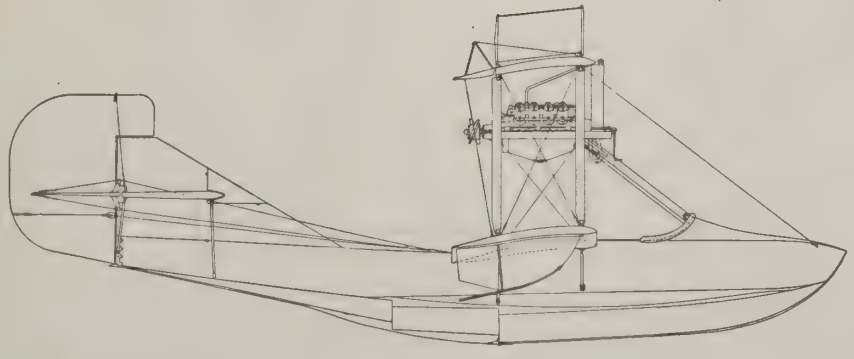
The Model OXX is an eight-cylinder, four-stroke cycle water-cooled Vee type engine, rated at 100 H.P. at 1,400 R.P.M. Bore and stroke, 4½" x 5".



Fuel tank capacity, 40 gallons. Oil capacity in engine crank-case, 5 gallons.



Consumption of fuel, 10 gallons per hour. Fuel consumption per B.H.P. per hour, 0.60 lbs.; oil, 0.03 lbs.



Weight, per rated horsepower, 4.01 pounds.

When desired the M-F boat is supplied with the new Curtiss K-6 engine, having 6 cylinders cast en-bloc, arranged in vertical position.

It is of aluminum construction. Rated horsepower, 150 at 1,700 R.P.M. Bore and stroke, 4½ by 6". Fuel consumption, .55 lbs. per B.H.P. per hour. Oil consumption, .03 lbs. per B.H.P. per hour. Weight of engine with oil or water, 417 lbs. Dead weight per rated horsepower, 2.78.

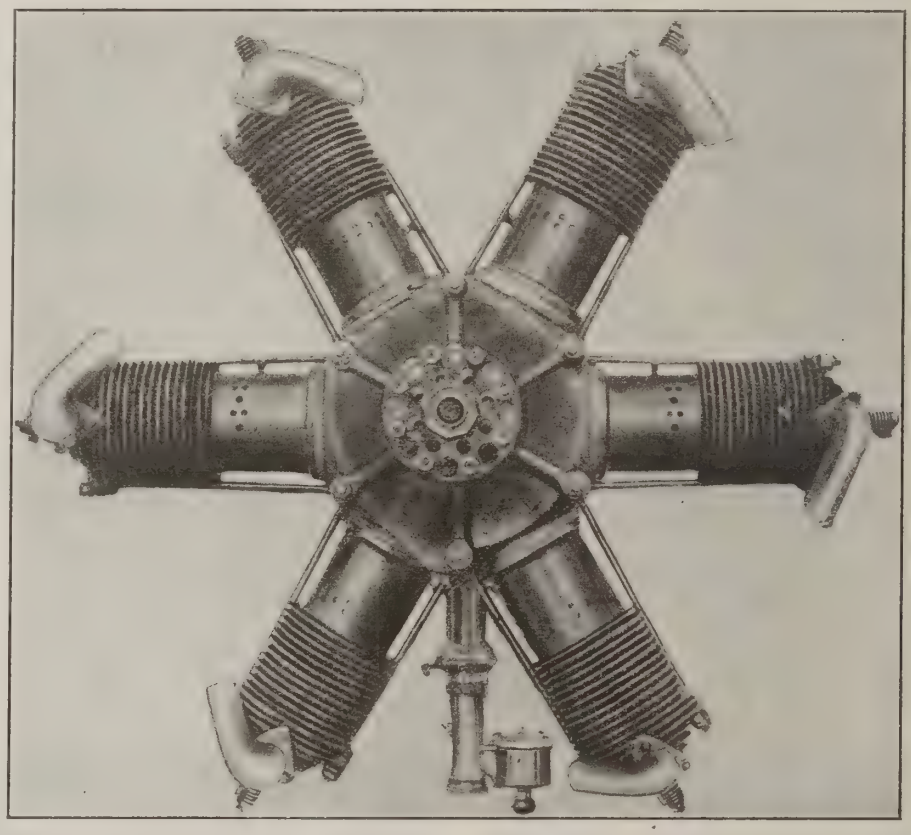
THE 80 H. P. AZTATL ENGINE

THE Aztatl engine, the first aviation engine constructed in Maxico and the first used there in the Aviation School, was first built in February 1917 under the direction of Colonel Alberto Salinas, in cooperation with Dr. Francisco Santarini, who, knowing the needs of the school and the elements with which to contend in manufacture, soon produced an engine with sufficient power to permit flying in the altitude of Mexico, and at the same time embodying simplicity of design and small number of parts, all standardized to facilitate construction and repair.

This engine is a radial type, aircooled; its six cylinders placed in groups of three in two parallel planes. Its general features reproduce the Anzani engine, which has won considerable recognition in the annals of aviation.

The body of the engine is formed of an aluminum crankcase cast in three parts; the front where the propeller hub is located, and the valve lifters of the engine, the central part which unites the other two and serves to support the cylinders, and the back part which holds the magneto and inside, the intake tube which carries the fuel mixture from the carburetor to the openings of each cylinder.



The cylinders are of a steel casting provided with small radiation fins for the aircooling. The pistons also have an iron foudation perforated at the lower part, with ends of the light material. Each group of three cylinders is coupled to one elbow of the crankshaft. The connecting rods, which are fastened to the piston by two bolts, are tubular in construction in order to reduce weight. The crank has two elbows, one for each group of the three cylinders. The crankshaft is supported in the crankcase by two large radial bearings, which extend through the crankcase to permit the fastening of the propeller. There are two valves for each cylinder, the intake which permits the drawing of the mixture from the carburetor automatically, and the exhaust valve which is operated by a valve lifter from the camshaft. The high tension magneto, which provides current with one spark plug in each cylinder, is fastened to the rear of the crankcase geared to the crankshaft. The lubrication is of the forced feed type; a two-pistoned pump located next to the magneto receives the oil from the tank and distributes it by means of a system of tubes to the upper part of the cylinders and to the combustion chamber. The oil is forced through the connecting rods and crankshaft. In addition to this automatic lubrication, an auxiliary hand pump within reach of the pilot permits the pumping of oil into the combustion chamber and supplements the lubrication and cooling of the engine.

The engine has the following specification:

Number of cylinders	6
Bore	115 mm.
Stroke	140 mm.
Weight of complete engine	147 kg. (324.079 lbs.)
Revolutions per minute	1,200
Nominal Horse Power	80
Horse Power in the altitude of Mexico	54
Consumption of fuel per horse power hour	325 gr. (11.375 oz.)

This engine has rendered invaluable assistance to the development of aviation in Mexico, and in aerial exhibitions the public has been able to judge its efficiency as an aeroplane engine. Experimentation is now being conducted in the shops on three new types of radial engines, of three, six and ten cylinders, from which it is hoped to obtain ever better performance.

In concluding this description a record of the principal proofs of the performance and efficiency of the engine is given; In Mexico, Pilot Martinez de Alba in his trial flight made a run of two hours, until his fuel was exhausted; and Martin del Campo made an altitude flight of 4,000 m. (13,123.36 ft.) above sea level in a Type "A" biplane. In Sonora, Pilot Riez Martinez made a flight with a passenger from Hermosillo to Ures and back in 2 hours and 20 minutes, having covered a distance of 200 km. (124.301 miles) over mountainous country. In addition to the record cited, practice flights are made with this engine daily, and formation flying for observation is performed over enemy territory.—Translated from *Tohtli.*

Propeller end of the Mexican Aztatl radial engine

Aerial Photography as an Aid to Forestry

A CANADIAN Air Service lieutenant, whose duties were in connection with the interpretation of photographs taken by observers on reconnaissance flights, points out in a Canadian forestry publication the immense value which aerial photography can be in the survey, appraisal and identification of unchartered forests.

Such amazing results were obtained with aerial photography during the latter part of the war, when cameras were developed to a high state of efficiency and photographers became more skilled in their art, that the application of this skill to the timber industry appears to have great possibilities. If carefully camouflaged enemy defensive works, concealed trench systems, hidden machine gun emplacements and gun pits, subterranean dugouts, wire entanglements and buried cable lines could be identified by skilled interpreters of aerial photos, there appears no good reason why the solution of the often difficult problem of identifying species of trees growing in unexplored country, difficult to explore on account of underbrush and lack of knowledge of the best natural routes and highways.

The military photographs with which such excellent results were obtained were taken from altitudes of 6,000 to 8,000 feet. They were taken under trying conditions in face of enemy aerial attack and anti-aircraft fire. Photographs taken from altitudes as low as 1,500 feet should reveal clearly details of terrain and species of trees growing on the tract under survey.

In the case of areas having a large variety of trees, a few pictures taken at a low altitude would be a valuable supplement to a photographic map or mosaic taken from a higher altitude, for it would serve as a means of identifying all the various species of trees, nature of under-

MAINTAINING CONSTANT PRESSURE BEFORE THE CARBURETORS OF AERO ENGINES REGARDLESS OF THE ALTITUDE

By LESLIE V. SPENCER, M.E.

Formerly Editor of Technical Publications, Experimental Department, Aeroplane Engineering Division, Bureau of Aircraft Production at the McCook Field, Dayton

(*Continued from last week*)

The Moss Turbo-Supercharger

IT has previously been brought out that the Sherbondy and Moss turbo-superchargers have few mechanical details in common, although both designs adhere to the same principles of operation. This is to be expected, in that both engineers worked entirely independently of one another. Therefore, neither device has a monopoly on all the good features; each has certain advantages that the other lacks, and in the final analysis it might be said that both are about on an equal footing as regards efficiency, when everything is taken into account.

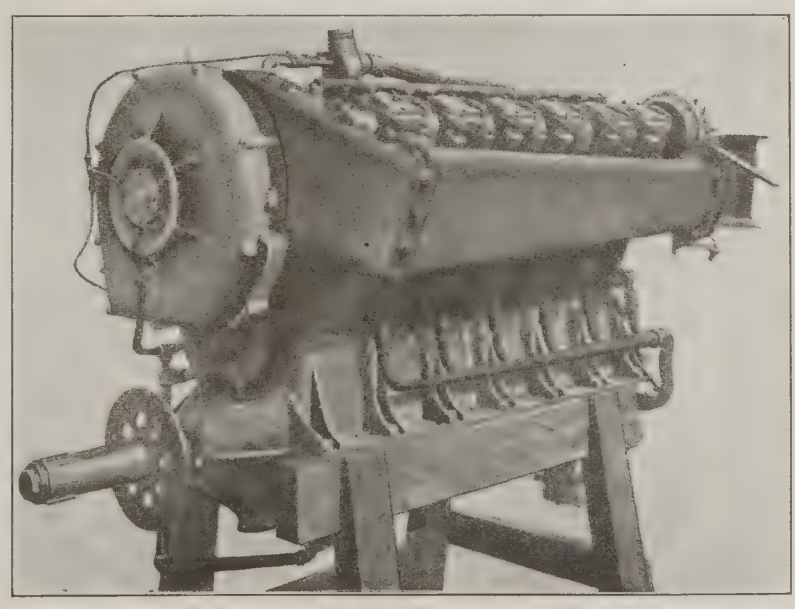
Dr. Moss, in his development work, had back of him his experience and that of the General Electric Co., Lynn, Mass., with which he is connected, whereas Mr. Sherbondy performed his work independently. He was, however, assisted by the Fergus Motors of America, Newark, N. J., which concern did much of the accurate construction work under his direction, and by the De Laval Steam Turbine Co., Trenton, N. J., where preliminary steam tests of the Sherbondy outfit were made prior to any operative trials on the Liberty engine. On the other hand, all Moss experimental work was carried on by General Electric, including steam testing.

Like Mr. Sherbondy, Dr. Moss was specially fitted to conduct experimental and research work on exhaust gas turbines and direct-connected air compressors through wide experience with gas turbines in general. The General Electric Co. has carried on experimentation for a number of years under Dr. Moss' direction along this line, but the difficult nature of the gas turbine problem is brought out forcibly by the fact that to date this concern has not been able to perfect its turbine and compressor units to the point where it cares to put them on the market as a commercial proposition. It will be appreciated, therefore, that Dr. Moss was not striking out blindly along a new engineering path in designing a small turbo-compressor unit, but the new part was the producing of such a unit for the highly special service which it is called upon to perform in an aviation engine in connection with the Rateau system of supercharging.

As the illustrations show, the Moss turbo-supercharger incorporates the turbine rotor and the centrifugal compressor air impeller on the same shaft, and is arranged so as to leave the Liberty engine carburetors in the center of the V, connected to the air discharge of the compressor by an induction pipe of generous proportions which is rectangular in section. The engine exhausts are on the outside, and the gases are sent to the nozzle box of the turbine by means of substantial specially-designed exhaust headers which connect at their front ends to the flanges on either side of the nozzle box.

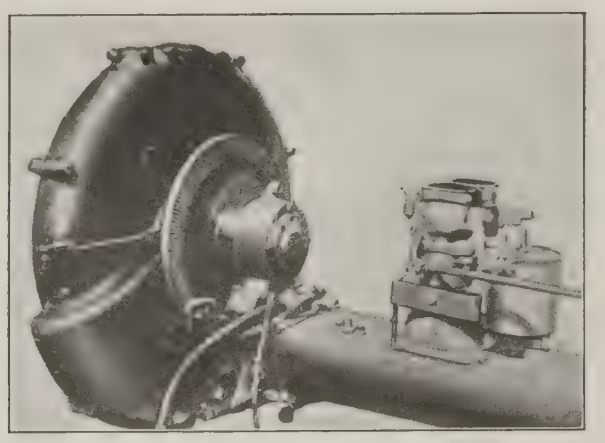
The very large size of the exhaust headers and the nozzle box is evident from the illustrations. By this design the exhaust gases are offered as unrestricted a passage in as direct a path as possible to the turbine buckets, so that the discharged gases from the engine should possess a large percentage of their outlet energy on reaching the point of expansion. This free passage feature should also have an effect upon the cooling of the device.

Unlike the Sherbondy machine, which has a circular nozzle plate, with nozzles all around the turbine wheel, the Moss nozzles are arranged in a semi-circular plate set into the front side of the nozzle box, as shown in the illustration. This should be a factor in keeping down the temperature of the rotor, since the intense exhaust gas heat is not being directed to the entire rotor all the time, but to only about one-half of its circumference.



In further comparison between this machine and the Sherbondy final design, it is also to be noted that due to the turbine and compressor being practically separate so far as their housings are concerned, the Moss device is of greater fore and aft width than the Sherbondy. This was no doubt partially due to a desire to permit as much air circulation between the two parts as possible, for cooling reasons. The construction has the disadvantage, however, that the machine cannot be installed on the Liberty engine with the propeller in its normal position. To accommodate the depth of the Moss machine there has to be a special propeller flange and hub construction in order to bring the screw forward a small distance. In building his machine this way, it is evident that the designer considered the advantage of greater cooling sufficient to outweigh any disadvantage due to the necessity for alternating the propeller position to make room.

Instead of the air being drawn into the compressor through an opening in the front center, as with the Sherbondy machine, the Moss air intake is an integrally cast mouth that leads from the side of the housing to the compressor center at the rear and just ahead of the turbine, where the air is caught up by the blades of the impeller. This part is therefore in the reversed position from that of the Sherbondy impellers, the entrance side of the blades being toward the rear instead of to the front.



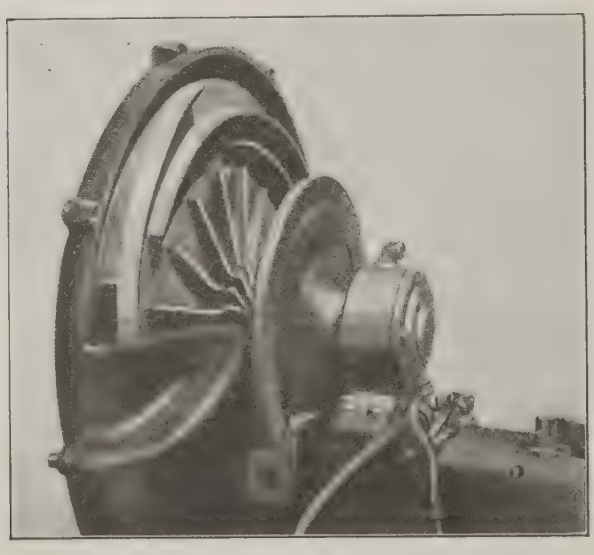
A feature of the Moss machine is the water-cooled rear bearing which shows clearly in one of the illustrations. This is nothing more or less than a special water jacket that surrounds the bearing proper, and through which water is circulated from the regular water circulation system of the engine. The machine also is provided with self-aligning bearings to take care of any slight inaccuracy of the position of the rotative parts due to the high speeds and high temperatures encountered in operation. There is also a thrust bearing to handle the thrust created by the action of the exhaust gas on the turbine blades.

In confirmation of the precautions taken in the design and the special features incorporated against overheating, the Moss apparatus has never given any appreciable overheating trouble in any operative tests yet conducted. The nozzles, which are subjected to the most severe heating conditions, have shown a slight red color after considerable running, but none of the other parts has become hot enough to reach a visible red. Undoubtedly the successful results obtained in this respect are due largely to the provision for free air circulation around the turbine and equally free method of exhaust. In the writer's opinion Dr. Moss has been entirely justified in claiming slightly more room at the front of his machine than is allowed by the normal position of the propeller of the Liberty engine, for this permits the design of the apparatus in such a way as to get about as good cooling effect as is possible in the necessarily limited space available. The matter of the heat dissipation is of premier importance in any development work of this nature.

In order to prevent the nozzle box and exhaust manifolds from getting out of shape due to the temperature and the pressure of the gas within, these chambers are internally braced by means of cross stays which are welded to the

Moss Supercharger Installed on Liberty Twelve

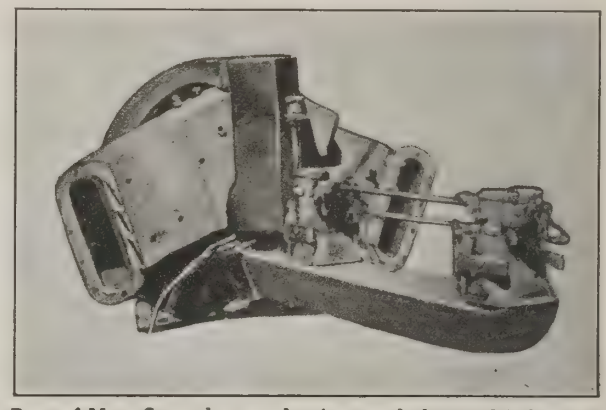
Rear of Moss Turbo-Supercharger



casings. This was found necessary due to the fact that the nozzle box must not be allowed to distort to any extent, and in order to maintain a good joint between the nozzle box and the manifold on either side the manifold must be made quite rigid without being heavy. The cross stays have proved a most satisfactory expedient.

Limitations and Future Possibilities of Supercharging

Of course, one of the first considerations in connection with the adding of any equipment or accessory to an aeroplane is whether or not the increased complication and additional weight which it entails are justified in the advantage gained. The turbo-supercharging system without question adds greatly to the complication of the powerplant of the plane, increases the number of things that can get out of order, and contributes some 200 to 300 pounds to the total weight of the ship. Unless automatically controlled, it also means one more unit for the pilot to handle, when he already has about as many things to control as one human being can possibly take care of.



Further, due to the very high operating temperatures of the devices that have so far been designed (the temperatures range anywhere from 1,250 to 1,400 degrees Fahrenheit), there is an added fire risk where a supercharger is used, which is a factor of no small importance. To minimize danger from this source, it is impracticable to have the combustible parts of the fuselage—wood and fabric parts—very near the supercharger. This would ordinarily mean a wider fuselage than would otherwise be necessary.

Another thing that enters into the problem is the matter of the propeller. If the screw is designed to operate efficiently in conjunction with the plane at or near ground level, this same propeller will not be able to hold the engine down to proper speeds when in the less dense atmosphere at altitudes, if there is some form of supercharging apparatus maintaining the engine's power at approximately the same value as at ground level. It would be impossible to design a fixed-pitch propeller to operate efficiently with the supercharged engine; therefore when the supercharger is developed to the point where it is entirely practical for high altitude planes, we must also have adjustable pitch propellers so that as the height is increased the pitch of the screw can be changed to get the greatest advantage out of the supercharger boost. This, then, gets down to the fact that the supercharging apparatus must not only be charged with the added weight which it adds to itself, but it must also be considered as weighing whatever additional the variable pitch propeller figures as compared with the fixed-pitch type. Not only that, but there has not as yet been a successful type of variable pitch air screw developed, which means that this experimental work should be carried on along with the development of the supercharging system itself. The variable pitch propeller spells still more weight, further complication of the aeroplane, and last, but not least, another control level for the pilot to worry about.

Moss turbine wheel and water cooled rear bearing

Again, the supercharging system must be practically air-tight on both the induction side and the exhaust side. The apparatus cannot operate satisfactorily if there is any pressure leakage either where the induction pipe joins the air discharge of the compressor, or where the carburetor or carburetors attach to the intake pipe. At 20,000 feet, as an example, the pressure outside the induction pipe is about 7.5 pounds per square inch, whereas within the induction pipe the pressure is about twice this amount. The reason for tight joints is therefore obvious. In order to have as little pressure drop

Rear of Moss Supercharger showing nozzle box and induction system

on the exhaust side between the point of engine exhaust and the point where the pressure is utilized to drive the turbine rotor, it is also apparent that there must be no leakage around the joints of the cylinder exhaust passages to the exhaust manifold, or at the juncture of the manifold to the turbine nozzle box. Both of these conditions of tight joints are difficult of fulfillment under field service conditions, as will readily be appreciated, but by the use of special forms of gaskets and the application of red lead to the flange connections this difficulty has been largely overcome in the experimental work so far done. In making these connections on the exhaust side, it also has to be borne in mind that due to the high pressures and temperatures in maximum operation of the apparatus allowance must be made for expansion of the manifolds and gas casing, for otherwise these parts would soon warp and crack. Therefore, although tight joints are essential, there must also be a certain degree of flexibility to the exhaust assembly. Possibly some form of expansion joint might be devised which would allow for movement, while at the same time maintaining pressure-tight connections between cylinders and exhaust headers, and headers and turbine.

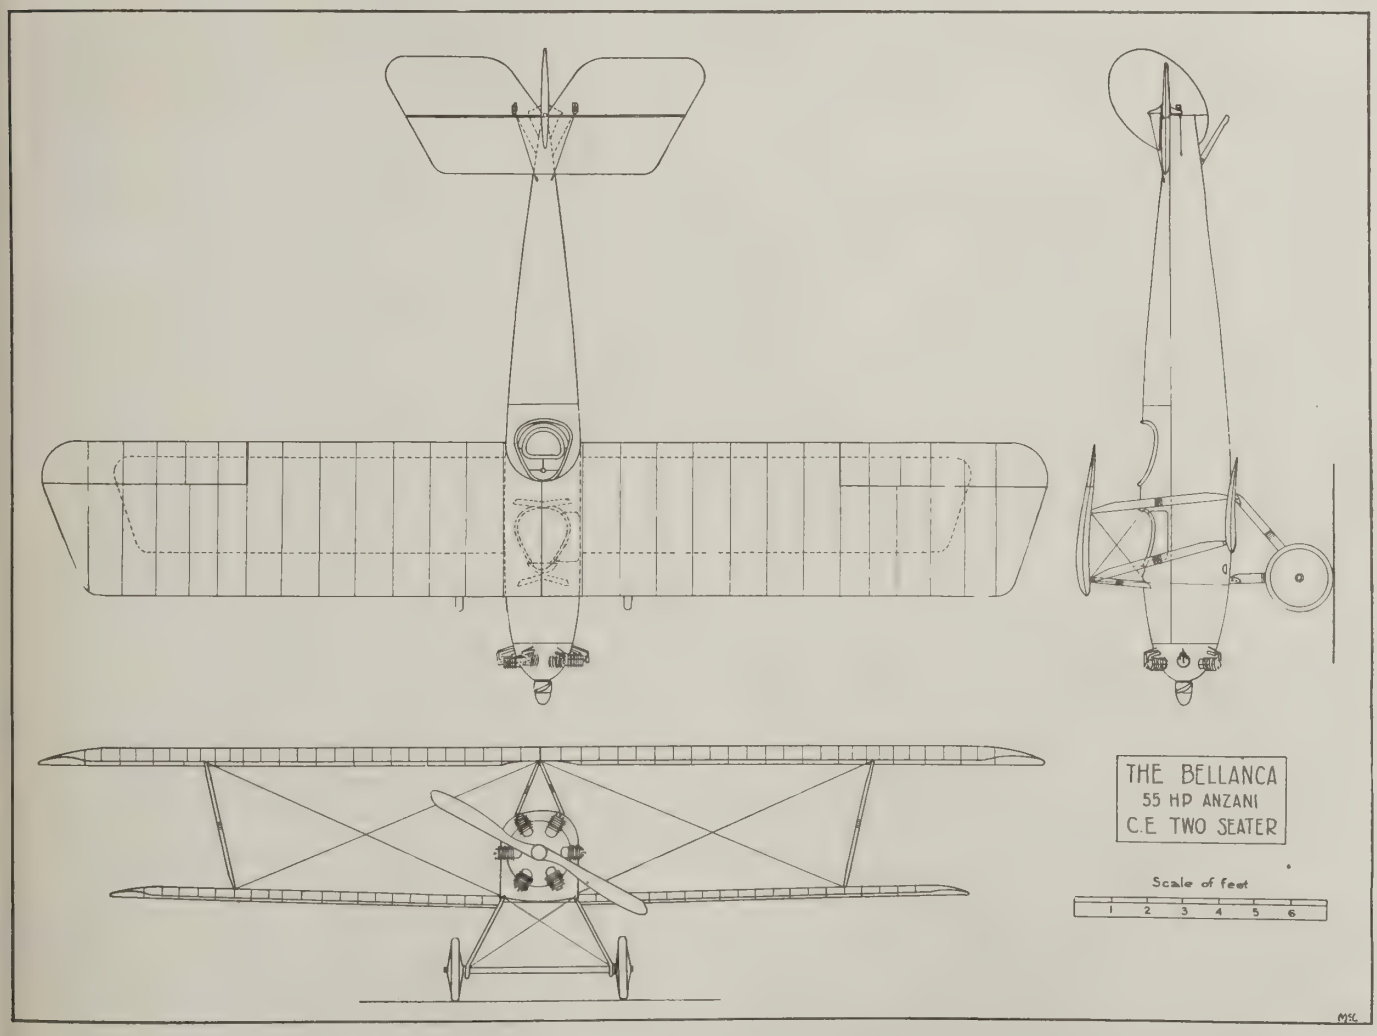
Use of a turbo-supercharger—or any supercharging apparatus, for that matter—of necessity means greater gasoline consumption. This at first thought might seem to be a serious objection, in that it would mean a lesser flight range for the supercharged plane. However, when it is considered that such a plane would, due to the constant power delivery regardless of the altitude, be capable of greater speed, and hence would cover more distance in a given time than the ordinary plane, the increased fuel consumption would be more than compensated for by the greater distance covered with each gallon of fuel.

Tests have shown that a Liberty engine on which a supercharger is installed uses anywhere from 10 to 15 per cent more fuel per horsepower-hour than does a standard Liberty engine, which on the average has a fuel consumption of about 0.504 pound per horsepower per hour.

Although the writer has no data on which to base such an opinion, it seems altogether likely that there would be some added trouble with the exhaust valves of a supercharged

engine, on account of the extremely high temperatures and pressures. This would no doubt mean the use of special material for these valves, otherwise they would be prone to excessive pitting, warping and burning, which would sooner or later affect the engine's power.

Up to a certain point, the fact that the compressed air would be heated above normal would have a tendency to promote efficient vaporization of the fuel. If the air attained too high a temperature, however, it would be detrimental to the mixture. The criterion of the amount of superheating of the air would be the temperature necessary to complete vaporization of the fuel. For the reason that in operation the temperature of the air sent to the carburetor by the compressor is often above that required for complete fuel vaporization, it has been found necessary in Europe to install some form of air-cooling device between the compressor and the carburetor to bring the air back to an efficient temperature. These air radiators have been either of the water-cooling type or merely atmospheric air coolers. The necessity for this auxiliary device has not been proven, however. It may not make enough difference in the practical operation of the supercharger to warrant its installation.



It takes anywhere from 5 to 10 per cent. of the engines delivered horsepower to drive the supercharger. Roughly, the engine without super-compression delivers only 60 per cent as much power at 15,000 feet as it does at ground level; at 20,000 feet, it can furnish but about 50 per cent as much as at the ground. Therefore, figuring the supercharger power at 10 per cent, the use of a supercharger means a horsepower recovery of 30 per cent at 15,000 feet, and a recuperation of 40 per cent at 20,000 feet. This serves to illustrate that the supercharging device is of increasing advantage as the altitude is increased, providing it performs its function of maintaining constant power delivery. It does not seem likely, however, that the Rateau principle can be utilized to advantage for operation at altitudes over 20,000 feet. At this height, the apparatus is rotating about as fast as possible within the safe limits of the available steels, and the operating temperatures are also about as high as known materials will withstand.

However, it seems that, when all is said and done, even though the supercharger were capable of operating efficiently only to 15,000 feet, it would be worth putting on an engine.

But, in the final analysis, supercharging is not intended for planes that are to be used for moderate altitude flying. It is of greatest advantage to the ship which is to be used for fast service at extreme levels. Flying steadily and on a straight course in the rarefied atmosphere of some 4 miles above the earth, the ship whose engine is able to develop the same power under these conditions that it delivers at the ground is destined to be the fast transportation plane of the future. With less resistance to its forward motion in this rarer atmosphere, yet with its power unaffected by this atmospheric condition, the future supercharged plane presents possibilities for speed that are unattainable as yet with any type of plane. With constant power, a propeller that will handle that power in the less dense atmosphere and with this advantage of lower resistance to forward motion, 200 miles an hour is almost within reach.

The long-range gun projects its missle up into the rarer atmosphere where the resistance to its travel is reduced. By this means its terrific speed is made the most of in covering seemingly impossible distances. So with the supercharged aeroplane of the future. Operating in a medium of less resistance, it can secure all the advantage of this rarer medium without its disadvantages.

The possibilities of development along this line, principally for long distance travel, are tremendous.

Scale drawings of the Bellanca Aeroplane described in the April 21st issue of Aerial Age

THE MANUFACTURE AND USE OF GLUES IN AEROPLANE CONSTRUCTION

By B. C. BOULTON, B. S., A. E.

THE development of a water-proof glue which should meet the necessary strength requirements and be thoroughly reliable has been one of the most important and difficult problems in our aeroplane program. At the close of 1917, the only glue that was accepted as satisfactory for the better grade of joint work was hide glue. And it did not possess any material water-proofing qualities, despite various attempts to make it water-resistant by the additon of certain chemicals, but had to be carefully protected from all moisture by several coats of varnish or shellac. Casein and blood-albumen glues were mentioned in a survey of various available glues, issued by the Forest Products Laboratory, in the fall of 1917, when they took up the study of aeroplane glues for the government. Both these, however, were still in the experimental stage, and were neither dependable, nor of sufficient strength. Since then the Laboratory has carried on extensive development work, and in testing has co-operated closely with various manufacturers throughout the country who have been engaged on this problem. Though the results were at first discouraging because of the severity of the deterioration tests required, yet within the last six months such progress has been made in the improvement of glue that it has been conclusively demonstrated that both casein and blood-albumen glues, when properly manufactured and applied, are equal in strength to all but the finest hid glues, are, for all practical purposes, waterproof, and are uniform and reliable. Casein glue, particularly, will be a very important, future factor, not alone in aeroplane construction, but in all high-grade joint work on which hide glues have heretofore been employed.

The present airticle treats each of the important glues in turn, briefly describing its nature and process of manufacture, and laying special stress on the mixing and application of the glue and the precautions to be observed to secure the best results. This article is based principally upon technical reports prepared for the Burea of Aircraft Production.

Classification of Glues

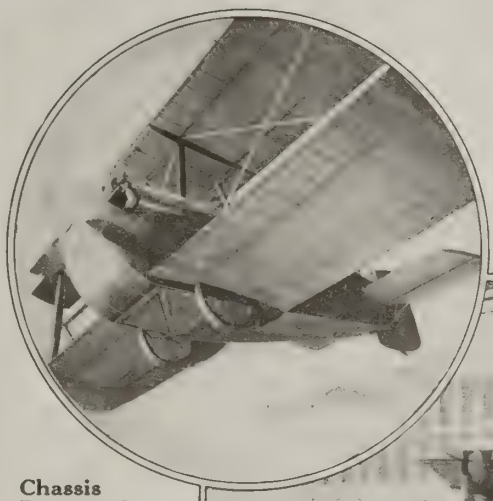
Glues may be divided into the folowing general groups: the so-called animal glues which include hide bone and sinew glues, blood-albumen, casein, fish and vegetable glues. The three animal glues are made from scraps of hide, green bones, and sinews of catle; blood-albumen glue from coagulated blood; casein glue from curdled milk; fish glue from fish offals, bladders and membranes; vegetable glues from certain plant growths and substances, such as cassava root, gums, and dextrines. A further important classification divides adhesives into true glues and cements: the former on setting merely give up their excess water and do not undergo any permanent chemical change; while the latter, not only lose their excess water, but alter their chemical nature by changes that cannot be reversed. This distinction further classifies glues as non-waterproof and waterproof, respectively. Glues may again be differentiated, according to their nature and the methods used in their application, as solid or liquid glues, and hot or cold glues.

Animal Glues

Physical and Chemical Nature: Glue is the first product of the hydrolysis of animal connective and elastic tissues. (Hydrolysis is a chemical reaction that occurs between a salt and water, in which the water is decomposed and an acid and a base, or an acid and a basic salt are formed.) When heated with water, these tissues lose their peculiar structure, swell and finally dissolve. Upon cooling, this solution jellies, and dries into a horny, translucent mass, of a color, varying with the purity of the stock, from pale yellow to dark brown. This dry glue will redissolve in hot water and the solution possesses strong adhesive qualities. No essential difference exists between glue and commercial gelatin, so extensively used in the preparation of foods and drugs. The latter, being more carefully made from selected stocks, is of lighter color and contains fewer impurities. These impurities consist of slight amounts of mineral matter, and sometimes, grease, free acid, alkali, odoriferous substances, and certain nitrogenous materials grouped under the name of "non-glue." Of these mucin, an impurity present in the original glue stock that should be removed by the preliminary treatment of the stock, is thought to be the cause of the "foaming" of glue. In addition to mucin, the non-glue contains nitrogenous decomposition products, produced by the hydrolysis that occurs when glue is subjected to prolonged heating. None of these substances possess any adhesive qualities. The formation of such products is the explanation of the rapid deterioration in the strength of overheated glue. Both gelatin and glue swell in cold water, but do not dissolve until the water is heated. Their difference in adhesive power and their similarity in chemical and physical nature are difficult to account for. Glue contains two essential constituents: glutin, an amorphous, odorless, tasteless, protein substance, soluble in water and of great adhesive strength; and chondrin, similar to glutin, but derived largely from cartilaginous and young bone tissues, and not equal to glutin in binding power. Chondrin, though not having as great gelatinizing properties as gelatin, is much more viscous and adhesive. Glutin is more abundant in hide glues; chondrin in bone glues, a fact that accounts for the superiority of the former class of glues.

Manufacture of Hide Glue: Clippings from the hide, also the tail, ear and head pieces form the bulk of the raw material used for hide glue. No tanned skin or parts that have begun to spoil can be utilized. Briefly summarized, the process of glue making from either hide, bone, or sinew consists of three steps: first, washing the stock and treating it with lime to remove extraneous material (with bone stock, the material, after being washed, is usually crushed and extracted with dilute acid before it is limed); next, boiling the stock to convert the glue-forming substances into a glue solution which is concentrated, and then jellied by cooling; lastly, slicing, and drying this jelly to form dry, cake glue. Though the process, as outlined, is very simple, and variation in the many factors involved produces marked differences in the glue.

A somewhat more detailed description of the manufacture is as folows: the glue stock, wet, or dried and salted, is washed, and then steeped for several weeks in milk or lime in wooden vats or cement pits. Frequent stirring of the material with long, forked sticks is necessary. The mass swells, and the fats are converted into lime soap, while the hair flesh, and blood are separated from the hide and partly dissolved. The stock is now thoroughly washed in tubs with mechanical stirrers to remove all lime, lime soap, and dirt. Dilute hydrochloric, or better sulphuric acid that both plumps and bleaches the stock, is used.to remove the last trace of lime. After any excess of acid has been washed away, and the water dried or pressed out, the material is ready for cooking to change the collagen into glue. During this process the time and temperature must be carefully watched, since long continued cooking or actually boiling lower the quality of the glue. Grease, and lime soaps rise and are skimmed off. Solid matter (hair, dirt, etc.) sinks, and the liquor is drawn off through it. As all the stock is not dissolved in the first liquor, it is cooked several times more in fresh waters to extract all the glue. The first run yields the best glue. Usually, all the liquors are mixed to secure uniformity. Open vats, heated by steam coils, are generally used in this rendering process.



Should the liquor be too thin to jelly, it is concentrated in vacuum pans, then run into coolers, relatively small, galvanized iron vessels and chilled by refrigeration at 32° F. In 12 to 24 hours the solution jells. It is now turned out on a table, cut into slices ⅛" to ¼" thick by tight wires in a frame, and the slices placed in single layers on wire frames that are run into drying rooms from which sunlight is excluded. During this drying period the glue must be carefully watched, for it is either very apt to mould or liquefy through bacterial action in too low temperatures or, if the temperature rises above 95°-105° F., it is liable to melt. But in clear, cold weather, owing to the low humidity, the temperature in the drying room may rise to 110° F. In the summer, very little glue is made owing to the impossibility of drying the films. Should wet glue be frozen and afterwards dried, it becomes spongy and porous. One day is required for drying, and then the films are ready to be broken or ground in a disintegrator.

Manufacture of Bone Glue: Fresh, green bones are the raw material for bone glue, which is very similar to hide glue. The bones are first sorted, then passed through a mill which cracks them slightly, and from there taken to the extracting plant for the removal of fat. This operation may be performed by open boiling, by digestion with steam at 40 pounds pressure, or by extraction with solvents. The last method is in general use because it is most efficacious. Boiling leaves a good deal of fat in the bones, and the second method removes, not only the fat, but also a large portion of the glue-yielding substances. Benzine is the most common solvent. After extraction, the

EVERY FIRST CLASS AEROPLANE REQUIRES A RETRACTABLE CHASSIS

The World's Most Efficient Light Scout MARTIN KIII

Chassis Retracted

First Shock Absorbing Rudder

First Retractable Chassis

No other light scout of low horsepower can even approximate the performance of the K 3 for the following reasons:

1—The Retractable Chassis, protected by both basic and improvement patents for any shape, or method of retracting, eliminates 17% of the useless or parasite resistance.

2—The K-bar Truss, acknowledged by the British Air Board to be the only rigid single lift truss, eliminates half of the useless or parasite cellule resistance.

3—The Martin form of wing end, proved both in America and Europe, the most efficient shape.

4—The Shockabsorbing Rudder which simplifies rudder bracing and control, provides exceptional taxing manoeuverability and eliminates the Parasite resistance of the usual tail skid.

5—The Wing end Aileron, proved by actual tests in full flight to be four times as efficient as the trailing edge aileron, leaves the K 3 wing aerofoil unimpaired.

6—The structure of the K 3 has a **tested safety factor of eight** and weighs complete with motor only 350 lbs. (Compare this with the weight of other 40 h.p. scouts.)

Exclusive manufacturing rights for a similar commercial plane designed around a reliable 40 h.p. American motor for sale for 5% of the gross sales.

CAPT. JAMES V. MARTIN, U. S. Master Mariner and pioneer aeroplane builder who originated and demonstrated in 1911 the modern tractor biplane in all its essential features, such as interconnected trailing edge ailerons, tail decalage and a modern type fuselage with clamp longeron fittings.

All the Martin devices are freely at the disposal of the U. S. War Department and can be used on reasonable terms by other constructors.

RECORD!

...for the future in some cases and would not suffice in others."

MAIL PLANE MAKES RECORD.

111 Miles an Hour Averaged Between Capital and New York.

WASHINGTON, April 11.—A record flight for an airplane equipped with a 150 horse-power Hispano-Suiza motor, was reported to have been made to-day by Pilot Leon D. Smith of the postal aerial mail service in a flight from Washington to New York. Carrying 157 pounds of mail matter in addition to a full load of gasolene, an average of 111 miles an hour was maintained for the entire distance of 218 miles.

The flight was made in one hour and fifty-eight minutes, the time from Washington to Philadelphia, 128 miles, being one hour and eleven minutes and from Philadelphia to Belmont Park, New York, forty-seven minutes.

HOME!

The boys are home!

A year and more ago they marched away and left their homes and happiness and friends behind to go to France to fight for us. They fought—they won—and now they're home again.

They've done their part, those boys of ours—they saw it through.

And we who crowd the curb and wave our hats and cheer to let them know we're glad—how about us?

We bought Liberty Bonds to put up the money to buy the guns those fellows fought with. They're proud of us.

They know we backed them to our limit while they were "over there."

But our work isn't over.

We can't let the job those boys have done in France go unfinished.

We've got to see it through.

We've got to raise the money to make sure of the Victory they've won and bring the rest of our soldiers back.

The Victory Liberty Loan is coming—Let's see it through!

next step is treatment with dilute hydrochloric acid (sp. gr. 1.05) to dissolve the calcium phosphates and carbonates. The cartilaginous material is now washed with lime water to remove any acid. When the washing is completed the mass is boiled in water or steamed in a digester until dissolved. Any grease that forms is skimmed or filtered off. The glue liquor is then run into shallow vats where it is clarified by the addition of alum. After ten minutes boiling it is allowed to settle, before being drawn off into cooling vessels, refrigerated and dried as previously described. Frequently, for the lower-grade glues, benzine-extracted bones are directly boiled or steamed without the removal of the dirt and grease. After the glue solution is sufficiently concentrated it is strained through cloth, bleached by sulphurous acid, and evaporated at 140° F. in vacuo, or in open troughs with half-submerged steam coils.

The process used in making sinew glue is very like that for hide glue.

Fish glue is made by boiling, at 230° F., fish heads, tails and fins. Since it has very weak jelling properties, it is ordinarily made into liquid glue. The offensive odor of this glue is destroyed by creosote or oil of sassafras.

Either fish or animal glues can be made into liquid glues by treatment with acetic, nitric, or hydrochloric acids, a process by which their power of gelatinizing is lost. The adhesiveness of such a glue is not materially changed, and it does not require heating.

Preparation and Use of Animal Glues: Very frequently a high-grade glue will give very poor results, simply because it has been misused in some way. It is therefore necessary to emphasize strongly that with all glues, for the highest grade work, precautions and directions given in the discussion of the mixing and application of a glue should be followed both strictly and intelligently. On unimportant work a reasonable degree of latitude is permissible.

The required amounts of glue and cold water must be weighed out in the proportions that have been previously determined for that particular glue, as described later in the specifications. If the glue is in the form of cakes, flakes, or ribbons it should be broken up into small pieces about the size of peas and soaked, in a covered vessel with the proper amount of cold water, until every particle is thoroughly softened. Occasional stirring is necessary to insure the water's reaching every bit of glue, for if any lumps remain hard the prolonged heating, necessary to melt them, seriously lowers the quality of the glue. Even for powdered glue, the time of soaking must be at least two hours.

The softened glue is transferred to water-jacketed glue pots in which it is melted as quickly as possible without overheating. The best working temperature of the glue is 140° F., never above 150° F. The glue pots should be kept covered, when not in actual and continuous use, to prevent the escape of water from the glue and the formation of a surface scum. Any scum that may form must be removed. Never melt glue over an open flame or by the injection of live steam, because the local overheating injures the glue strength. Glue which has been heated for eight hours or longer must not be used. Likewise, any glue that has been heated at any time, on any day, must be rejected and not used again. The glue solution, once it has been heated, should never be allowed to cool, for re-heated glue has not the same tenacity as a fresh solution.

The room in which hot glues are applied should be free from drafts, and as warm as healthful working conditions will permit. The wood should be uniformly dry, and at least as warm as the room to prevent a sudden chilling and setting of the glue. The wood should, however, not be heated to too high a temperature, since hot wood readily absorbs moisture from the glue, leaving it dry, and thereby lowering its elasticity. The wood surface should "fit" perfectly, be lightly toothed with a fine toothing plane, and be clean. The glue must be applied to both surfaces of the joint, and spread freely and as rapidly as is consistent with good workmanship. Special care must be exercised to avoid the formation of air bubbles in the joint, which break the continuity of the glue film. These are due to carelessness in applying the glue or to foaming and frothing of the glue. Pressure should be applied quickly to prevent premature jellin or setting of the glue. A sufficient number of clamps must be used to distribute this pressure evenly over the entire joint that the surfaces may be in close contact at all points. The intensity of the pressure should be about 150 lbs. per sq. in. From 5 to 12 hours, depending on the character of the work, must elapse before the clamps are removed, and not for 24 hours may any sudden strain be put upon the joint. If the glued surface is very large, or if there are many laminas of wood, provision should be made for properly drying the wood. In the case of all hot glues, particularly, care must be used in maintaining sanitary conditions in the mixing room and glue room; all glue pots, containers, and brushes must be washed at the close of each day's work; all scraps of glue about the floors and tables must be removed. Unless these precautions are rigidly observed fresh glue is liable to infection by bacteria which seriously impair its quality. Good glue has a clean odor. Decomposed glue must be rejected.

Hide glue of good quality, in spite of certain disadvantages, is recognized as being superior in strength to any other animal or vegetable glue. It is, therefore, used for propeller and all other high-grade joint work. Because of its lack of waterproofness it must be thoroughly protected by varnish or shellac. Bone and sinew glues find use in less important work; vegetable glues are extensively used for furniture; fish and other liquid glues where strength or reliability are less necessary.

Egg and Blood Albumen

Chemical Nature: The white of an egg is called albumen, and its chief constituent is what is known chemically as albumin, a viscous, nitrogenous substance, similar to the albumin of blood serum. Egg albumen is made up of 84.0% water, 11.9% albumen, 3.6% fat, etc., and 5% ash. (In further discussion the general term albumen will be used to mean albumin.) Albumens combine with both acids and bases to form acidic or basic salts, albuminates. With water they form perfectly clear, odorless solutions.

Manufacture of Egg Albumen: Eggs are broken and the whites carefully separated from the yolks. To obtain the clear albumen the whites are strained through silk gauze lining the drum of a centrifugal machine, and allowed to settle for 30-40 hours. (The drums of this machine must be lead lined to prevent chemical action.) An alternative method of clearing the albumen is to cool it in iron vessels for 5-6 days at a low temperature, a little tannic or acetic acid is sometimes used in the clarification. The clear albumen is dried as rapidly as possible in a stream of dry air or in vacuo under 120° F. (above this temperature the albumen turns yellow). Within 4-6 hours this process is completed, and the albumen is obtained in the form of thin, clear, elastic sheets. About 100-125 eggs are required to yield a pound of the dry albumen.

The methods of producing blood albumen are very similar to those just described. Fresh blood from cattle is spread in shallow dishes and a separation occurs between the fibrin of the blood and the pale yellow serum. After this is complete, the serum is strained through silk gauze lining the drum of a centrifugal machine. As with the egg albumen it is allowed to setle 30-40 hours, when the albumen should be quite clear. It is then dried in the manner outlined above, and forms flakes, varying in color from gray to black according to the purity. The purest is of a grayish yellow color. The blood from one cow will yield slightly less than a pound of the dry albumen.

A very pure albumen is obtained by forcing the serum through charcoal filters and precipitating the albumen by basic lead acetate. After washing, the precipitated lead albuminate is decomposed by carbonic acid and the lead removed by sulphuretted hydrogen. The albumen is then filtered and dried as before.

Albumen Glues

Preparation: Formulae for the preparation of these glues are still kept secret, both by the trade and the laboratories working on glue development. The dried albumen of course forms the chief constituent and to it are added amonia and lime. In preparing the glue the dry albumen is soaked for about 1½ hours, and then stirred in a glue mixer for a few moments. Amonia is added, the mixture again stirred a short time, and the lime in dry form slowly introduced while the stirring continues at low speed. After standing about an hour the glue is carefully poured from under any scum that may have formed on the top and is ready for use.

Application: Albumen glues must be applied hot, and the precautions necessary with all hot glues have to be observed. The room should be warm and free from drafts, and the wood surfaces at room temperature or above. A machine spreader is used in applying the glue, and special hot presses are required for pressing and drying the glued parts. A considerable degree of care and skill is necessary for satisfactory results. Attention should be called to the very deleterious effects of foaming with albumen glues. Foaming is largely due to the air that is ground into the glue by the spreader. With extra thick spreads of glue the pockets of air formed during the pressing are larger than with thin spreads. Wherever such a pocket occurs there is no contact between the faces of the joint. Foaming seriously impairs the strength and waterproofing properties of albumen glues.

Like casein glue, albumen glues are not glues within the strict meaning of the term but are cements; that is, upon setting their hardening is due, not merely to the evaporation of water in the glue, but to changes in their chemical composition. The presence of water will not, as in the case of animal glues, cause them to soften after setting has once taken place,

because the chemical changes that have occurred cannot be reversed. Albumen glues are therefore practically waterproof when properly mixed and applied. They are also very strong, even superior to hide and casein glues under the best conditions, but because of the care that must be used in their application albumen glues are not so reliable as other types. Their chief use is in the manufacture of plywood. Blood albumen glue is much more widely used than egg albumen since it is less expensive.

Casein

Chemical Nature: Casein, the chief constituent of casein glue exists in fresh milk, in a state of suspension, as colloid, and is so finely divided that it can be separated by filtration only with great difficulty. Eighty-five per cent of the protein of milk consists of this substance. What is called casein of milk appears to be a compound of casein with lime that may be regarded as generally a weak acid. Casein can be obtained from milk in two ways: by treating the milk with an acid, or by curdling it with rennet. When milk is acted upon by an acid the lime casein compound is split up, and paracasein is precipitated in the form of curd. Casein combines with strong acids, acting in their presence like a weak base. In the curdling of milk by rennet, first the enzyme of rennet splits the lime casein into paracasein, the curd, and whey albumin, then coagulation follows if lime salts are present. "Self soured" or "natural sour" casein is similar to that produced by an acid. Milk is spontaneously soured by lactic acid, produced by the action of lactic acid bacteria on milk sugar. Considerable differences in physical and chemical properties exist between acid and rennet precipitated curd. The former does not contain any lime salts because these are all dissolved by the acid. The rennet curd is more elastic and is not sticky.

Reference to the government specifications on casein, given later, show the general proportions of some of the constituents. The percentages of the elements present in cow milk casein, from analysis of a pure sample, are as follows:

Carbon	52.9 %
Oxygen	22.8 %
Nitrogen	15.6 %
Hydrogen	7.0 %
Phosphorus	.85%
Sulphur	.77%

Manufacture of Industrial Casein: As indicated above there are two general methods for the precipitation of paracasein: the first and more important is the acid, or natural sour process; the second the rennet process. This latter method has not been approved by the government. Acid curd is precipitated from the skimmed milk by lactic acid, or by either dilute sulphuric or hydrochloric acids. The yellowish precipitant is redissolved in alkali (sodium bicarbonate) and reprecipitated with diute acetic acid. The curd then is well washed and pressed, after which it is stirred to pulp with water (100 parts curd to 50 parts water). When this operation is completed it is steamed or cooked 25-30 minutes in a wooden vat with about 150 pars of a 1% solution of soda to remove the lactic acid and butter fat. Upon heating, the mass forms a thin, milky fluid which is transferred to a separate vessel to cool and there precipitated by dilute nitric acid. The casein collects at the bottom; the supernatant liquor is drawn off; and the casein is rinsed with water. The casein is allowed to settle in the water which is then very gently poured off. This operation is repeated until the wash water is neutral, when the casein is drained on filter cloths, pressed, and dried on trays in drying chambers at 120°-140° F. One hundred parts curd yield 45 parts of purified casein, free from lactic acid and butter fat. If the procedure just outlined is carefully followed, no trouble should be encountered in meeting the government requirements as to acidity, or fat and moisture contents.

Casein Glue

Chemical Nature: In all the various formulae used in the preparation of this glue the main constituents are casein, lime and sodium silicate. In the presence of water the alkali reacts with the casein to form new compounds. The water-proofness of casein glue is due to the fact that after the glue has once set the chemical changes which occur during the mixing and setting cannot be reversed. From the analyses (made by the Chemical War Service Laboratory) of two typical casein glues, can be obtained an idea of the various constituents and their relative proportions.

	Le Grandville Glue	C. W. S. Laboratory Glue
Casein	36.00	44.65
Calcium hydroxide	23.80	27.90
Sodium silicate	17.00	14.85
Gum arabic	5.50	7.55
Moisture	5.30	5.05
Calcium carbonate	8.00	
Ammonia (free)	1.25	
Iron, aluminum, magnesium (as oxides)	1.50	
Undetermined	1.65	
	100.00	100.00

The "Le Grandville" glue was a new, French, propeller glue; the C. W. S. L. glue, one that was developed by the Laboratory as an equivalent of the French glue. The casein used in the Laboratory glue was designated as "self-soured", "extra-fine" casein, and the lime was technically pure.

Since the special methods of manufacture of casein glue as well as the formulae employed are still trade secrets, the procedure followed by this Laboratory is of interest. One pint of gum arabic was dissolved in five pints of 40% commercial water-glass (sodium silicate) and evaporated over a water bath till dry enough to grind. After grinding to 50 mesh, the silicate gum-arabic mixture was thoroughly mixed with calcium hydroxide of 150 mesh size and casein of 40 mesh size in the following proportions: casein 40, alkali 25, gum mixture 20. This mixture dissolves readily in cold water, more easily in fact than the "Le Grandville" glue and furthermore it does not "gel" as quickly as the latter. The amount of water added to the mixture was 10 parts (by weight) of dry glue to 22 parts water.

(To be concluded)

UNIVERSITY OF WASHINGTON ANNOUNCES AERONAUTIC COURSE

IF present plans materialize, the University of Washington will this fall offer a complete course in aeronautical engineering. The tentative curriculum proposed by Mr. J. W. Miller, who has charge of the work, is as follows:

First Quarter—Algebra, 3; engine problems, 3; general chemistry, 5; drawing, 3; woodwork, 1; military science, 2.

Second Quarter—Trigonometry, 3; engine problems, 3; general chemistry, 5; drawing, 3; woodwork, 1; military science, 2.

Third Quarter—Analytic geometry, 3; engine problems, 3; general chemistry, 5; aerodynamics, 3; woodwork, 1; military science, 2.

First Quarter — Calculus, 3; aerodynamics, 3; physics, 5; machine design, 3; metal work, 1; military science, 2.

Second Quarter—Calculus, 3; English, 3; physics, 5; machine design, 3; metal work, 1; military science, 2.

Third Quarter—Aerostatics, 5; English, 3; steam engines, 3; steam laboratory, 3; metal work, 1; military science, 2.

First Quarter—Mechanics, 3; aeroplane design, 5; flying boat design, 5; direct current (EE), 4.

Second Quarter—Mechanics, 3; aeroplane design, 3; dirigible design, 3; alternating current (EE), 4; elective, 3.

Third Quarter—Structure of metals, 3; aeroplane metals, 2; aerial properties, 5; transportation, 3; elective, 3.

First Quarter—Business law, 3; thermodynamics, 3; organic chemistry, 5; aerial properties, 2; elective, 3.

Second Quarter—Gas engines, 3; aerial maps, 2; organic chemistry, 5; elective, 5.

Third Quarter—Aeronautical engines, 2; ignition system, 2; organic chemistry, 5; thesis, 3; elective, 3.

At the present time no department of aeronautics has been authorized by the university, but the above curriculum indicates the probable outline of the course. Changing methods of aeroplane construction will from time to time cause changes in the course, dropping those subjects no longer having a bearing on aeroplane building. Thus organic chemistry is included, as it includes investigations in dopes and fabrics used in present day construction. Should some other methods of construction supersede the present method, this subject would be eliminated from the curriculum.

The new Boeing Aerodynamic Laboratory will be utilized in this work. This wind channel was the gift of W. E. Boeing to the University of Washington. The channel proper is similar to those so successfully used at the Massachusetts Institution of Technology, the testing laboratory of the Curtiss Aeroplane and Motor Corporation, and the National Physical Laboratory at Teddington, England. As aeroplane designers are largely dependent on the results of these model tests in wind channels, it will be readily appreciated that the university's laboratory will be of utmost value to aeroplane builders. Much research work will be conducted, which, it is hoped, will make possible a higher standard of efficiency in aircraft.

AEROPLANE RADIO TELEPHONE APPARATUS

BY EDGAR H. FELIX, A., I. R. E.,
FORMERLY RADIO ENGINEER, SIGNAL CORPS

THE general attention which has been recently given the radio telephone by the general public, particularly since the demonstrations of the device at the Aeronautical Exposition and elsewhere, has led to a desire for an understanding of the operating principles of modern radiophone apparatus.

At the Exposition, the incoming signals were amplified through loud-speaking megaphones, and hundreds of persons were given the opportunity of listening to radio telephone conversation between the demonstration booth, aeroplanes and dirigibles in flight, submarines and battleships in New York harbor and nearby land stations. It was possible to visualize the application of these devices aboard aircraft and submarines, making conversation possible under all conditions. The particular type of loud-speaking outfits referred to above had been installed on submarine chasers, the loud-speaking receiver being mounted on the bridge, and the speaking microphone attached to a flexible cord. It was thereby possible for captains on cooperating submarine chasers to confer while closing in on enemy "subs," their words being amplified far above the noise of the motors, the straining of the ship and the howl of the wind.

Those who were privileged to witness the voice-commanded flying conducted on the roof, the planes circling overhead, quickly and efficiently obeying the commands of those below, with the precision of a well-trained company of infantry on the drill field, could easily imagine the advantage voice-commanded combat squadrons had over an unco-ordinated enemy. The installation used is shown in Fig. 2. As Captain Rickenbacker watched the planes, he recounted several instances occurring in his own personal experience where a ground observer with radio telephone equipment could have warned the aviator above of danger—an enemy plane, for instance, diving from above—in time to have made unnecessary the supreme sacrifice.

The power of concerted action, subject to constant modification in accordance with the exigencies of combat which the radiophone gives a squadron operating against an enemy, makes it infinitely more potent than a squadron which must depend upon the initiative of the individual aviator and his ability to carry out a plan of action against the enemy without recourse to any system of intercommunication with the other members of his squadron.

The Figs. 3 and 6 show various types of microphones, headgear and generators developed by the Signal Corps for aeroplane radio telephony. This work was conducted by the

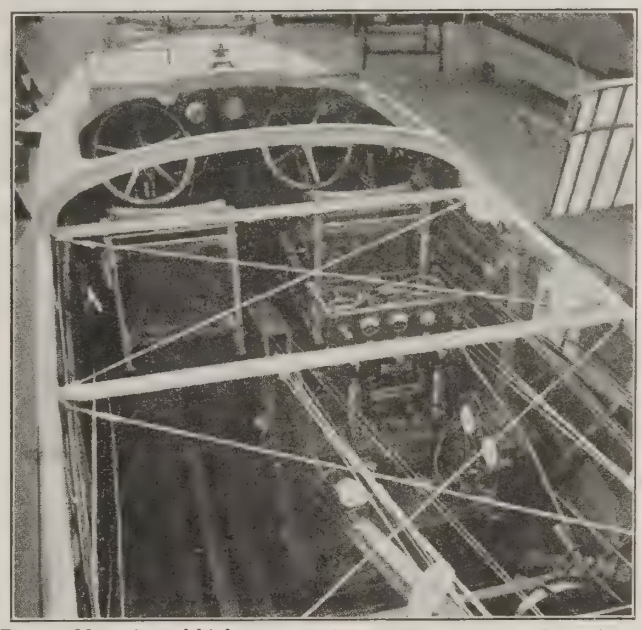

Fig. 1—Mounting of high power radio telephone set in a flying boat, showing small space required

Radio Development Section, of which Lieutenant-Colonel Nugent H. Slaughter was Officer-in-Charge, and Colonel C. C. Culver was liaison officer for the Air Service. The aeroplane radio telephone outfit which had most extended application during the war, was that type known as SCR-68, the letters SCR signifying Signal Corps Radio. This set consists of three units adapted to easy mounting on the plane. The helmets, mouthpieces and generators used are illustrated, and as well the transmitting and receiving apparatus mounted on the plane.

The power developed by the windmill driven generator is applied to the "vacuum tubes," the generators of the high frequency sustained oscillations which make radio telephony possible. The successful application of vacuum tubes to this purpose has been the greatest step in advance in the perfection

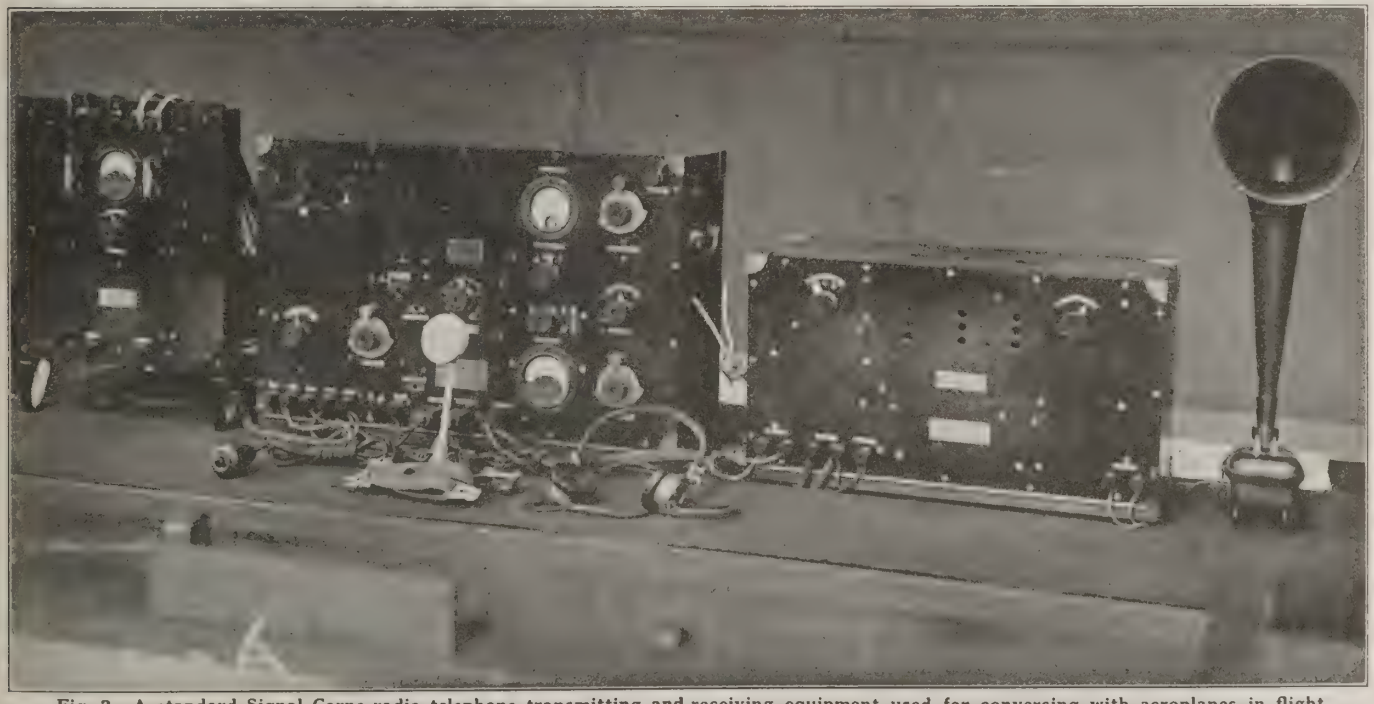

Fig. 2—A standard Signal Corps radio telephone transmitting and receiving equipment used for conversing with aeroplanes in flight

Fig. 3—The radio receivers are incorporated in the helmet and are also connected to the interphone between pilot and observer. The transmitter is strapped on the breast

of radio telephone apparatus of the last decade. Let us consider the principle of operation of the vacuum tube.

It has long been observed that if a plate of nickel or other conductor be inserted in an incandescent bulb, as shown in Fig. 4, which is highly evacuated, and if the potential of this plate be raised above the potential of the filament by means of a battery, a stream of electrons, constituting an electric current, will flow from the filament to the plate. It was also observed that current could be made to pass from the filament to the plate, but not from the plate to the filament. This effect has been utilized for the rectification of high freqency alternations, and is considerably more efficient as a rectifier of radio signals than the minerals, such as galena, silicon and carborundum.

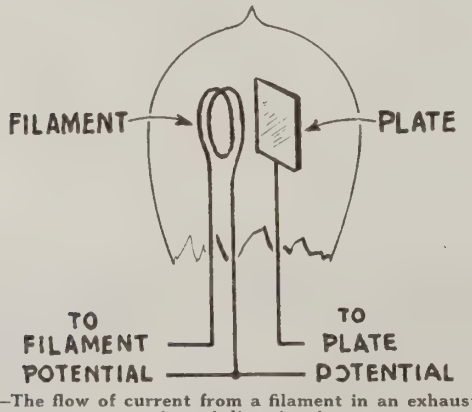

Fig. 4—The flow of current from a filament in an exhausted bulb is uni-directional

The quantity of electrons radiated from the filament is dependent on its length and the brilliancy to which it is lit. If the potential to which the plate is raised is sufficient, all the electrons radiated from the filament will flow to the plate. In practice, however, the plate potential is maintained at less than "saturation" voltage, as the voltage at which all the electrons flow to the plate is termed. The result is that a "space" charge accumulates between the filament and the plate, which opposes and chokes off the flow of electrons to the plate as soon as it grows to sufficient magnitude.

In order to overcome the space charge, a "grid," consisting of three or four small zig-zag platinum-coated wires, is introduced between the filament and plate. This is shown diagramatically in Fig. 5.

Let us consider the effect of applying an alternating current on this plate. As the charge on the grid increases, it is assisting the accumulation of the space charge, thus choking off the plate current. Now, as the alternation reverses, the space charge is neutralized, and the plate current increases, as shown by the accompanying curves in Fig. 10.

The result is that the alternations on the grid are reproduced in greatly amplified form in the plate circuit. Considerable

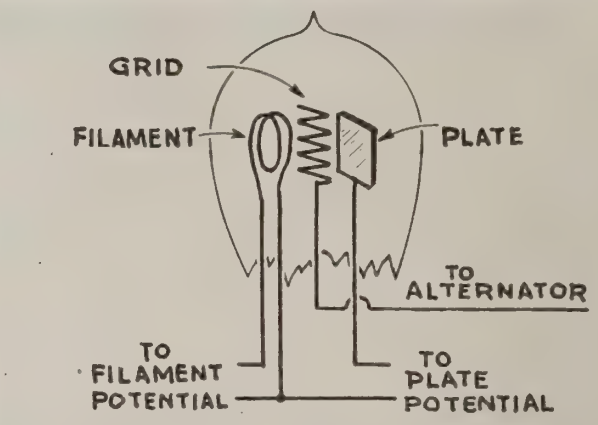

Fig. 5—The grid serves to dissipate the space charge and its potential determines the current flow in the plate circuit

amplification of incoming signals can thus be obtained. Frequently three vacuum tubes are connected in cascade, each amplifying the signals of the preceding one, and amplifications in the order of 1,000 times the original strength of signal are obtained. This makes possible the design of loud speakers, which will take a weak signal and so augment it that it will be audible two hundred feet from phones. In transcontinental telephony weak voice current are magnified by this means so that clear and strong signals come in over a line three thousand miles long.

In the consideration of the amplifying action of the vacuum tube, I have assumed that an alternator was placed in the grid circuit. The fact has been established that any change in grid potential causes an exactly similar but considerable augmented current to flow in the plate circuit. The use of the vacuum tube as a generator of high frequency currents is merely an application of this amplifying action. Instead of an alternator (see Fig. 8), a coil having from twenty to a hundreds turns of wire is placed between the grid and filament. Inside of this coil, inductively coupled to the grid coil, another coil of similar size is placed, which is connected between the plate and the filament.

Let us see what happens when the current is turned on and the filament lit. At first there is an instantaneous rush of current to the plate, through the coil of wire back to the filament. This rush of current is checked when the space charge begins to accumulate. As the current flows through the plate circuit, it passes through the coil of wire, causing a magnetic field to

Fig. 6—The source of power for the radio telephone is a small wind-driven generator, mounted on the landing gear

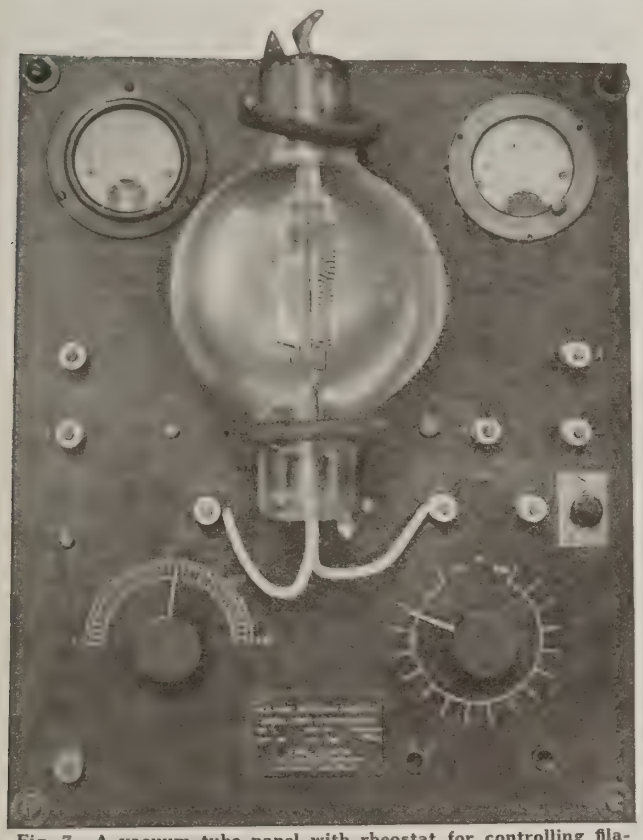

Fig. 7—A vacuum tube panel with rheostat for controlling filament brilliancy, filament ammeter and plate circuit ammeter

surround it. This field interlinks with the coil in the grid circuit, causing a change of potential on the grid. This in turn causes a change of plate current, which again has its effect on the grid, through the intermediary of the coils. And so on. The frequency of these oscillations, which continue in perfect sine wave form, is determined by the size of the coils used. On aeroplane transmitters this frequency frequently reaches the figure of two million alternations per second.

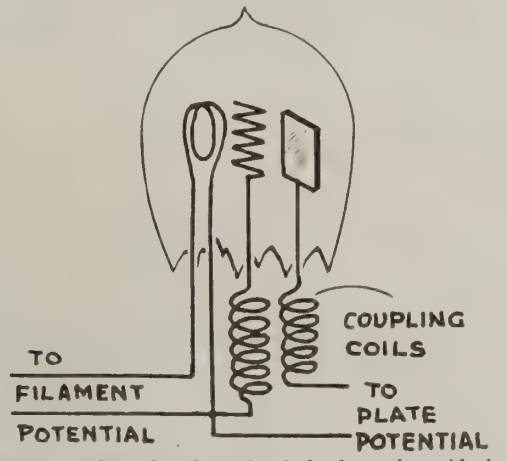

Fig. 8—By coupling the plate circuit back to the grid circuit a "repeater" effect is obtained, the grid serving as a trigger

To radiate these waves into the ether, it is merely necessary to couple the plate coil to the trailing antenna on one side and the "ground," which on board a plane in flight is the motor and bonding wires, as shown in Fig. 9. A microphone is added in the grid circuit, which modulates the emitted currents to the vibrations of the voice. These are picked up by the receiving antenna, rectified and amplified as already described.

We have successively described the functioning of the vacuum tube as a rectifier, amplifier and oscillator. All three of these functions can be performed at the same time by the same tube. On most Signal Corps apparatus, however, several tubes are used, each adapted to its particular function. Considerations of detail, however, are not within the scope of this article.

As an illustration of how freely even the earlier types of bulbs could be manipulated, the reader will recall the conversations by radio telephone between Arlington and Honolulu, a distance of 5,100 miles. For this purpose, at least 300 tubes were used in the course of the experiments, and on several occasions as high as 500 tubes were generating currents at the same time.

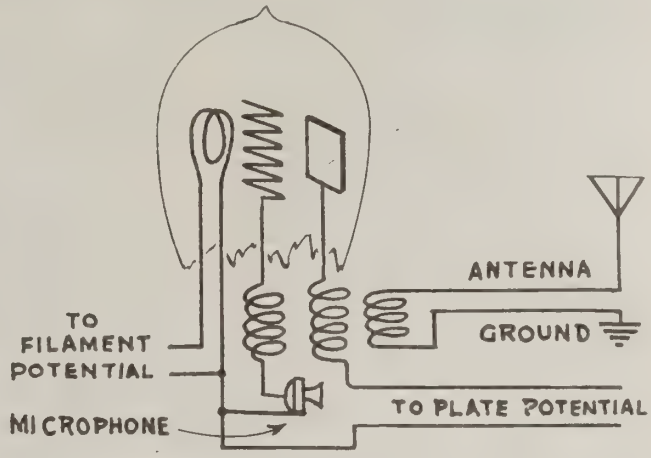

Fig. 9—The plate circuit currents, regulated by the voice, are passed off into the ether through coupling coils

Aside from military use, the aeroplane radio telephone has been already used on passenger carrying planes. The aeroplanes which are used to ferry members of the Peace Conference between London and Paris are equipped with radio telephones, so that Lloyd George and Bonar Law can get in touch with officials during flight as efficiently as in their offices.

It has been demonstrated by General Kenly and Secretary Daniels that it is quite practical to use the commercial wire telephone as far as a convenient radio telephone transmitter which is in range of a plane in flight, and transform the voice currents into radio waves, and converse over the circuit, partly wire, partly radio, without difficulty. By this means an aviator flying over the Alps can telephone by radio to a ground station below, his voice carried by wire to a high power trans-Atlantic radio telephone transmitting station, transmitted to a radio receiving station in the United States, carried over the continent by the wire telephone lines, and re-radiated into the ether to a plane flying over the harbor of San Francisco.

The British Marconi Company is already prepared to give radio service aboard aircraft on terms similar to those applying to shipboard installations. We can, therefore, look forward to the time when radio communication will form an even more vital and important function in aerial commerce than in marine commerce.

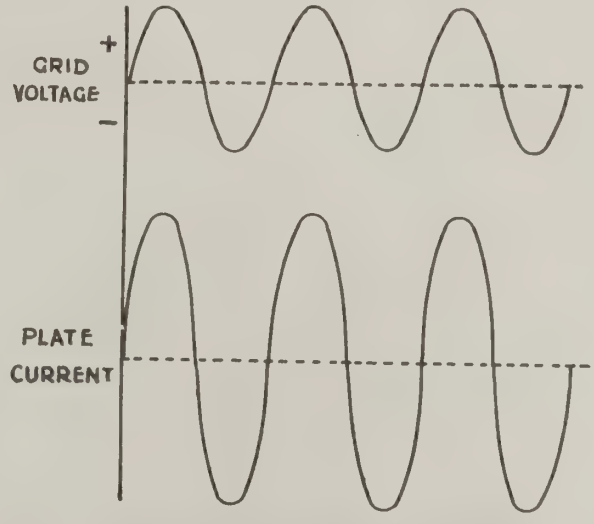

Fig. 10—The plate current is dependent on and faithfully reproduces all variations of grid potential, when adjustments are correctly made

Recent Naval Orders

Commander John H. Towers, to command of N. C. seaplane division No. 1.

Lieutenant Commander Marc A. Mitscher, to connection transatlantic flight.

Lieutenant Commander Patrick N. L. Bellinger, Lieutenant Commander Albert C. Reed and Lieutenant Commander Robert L. Lavender, to connection transatlantic flight.

Lieutenant David H. M. Culloch and Lieutenant Louis T. Barin, to duty in connection with N. C. seaplane division No. 1.

Lieutenant Henry W. Hoyt, to assume command U. S. Naval Air Station, Akron, Ohio.

Lieutenant Robert D. Kirkpatrick, to naval air station San Diego, as executive officer.

Lieutenant (junior grade) Ralph H. Norris, to duty naval air station, Montauk, L. I., N. Y.

Lieutenant John F. Meloney, to naval air station, Cape May, N. J., for dirigible balloon training.

Lieutenant (junior grade) A. H. Beggs, to duty naval air station, Anacostia, D. C.

Army Aero Field to be Established at Camp Bragg

A flying field is to be established at Camp Bragg, North Carolina. It will be known as Pope Field, in honor of Lieut. Harley H. Pope, who lost his life in an aeroplane accident.

Reserve Naval Aviators Invited to Take Examination for Regular Service

Washington, D. C.—The Navy Department is preparing to invite requests from Reserve aviators who desire to take examinations for the regular service, providing Congressional authorization is granted permitting a limited number to enter the regular navy. Only such reservists who pass special examinations will be permitted to enter the regular service.

Official Films of War in the Air to be Released by Signal Corps

Washington, D. C.—The War Department has officially announced that it will arrange for the release of thousands of feet of film, taken by the Signal Corps, of all phases of military activity, including training and combat work of aviators. These films will be released to form part of the film "news weeklies."

Kelly Field's Altitude Record Broken

San Antonio, Tex., April 17.—Lieut. W. R. Sweeley broke the Kelly Field altitude record in a Curtiss JN-4H aeroplane, by reaching an altitude of 19,600 feet.

Demobilization of the Air Service

Progress in Demobilization

According to reports received from the Air Service the net decrease in the total commissioned and enlisted strength from the date of the armistice to April 10 was 68 per cent.

The following table shows the distribution and per cent. of net decrease to April 10. The strength April 10 includes only officers and men not yet ordered discharged; it does not include 2,088 men at demobilization camps awaiting discharge.

	Nov. 11	Apr. 10	Per cent net dec.
Cadets	5,775	879	85
Officers	20,586	6,609	68
Enlisted men	164,266	54,003	67
Total	190,627	61,491	68

Demobilization of Air Service Personnel Overseas

During the week ended April 19, 1919, the Air Service personnel overseas decreased 752 men, as against a weekly average of 2,457 during the eight preceding weeks. The strength of the Air Service in the United States and overseas is shown for various dates in the followign diagram:

	U. S.	Overseas
November 11	111,846	78,786
December 2	115,216	78,061
December 26	99.010	59.917
January 30	46,919	57,527
February 27	33,649	53,087
March 28	25,347	41,800
April 10	20,636	40,855

Sixty-seven per cent. of the officers of the Department fo Military Aeronautics and 63 per cent. of the Bureau of Aircraft Production have been discharged.

Victory Button for All Who Served in War Being Issued

Washington, D. C.—A lapel button will be issued to all officers and enlisted men (excepting members of the S. A. T. C.) upon forwarding discharge papers or duly certified copies to supply officer of the nearest military post, camp or station, including recruiting stations.

The button for those wounded in service is of silver; all others receive a bronze button.

Signal Corps Issues Radio Instruction Book

The Signal Corps has issued its comprehensive radio instruction book, known as "Radio Pamphlet No. 40." This book was prepared for the rapid training of radio electricians at the Bureau of Standards under the direction of the Training Section of the Signal Corps by Dr. J. H. Dellinger, in collaboration with a group of radio authorities.

This book is an excellent instruction treatise for practical radio men, as it deals not only with radio theory and radio instruments, but covers thoroughly those phases of electrical engineering that apply to the radio art. In fact, 170 pages are devoted to A. C. and D. C. theory, motors, dynamos and storage batteries, and 180 cover thoroughly radio theory and practice.

The chapter dealing with vacuum tubes, their theory and use, is particularly clear and comprehensive.

Honorable Discharges

The following officers are honorably discharged from the Service of the United States: First Lieutenants Clarence N. Walker, Edward J. Nolan, John H. Snyder, George E. Ramey. Second Lieutenants: Roger D. Acker, Carl H. Butman, William P. Boyd, Warren P. Gillelen, Jr., Charles J. Henderson, Frank S. Welsh.

New Commanding Officers for Love, Payne, Selfridge and Ellington Fields

Washington, D. C.—The following Special Orders, recently made public, announce new commanding officers for several important field:

Lieutenant-Colonel Harvey B. S. Burwell, J.M.A., A.S.A., ordered from Rockwell Field, San Diego, California, to Love Field, Dallas, Texas, to assume command.

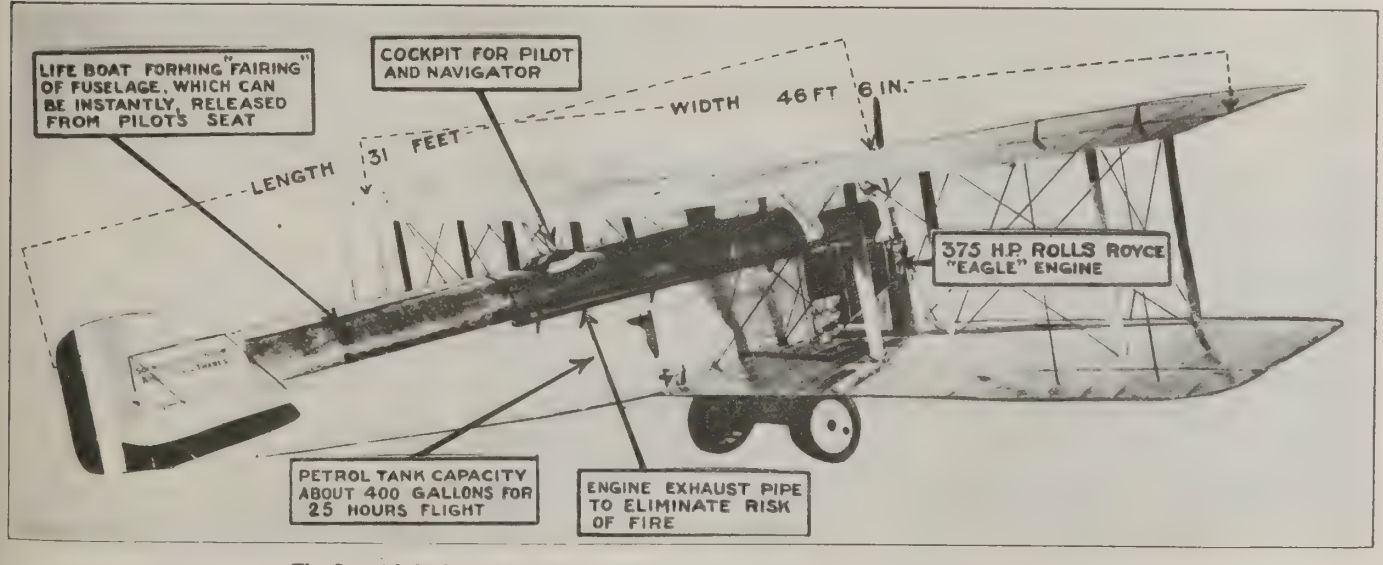
Major Clinton W. Howard, J.M.A., A.S.A., ordered from Rockwell Field, San Diego, California, to Payne Field, West Point, Mississippi, to assume command.

Major Albert L. Sneed, J.M.A., A.S.A., ordered from Love Field, Dallas, Texas, to Washington, D. C.

Major Jacob H. Rudolph, A.S.A., ordered from Chapman Field, Miami, Florida, to Selfridge Field, Mount Clemens, Michigan, to assume command.

Lieutenant-Colonel Lawrence W. McIntosh, J.M.A., A.S.A., ordered from Selfridge Field, Mount Clemens, Michigan, to Ellington Field, Houston, Texas, to assume command.

Major John E. Russell, J.M.A., A.S.A., ordered from March Field, Riverside, California, to Hazelhurst Field, Mineola, Long Island, New York.



Officers Designated Reserve Military Aviators

The following-named officers, having completed the required tests, are rated as Reserve Military Aviators: Captain Lloyd T. Jones, Captain James A. Langston, First Lieutenant Hiram E. Wilson.

Navy Aviators to Attempt Speed Tests

Hampton Roads, Va., April 26.—Following the announcement of the establishment of the 20-hour 1,250-mile naval endurance record, officers at the Naval Station at Hampton Roads declared that a seven-hour speed test would be attempted in the near future.

It is proposed to use a faster fachine than the F-5 that made the endurance record and the route will be between New York and Norfolk. Naval aviators believe they can make two round trips from Norfolk to New York within seven hours, if weather conditions are favorable.

The Sopwith biplane, in which Harry Hawker will attempt to fly across the Atlantic

FOREIGN NEWS

Chile Planning Insurance for Aviators

A bill for the establishment of insurance for flying officers who have not come under the regulations for flying pay is under consideration of the Congress now in session.

Aerial Transport Route in Spain

Several French airmen are studying the problem of an aerial transport line between Toulouse, France, and Rabat, in Morocco. The route will follow the Spanish coast of the Meditteranean and Barcelona is to be the first landing place. Lieutenant Lemaitre will be directing pilot of the line. Two-seater biplanes, powered by Salmson engines, built by the firm Latacoere will be used on the route.

Royal Aero Club of Cataluna Establishing Landing Field

The Royal Aero Club of Cataluna is establishing a landing field not far from the center of the city, in order to foster aviation in Spain. This will provide two landing fields in Cataluna, for the Catalan Aviation School has its grounds on the outskirts of the city.

Vedrines, Pioneer Aviator and Record Holder, is Accident Victim

Paris.—Jules Vedrines, a noted French aviator, was killed on April 21 when his machine fell in the Department of Drome while attempting to make a non-stop flight from Villacoublay to Rome, over a route of 700 miles.

Jules Vedrines was one of the leading French airmen. One of the first Frenchmen to take up aviation, he was very active in 1911 and 1912 in aerial races in Europe, winning the Paris-Madrid race, finishing fourth in the European circuit race, and making various records for height, distance and speed, and finishing second in the British circuit race.

He was one of the first aviators to fly from London to Paris, doing this on August 4, 1911.

In August, 1912, he came to America and won the international aviation race at Chicago on September 9. In 1913 he flew from Paris to Cairo.

Vedines served in the French aerial service early in the war and was later made an instructor. On January 19, this year, he accomplished the feat of landing on a roof of a building with an aeroplane.

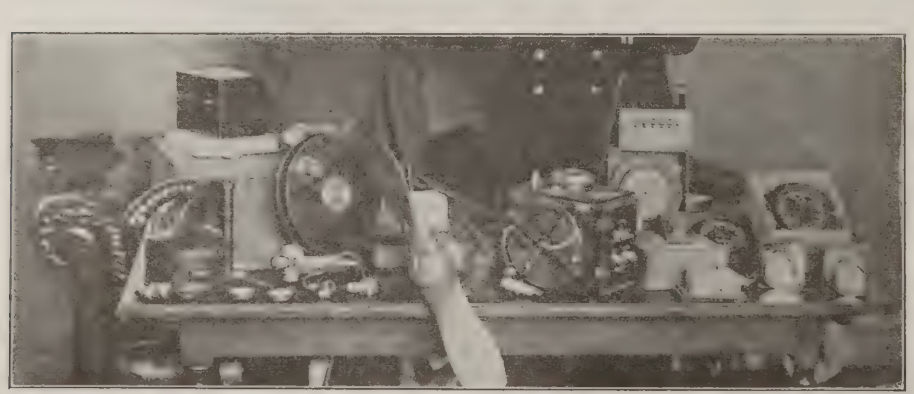
Canadian Government Will Subsidize St. Maurice Forest Protective Association to Aid in Purchase of Aeroplanes

The Province of Quebec does not intend to have aeroplanes of their own to patrol its vast forest area, but this session the St. Maurice Forest Protective Association will be given a subsidy to aid in its task of guarding the forests on the St. Maurice with aeroplanes. The association which comprises big companies with timber concessions is now in communication with the Hon. C. C. Ballantyne, Minister of Marine and Fisheries, with a view to securing some aeroplanes, and the work of patrolling by this method will commence next summer, according to reports to Hon. Jules Allard, Minister of Lands and Forests. Hon. Mr. Allard's bill respecting the protection of forests against fire was introduced in the Legislative Assembly by Hon. L. A. Taschereau.

Prague Becoming Aviation Center

Prague, April 7.—Prague is to become the great junction of air routes of Central Europe. From the flying grounds of Prosek, near here a regular service of "air buses" will be started soon to Padua, Italy, via Vienna, a distance of 225 miles.

Trial flights already have taken place, the duration of the trip being four hours and fifteen minutes. The machines used will be Italian triplanes with motors developing 2,000 horsepower, and carrying forty-seven passengers.



Canadian Pacific Railway Asks Official Permit for Air Transport

Ottawa.—The Canadian Pacific Railway Company will ask Parliament for authorization to operate an aircraft service between such points within or without the Dominion as it may find desirable, it was announced officially recently.

Echo de Paris Offers $60,000 Prizes for Touring Flights

The *Echo de Paris* is offering $60,000 in prizes for a competition in which safety and comfort will be the chief consideration before the judges in making their awards.

The course will consist of some 20 stages totalling 2,500 miles. It will cover the principal towns in France and stretch into all neighboring countries except Germany.

The radio and instrument equipment for the Short Trans-Atlantic plane which Major Wood will attempt to fly from Ireland to Canada

Air Ministry to Dispose of 30,000,000 Yards of Linen

In answer to a question raised in Parliament, an official of the Ministry of Munitions stated that the total stocks of linen on hand and available for disposal is 31,970,725 yards.

Seaplane Bomber Converted Into Thirty Passenger Carrier By Air Ministry

London—In the Navy Dockyard at Lorient the trials have been taking place of a giant seaplane which was originally intended for war purposes, and which has now been converted for commercial use. The first trials have given excellent results. The seaplane is driven by three 12-cylinder motors of 400 h.p. each, which drive three propellers, two at the rear and one in front. The body of the machine will accommodate thirty passengers. The three motors require 235 litres of petrol an hour. The speed is from 78 to 93 miles an hour, and an uninterrupted flight of ten hours can be made, as two petrol tanks holding 1,110 litres of petrol each are carried.

Four Rival Companies to Operate London-Amsterdam Service

It is stated from Amsterdam that no fewer than four syndicates are preparing to start companies for establishing aerial services between London and Amsterdam. According to the *Telegraaf* the British authorities have suggested to these syndicates that they should come to an agreement and form one joint company. Steps in this direction are accordingly being taken.

Federation Aéronautique Internationale to Meet in Neutral Country

At an early date, the first meeting of the Fédération Aéronautique Internationale is to be held, probably, according to *The Aeroplane*, in a country that was neutral in the great war. Amsterdam, it is stated, is almost certain to be chosen. Madrid was mentioned in this connection, but unsettled political conditions in Spain and the greater distances for most of the delegates to travel there have led to the choice of Amsterdam. Germany—and probably Austria also—will be represented at this important meeting of the F. A. I.

New Title for British Cabinet Minister Representing Air Force

The King has approved the substitution of the title "Secretary of State for the Royal Air Force" to that of "Secretary of State for Air."

Prince of Wales's Flight Over London

The Prince of Wales paid a visit to the Handley Page factory and aerodrome at Cricklewood recently, and went for a flight in a Handley Page machine, type 0.400, with two Rolls-Royce engines. The pilot was Lieutenant Carruthers, R.A.F., and the other passengers were Lady Joan Mulholland, Lord Claud Hamilton, and Admiral Mark Kerr.

The flight lasted about one hour, and the machine passed over Buckingham Palace, the Houses of Parliament, Fleet Street, and St. Paul's Cathedral.

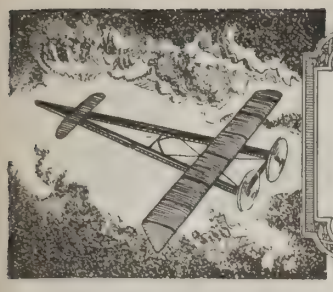
The Prince spent some time with Lieutenant Carruthers, having the whole mechanism explained to him. While the wings were being folded back preparatory to housing the machine, another Handley Page aeroplane of the same type (0.400) passed over the Cricklewood aerodrome with Mr. Bonar Law on his way to Paris.

British Engineering Standards Association Prepared 130 Aircraft Standards

During the past year and a half the British Engineering Standards Association, 28 Victoria Street, S.W.1, has been responsible for the preparation of all specifications for aircraft materials on behalf of the Department of Aircraft Production. During this period some 70 British standard specifications for aircraft materials were issued, and 60 more were practically complete when hostilities ceased. These specifications were distributed to the makers by the department, as the whole of the aircraft production of this country was under its control.

Farman's Goliath Makes First Regular Paris-Brussels Flight With Distinguished Passengers

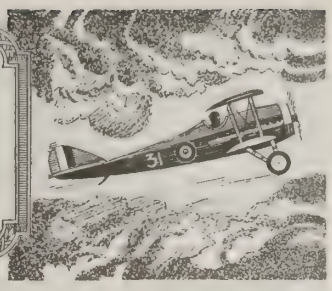
On Saturday, March 22nd, M. Farman's "Goliath" left Toussus-le-Noble, near Paris, on its first civilian passenger service flight between the French and Belgian capitals, according to *The Aeroplane*. The start was to have been at 9 a. m., but was delayed owing to the snow. The machine eventually left the aerodrome at 1.25 o'clock, piloted by Lt. Bossoutrot.



The burgomaster of Enghien (Belgium) was among the passengers, and on the return journey M. Rafaël Guariglia, Italian Charge d'Affaires at Brussels, was carried. The return journey was made on Sunday, the 23rd. The respective times were: Outward, 2 hrs. 50 min.; return, 2 hrs. 57 min., the machine landing at Toussus at 5:45 p. m.. The service will be weekly until further notice.

Lieut. Roget Flies from Marseilles to Paris in 3¾ Hours

Lieut. Roget, who on January 26 made the double flight across the Mediterranean, flew from Marseilles to Paris in a Renault-motored Breguet biplane in the remarkable time of 3¾ hours. The distance from Marseilles to Lyons was covered in 1 hour and 45 minutes. The average time for the entire flight was 143 miles an hour. By rail the journey requires 14 hours.



French Aviator Flies 560 Miles in 5 Hours

Lieut. Janquet and two passengers flying from Alicante via Barcelona to Toulouse accomplished the 560 miles in five hours.

ELEMENTARY AERONAUTICS *and* MODEL NOTES

By John F. McMahon

A Speed Model Aeroplane

THE model shown in the accompanying drawing in this issue is what is known as a SPEED model, and some have been known to travel at speeds greater than 50 miles per hour. In fact, one designed by the writer, which was exactly like the drawing, and used in a speed contest held at Van Cortlandt Park about four years ago, travelled at the rate of 55 miles per hour.

These speed contests are held over a measured piece of ground one-tenth of a mile long, and the model must pass each point—that is, the starting and finishing lines—in order to be officially timed.

It is a very hard thing to control these models, as the least little change in the wing surface or even a slight resistance on one side will make the model turn in a circle. I have seen model after model started in these speed contests and never reach the finish line, although they would cover much more ground travelling in circles than would be necessary in the straightaway distance.

Although the model in the drawing looks out of proportion and awkward, it is a very fine looking machine in the air, and the model builder is well paid for his work by the flights and the enjoyment he gets out of it.

These differ to the long distance models inasmuch as one need not travel as far to bring the model back after each flight, and, again, four sets of rubber are needed to complete the model.

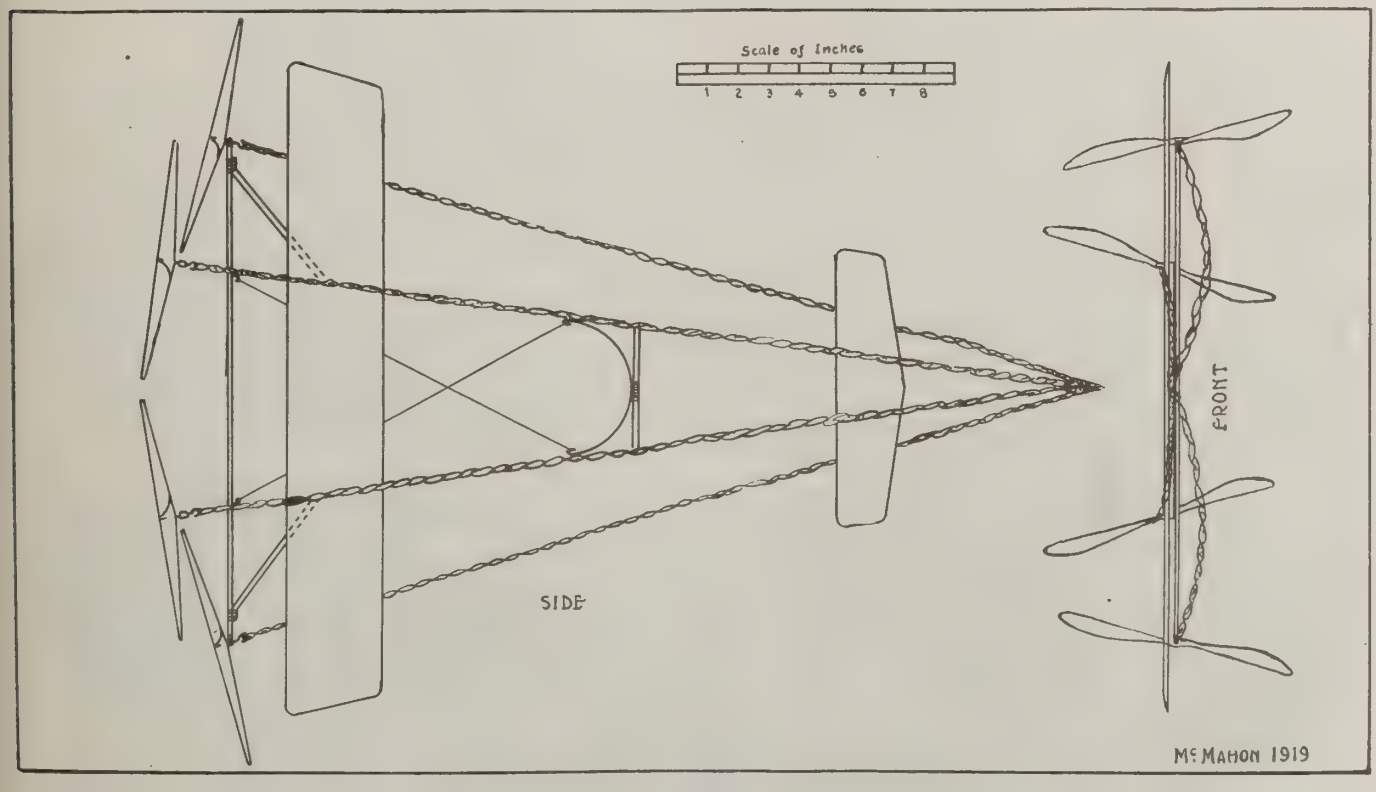
While a speed contest will not be included in the coming contests, it would be well for models clubs who intend conducting a set of flights for prizes to include a speed contest on the program, and I am sure that it will be the closest contested and most enjoyed of the program.

The expense of building a model of this kind is very low and one can be constructed from parts saved from wrecked long distance models.

To construct the model proceed as follows:

Make the frame first of ¼ x 3/16″ spruce 30½″ long. The ends of each longeron is tapered slightly and fastened together with thread and glue forming the apex of a "V." This frame is known as an "A" frame and is the strongest known for model construction. A piece of spruce ¼ x ⅛″ and about 17″ long is given a stream-line shape and fastened across the main longerons at a point a few inches from the rear, as shown. This becomes the hanger for the outside propellers. This spar must be braced at the ends with a piece of bamboo running from the ends of the spar to the longers. This takes up the pull of the rubber motors. Bearings made of 1-32″ I.D. brass tubing about ⅜″ are soldered to strips of brass and fastened to the ends of this spar. Two more bearings made of a piece of tubing with a copper washer soldered to each and fastened by inserting into a block of wood are fastened to the ends of the longerons, on the top side. These bearings are for the inside propellers.

The propellers are of the low pitch type and are 8″ in diameter. There are four in number and all are pushers.



The best way to make the wings is to procure a piece of white pine or clear spruce 3/16″ thick, 3 x 22″, and sandpaper one side to a smooth finish. This side is the under side of the wing. The top should then be shaped to a true wing shape and sandpapered to a smooth finish, as before. Then two coats of shellac should be applied. In order to keep the wings from splitting many model builders glue silk to the under side of the wings and after drying press it with a hot iron. Then shellac or a varnish made of *Ambroid* glue diluted with acetone or banana oil is applied to give it strength.

The wings should be fastened on to the model with rubber bands to allow free movement forward if the model should strike the ground forcefully.

The balancing of a model of this kind is very difficult, and it requires patience and many tryouts before the correct balance is found.

The proper way is to wind the rubbers up to their full capacity, and have the main wing about away from the first or outside set of propellers. The elevator should be up to about 4 inches from the apex of the "V" and should have the front edge elevated about ¼″ higher than the trailing edge.

When the model is released it will be easily seen whether the model is correctly balanced or not, and it will be protected from pitching nose first to the ground.

High speed rubber powered motor described above

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

The Man Who Stayed at Home

(With apologies)

I have a "gold" lieutenancy,
A "shave-tail" in the A. S. C.,
I'd like to fight for Liberty,
But I must STAY at home.

I've not a worry or a care,
The greatest danger that I dare,
Is slipping from my swivel chair;
I have to STAY at home.

I've got about as much a chance
Of getting over there to France
As dead canaries have to dance,
And so I STAY at home.

Each day I ask the Colonel please
With tear-stained cheek and bended knees,
To only send me overseas,
But still I STAY at home.

He puts my name upon the shelf,
And wishes me the best of health
And says he can't get there himself—
And so I STAY at home.

I see myself in future life,
With carcass free from wound or strife,
Explaining to my loving wife,
Why I had STAYED at home.

—*S. B. S.*

In Air Service Parlance

Private "C.C.Pill" inserted the following brief notation in his diary of his pal's most exciting experience in France:

"A.B.P. in the S.O.S. at A.S.P.C. No. 2 went A.W.O.L. on the Q.T. He was nabbed by the M.P. at A.P.O. 702 at 8.05 P.M. His C.O. was O.D. at the time, so he got a C.M.P.D.Q. Charge 94th A. of W., Par. 41144, G.O. 1313. Findings G. as C. Sentence, 2/3 of 2 and 30 at K.P. The O.I.C. forbade him to go to the A.R.C. or Y.M.C.A. In short, he was S.O.L."—*E. and V., 466th A. S., in "Yank Talk."*

How Do They Do It?

(Lieutenant Thompson is an Air Service cadet, watching the mechanics tune up his plane for his first solo flight.)

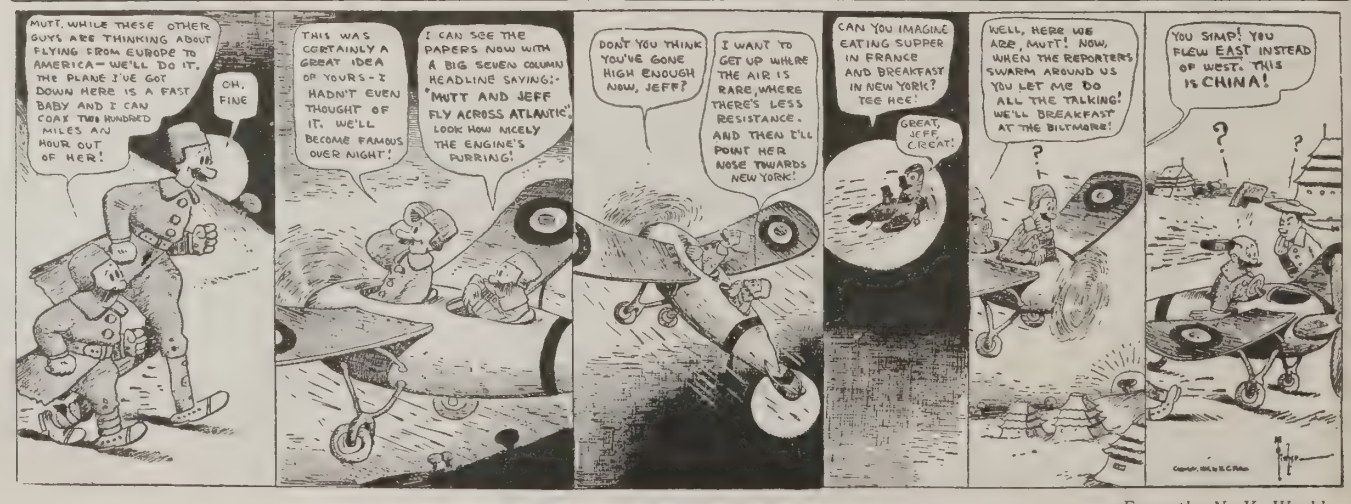
Lt. Thompson to Mechanic: "What's the trouble with this ship?"

Mechanic to Lt. Thompson: "Sir, the bearings are burned out." (Lt. Thompson looks at mechanic in astonishment.)

Lt. Thompson to Mechanic: "I thought these ships were equipped with fire extinguishers?"

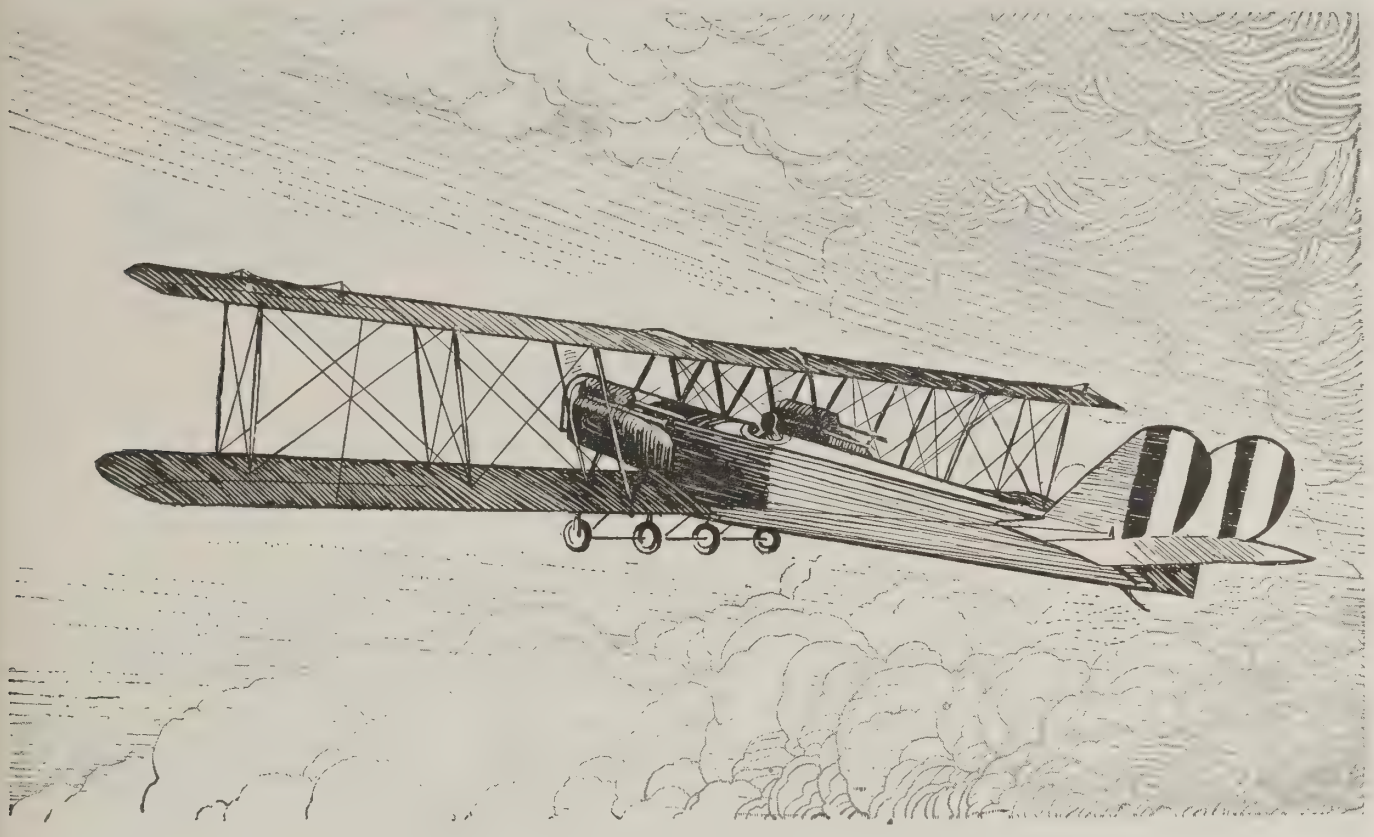
Mechanic to Lt. Thompson: "Yes, sir; they are."

Lt. Thompson to Mechanic: "Well, why didn't you use it?"



The Transatlantic Flight

Unto the 'wakened Element, its lover;
The Aeroplane, flying over!
Midocean hears those wings—
The high adventurings
Of man's soul, so desiring
The upper skies—so long aspiring!
Always there have been ready
Heroes whose wills were steady—
Who were in love with the Unknown.
How soon to come into their own!
Even now, they robe for flying—
They, the Undying!
Yes, though they were to fall,
'Twere to Valhalla's hall!
Shine, sun and moon of Ajalon,
Such deathlessness upon!
Wane, tempest, and be gentle, storm,
When wings the Chosen's form!
O sunlight, flash on
This new, immortal passion,
This heaven-intoxicated science.
Irreverent, but absolved defiance,
Man's powers gloriously taxing
Earth at your waxing,
And answering aether tidal,
This is your ever-destined moment bridal.



—*Isabel Fiske Conant,* in the *New York Times.*

Valsparred in war and peace—

THE Glen L. Martin "bomber," no longer needed for warlike purposes, has demonstrated its value as a commercial machine—

And it's still Valsparred, of course.

Recently this airplane, equipped with two Liberty motors, flew from Pittsburgh to Washington (175 miles) in one hour and fifteen minutes, making a record.

The "fast express" airplanes now being developed to carry on the work of peace, *must* be varnished with Valspar to attain highest efficiency. No other varnish embodies both the elasticity necessary to withstand the terrific vibration, and the water-proofness necessary to resist the erosion of moisture particles driven at enormous speed against the airplane surfaces.

Valspar resists all of the destructive effects of high speed and hard usage in airplane service and is *the only varnish that is actually weather-proof and water-proof.*

A Three Months Record

From the First of January to the end of March—three months—AERIAL AGE readers had a greater volume of authoritative material presented to them than the readers of any other aeronautical publication in America. The following is the remarkable record:

151 Pages Technical Material
17 Illustrated Aeroplane Descriptions
20 Illustrated Motor Descriptions
610 General News Paragraphs
491 Illustrations
371 Advertising Pages

Since the Signing of the Armistice

Much engineering data of great value could not be published on account of censorship regulations prior to November, but when the censorship was lifted AERIAL AGE was

The First to Describe

(1) The Liberty Motor, devoting fourteen pages to a complete description, including fifty illustrations.
(2) The Hispano-Suiza Aviation Motor, telling the complete story with twenty-six illustrations.
(3) Description of Naval Aircraft Factory with many photographs.
(4) Duesenberg 850 H.P. Motor, with complete illustrations and diagrams.
(5) King-Bugatti Motor, sixteen pages and forty illustrations.
(6) The N.C-1 Flying Boat, Caproni Triplane, Standard Handley-Page, Standard El Defense Scout, Standard Postplane, Christmas Bullet, Bellanca Biplane, Gallaudet Seaplane, Le Pere Fighter, Ordnance Scout, De Haviland 4, Breguet-Biplane, Sunstedt Seaplane, etc.
(7) Complete report of Hughes Aircraft Investigation.
(8) Complete aircraft reports by Secretary Baker, General Kenly, Secretary Daniels, J. D. Ryan, and Postmaster General Burleson.
(9) Aero Club of America plans for Captain Bartlett's flight to the North Pole to explore 1,000,000 miles of unexplored territory, to collect data on air currents as well as to make soundings in the Polar Basin.
(10) The extensive plans of the Aero Club to foster aerial transportation, sport, etc., with list of seventeen trophies and prizes to be competed for during the coming year at Atlantic City.

This editorial record is unequalled by any other American Aeronautical Journal. If you desire to

AEROPLANE INSURANCE

Merchants Fire Assurance Corporation of New York

announces the appointment of

MR. AUSTEN B. CREHORE

as Manager of their newly established Aviation Insurance Department.

Mr. Crehore was for two years a Pilot of the Lafayette Flying Corps and is an insurance man of considerable experience and for these reasons we consider him especially qualified to manage this branch of insurance. We are therefore prepared to furnish all forms of aerial insurance coverage, and quotations will be gladly given and full information submitted.

brush, quality and nature of soil, geological features and other facts of interest to the lumberman. If photographs were taken with a stereoscopic camera, they could be viewed through a stereoscope and undulations of the ground which would tell the direction of the flow of streams could be observed.

The great saving of time, the increased thoroughness of the work and the increased efficiency of the logging parties sent out would not be the only inducements for the use of aerial photography in the lumber industry. The lumber man would have a permanent photographic record of the condition of the tract without recourse to expensive survey or inaccurate records. He would find that the aerial map is not only more satisfactory and more quickly obtained, but it can be obtained at a lower cost than survey from the ground.

Arrangements with the Canadian air police service and lumbermen are suggested, as this would be considered preferable to the use of privately owner aircraft. This would obviate the necessity of having planes, operators and cameras. The cost of producing photographs is $4.00 per dozen. In addition to this there is the cost of the plane and the services of the aviator. If an organization, such as the Northwestern Mounted Police, is equipped with aeroplanes, service to the lumbermen could be rendered sufficiently cheaply to be a commercial proposition.

Additional Honors Won in the Air by Americans

There follows a list of American officers who have won decorations according to the records in the War Department; whose names do not appear in the official list previously issued and published in the March 3 issue of AERIAL AGE:

Croix de Guerre

1st Lieut. Thomas P. Atkinson..Fort Sill, Okla.
Lieut. Walter L. Avery.....Columbus, Ohio
2nd Lieut. Alfred B. Baker..Washington, D. C.
2nd Lieut. Newel C. Barber...Medford, Oregon
Lt. H. St. John Boldt.....New York, N. Y.
Lieut. Alford J. Bradford.....Duluth, Minn.
1st Lieut. John Cotton.....Gallup, New Mexico
1st Lieut. Wm. B. Cowart.....Houston, Texas
2nd Lieut. D. W. Davis.....
1st Lieut. Frank A. Dixon.....Pittsburgh, Pa.
1st Lieut. Allyn M. Eddy.....New York, N. Y.
1st Lieut. Alvin C. Goodale.....Pasadena, Calif.
Lieut. James G. Hall.....Pennsgrove, N. J.
Major Melvin Adams Hall .....New York City
2nd Lieut. Bradley B. Hammond, Brighton, Mass.
Capt. E. R. Haslett.....Webb City, Mo.
2nd Lieut. Rodger W. Hitchcock,
Los Angeles, Calif.
Lieut. Alfred N. Joerg.....Brooklyn, N. Y.
Lieut. Wm. Lovett, Jr.....Los Angeles, Calif.
2nd Lieut. John C. Lumsden.....Wilson, N. C.
1st Lieut. Harold W. Merrill...Westerly, R. I.
Lieut. Russell McCormack.....Philadelphia, Pa.
2nd Lieut. Richard N. Moody
Minneapolis, Minn.
2nd Lieut. Charles L. Miller, French .....
1st Lieut. Roy K. Patterson.....Roselle, N. J.
2nd Lieut. Paul Penfield.....Detroit, Mich.
2nd Lieut. Earl W. Porter.....Atlantic, Iowa

Military Medal, British

Adj. Bert Hall, French, Pilot....New York City

District Supervisors

The offices of District Supervisors of Air Service Activities in the following named districts have been ordered abolished, effective March 31, 1919:

Eastern District,—Headquarters, O. D. M. A., Executive Section, Supervisor's Branch.

Southeastern District,—Headquarters, Montgomery, Ala.

Northeastern District,—Headquarters, Indianapolis, Ind.

Southern District,—Headquarters, Houston, Texas.

Southwestern District,—Headquarters, Dallas, Texas.

Western District,—Headquarters, Coronado, California.

The functions heretofore performed by District Supervisors will, in the future, be exercised by the office of the Director of Air Service, and by Department Air Service officers in accordance with definite instructions to be promulgated later.

Cited for Distinguished Service

The Commander in Chief, in the name of the President, has awarded the distinguished-service cross to the following-named officers and soldiers for acts of extraordinary heroism described after their names:

Second Lieut. Clinton S. Breese, observer, 12th Aero Squadron. For extraordinary heroism in action near Argonne, France, November 2, 1918. While on an infantry contact mission, Lieut. Breese and his pilot were attacked by four enemy planes and driven back, but realizing the importance of their mission, deliberately returned and attacked the four planes, sending one to the earth and driving the others away. Unmindful of the damaged condition of their plane and of their own danger, they then flew for an hour within 100 meters of the ground through a continuous heavy machine-gun fire until they had accurately located our front-line positions. Home address, R. P. Breese, father, 115 McCall Street, Waukesha, Wis.

First Lieut. Kenneth H. Holden, pilot, 12th Aero Squadron. For extraordinary heroism in action near Argonne, France, November 2, 1918. While on an infantry contact mission Lieut. Holden and his observer were attacked by four eenmy planes and driven back, but realizing the importance of their mission, deliberately returned and attacked the four planes, sending one to the earth and driving the others away. Unmindful of the damaged condition of their plane and of their own danger they then flew for an hour within 100 meters of the ground through a continuous heavy machine-gun fire until they had accurately located our front-line position. Home address, Mrs. E. M. Moran, sister, 1110 Washington Street, Michigan City, Ind.

Second Lieut. (Observer) Thomas B. Dodwell, Royal Air Forces, British Army. For extraordinary heroism in action near Bruges, Belgium, August 13, 1918. This officer and his pilot led two other machines on a long photographic mission over the area north of Bruges. Over Thourout they were attacked by six enemy planes. While heavily engaged, Lieut Dodwell and his pilot saw one of their machines in difficulty and trying to make our lines with an enemy plane close at his tail. Regardless of their own danger from the remaining planes, they dived to the assistance of the crippled plane. Taking advantage of their preoccupation, several enemy planes attacked from the rear, but, in spite of this rear attack, they drove off the enemy plane and allowed the damaged plane to land within our lines. Half of the tail plane was shot away, but Lieut. Dodwell climbed along the wing and lay down along the cowling in front of the pilot, enabling the pilot to regain partial control of his machine. When nearing the ground, he crawled back into the cockpit to allow the nose to rise, and the pilot made a safe landing. The presence of mind and cool courage of this officer saved the machine from crashing to the ground. Home address, Henry Dodwell, father, The Day House, Wellington, Shropshire, England.

First Lieut. Louis C. Simon, Jr., Air Service, 147th Aero Squadron, United States Army. For the following acts of extraordinary heroism in action near Cierges, France, September 28, 1918, Lieut. Simon is awarded a bronze oak leak, to be worn on the distinguished-service cross awarded him October 23, 1918. Lieut. Simon and two other pilots encountered nine (type Fokker) enemy planes, which were protecting an observation plane (type Rumpler). Lieut. Simon attacked the lower formation of four planes alone and drove them off. He next dived at the observation plane and set it crashing to the ground in flames. Next of kin, Mrs. M. E. Simon, mother, Normandie Hotel, Columbus, Ohio.

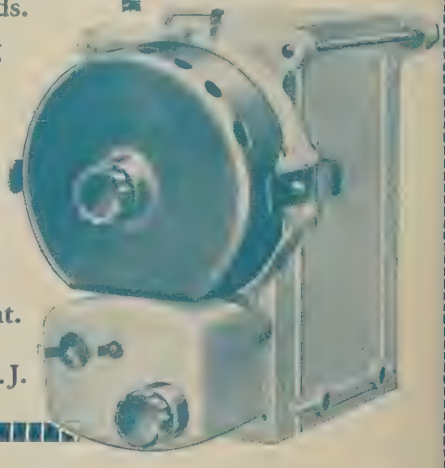
Aero still holds the world's altitude record



The record of 29,200 feet, established last summer by Major R. W. Schroeder at Dayton, Ohio, still stands as the world's altitude record. The Hispano-Suiza engine in his Bristol plane was fired by the Standardized Aero Magneto—which was adopted for the gigantic U. S. air program as the exclusive official magneto.

Major Schroeder gives full credit to the simplified construction, the intense spark and the absolute dependability of the Standardized Aero that nursed his supersensitive engine to a place in the world's records.

It is rumored that he will again this coming summer attempt to lower his own altitude record. And so great is his confidence in the Standardized Aero that the plane he chooses will again be driven by the same magneto which made his previous record breaking flight possible.

This is but one more gratifying testimony of the dependable performance of Aero equipment.

VOL. IX NEW YORK, MAY 12, 1919 NO. 9

SECOND PAN-AMERICAN AERONAUTIC CONVENTION GREAT SUCCESS

Winston Churchill, Admiral Lovatelli, President Menocal, Santos-Dumont and Other High International Officials Send Greetings

Important Scientific Demonstrations

THE country at large is applauding the Second Pan-American Aeronautic Convention and cables are received daily from high authorities in different countries greeting the advent of the convention.

The Hon. Winston Churchill, in a wireless to Mr. Alan R. Hawley, said:

"All good wishes for the success of the Pan-American Aeronautic Convention. May this new art and science prove a bond of kinship between the English-speaking people. The oceans have divided us. Let the air unite us. Let the air unite us in the comradeship of daring and the painstaking study of the means of mutual protection."

In opening the Convention, Secretary of War Baker sent the following wireless:

"I send greetings to the Second Pan-American Aeronautic Convention. Here in France one sees the great triumph which has been achieved in aeronautics during the war and American contribution, its value and significance."

Subsequently, Secretary Daniels sent the following wireless message:

"I regret that absence from the country denies me the pleasure of being present at the Second Pan-American Aeronautic Convention. My visits and conferences with aeronautic experts of France, Italy and Great Britain convince me that the largest field of adventure and invention lies along the line of the further complete conquest of the air. Inasmuch as the first flight was made by Mr. Wright in America, I trust that the Government of our country and the citizens of America will heartily and earnestly advance this science which means so much to mankind."

Rear-Admiral M. Lovatelli, Italian Naval Attaché, transmitted the following communication from Gabriel D'Annunzio:

"I have the honor of transmitting to you the following radiogram, which has been forwarded by Admiral Delbono, the Italian Minister of Marine: 'People of the Union, gathered together to assume the conquest of eternal Heaven today, the salutes of Italy reach you as warmly as when in that distant April you sprang up in defense of the eternal spirit of man against the menace of barbarism. In the moment of its grave grief, Italy calls upon the people of George Washington and Abraham Lincoln to present the unjust sacrifice of those who have given all for the glorious cause. People of the Star Spangled Banner, make sacred by noble

U. S. Army, Navy and Marine Corps delegates at the Second Pan-American Aeronautic Convention, photographed with the representatives of ten countries, Aero Club of America officials, Eddie Stinson and Miss Stinson, at the Atlantic City Airport. Major Reed G. Landis, second ranking American Ace, is shown next to Colonel Herr, Captain Bosc, French High Mission and Major F. F. Evans, U. S. Marine Corps are shown on the left

testimonies the day which glorifies in yourselves the most noble thing in the world, the wing of man and of liberty. Gabriel D'Annunzio.' "

The Honorable Victor Hugo Barranco, special representative of President Menocal, of Cuba, flew to Atlantic City from New York in a Curtiss aeroplane piloted by Aviator John Rolff, carrying wireless greetings from President Menocal to the Convention reading as follows:

"The marvelous progress already attained in this new field of human activity, made possible by the genius and concerted efforts of so many of your countrymen, and the brilliant part taken by American aviators in Democracy's triumph over the forces of Autocracy in the great conflict so recently brought to a glorious end, contains the promise of still greater things for the near future.

"Permit me, therefore, to again congratulate the Aero Club for its magnificent work and to offer my sincere co-operation in everything that it may be within my power to do to contribute to the success of its efforts for the extension of aerial communication between the North and Latin-American countries; such facilities will promote the advancement of culture and commerce and serve to draw still closer the already friendly ties uniting our respective countries. (Signed) M. G. Menocal."

The Royal Aero Club of Great Britain cabled the following greetings.

"We learn with pleasure of the great awakening of interest and enthusiasm for the cause of aeronautics for which our respective clubs have always worked together. We greet your airmen and wish you great success. (Signed) President, Royal Aero Club."

Mr. Alberto Santos-Dumont, the famous pioneer airman and President of the Pan-American Aeronautic Federation, who was prevented from coming to Atlantic City this month, but will come in June, cabled as follows:

"The discussion of important aspects of modern aviation, the outdoor demonstrating of aircraft and the exhibits on the Steel Pier at Atlantic City are all bound to create a popular interest in aeronautics that will certainly make for the progress of all branches of aviation. This Pan-American Convention and Exhibition is a fine thing for aeronautics, and should be productive of wonderful results. It is an important factor for developing cordial relations between the American Republics. (Signed) Alberto Santos-Dumont."

The Norwegian Aero Club cabled from Christiania, Norway, as follows:

"Please present Committee of Pan-American Flying Exposition, Atlantic City, the compliments and heartiest congratulations from Norwegian Airmen upon opening. (Signed) Norwegian Aero Club."

The Special Representatives of Chili, General Pinto and Carlos Silva, who were present at the ceremony, brought a message of greeting from the Chilian Government and the Aero Club of Chili.

Greetings were also read from Rear-Admiral Robert E. Peary, President of the Aerial League of America; President Emanuel Estrada Cabrera, of Guatemala; President Porras, of Panama; from the President of Haiti; from the Minister of Public Instruction of Venezuela; from the Minister of the Interior of Ecuador, and from Paraguay, Uruguay, Mexico, Costa Rica.

Parachute Demonstration

The first public demonstration of "Life preservers of the Air" was staged as one of the special features of the Second Pan-American Aeronautical Convention on May 3.

Lieut. Jean Ors, the noted French aeronaut, whose genius is responsible for the newest aerial safety device, ascended in an aeroplane piloted by Eddie Stinson. As the machine attained a speed of 80 miles an hour and an altitude of 500 feet over the heads of the beholders, Lieut. Ors, who occupied the seat directly behind the pilot, stepped over the cowl and leaped into space, releasing the air life preserver, which is a new type of parachute, by the jerk of the main suspending rope as he went over the side.

Stinson and his aeroplane sailed on in the straightaway. Crowds below caught the flash of Lieut. Ors' body as it was catapulted from the machine by the tremendous speed of the aeroplane. In a split second the umbrella-shaped top of the parachute spread out in a white canopy of safety over his head. Twenty-five feet below, suspended by the guide ropes leading down from the fringe of the "umbrella," Lieut. Ors' plummet-like plunge earthward was halted before he had descended fifty feet. There was no jerk. The wide spread of the parachute slowed up his descent as gradually as if brakes had been eased on slowly.

The leap was made against the sun and the sheer texture of the silk umbrella as the 18-mile wind from the south caught it, revealed the aeroplane through it. Lieut. Ors had jumped from the aeroplane just as it swung out over the waters of the Thorofare.

Major Thomas S. Baldwin, Director Atlantic City Municipal Air Port, the first air port in the world

The first to congratulate him was Engineer-Commander K. Kitishima, of the Japanese Imperial Navy, who represented his Government at the field. The Nipponese observer showed keenest interest in the construction of the parachute, while the crowds rushed up to greet the aeronaut as he released himself from the harness to which the ropes of the parachute were fastened.

Engineer Commander K. Kitashima of the Japanese Imperial Navy and Rear Admiral W. N. Little, U. S. N., retired

Lieut. Jean Ors, who demonstrated his marvelous parachute for aeroplane service

Lieut. Ors in one of his parachute descents from an aeroplane

There were two remarkable features that caught the attention of the spectators. First it was noted that of all the nations represented among the experts gathered to witness the demonstration, the United States was the only Government not represented officially. The second was the fact that the leap of Lieut. Ors had been made from a 500-foot altitude, which is a record low altitude for such a parachute test.

Ten minutes after he had finished the test, Lieut. Ors showed the practicability of the parachute for commercial purposes. Using a smaller type parachute, he swept into the air once more and released the parachute with a heavy rock attached to demonstrate how the contrivance could be employed in dropping mail bags or other packages in safety. Although the wind had freshened to twenty miles an hour, the parachute "delivered" its goods 40 feet from the designated spot, landing as gently as a feather on the grass. The drop was made from 100 feet.

The judges included the representatives of ten different nations, besides the representatives of the Aero Club of America, the Aerial League of America, the International Aeronautic Federation, the Pan-American Aeronautic Federation, the Aero Club of Pennsylvania, the Aero Club of California, the Aero Club of the Northwest, the Aero Club of Illinois, the Aero Club of Missouri, the Aero Club of Colorado, the Aero Club of Minneapolis, the Aero Club of Atlantic City, the Aero Club of Cuba, the Aero Club of Argentina, the Aero Club of Chili, the Aero Club of Brazil, the Aero Club of Uruguay, the Aero Club of France, the Aero Club of Italy, the Yale University, the Harvard University, the Pennsylvania University, Columbia University, Amherst University, University of Illinois, University of California, the Society of Automotive Engineers, the Automobile Club of Amercia, the National Geographical Society, the American Geographical Society, and other scientific and national organizations and representatives of the American and foreign press.

Lieutenant Ors won the $500 special prize for Aerial Life Preservers and may win the $500 prize offered by Mrs. Louis Bennett of New York, for the best aerial life preserver, the contest for which will last during the entire month. The prize was paid in Liberty Bonds by the Contest Committee of the Aero Club of America.

Among the officials present were: Commander H. Dons, Naval Attaché, Norwegian Legation; Lieut.-Commander A. Trindale, Portuguese Naval Air Attache; Capt. F. C. Sejerstere, Swedish Legation; Engineer-Commander K. Kitishima, Imperial Japanese Navy; Rear-Admiral W. N. Little, U. S. Navy (retired); Capt. C. Berisso, Military Attache, Uruguay Legation; Victor Hugo Barranco, Representative of Cuba; Captain Pierre Edgar Bosc, member French High Mission; General Pinta, Representative of Chili; Lieut. Edgar Henry Garland, Royal British Air Force; Capt. G. Lennstrand, British Royal Air Force; Lieut. Santiago Cavipugano, French Air Service; Major S. Herbert Mapes, of New York Aerial Police; Mr. Alan R. Hawley, President Aero Club of America; Mr. A. T. Bell, President of Atlantic City Aero Club; Mr. Henry Woodhouse, Member of Board of Governors, Aero Club of America; Mr. Charles Elliott Warren, Member of Board of Governors, Aero Club of America; Col. Jefferson De Mont Thompson, of New York Aerial Police; Mr. Augustus Post, Secretary Aerial League of America; Mr. Hugh L. Willoughby, member, Contest Committee, Aero Club of America; Mr. Fred Wagner, Official Starter; Major Reed G. Landis, second ranking American Ace, late of Air Service, U. S. A.; Mr. Edward Stinson, Aviator.

Intercollegiate Trophies

S. Raymond Beckwith, University of Pennsylvania water polo star, captured the first of a series of intercollegiate seaplane races that were a late afternoon feature over a three-mile circular ocean course off the upper beach, with the Steel Pier, headquarters of the convention, as the central point. The college boys covered a total distance of 30 miles.

The contest was particularly interesting by reason of the fact that there was a keen rivalry for the family honors between the Penn Beckwith and his brother, Ensign A. A. Beckwith, representing Yale, who finished third.

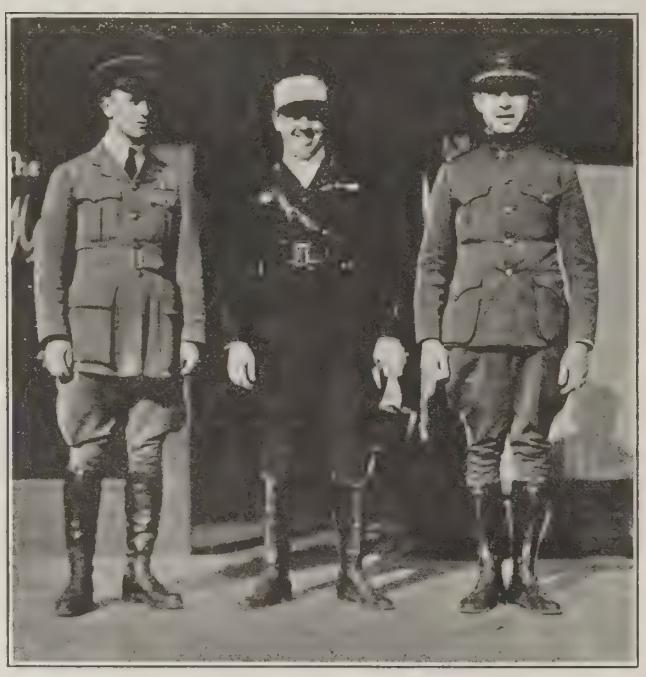
The University of Pennsylvania time was 23 minutes and 26 seconds, which gave Mr. Beckwith the first prize of $250, and he also becomes the first holder of the annual intercollegiate Trophy.

The second prize of $150 was won by Ensign M. S. Martin, with Lieut. R. M. Craigmyle, as passenger, representing Columbia University. Ensign Martin's time was 25 minutes and 13 seconds.

Ensign Beckwith, who landed Yale's colors third, won the $100 prize with a time of 26 minutes and 51 seconds, while

the fourth prize of $50 was won by Augustus Post, representing Amherst College. His time was 29 minutes and 3 seconds.

In the contest for the Intercollegiate Trophy for Land Aeroplanes, which was held at the Atlantic City Air Port, Columbia, represented by Lieutenant A. L. Smith, covered the ten laps in 10 minutes and 30 seconds, winning the first "expense money" prize of $250 and the first claim on the $2,000 trophy.



Yale, represented by Ensign Alfred A. Beckwith, covered the ten laps in 13 minutes and 35 seconds, winning the second prize.

Columbia, represented by Lieut. Guy S. Lennstrand, covered ten laps in 14 minutes and 39 seconds. Pennsylvania did not participate in this land aeroplane race.

Woman's Flying Trophy Offered

Miss Marjorie Stinson, sister of the noted aviator, Eddie Stinson, who has won a number of honors during the races of the Second Pan-American Aeronautic Convention and Exhibition, arrived at Atlantic City today and gave a number of flying demonstrations at the Atlantic City Air Port.

The interest created by her flying was great, and Mrs. May Brown Dietrich of New York, the daughter of ex-Governor Brown of Maryland, immediately offered a trophy to be

Lieut. Edgar H. Garland, Lieut. Santiago Campuzana, and Ensign A. A. Beckwith were three of the contestants

competed for annually to be known as the Women's Flying Trophy.

The trophy was offered through the Aerial League of America and a Committee is being appointed to make the rules for the competition, which will start at Atlantic City Air Port next Saturday.

Blimp Bombards Pier and Boardwalk with Victory Loan Literature

A giant "blimp" that cruised up the coast from Cap May under orders from the commander of the Fourth Naval District, "bombed" the convention hall of the Pan-American Aeronautical Congress on the Steel Pier and the Boardwalk with Victory Loan literature. The big dirigible, with a navy crew, entertained the thousands along the Boardwalk with its graceful maneuvres over the combers. Maj. Mapes, in charge of the Aviation Department of the New York Police Department, wig-wagged commands to the ship, which responded instantly to the signals as they were delivered, taking direction and executing turns as he instructed. The novel performance proved to be one of the most interesting featudes on the day's program.

Sunday Memorial Service

Dramatic was the tribute of the Second Pan-American Aeronautical Congress to the eagles of the allied nations who gave their lives in the cause of humanity. The setting was impressive when the prelude to the memorial services at the Aeronautic Hall on the Steel Pier started.

B. H. Kendrick and E. K. Jacquith, who are taking a prominent part in the competitions

Hundreds inside, sitting with bowed heads in silent prayer, suddenly heard the whirr of propellers and the throb of engines overhead, singing the eulogy of the comrades gone over the horizon to their reward. There came a soft thud on the roof of the big auditorium—another—then in quick succession came others above and at the sides of the building. A blotch of red flashed past a window near the front of the stage on which sat the international representatives. It was the guard of honor, led by Eddie Stinson, wheeling above the audience, dropping roses from the skies in memory of the valiant airmen who made the supreme sacrifice. The air patrol continued all through the meeting, while crowds on the pier decking watched and bared their heads each time the winged squadron passed over.

The services inside were presided over by Secretary Au-

Lieut. Chas. E. Ruttan, U. S. N., whose remarkable paintings are being shown for the first time on the Steel Pier

Official representatives of twelve nations who witnessed the tests of the new "aerial life preserver" used by Lieut. Jean Ors

gustus Post, of the Aero Club of America and the Aerial League of America. Mr. Post stressed the fact that self-sacrifice was the great spirit of America during the war—the spirit carried to Europe by the Yankees. He referred to the heroes whose memory the services honored today as noble examples of that spirit.

The Rev. Henry Merle Mellen, of the First Presbyterian Church, this city, who delivered the eulogy of the day, said in part:

"The dirge that we with peculiar fitness should sing at a service of this kind is suggested in Miss Adams' immortal hymn, 'Nearer, My God, to Thee.' The spiritual song writer must have had a kind of vision of these latter days, when the sons of men are so wondrously 'on joyful wing cleaving the sky.' Nay, she must have had some divinely fine sense of such men as we honor today when she continued, 'sun, moon and stars forgot, upwards I fly.'

"Cleaving the sky, these men soared to wonderful physical heights, and from the greater heights of duty and achievement took their leave of earth, kissing the ground in farewell with their bodies, while their souls winged their way to the throne of God. They ascended to the summit of heroic service and thence vaulted serenely to the realm of the Immortals. They were martyrs of the New Faith, which is not a new, but the old, perennial faith that bold souls have in the progress of the race toward higher and more spiritual achievement.

"True, they loved the adventure of the world above the sky line. They risked their lives in hazardous undertaking for the sheer peril of the thing. And probably not one of them could have given a clear-cut definition of the moral reason within him as he ascended over battlefields or training camps. Nevertheless, they have told us by their eloquent sacrifice, that it is better to die in undefined moral adventure than to live in snug, prosy platitude, hugging the earth in complacent self-satisfaction. When we draw around them the larger circle of the Great World War and its tremendous moral issues, we are justified in clothing them with the light that never was on land or sea. That light, as was said by the inspired writer many centuries ago, is 'the light that lighteneth every man that cometh into the world.' They knew that light was in them and were satisfied, even in the spirit of adventure to be guided by it. In the economy of the Divine not a single form of life is lost—never! Each spark of life adds to the onward way of progress.

W. W. Young, the first life member of the Aero Club of America, said:

"In the early days of the war Lord Kitchener, the greatest and most far-sighted general of his time, is reported to have said that an aeroplane, to him, was worth a division of troops.

"That was when aviators were merely the 'eyes of the Army.' Soon they became the teeth, the cutting edge; and these men who gave their lives were the very vanguard of Freedom.

"Before such a gift at such a cost we stand awed and helpless, but we can at least acknowledge our obligation and sympathy for those who feel, perhaps, even more than ourselves, the worth of the price paid. So I have the honor to propose this resolution:

"BE IT RESOLVED, That we, members of the Second

Pan-American Aeronautic Convention assembled in memorial meeting, in the Presence of Almighty God, wish most solemnly to avow our overwhelming debt to the heroic courage and devotion of those who gave their lives, through military aviation, for the purchase of our freedom."

The National Anthem was sung by B. F. Butts, and Miss Evelyn Tyson acted as accompanist. Dr. Howlett of the First Baptist Church pronounced the Benediction.

Thousands of Engineers to Attend Convention

Mr. Alan R. Hawley, President of the Aero Club of America and Chairman of the Pan-American Aeronautic Federation, received the following telegram today:

"Mr. Alan R. Hawley, Chairman Pan-American Aeronautic Federation, Hotel Chalfonte, Atlantic City, N. J.:

"Engineers' Club, Philadelphia, and affiliations three thousand strong, extend congratulations successful inauguration Atlantic City Air Port, and suggest Saturday, May 24th, be selected as Engineers' Day, your Committee requesting all Engineering Societies of America which have been invited to the Convention to be present on that date. Our Committee on Arrangements will see you next Tuesday afternoon, Air Port Field. (Signed) Lewis H. Kenney and Joseph A. Steinmetz."

It is expected that on that date not less than ten thousand engineers will be present and some startling developments in aeronautic engineering will be made public.

Insurance Policies Issued

Beginning Tuesday, May 5, every person that makes a flight at Atlantic City Airport carries a $5,000 insurance policy with his or her flight ticket.

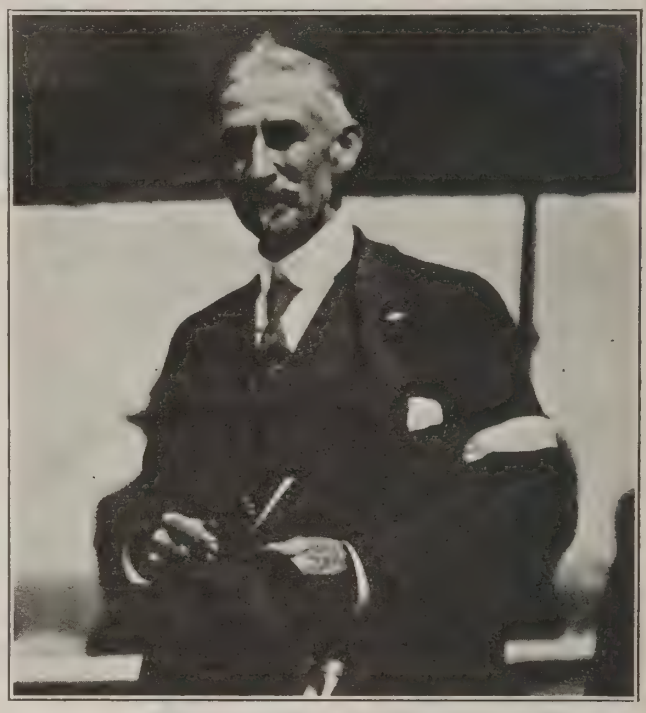
The Managing Editor of AERIAL AGE was presented by the Aero Club of America with one of the first policies issued. Mr. Alan R. Hawley, the president of the club, in presenting it at the regular meeting of the Convention, expressed the appreciation of the Aero Club of America, the Aerial League of America, and the forty affiliated organizations for the splendid support given to the progress of aeronautics by AERIAL AGE.

This most important development in popularizing aeronautics has come as a result of requests made two months ago by the Aero Club of America and the Aerial League of America to the Insurance Companies to send experts to the Second Pan-American Aeronautic Convention to discuss the subject; and supplying these experts with facts regarding the comparative safety of aviation and air travel.

This development which was hailed with greatest interest and satisfaction by the hundreds of people assembled here for the Convention was chrystallized today by the arrival of Messrs. Charles H. Payne and J. W. Richardson, representatives of the Travelers Insurance Company with the Company's newly issued "Aviation Accident Ticket Policies", crisp and new from the presses, providing for insurance for aviators and passengers at the low rate of only fifty cents per thousand dollars. The new policies were in large demand. The first fifty policies issued were for historic and souvenir purposes to President Wilson, Secretary of War Baker, Secretary of the Navy Daniels.

First Aerial Police Arrest

New York's Aerial Police force, co-operating with the shore authorities, made the first airplane "arrest" ever recorded as one of the features of "Aerial Police Day" staged here on the program of the second Pan-American Aeronautical Convention. The "arrest" was but one of the many demonstrations of the practicability of cloud cops as a recognized department of the police force of modern cities.



Fifteen members of the New York air force, who made their first public appearance in their sky blue uniforms, put the program through before representatives of leading cities of the east, making a big hit with their work and incidently giving the Atlantic City Air Port the honor of being the first "headquarters" in action in making an actual arrest.

Sheriff Alfred Perkins, of Atlantic County, drove to the aviation field in his automobile and left it parked near the end of the grandstand. While he was chatting with Eddie Stinson, the skyrocket among the aviators here praticipating in the meet, Richard Black, deputy of the Atlantic City Vice Squad, "stole" his automobile and started on a mad dash along the Meadow Boulevard which parallels the airport. The "thief" headed towards Pleasantville, the mainland town at the other end of the meadows five miles away.

Seizing a small Ors parachute, which had been used during the past several days to demonstrate mail bag "smashing" without the necessity of a stop, Sheriff Perkins leaped aboard the Stinson aroplane. About this time Deputy Chief S. Herbert Mapes, of the cloud force "recognized" Black as a "notorious New York Motor bandit" as the "thief" shot past the grandstand. Capt. Horace Keane, of the air division, was circling overhead in Aviator Stehlin's 'plane, and Major Mapes, operating a wireless telephone from "headquarters", shot instructions to him that the man in the automobile was "badly wanted in New York". Capt. Keane wheeled about and set sail for the mainland just as Sheriff Perkins, aboard Stinson's machine left the ground, and they took up the pursuit together.

The speeding aeroplanes beat the motor car to Pleasantville where the Sheriff dropped a message via the parachute to a traffic officer on the Shore Road over which all motor traffic must pass to get anywhere on the mainland. The policeman intercepted the speeding "thief" as he approached the crossing and placed him under arrest.

Capt. Keane descended in a field nearby and lodged a detainer with Sheriff Perkins, who had also alighted, and the two walked over to the "prisoner". County Detective Harry Fulmer "happened along" about that time and the "thief"

Capt. Hugh L. Willoughby, one of the American aeronautic pioneers, is keenly interested in all the happenings at the Convention

was turned over to him to bring back to the field. Black, handcuffed to Fulmer, was back in front of the grandstand eleven minutes after he had "stolen" the car and the first official aerial arrest was recorded at airport "headquarters".

A short time later Maj. Granville A. Pollock, wing commander of the police squadron, demonstrated an "arrest" with a seaplane capturing a motorboat "pirate" in the waterway that forms a part of the airport. The air cops later showed just how they will police "beats" established in the air, putting on a simulated wireless conversation with an express train conductor dashing across the meadows to show how trains could be intercepted between cities in case of an emergency or in getting quick aid to wrecks.

Aerial Shooting Contests

Following a conference held at the Atlantic City Municipal Airport, in which aces and prominent aeronautic authorities of nine countries participated, and at which ways and means of maintaining efficiency in shooting from aircraft were discussed, the Aerial League of America offered a trophy to be competed for annually to be known as the "International Aerial Shooting Trophy", and another trophy to be known as the "National Aerial Shooting Trophy".

In these contests the gunner will go up in an aeroplane and occupy the position of the observer. The gun is mounted on the top of the plane of the machine, so the gunner can fire upwards and sidewards; but not downward. The gunner will have ten shots and will have to try to bring down ten small free balloons painted like birds. The gunner fires at the ballons, one by one. The instant the ballon is hit, it explodes and falls. The judges watch the contest and note the

time required to bring down the ten balloons in each case. The best time made in bringing down the ten balloons will establish the championship.

Major Reed G. Landis, second ranking American ace and son of Judge Landis, who is an expert shot and is one of the champions of the idea, said: "This tournament is to be a most valuable factor in maintaining shooting efficiency and will, therefore, be of utmost importance for national defense. The competitions for this trophy will give an opportunity to the thirty thousand American aviators who have left the Army and Navy to maintain their efficiency in aerial gunnery. They will also afford training in aerial shooting to tens of thousands of marksmen and shooting experts who have not yet taken up aviation. It will be a great thing for both the nation and the individual."

The aces and aeronautic experts who discussed the aerial shooting contests included: Major Reed G. Landis, second ranking American ace; Major F. T. Evans, U. S. Marine Corps Air Service; Colonel Jacob M. Coward, U. S. Army; Colonel John K. Herr, U. S. Army, representing the Secretary of War; representatives of the Navy: Captain Granville A. Pollock, late of the Lafayette Escadrille, now in charge of the Aerial Squadron, New York Police; Colonel Jefferson De Mont Thompson, in charge of the Aviation Section, New York Police; Major S. Herbert Mapes, Captain Pierre Edgar Bosc, member of the French High Commission; Lieut. Commander A. Trindale, Portuguese Naval Air Attache; Commander H. Dons, Naval Attache, Norwegian Legation; Capt. F. C. Sejorstere, Swedish Legation; Engineer-Commander K. Kitshima, Imperial Japanese Navy; Rear Admiral W. N. Little, U. S. Navy (retired); Capt. C. Berisson, Military Attache, Uruguay Legation, Victor Hugo Barranco, Representative of Cuba; General Pinta, Representative of Chili; Lieut. Edgar Henry Garland, Royal British Air Force; Capt. G. Lennstrand, Royal British Air Force; Lieut. Santiago Compuzano, French Air Service; Mr. Alan R. Hawley, President Aero Club of America; Mr. A. T. Bell, President of Atlantic City Aero Club; Mr. Henry Woodhouse, member of Board of Governors, Aero Club of America; Colonel Charles Elliott Warren, Mr. Augustus Post, Secretary Aerial League of America; Captain Hugh L. Willoughby, Mr. Fred Wagner, W. W. Young, the noted engineer; Ensign H. D. Enger, U. S. N., late of the Lafayette Escadrille; A. S. Abell, 2d; Earl S. Ovington, Edward Stinson, the famous aviator.

The plan was first suggested by Major Thomas S. Baldwin, U. S. A.

DAILY PROGRAM FOR PAN-AMERICAN AERONAUTIC CONVENTION, EXHIBITION AND CONTESTS

SATURDAY, MAY 10TH

AFTERNOON—Army, Navy and Marine Corps Day. Aerial contests and tournament.
EVENING—United States Army and Navy Officers' Reception. Reception and addresses at Aeronautic Exhibition Hall of the Steel Pier.

SUNDAY, MAY 11TH

AFTERNOON AND EVENING—Presentation of the flags by different States of the United States to the Aero Squadrons representing the States. Each State will present a flag to each Aero Squadron, the members of which were overwhelmingly natives of that State. The presentation will be made by representatives from the State and the Aero Club and Aerial League branch of that State. All States and cities are invited to send delegates, and the Army, Navy and Marine Corps to send representatives.

MONDAY, MAY 12TH

AFTERNOON—Demonstrations and illustrated addresses on the "Value of Aircraft for Advertising by Day and by Night." All national advertisers and advertising agents invited to attend.
EVENING—"Pan-American Aerial Transport Over Land." Addresses by members of the commissions of the 20 Latin-American Republics.

TUESDAY, MAY 13TH

AFTERNOON AND EVENING—"Pan-American Aerial Transport Over Water." Addresses by members of the 20 Latin-American Republics' Commissions.

WEDNESDAY AND THURSDAY, MAY 14TH AND 15TH

AFTERNOONS AND EVENINGS—"The Airways and Aerial Transport in Europe, Canada, Africa, Australia and Asia."

FRIDAY, MAY 16TH

AFTERNOON AND EVENING—"Aerial Navigation Instruments for Flying Over Land and Water." Aviators, navigators, scientific instrument makers and aeronautic experts invited.

SATURDAY, MAY 17TH

AFTERNOON—Aerial races and contests. Illustrated addresses on Aerial Photography.
EVENING—Ball.

SUNDAY, MAY 18TH

AFTERNOON AND EVENING—Illustrated addresses on "Aerial Exploration and the Use of Aircraft for Coast and Geodetic Survey."

MONDAY, MAY 19TH

AFTERNOON—Addresses on "Need of Broader Attitude Regarding Insurance for Aircraft and Aviators."
EVENING—Illustrated address on "How Army Medical Standards and Inspection Lessen Accidents." Insurance companies and agents invited.

TUESDAY, MAY 20TH

AFTERNOON AND EVENING—Illustrated addresses showing different ways of crossing Atlantic by air and the problems to be solved to accomplish same successfully.

WEDNESDAY, MAY 21ST

AFTERNOON—Aero Safety Day. Discussion of aero safety provisions made; improvements in aeroplane construction; increased reliability of aero motors; devices which make for safety in flying.
EVENING—"Progress Made in the Art of Piloting Aeroplanes." Illustrated.

THURSDAY, MAY 22ND

AFTERNOON AND EVENING—Addresses and discussions of meteorology—"How the Weather Forecasts Can Be Extended and Made More Efficient by the Use of Aircraft in Exploring the Upper Air," also "How the Weather Forecasts Help Aerial Navigation," and "Topographic and Climatic Factors in Relation to Aeronautics."

FRIDAY, MAY 23RD

AFTERNOON AND EVENING—Addresses on "Aerial Jurisprudence—Aerial Laws and Regulations of Air Traffic." (First day). Lawyers, traffic commissioners and police authorities of different countries invited.

SATURDAY, MAY 24TH

AFTERNOON—Races and contests.
EVENING—Illustrated address on "Need of Establishing Altitude Levels for International, Interstate and Interurban Air Travel."

SUNDAY, MAY 25TH

EVENING—Aeronautic Art Day. Address on "Aerial Painting and Sculpture of Different Countries, and Exhibition of Aerial Paintings," by Lieut. Farre, Lieut. Ruttan and others. All prominent artists, managers of art galleries and art patrons invited to attend.

ENGINEERING WEEK

MONDAY, MAY 26TH

EVENING—"Aeronautic Engineering Problems and Their Prospective Solution." Opening of contests for designs and ideas for large aeroplanes.

TUESDAY, MAY 27TH

EVENING—"Factors That Increase the Efficiency for Large Dirigibles." "Advantages of Veneer and Plywood for Aircraft Construction."

WEDNESDAY, MAY 28TH

AFTERNOON—Address on "Problems of Flying at 35,000 Feet and Over, and Their Prospective Solution."
EVENING—"Present Day Aero Engines."

THURSDAY, MAY 29TH

AFTERNOON—"Flying Boats Versus Hydroaeroplanes for Sport and Transportation."
EVENING—Contest for designs and ideas for large aeroplanes.

FRIDAY, MAY 30TH (Memorial Day)

AFTERNOON—Aircraft contests.
EVENING—Reception at the Aeronautic Hall, Steel Pier.

SATURDAY, MAY 31ST

AFTERNOON—Aircraft contests.
EVENING—"International Medical Standards for Aviators in War and Peace." Reports from different countries illustrated with attractive films. 50,000 medical men invited.

SUNDAY, JUNE 1ST

AFTERNOON AND EVENING—Award of prizes and diplomas for all events.

TROPHIES AND PRIZES TO BE COMPETED FOR AT ATLANTIC CITY IN MAY

THE following Trophies and Prizes have been offered for competition at Atlantic City, and from other points to Atlantic City from May 1st to May 31st. All contests are open to Army, Navy, Aerial Mail and civilian aviators.

(1) **$6,000 Curtiss Marine Flying Trophy.** Mr. Glenn H. Curtiss has offered a prize of $1,000 to go to the first entrant for the Curtiss Marine Flying Trophy who covers the distance of 1,000 miles without stopping. The contest for this prize will open on May 1st, and continue until it has been accomplished.

The entrants who wish to compete for this trophy and prize during the Convention can fly over the 60-mile course between the Steel Pier and Cape May Air Station. This magnificent trophy is exhibited at the Art Salon on the Steel Pier.

The entrant's record will be counted as a flight for the Curtiss Marine Flying Trophy and $1,000 under the rules for the 1919 competition for this trophy.

(2) **The $5,000 Pulitzer Trophy,** offered for annual competition, to be awarded this year to the aviator who makes the best record in flying land or water planes from anywhere to Atlantic City, and from Atlantic City to anywhere during the month of May.

Competitors for this trophy will start from or end at the Atlantic City Air Port, on Albany Avenue, Atlantic City, which affords unsurpassed facilities for both land and water aeroplanes.

(3) **The Boston Globe Trophy and $1,750** cash prizes to be awarded as follows: $1,000 and the trophy to the aviator who makes the best record in flying from Atlantic City to Boston, or from Boston to Atlantic City during the month of May; $500 and $250 to the aviators who make the second and third best records, respectively.

Start or ending will be on the Atlantic City Air Port.

(4) **The Cleveland Plain Dealer Trophy and $1,750** cash prizes to be awarded as follows: $1,000 and the trophy to the aviator who makes the best record flying from Atlantic City to Cleveland, or from Cleveland to Atlantic City during the month of May; $500 and $250 to the aviators who make the best records, respectively.

Start or ending will be on the Atlantic City Air Port.

(5) **The Detroit News Trophy and $1,750** cash prizes to be awarded as follows: $1,000 and the trophy to the aviator who makes the best record flying from Atlantic City to Detroit, or vice versa, during the month of May; $500 and $250 to the aviators who make the best records, respectively.

Start or ending will be on Atlantic City Air Port.

(6) **The Atlanta Journal $1,750 prizes,** to be awarded to the three aviators who make the best record flying from Atlantic City to Atlanta, Georgia, carrying the Journal.

Start or ending will be on Atlantic City Air Port.

(7) **Colonel William A. Bishop's "Ace of Aces Trophy,"** to be awarded to the aviator who makes the best record in flying from Toronto to Atlantic City, or vice versa, during the month of May.

Start or ending will be on Atlantic City Air Port.

(8) **The $3,000 New York Herald Aero Efficiency Prizes,** to be awarded as follows: $1,000 to the aviator who covers the greatest distance in a non-stop cross country flight, starting from or ending at Atlantic City between May 1st and May 30th with an aeroplane of any horsepower.

$250 to each of the aviators who cover the greatest distance in a non-stop flight from or ending at Atlantic City between May 1st and May 30th with aeroplanes of:

(a) not over 100 h.p.
(b) not less than 100 h.p. and not over 200 h.p.
(c) not less than 200 h.p. and not over 400 h.p.
(d) not less than 400 h.p. and not over 600 h.p.
(e) not less than 600 h.p. and not over 800 h.p.
(f) not less than 800 h.p. and not over 1000 h.p.
(g) not less than 1000 h.p., and over without limit.

Start or end of flight will be on Atlantic City Air Port.

(9) **$2,000 Intercollegiate Seaplane Speed Trophy,** for annual competition, to be awarded to the college whose representative makes the best record in flying ten times over a five-kilometer course at Atlantic City each Saturday off the Steel Pier during the month of May.

This trophy is to become the property of the college that wins it three years in succession.

(10) **$2,000 Intercollegiate Aeroplane Trophy,** for annual competition, to be awarded to the college whose representative makes the best record in flying ten times over a five-kilometer course at Atlantic City each Saturday during the month of May. To be held at the Atlantic City Air Port.

This trophy is to become the property of the college that wins it three years in succession.

(11) **$2,750 Cash Prizes for Intercollegiate Weekly Seaplane Races,** offered under the terms of the will of Mr. Samuel H. Valentine. These prizes are to be awarded in connection with the races for the Intercollegiate Seaplane Trophy described above. They are offered to assist the collegiate aero clubs and individuals making the entries to defray the expenses connected with entering a team. Competing for same will not, therefore, endanger the amateur status of the competitor.

There will be four prizes awarded each Saturday for the best speed made in competition for the annual Intercollegiate Seaplane Trophy as follows:

First prize	$250
Second prize	150
Third Prize	100
Fourth Prize	50

Colleges are permitted to appoint new entries and enter different machines for each race. The name of the entrant and type of machine need not be announced until half hour before the race.

(12) **$2,750 Cash Prizes for Intercollegiate Weekly Aeroplane Races,** offered under the terms of the will of Mr. Samuel H. Valentine, are to be awarded in connection with the weekly races for the Intercollegiate Aeroplane Trophy described above. They are offered to assist the collegiate aero clubs and individuals making the entries to defray the expenses connected with entering a team. Competition for same will not endanger the amateur status of the competitors.

There will, therefore, be four prizes awarded each Saturday for the best speed made in competition for the Annual Intercollegiate Aeroplane Trophy, as follows:

First Prize	$250
Second Prize	150
Third Prize	100
Fourth Prize	50

Colleges are permitted to appoint new entries and enter different machines for each race. The name of the entrant and the type of the machine need not be announced until half an hour before the race.

(13) **The Intercollegiate Dirigible Trophy.**
This may not be held until later in the season.

(14) **The Intercollegiate Balloon Trophy.**
This may not be held until later in the season.

All of these contests, except the intercollegiate, are open to Army, Navy, Marine Corps, intercollegiate and civilian aviators. The rules are similar, so that a competitor can compete for more than one trophy in one flight.

The intercollegiate contests are open to both graduates and undergraduates.

(15) **Open Seaplane Speed Contests** (with handicap) for twelve laps of five miles each. To be held on Decoration Day. Prizes to be awarded under the terms of the will of Samuel H. Valentine and sanctioned by the Aero Club of America.

First Prize $1,000
Second Prize 500
Third Prize 250

(16) **Aerial Commuting Prizes.**

1. To be awarded to entrants who cover the greatest total distance in commuting by air from anywhere to Atlantic City during the period of the Convention.

First Prize .....Gold Medal
Second Prize .....Silver Medal
Third Prize .....Bronze Medal
(Distance to be measured in straight line.)

2. To be awarded to entrants who make the greatest number of trips in commuting by air from anywhere to Atlantic City during the period of the Convention.

First Prize .....Gold Medal
Second Prize .....Silver Medal
Third Prize .....Bronze Medal

3. To be awarded to entrants who make the longest flight in commuting from anywhere to Atlantic City during the period of the Convention. (Distance to be measured in straight line.)

First Prize .....Gold Medal
Second Prize .....Silver Medal
Third Prize .....Bronze Medal

(17) **$2,000 Opening Day Prizes,** offered under the terms of the will of Samuel H. Valentine for land aeroplanes and seaplanes. To be awarded to the aviators making the best records in competing for any of the trophies and prizes on May 1st, flying from Atlantic City to anywhere, and from anywhere to Atlantic City. Competitors starting from Atlantic City will start from the Municipal Air Port at Albany Avenue, Atlantic City. Competitors from other points will end their flights at the Air Port.

(18) **$500 Aerial Runabout Races,** offered under the will of Mr. Samuel H. Valentine for speed competition between one-seater aeroplanes of not over 75 h.p. Two races are to be held as follows:

First race, Saturday, May 10th, at the Atlantic City Air Port, Albany Avenue, Atlantic City:

First Prize $250
Second Prize 150
Third Prize 100
Fourth Prize 50

(19) **The Akron Trophy,** presented by Major Thomas S. Baldwin, to be presented to the pilot who makes the best time with any type of aircraft in flying from Akron to Atlantic City, or Atlantic City to Akron, during the month of May.

Start or landing must be made on the Atlantic City Air Port.

(20) **$100 West Point Merchants' Association Prize,** to competitor of Pulitzer Trophy who starts from or ends at West Point, Mississippi.

(21) **Woman's Trophy for Flying,** offered by Mrs. May Brown-Dietrich, through the Aerial League of America, for competition by women under rules to be drawn by the Contest Committee.

Record of Competitors

MAY 1st CONTEST:

ROLAND ROHLF. Hon. Victor Hugo Barranco, passenger. 90 h.p. Curtiss "Oriole" Biplane, from Westbury, Long Island, to Atlantic City Air Port, 118 miles; two hours and eight minutes. Return flight, one hour and twenty-five minutes. Both flights in driving storm.

EDDIE STINSON. Lieut. G. W. Shaw, U. S. N., passenger. 90 h.p. Curtiss Biplane, from Queens, Long Island, to Atlantic City Air Port; two hours, thirty-three minutes, in driving storm.

E. K. JACQUITH. 90 h.p. Flying Boat from Atlantic City to Rockaway Naval Air Station in driving storm; one hour, forty-five minutes.

B. H. KENDRICK. 90 h.p. Flying Boat, from Atlantic City to Newark, in driving storm; two hours.

MAY 2nd CONTEST:

B. H. KENDRICK. 90 h.p. Flying Boat, from Newark to Atlantic City; two hours, fifteen minutes.

E. K. JACQUITH. 90 h.p. Flying Boat from New York to Atlantic City; two hours, twelve minutes.

MAY 3d:

A. LIVINGSTON ALLEN, with John P. Davis as passenger, flew from Roosevelt Field, Long Island, to Atlantic City Air Port in one hour, twenty minutes.

In all Intercollegiate Contests the entries must be either undergraduate or graduates of their respective universities holding the pilot certificate issued by the Aero Club of America, under the rules of the International Aeronautic Federation.

The N. C. 4 Trans-Atlantic Cruiser being put in shape for the first leg of the journey at Rockaway

THE NEWS OF THE WEEK

50,000 See Airship Shot Down By Foe in Mimic Battle

Fifty thousand persons watched the great mimic battles in Van Cortlandt Park getting the most thrilling and vivid picture of how and why the Hindenburg line crumbled under the pressure of American fighters.

One thrilling incident was when an observation balloon was sent up two thousand feet to report the "enemy" doings and fire from the "enemy" hit the envelope and set the balloon afire. Instantly its pilot was seen to jump off the basket, and as he did a large parachute opened up and carried Lieutenant Herbert H. Mills, of the Twenty-second balloon company, safely to the ground. This was the signal for the afternoon battle to start.

Aerial Police Visit Philadelphia

Aero policemen of New York City, the first city in the world to introduce "fly' cops in the highest sense of the word, made their pioneer extended flight Tuesday afternoon, carrying greetings from Mayor Hylan to Mayor Smith of Philadelphia.

Two Curtiss JM-4D training planes, piloted by A. Livingston Allen and Joseph D. Bennett, lieutenants in the Aerial Police Reserve, carried Police Inspector John F. Dwyer of the New York Police, and Major Dinshah P. Chadiali, governor of the Wanamaker Aviation School, from Sheepshead Bay to Philadelphia.

The aviation school of the Police Reserve was founded by Special Deputy Police Commissioner Rodman Wanamaker with a view of training aviators for the Government while the war was going on. It will be used in the future to train aviators for the police department.

"It will only be a short time until aerial traffic policemen will be on duty in the air over New York City," said Commissioner Wanamaker, "to control and regulate traffic."

The use of the machines was donated by J. P. Davies of the Curtiss Aeroplane & Motor Corporation.

Good Landing Club Will Aid U. S. Fliers

An informal tea marked the opening of the Good Landing Club at 114 East Thirty-ninth street, on May 4 by the Treasure and Trinket Fund Committee of the National Special Aid Society. After the club had been formally opened the keys were turned over to the officers by the Fund Committee treasurer.

Among the ladies who will serve on the committee are Mrs. William Allen Bartlett, chairman of the aviation committee; Mrs. Edward Robinson, chairman of the house committee; Miss Fredrica F. Winfield, secretary, and members of the priority board.

The Treasure and Trinket Fund was

N. C. 3 Flying Boat being launched at Rockaway Point Naval Air Station preparatory to the Trans-Atlantic flight. The insert shows Commander J. H. Tower, who will be in charge of the three flying boats, the N. C. 1, N. C. 3, and N. C. 4

The N. C. 4, which at the time of our going to press, is awaiting favorable weather conditions to start from Rockaway on the Trans-Atlantic flight

The Trans-Atlantic Cruiser N. C. 3, equipped with 4 Liberty Motors, waiting at Rockaway for the hop to Newfoundland

Thomas-Morse type MB-3 single-seater fighter, equipped with 300 H.P. Hispano-Suiza engine. Span, 26′0″, length overall, 20′0″, height, 9′1″. Total weight loaded, 2050 pounds. Fuel and oil capacity for three hours' flight at full power. High speed—163 2/3 M.P.H., climb to 10,000 feet in 4 minutes 52 seconds

established to meet the needs of our air service, the welfare of the dependents in the case of disaster and the long list of the flyer's wants. The fund also provides the necessary equipment and comforts not yet furnished by the Government.

Big Aerodrome and Wireless for League Capital

The first meeting of the League of Nations in Geneva as the capital will be held in the famous Alabama Hall of the City Hall, it is learned.

The local authorities have been notified that a site one and one-half miles square on the lake shore will be required for the permanent home of the League, and several such sites have been offered by old families of Geneva.

The most powerful wireless station in the world will be constructed here, and also a huge aerodrome for diplomatic aeroplanes, all of which will be extra-territorial. The local authorities are giving every assistance.

Albuquerque Has Aerial Landing Place

Albuquerque, N. M.—Realizing the possible value of aircraft in the patrol of cattle and sheep ranches, the protection and survey of forests and the carrying of mail, the city of Albuquerque which in co-operation with the Albuquerque Aviation School, has prepared the best landing field in the southwest, comprising about forty acres of ground at the terminus of the street railway and the electric light service on the outskirts of the city. The establishment of this field has been brought about by the progressive work of the local Chamber of Commerce.

Dr. Poor Describes Aerial Navigation Instruments

Washington, D. C.—Dr. Charles Lane Poor on April 29 described the computing machine which he developed for the solution of navigation problems encountered in aerial navigation, before the National Academy of Science.

With this instrument the calculations are actually performed with a few direct, simple movements, and with an accuracy equivalent to that with four-place logarithmic tables. In principle this instrument is essentially a circular slide rule. Its accuracy is sufficient for "off shore" navigation on board ship and is ample for any work on aeroplanes or airships.

Enid, Oklahoma, Has Municipal Aerial Landing Field

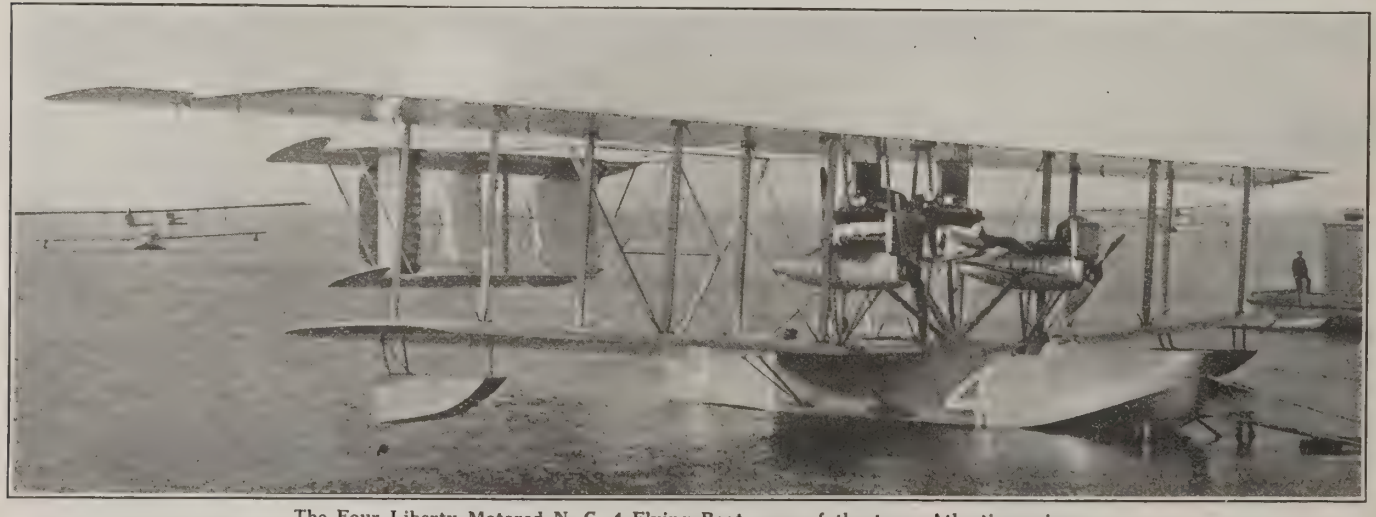
Enid, Okla., April 30.—A municipal aerial landing field has been established at this city, as a result of the work of the Chamber of Commerce. A cement circle, ten feet in diameter, has been laid to attract the attention of airmen.

An aeroplane sales agency was established here several weeks ago, and two Curtiss JN-4D planes were sold within one week.

The landing field and hangars have been completed since April 18, and is claimed to be the second municipal landing field to be established in the United States.

Aeroplane Courier Procures Passports on Time for Mexican Trade Delegation

San Antonio, Texas—The Mexican Trades Delegation, composed mostly of Texas business men, making a tour of Mexico for the purpose of encouraging and arranging for trade relations, had assembled in San Antonio under the direction of the Chamber of Commerce. All arrangements had been completed late Friday night and the party had boarded the special train on the I. & G. N. R. R., which was to take them on their pilgrimage, when it was discovered that nine of the passports had not arrived. Telegraphic permission was secured immediately, pending receipt of the passports, and the train started for the border.



Saturday morning the Secretary of the Chamber of Commerce called up Kelly Field, explaining the situation and stating that the passports had been received from the State Department, in Washington, and asking if it would be possible to dispatch a courier by aeroplane with the missing documents.

Colonel Fechet, Commanding Officer of Kelly Field, immediately responded, and at two o'clock Lieutenant H. S. Kenyon, accompanied by a mechanic, left by plane for Laredo. Owing to heavy clouds, and to the smallness of the landing field at Laredo, Lieutenant Kenyon was forced to use a Curtiss JN-4 Canadian, equipped with a four-hour tank, in the face of a twenty-mile wind. The 150-mile trip was made in remarkably good time, three hours and twenty minutes. The passports were delivered to the Custom Officer and the Trade Delegation was free of all encumbrance.

The return trip was completed in two hours and twenty minutes, Lieutenant Kenyon flying at a higher altitude and taking advantage of a thirty-five-mile wind.

Six Columbia Airmen Chosen for Contests

Six men were elected yesterday, at a meeting of the Columbia Aero Club, to represent Columbia University in the intercollegiate flying contests to be held at Atlantic City. They are Ronald M. Craigmyle, Guy S. Lennstrand, E. L. Smith, M. S. Martin, A. L. Tait and M. G. Spooner. They will have two planes and will be divided into two crews. Columbia will compete for the Pulitzer Trophy.

The Four Liberty Motored N. C. 4 Flying Boat—one of the trans-Atlantic cruisers

The AIRCRAFT TRADE REVIEW

American Railway Express to Establish Aerial Service

Mr. R. E. M. Cowie, Vice-President of the American Railway Express Company, made definite announcement to the effect that his company is prepared to establish regular aerial express service between New York and Chicago. Mr. Cowie has pointed out the possibilities of such a service, which will be found invaluable in transporting with the greatest possible speed emergency articles and light important express matter.

This service can be used to advantage when, for instance, medicinal or surgical articles are required without delay. Important papers and documents can be quickly transported by aeroplane when it sometimes becomes imperative that they reach a certain destination a day or two ahead of the fastest existing mail service. Another phase in which the plane service would be economical would be in bringing from some distant city small pieces of machinery or mechanical apparatus to replace or repair machinery the failure of which to operate would mean that hundreds of men might be idle until the repair could be made.

Commercial transportation will divide itself into three parts—passenger carrying, postal service and express service, and in its policy of progressiveness the American Railway Express Company is to employ the aeroplane as being the next advance in express service.

The Company does not contemplate the outright purchase of planes, but is willing to negotiate immediately with companies establishing regular flight service between far-distant cities to carry articles handled by the American Railway Express Company.

Personal Pars.

The Black & Decker Mfg. Co., of Baltimore, Md., have established a New York office, Room 2920, Equitable Building, in charge of Mr. G. R. Lundane, who will supervise the distribution of Black & Decker products in New York City and surrounding territory, including the State of Connecticut. Mr. Lundane was previously eastern district salesmanager for the manufacturers of Rayfield carburetors.

Percy F. Todd, who was connected with the engineering division, Bureau of Aircraft Production, at Detroit, Mich., is now with the tractor division of the General Motors Co., of that city.

Matthew C. Ditman, who had active charge of the affairs of the American Bronze Corporation, Berwyn, Pa., while its president, John W. Watson, was in Government service, has been relected vice-president and treasurer, and in addition appointed general manager.

William F. Parish, manager of the lubrication division of the Texas Co. and lately chief of the oil and lubrication branch, Air Service, has been appointed technical director of the Sinclair Refining Co., of Chicago, Ill.

F. Leroy Hill has severed his connection with the aeroplane engineering division, Bureau of Aircraft Production, and is now located at Berkeley, Cal.

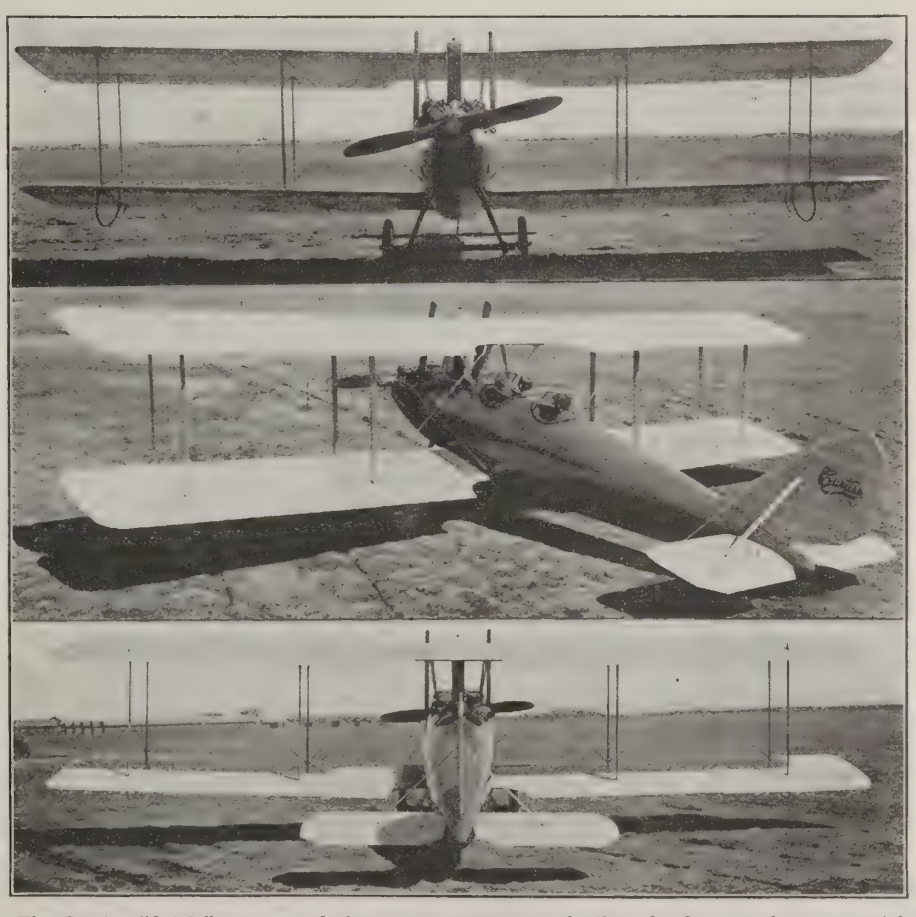
H. L. Greene has been appointed chief metallurgist of the Willys-Overland Co., Toledo, Ohio, and its allied companies. He was formerly chief metallurgist of the Canadian branch of the organization, the Willys-Overland, Ltd.

Frank King has resigned as aircraft engineer, Wright-Martin Aircraft Corporation, New Brunswick, N. J., and is now associated with the Columbia Grafanola & Dictaphone Co., Fairfield, Conn.

The Curtiss "Oriole" a Commercial Plane

Immediately after the signing of the armistice, the Curtiss Aeroplane & Motor Corporation directed the energies of its designers toward the development of aircraft designed to meet commercial needs.

The "Oriole," designed by W. L. Gilmore, aeroplane engineer for the Curtiss Engineering Corporation at Garden City, L. I., is the first post-bellum aeroplane designed primarily for the comfort of passengers—the first plane which is not a war adaptation.



It is a three-passenger biplane, the fore cockpit being commodious enough for two passengers seated side by side. All the controls are in the rear cockpit.

It embodies a new idea in construction of the fuselage or body which is of special wood-ply, made in two parts and connected on the center line. Longitudinal stringers, running fore and aft, aid to rigidity. It is elliptical in section and it contains no real diaphrams.

The upholstering in the passenger's cockpit is made of the finest leather and the curved windshield protects the occupants and gives them a clear vision while flying.

It is colored like the oriole, after which it has been named, the body being orange, the wings yellow and black. It is equipped with the Curtiss OX-5 motor which was used exclusively in the JN-4D training planes in which most of the American and Canadian aviators were trained.

It is 25 feet long, 36 feet from tip to tip and is 9 feet 5 inches in height. Its total weight loaded is 2,188 pounds and carries a useful load of 767 pounds. It has a maximum flying speed of 85 miles an hour, and a landing speed of approximately 40 miles an hour.

The Curtiss "Oriole", accommodating two passengers and pilot, the first purely commercial machine to be produced in America

Hon. Albert S. Burleson, Postmaster General
Hon. Otto Praeger, Second Assistant Postmaster General
J. B. Corridon, Superintendent, Division of Aerial Mail Service

Bureau of Aircraft Development Favored by Postal Officials

Washington, D. C.—The creation of a bureau of aeronautical development, which would have charge of inventing and designing aircraft and appliances for all branches of the Government, rather than a department of military aeronautics, which would have charge of the operation of aircraft as well, is favored by the Post Office Department, as a means of advancing the aeroplane mail service.

Such a bureau, in the opinion of post office officials, should be independent of any government department, the personnel aeronautical engineers familiar with the requirements of all branches of the government dealing with aeronautics, including the Army, Navy and Post Office Department.

The concentration of all development work in one Bureau familiar with the requirements of all branches of the Government would result in more efficient design and more rapid development, according to postal officials. Duplication of effort would be avoided and application of experience gained to all problems would be assured.

Cairo-Karachi-Bombay to Be First Public Postal Aero Mail Line for England

London.—The first regular aero-mail service in the British Empire available for unofficial letters will shortly be started between Cairo, Karachi, and Bombay. Postal arrangements are nearing completion, and in due course, it is stated, an announcement fixing rates will be made. Letters from Great Britain for the Indian aero-mail will have to be marked "Express—Air Service," and an express fee, probably of two or three shillings, will be charged. The likelihood of frequent interruption by fog and other atmospheric conditions is regarded by the postal authorities as a fatal bar to the introduction of any regular aerial mail services in the United Kingdom.

Daily Aero Mail Service Between Avignon and Nice in Operation

A daily postal service has been started between Avignon and Nice. From now onward an aeroplane will be ready to carry mails for Nice left at Avignon by the Paris-Lyons train which arrives at midnight. A machine will also deliver mails from Nice at Avignon in time for the midnight train for Paris. A regular postal service by aeroplane is also announced between Rabat (Morocco) and Algiers.

Dana C. DeHart, known among the Aerial Mail pilots as "Daddy"

Aerial Mail Records Being Made in France

The Paris-Bordeaux aerial mail route is now in regular operation. The best time made so far is 3 hours 40 minutes in a Salmson postal biplane piloted by Lieut. Chretien and Lieut. Gibot. This time was equaled by Adjutant Rachot in a Bordeaux to Paris flight.

On March 25th Adjutant Patin, carrying four bags of mail and 1,200 telegrams, covered the distance from Lille to Paris in one hour.

The Paris-St. Nazaire aerial mail route is in regular operation. Adjt. Mohr made a record when he flew Paris-Le Mans and return (250 miles) in 2 hrs. 35 mins.

The French Africa, the first military postal machine from Casablance arrived at Tangier at 11 o'clock on March 19th. The journey took 5 hrs. A regular service is in operation between Tangier and Rahat.

Peruvian Postmaster - General Seeks American Aid for Aerial Mail

The Postmaster-General at Lima is asking for offers from European and American firms for establishing an aerial mail service.

Dana C. De Hart, Aerial Mail Pilot, has been flier since 1911

Dana C. De Hart, known among aerial mail pilots as "Daddy," was born in Los Angeles, California, on June 17, 1886. He learned to fly in a pusher machine, without any dual instruction, in the early part of 1911, passing the Aero Club of America tests a few months later and receiving pilot's certificate No. 129. He made some early experiments with wireless telegraphy on aeroplanes, and during 1911-1912 instructed and flew exhibitions for Eaton Bros., Hyde Park, Cal. One of his students was Tom Gunn, the first Chinaman in the world to become a licensed flier, and who is now head of the Chinese flying service. Mr. De Hart later entered the automobile business at San Jose, Cal., and did little flying for three years. When the country took part in the war he went to San Diego, Cal., and became a civilian flying instructor for the army, being advanced from a junior to a senior instructor. On August 19, 1918, he was employed by the Aerial Mail Division, and has been a consistent, all-weather pilot, never failing to attempt a flight, no matter how serious the elements. He is also in charge of compass work on the Washington-New York route.

Seaplane in Flight for Victory Loan

In the interest of the Victory Loan, a hydroplane carrying three passengers flew from Albany to Keyport, N. J., making the 180 miles in two hours and fifteen minutes flying time. Incidentally, the trip provided data to be used in opening the proposed Hudson River air line.

The 'plane, a product of the Aero-marine Plane and Motor Company, left the water in front of the Albany Yacht Club. The first stop was made at Poughkeepsie, which was reached fifty minutes after the start. At Keyport the three passengers, Pilot C. J. Zimmerman, Mechanic Richard Greisinger and M. Mack Nomburg, were taken ashore at the Aeromarine factory.

Japanese Air Student Flies in Mail Plane

Ukitern Ozaki, son of the former Japanese Minister of Justice, made a flight from Washington to Belmont Park, completing the trip in two hours and twenty minutes. He was piloted by L. D. Smith, air mail pilot, who brought the mail from Washington. The young Japanese, who is here to study air navigation, enjoyed the journey from the capital, and said it taught him much.

THE SIDDELEY-DEASY "PUMA" AERO ENGINE

THE design of the Puma engine was started in January, 1917, and the first experimental model was completed in the following March. By the end of the autumn the engine was being produced on a quantity basis, and by the signing of the Armistice more than 625 engines had been delivered, in addition to a vast number of spare parts.

This engine, designed and manufactured by the Siddeley-Deasy Motor-Car Company, Limited, of Coventry, is of six cylinders, whose bore and stroke are respectively 145 m.m. and 190 m.m., giving a total cylinder capacity of 18.8 litres. The two outstanding features of this engine are the construction of the cylinders and the arrangement of the mechanism actuating the valves; these features not only give this power unit a decidedly distinctive and handsome appearance, but greatly facilitate the dismantling and erection of the engine for any such repairs as are likely to become necessary, and render the successful maintenance of the engine a comparatively simple matter even by mechanics possessing no very great skill or experience.

The cylinders consist of a thin steel liner, forming the working barrel, which is mounted in an aluminium casting forming the cylinder heads, water jackets, valve passages, and inlet manifold; these aluminium jackets are cast in two separate units, each of which contains three cylinders. Near the level of the combustion chamber these jackets are divided, in a horizontal plane, into two portions, the joint being made by a number of bolts; leakage of water at the base of the aluminium jacket is entirely prevented by a rubber ring which is pressed against a shoulder on the steel liner by the castellated ring-nut screwing into the jacket; the general arrangement of these cylinders is shown in Fig. 1.

The cooling water is introduced at the top of the rearmost cylinder-jacket, and is uniformly distributed over the several cylinder heads and valve passages by an aluminium pipe running through the whole of the blocks of the cylinders; the water ultimately makes its escape near the top of the foremost cylinder jacket. The cooling of the lower portions of the cylinder barrels is effected by convection, and by turbulence arising from the rapid motion of the water through the top of the jacket.

The valve seatings are not cut directly upon the aluminium heads of the cylinders, but upon bronze rings which are expanded into the aluminium.

The heads of the cylinders are flat, and each carries one large inlet valve and two smaller exhaust valves. The exhaust valves are of tungsten steel, and each is held against its seating by a single volute spring; the inlet valves are of nickel steel, and each is provided with two telescopic helical springs. Adjustment of the valve clearance may be rapidly effected by means of a large diameter cap which screws on to the stem of each valve. The operating mechanism of the valves is unusual;

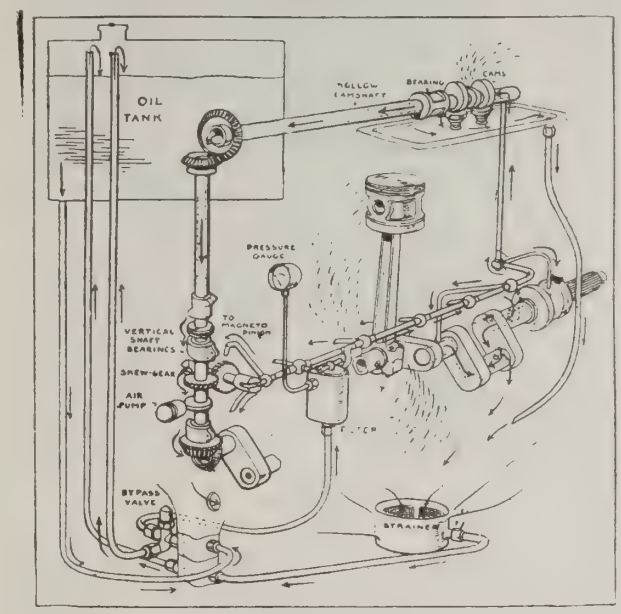

Fig. 2—Showing oil circulation of Siddeley-Deasy "Puma"

the camshaft is carried immediately above the exhaust valves, nothing beyond the aforementioned adjustable cap being interposed between these valves and their respective cams; the inlet valves are each operated through the agency of a small rocking lever, whose fulcrum is supported from the top of the camshaft housing.

The camshaft is carried in four large bearings carried in the camshaft housing; this housing is cast in aluminium, and is well provided with inspection doors, two of which are arranged upon each side of the engine; the whole of the valves and their gear are enclosed and their complete protection from the weather assured.

The pistons are die-cast from an aluminium alloy, and each carries three cast-iron rings near the head and a scraper ring

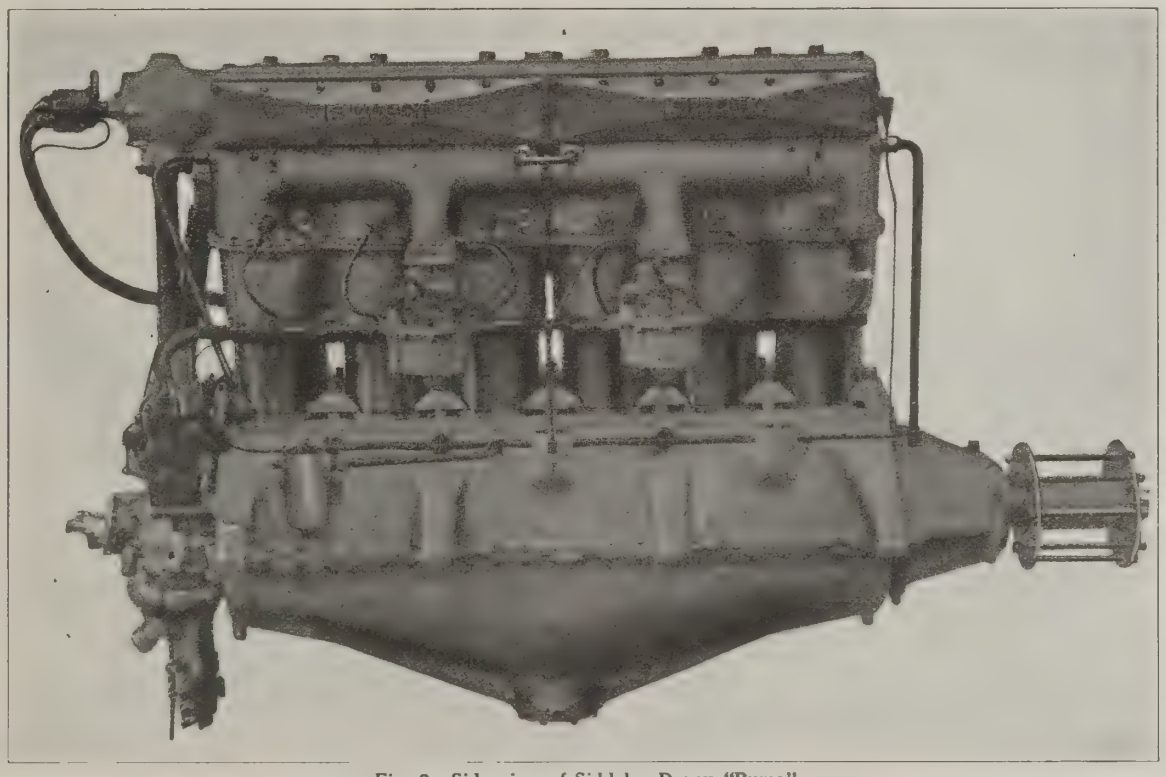

Fig. 3—Side view of Siddeley-Deasy "Puma"

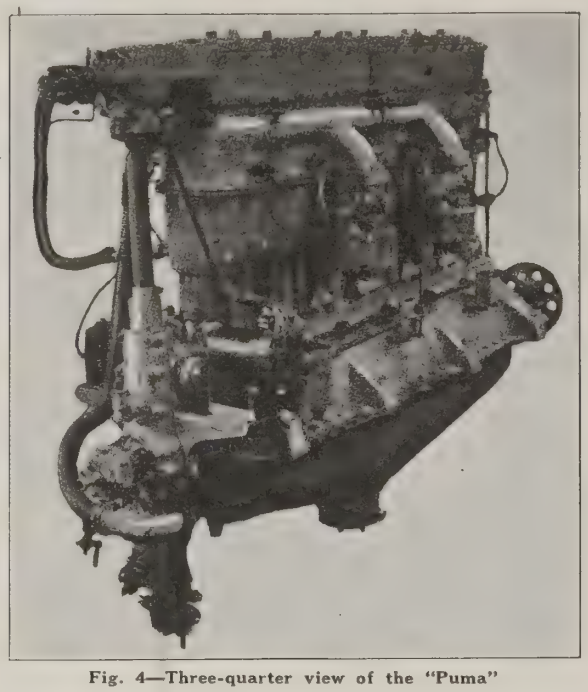

Fig. 4—Three-quarter view of the "Puma"

below the gudgeon-pin; the two grooves, whose sides are chamfered, are provided—one immediately below the lowest gas ring, and the other immediately below the scraper ring—in order to remove any surplus oil from the cylinder wall, this oil escaping into the crankcase through a row of small holes drilled in the bottoms of each of the two grooves. The hollow gudgeon-pin is made a floating fit in the piston bosses, longitudinal movement of the pin being prevented by means of "e"-shaped springs fitting into annular recesses cut in the piston bosses; the gudgeon-pin also floats in the little-end bush, which, in turn, floats in the connecting rod.

The connecting rods are machined all over from high-tensile steel, and are of H section. The big-end bearing cap registers into the rod and is held in position by four bolts; rotation of the white-metal lined bronze bush is prevented by a dowel pin.

The crankshaft is of the conventional six cylinder seven bearing type with the cranks spaced 120 degrees apart; both the crankpins and the journals are hollow, and in order to permit of internal circulation of oil the ends of both journals and pins are closed by two dished steel caps drawn together by a central bolt. The thrust bearing is situated some considerable distance from the foremost journal bearing, and for this reason a roller bearing is provided at the extreme forward end of the crankcase as an additional support for the shaft; beyond this roller bearing the shaft is serrated in order to receive the airscrew coupling. Screwed on to the rear end of the crankshaft is a single bevel pinion through which the camshaft and the whole of the engine accessories are driven.

The arrangement of the journal bearings is in accordance with the more usual six-cylinder practice. The upper halves of the intermediate bearings are carried in the upper half of the crankcase, the bearing caps being supported by long steel bolts, which also serve to hold the cylinders to the crank chamber. These bearing caps are of aluminium and are stiffened by steel keep-plates of channel section. The lower halves of the two end journal bearings are formed integral with the lower half of the crankcase. The whole of the crankcase is cast in aluminium, the upper half carrying the eight supporting arms of the engine, while the lower half serves merely as an oil sump. In addition to the four long cylinder bolts at the ends, the two halves of the crank chamber are held together by a large number of small bolts. The base of the lower half of the chamber inclines downwards from each end towards the centre and terminates in a small cylindrical well into which is fitted a filter for the oil; this filter is capable of being withdrawn from the outside of the engine.

The lubricating system of the engine is diagrammatically illustrated in Fig. 2. Driven by a vertical shaft, which operates the whole of the accessories, are two oil pumps of the gear type. The upper of these two pumps draws oil from an external tank and forces it through a filter carried on the off side of the engine and into a manifold of steel tube which runs through the whole length of the crankcase. Leading from this manifold are several branch pipes which supply oil to each of the journal bearings, the thrust housing, the bearings of the vertical shaft, the bevel wheels driving this shaft, and to the skew gearing operating the magnetos. The oil fed to the main crankshaft bearings passes into the hollow journals and by way of holes drilled in the crankwebs to the crankpins; oil is flung off the crank pins on to the cylinder walls and the little ends of the connecting-rods. Branching from the front end of the manifold is a pipe of constricted bore, through which oil is fed to the hollow camshaft. Some of this oil is thrown out through radial holes on to the camshaft bearings; after exuding from these bearings, it is flung on to the cams, rocking-levers and valve heads; the oil then collects in the bottom of the camshaft housing and is ultimately conveyed therefrom to the crankcase by way of two pipes. Such oil as is not thrown out continues to travel along through the camshaft, out of whose rear end it falls on to the upper pair of bevel wheels, and into the casting enclosing the vertical shaft, and eventually into the strainer in the base of the crank chamber. The oil which collects in the base of the chamber is drawn out by a second pump and forced back to the oil tank, from which it again circulates through the engine. As this second pump is of considerably larger capacity than the first, it follows that the sump is always free of liquid oil and excessive lubrication of the cylinders, due to oil splashed by the big-ends, is entirely prevented.

Two independent sparking plugs are fitted in each cylinder. Ignition may be carried out by two high-tension magnetos mounted upon platforms at the rear end of the engine and upon opposite sides of the vertical shaft from which they are driven by skew gearing. Usually one magneto is fitted, the second set of plugs being served by a small six-volt battery, through a Remy combined contact-breaker and distributor mounted at the rear end of the camshaft housing, and a coil carried on the other magneto platform.

The general layout of the engine is very well shown in the accompanying illustrations (Figs. 3 and 4). It will be

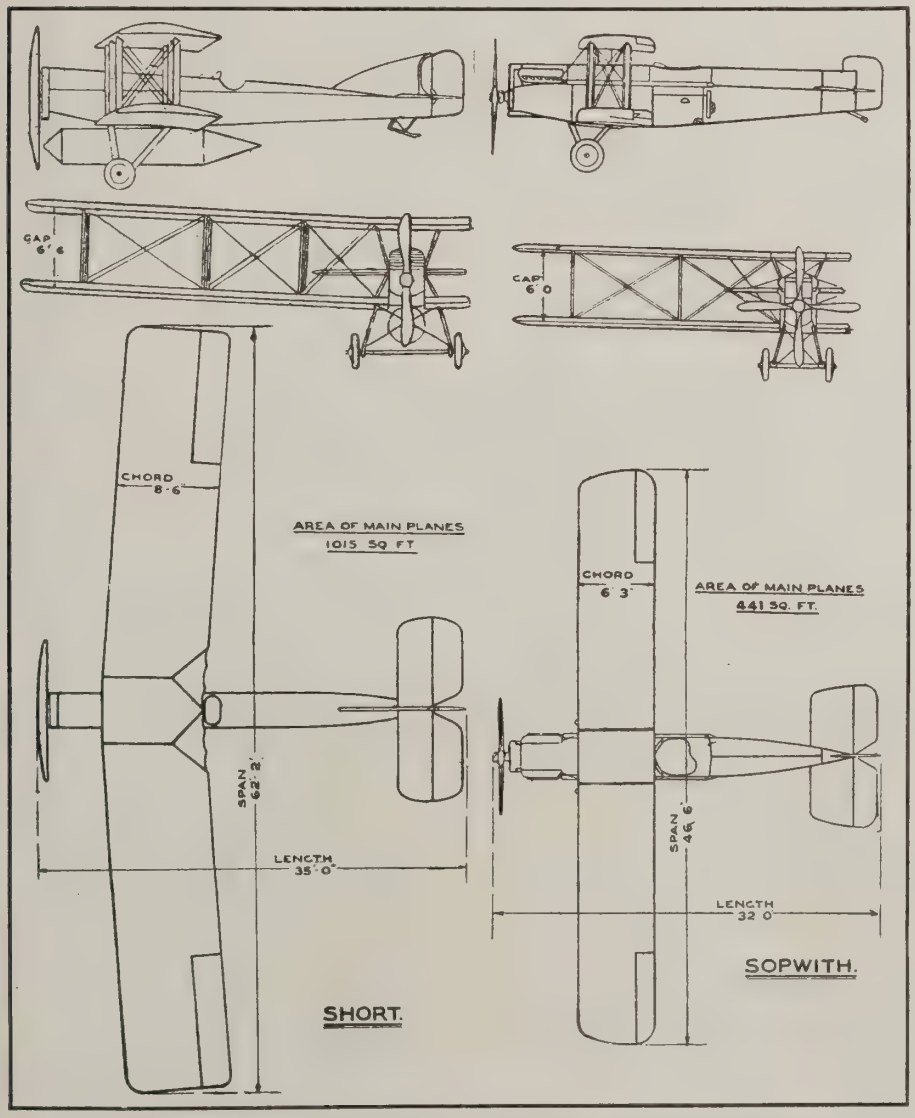
THE BRITISH ENTRIES IN THE TRANS-ATLANTIC RACE



AS interest centres more and more in this race, a few words dealing with the British machines entered will, we feel sure, be welcomed by our readers. From "Flight" we are able to give details of the machines entered to date.

Machines	H.P.	Speed	Pilot
Martinsyde ..	285	100	Mr. F. Raynham
Fairey	375	120	Mr. S. Pickles
Short	350	95	Maj. J. C. P. Wood
Sopwith	350	100	Mr. H. G. Hawker
Whitehead ..	1600	115	Capt. A. Payzo
Seaplane	440	—	Capt. H. Sundstedt

The Sopwith Machine

The Rolls-Royce engined Sopwith transport type specially designed for an attempt to win the Daily Mail Prize for crossing the Atlantic, is of the vertical biplane type, the wings having no stagger. Pilot and navigator are seated well aft, so as to give a large space in the fuselage between them and the engine, in which to fit the large petrol tank required for the great amount of fuel that has to be carried for a flight of this duration. This tank has a capacity of 330 gallons, while the oil tank contains 24 gallons, and the water reservoir 17 gallons. The weight of the machine empty is 3,000 lbs., and fully loaded she weighs 6,150 lbs. The accompanying general arrangement drawings will give a good idea of the dimensions of the machine. The engine fitted is a Rolls-Royce "Eagle" of 375 h.p., which will give the machine a maximum speed of 118 m.p.h. This speed will not, of course, be maintained all the way, the most economical speed from the point of fuel consumption lying somewhere between the maximum and the minimum speed, and varying with the lightning in load as the fuel is consumed.

The cockpit of the occupants is arranged in a somewhat unusual way, the two seats being side by side, but somewhat staggered in relation to one another. The object of this seating arrangement is to enable them to communicate with one another more readily and to facilitate "changing watches" during the long journey. The very deep turtle back of the fuselage is made in part detachable, the portion which is strapped on being built so as to form a small lifeboat in case of a forced descent on the sea. In this manner it is hoped to provide sufficient flotation for the occupants to remain afloat until a passing vessel may pick them up, should a descent be necessary. As the machine is not fitted with floats, it would, of course, be out of the question to get her off again once she was in the water. In other respects the machine does not differ greatly from standard Sopwith practice.

Scale planes of the Short and Sopwith Trans-Atlantic Aeroplanes

The Short Machine

Fundamentally the Short machine entered for the race does not differ greatly from their standard torpedo carrier known as the "Shirl." It is, as will be seen from the general arrangement drawings, a land machine fitted with wheels. In the place between the chassis struts usually occupied by the torpedo in the standard "Shirl" is slung a large cylindrical fuel tank which, should the necessity arise, can be quickly emptied so as to form a float of sufficient buoyancy to keep the machine afloat for a considerable period. In order to be able to carry the extra weight of fuel necessary for the long journey larger wings have been fitted, having three pairs of struts on each side instead of the two pairs fitted on the standard machine. A feature which is unique for this machine is the sweepback of the planes, which is very pronounced. This should form a very good feature by which to identify the Short machine, although from the fact that up to the present she is the only machine entered on which the westward flight will be attempted, she can scarcely be confused with any of the other entrants.

As in the case of the Sopwith machine, the Short is fitted with a Rolls-Royce "Eagle," and the fuel capacity is sufficient for a flight of 3,200 miles; in still air, of course. As the distance across is a little under 2,000 miles, this leaves a fair margin for adverse weather conditions, the prevailing winds in this part of the Atlantic being westerly at this time of the year. It will, therefore, be seen that the decision to make the westward flight may not be so dangerous as many are apt to imagine, and certainly considerable time will be saved by avoiding the delay of shipping the machine across before a start can be made.

The cockpits are arranged in the usual fashion in this machine, i. e., in tandem. A directional wireless set will be fitted as well as all the navigation instruments of the usual type. The maximum speed is expected to be about 95 m.p.h., but flying at cruising speed, and allowing for head winds, the actual speed may be expected to be considerably lower.

The Martinsyde Machine

The machine entered by Messrs. Martinsyde, Ltd., is more or less of standard Martinsyde type, with the occupants placed very far aft to allow of mounting a large petrol tank in the middle of the fuselage, in the neighborhood of the centre of lift where the decrease in fuel weight as the fuel is used up will not alter the trim of the machine. Unfortunately we have not been able to obtain any illustrations of the Martinsyde machine, but in outward appearance it does not present any radical departures from the standard. It has the distinction of being the lowest powered machine in the race, the engine being a Rolls-Royce "Falcon" of 285 h.p. As the Martinsyde machines have always been known for their great efficiency, this is an advantage inasmuch as less fuel will

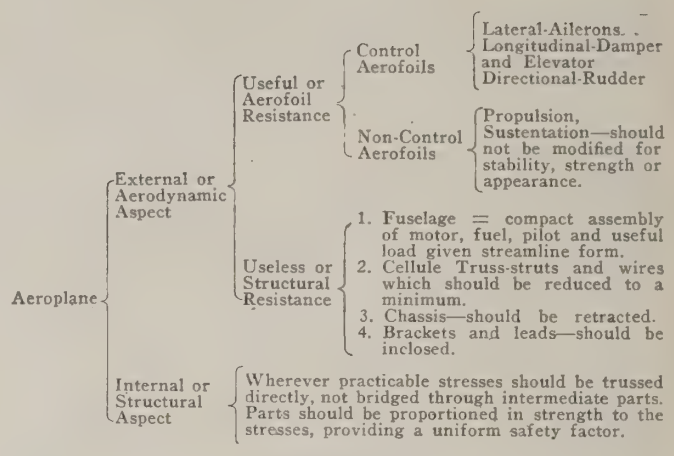
THE PRINCIPLES OF AEROPLANE DESIGN

By CAPTAIN JAMES VERNON MARTIN

INTRODUCTION



Primary Divisions

THE guiding principles of aeroplane design are neither numerous nor difficult of comprehension, but their thorough-going application involves the most painstaking laboratorial and flight tests and the replete use of higher mathematics.

Primarily the problem of the aeroplane is one of wind resistance, and secondarily of internal structure. This gives rise to the first division:—the external or aerodynamic, and the internal or structural aspect of the aeroplane.

It will be noted that the members of this division are relatively independent of each other; this means they form the basis for the study of special problems unconditioned by problems in the opposite division; for instance, the aerodynamic aspect deals with only the form and area of the parts of an aeroplane exposed to the air, while the structural problems, limited to the dimensions and stresses aerodynamically determined, may be pursued without further reference to air resistances. In other words, it is a matter of indifference aerodynamically what structure or safety factors are employed within the external skin for an aeroplane, and of equal indifference structurally what aerodynamic characteristics the aeroplane may have. As a consequence we find planes in which the structural engineer has trussed his stresses so ingeniously that a large percentage of the total weight is represented by useful load, but the total load carried will vary directly with the aerodynamic properties of the plane or, more specifically, with the lift/drift ratio and the horsepower employed; thus the plane may be very good structurally and poor aerodynamically, or vice versa.

I do not hesitate to emphasize the importance of rendering these primary divisions clear and distinct in order to avoid serious confusion, and in order to assist the student of aviation in electing to which sub-division he should devote his energies.

External Aspect

Of one thing I feel certain, that there will be found no other word so universally applicable to the successful achievements of the aeroplane engineer as the word "compromise," for my own experience teaches that while we have clearly defined ideals, we must always remain at a respectful distance from them because of practical inhibitions.

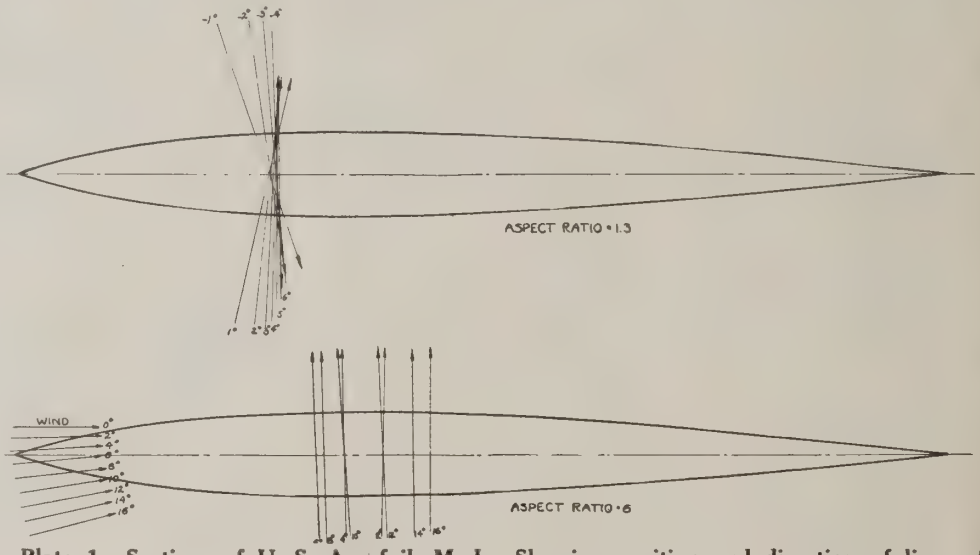


Plate 1—Sections of U. S. Aerofoil, M. I. Showing position and direction of lines of resultant air force

As a working example of this conflict between the aerodynamic ideal and the practically attainable, let us consider the recent attempts to design and build what may be termed the perfect aeroplane, one having only useful or aerofoil resistance. Such an aeroplane is obtained by selecting an aerofoil of comparatively deep cambre and increasing the cord until the resulting wing section is deep enough to completely house motor, man, fuel, chassis and useful load. Thus in the drawing, Plates 1 and 2, we have an aerofoil U. S. M. I. which with a standard aspect ratio compares most favorably in efficiency with other aerofoils, and is of nearly double cambre; it also has a relatively slight center of pressure movement throughout flying angles, and is particularly well adapted for the requirements of this problem in possessing zero lift at zero in-

SECOND PAN-AMERICAN AERONAUTIC CONVENTION AND EXHIBITION

To Be Held Under the Auspices of The Aero Club of America, The Aerial League of America and the Pan-American Aeronautic Federation.

From Thursday, May 1st, 1919,
to
June 1st, inclusive,
at
Atlantic City, N. J.

Intercollegiate Contests Throughout the Summer

CONTESTS TO BE HELD EACH SATURDAY

(1) Seaplane Contests (general),
(2) Curtiss Marine Flying Trophy and Prizes,
(3) Intercollegiate Seaplane Contests,
(4) Land Aeroplane Contests,
(5) Dirigible Contests,
(6) Kite Balloon Speed in Ascending and Descending, and Maneuvering Contests,
(7) Parachute Competition,
(8) Aviette (bicycles and motorcycles with wings) Contests.

EVERY DAY ACTIVITIES

(1) Exhibits of Aeroplanes, Motors and Accessories on the Steel Pier,
(2) Demonstrations and tests of Seaplanes, Land Aeroplanes, Motors, Dirigibles, Kite Balloons, to prospective purchasers and representatives of different governments,
(3) Aerial Passenger Carrying by seaplanes and dirigibles, and kite balloon ascensions,
(4) Moving pictures and Addresses by leading authorities on most important phases of aeronautics.
(5) Competition for the Pulitzer Trophy.
(6) Competition for the Atlanta Journal Trophy.
(7) Competition for the Curtiss Marine Flying Trophy.

The Governments and Aeronautic, Sporting, Scientific, Industrial and Civic organizations of the United States and all the countries in the world, excepting Germany and her allies, are invited to send representatives to attend this great aeronautic event. On arrival in the United States these representatives should call at the Headquarters of the Convention Committee at No. 297 Madison Avenue, New York City, to register and receive their official badges and the official program.

In the event that it is more convenient for them to go directly to Atlantic City they will register at the offices of the Convention located at the following Atlantic City hotels: Hotel Traymore, Hotel Chalfonte, The Breakers Hotel, Hotel St. Charles, Hotel Marlborough-Blenheim, Hotel Chelsea, Hotel Alamac, Hotel Dennis and Hotel Haddon Hall.

Representatives of the Convention Committee will be at the Bureaus of the Aeronautic Convention at the above-named hotels and will issue the official badges which admit the bearer to the Aeronautic Hall, as well as the Aero Exhibition on the Steel Pier, the judges' enclosure during contests, and to the Aerodrome and seaplane stations where the aircraft and motors will be demonstrated.

All communications until May 1st should be addressed to Rear Admiral Peary, Chairman, Aeronautic Convention, Aero Club of America, 297 Madison Avenue, New York City.

Entries for the contests should be addressed to the Contest Committee, Hotel Chalfonte, Atlantic City, N. J.

From New York to Atlant

cidence which avoids longitudinal stability problems due to enormous speed.

But having overcome all the special problems involved, and after having evolved an internally trussed wing of great strength, is the job when complete as efficient aerodynamically as the best job of the imperfect type? I answer, No, not at least up to the present writing, for the acid test of a final job, its total lift/drift ratio shows less value than certain standard tractor biplane types. The race for efficiency is very close and while the best conventional type has many practical advantages over the perfect or wing type, I shall certainly not be so dogmatic as to deny the future possibility of adapting the wing type successfully in these respects. It is a more fundamental compromise which leads me to hope for the continued supremacy of the tractor biplane, namely, the effect of aspect ratio and the plan form of an aerofoil upon the lift/drift ratio.

Our wind tunnel experiments show that a reduction in aspect ratio (that is, a reduction in the span of the wing relative to its cord) results in a decided loss in efficiency; for instance, tests made with the M. I. section having an aspect ratio of six shows lift/drift curves, (a) Plate 6, while the same section reduced in aspect ratio to 1.3 shows lift/drift, (b).

Referring to Plate 3, the drift (R) of an aeroplane represents the air resistance which must be overcome by horsepower expended in the thrust in order to develop the lift (L) which represents the total load which can be sustained at a given speed. Thus it will be observed how direct an index to an aeroplane's aerodynamic efficiency we have in the total lift/drift ratio, and it follows that of two aeroplanes having equal safety factors and proportion of useful to total load that one having the greater lift/drift, ratio will be the more efficient and practically useful.

One example of the effect of a difference in lift/drift ratio in aeroplanes otherwise similar will be found by comparing a tractor biplane having a lift/drift of eight with one of ten on a flight of 400 miles. Supposing the machine with lift/drift 8 has a total load capacity of 5,000 pounds for a given horsepower expenditure, and that this is divided into weight of aeroplane 2,000 pounds, fuel—2,000 pounds, and useful load—1,000 pounds, then the aeroplane having a lift/drift of 10 and the same horsepower and structural weight will have a total load of roughly 6,000 pounds, divided into weight of aeroplane 2,000 pounds, fuel 2,000 pounds and useful load 2,000 pounds. It will be evident that we do not fly the 400 miles in order to carry the aeroplane weight or the fuel consumed en route, hence, since the difference between the respective lift/drift ratios doubles the useful load, it will be observed that in this instance an increase of 20 per cent. in the lift/drift ratio has doubled the practical utility of the aeroplane. When considerations such as these are realized, it will not be long ere the commercial and military demands of an aeroplane will resolve themselves into two prime factors, one concerning the total lift/drift and the other the ratio of useful to total load.

Having digressed slightly to emphasize the value of the highest possible lift/drift ratio, let us return to the problem as to which type of aeroplane promises the highest ratio. The highest ratio obtainable, judging from data so far available, is from an aerofoil having an aspect ratio of ten and a form of wing end similar to that shown in Plate 4, and our problem is, what departures from this ideal will involve the least lift/drift reduction?

Suppose we attempt to obtain a good aspect ratio, say 6 (See Plate 4), then if we are to avoid external trussing, as by supposition of the perfect aeroplane we must, we will find the distribution of our loads necessary. This could be attained by disposing our motors chassis and man, as represented in the sketch. The dimensions of this craft would be at least 40 feet in cord and 240 feet in span in order to afford a vertical dimension of 4 feet within the aerofoil skin at the greatest cambre. The many practical difficulties of this design will be readily apparent, but we shall dwell only with those essential modifications which make manoeuvrable flight possible, i. e., the improvisions to create adequate directional and longitudinal moments. The lateral movements can easily be secured by wing and ailerons, and through a regulation of their differential in respect to variation in the head resistance these ailerons could be used to create the necessary directional moments, but there still remains the very necessary leverage about the transverse axis in order to create an adequate longitudinal moment. If this could be secured by a flexing of the rear portion, we should indeed have the perfect aeroplane, and a study of Plate 5, Figures 1, 2 and 3, showing the displacement of the force vectors on R.A.F. 6 will indicate such a possibility. However, nothing short of an actual test of this type will answer the question of practicability.

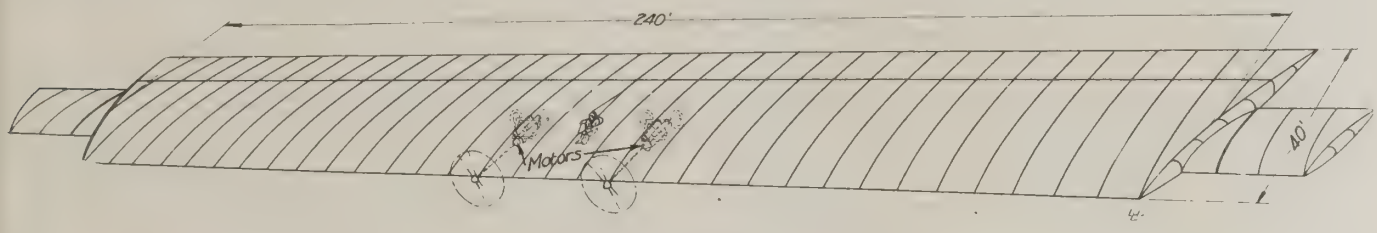

Plate 4—The perfect aeroplane

This study of the perfect type aeroplane leads us to compare the relative merits of the modified wing type Plate 2, having a low aspect ratio and the conventional tractor biplane. The issue is, whether the loss in lift/drift ratio, due to diminished aspect ratio, is greater than the loss due to the structural resistance of the tractor biplane as combined with an advantageous aspect ratio. There is an additional loss which seems necessary in the modified wing type aeroplane of low aspect ratio, namely, that requirement (Compare Plate 2 and Plate 4) which calls for the opposite form of wing end to that which has been found most efficient. When every care has been exercised to obtain the best ordinates for a deep cambre wing (here also there is a loss, probably 10 per cent. over less cambred section), we find both by calculation and by wind tunnel test that it is difficult to secure a lift/drift greater than 10 with an aspect ratio of 1.3. (See Plate 6).

The next consideration is: to what minimum can structural resistance in the conventional type be reduced in order to compete with the above figure. It may be interesting to note that the lift/drift ratio on the average Naval and Military plane, as at present constructed, varies from a low mark

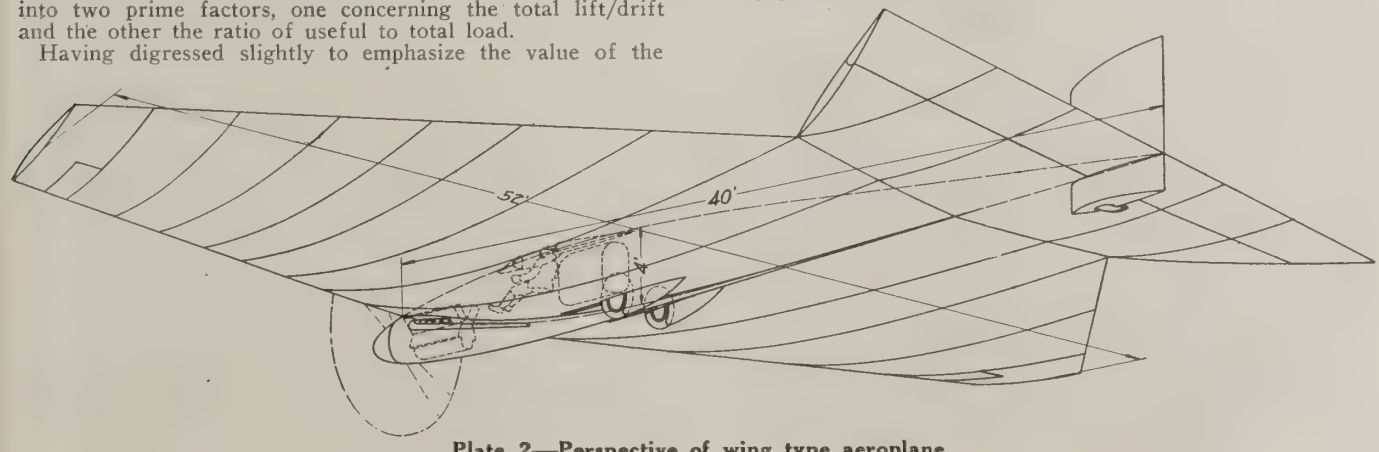

Plate 2—Perspective of wing type aeroplane

below 6 and seldom reaches more than 8, but this is due partly to a lack of appreciation of lift/drift ratio by Government Officials and partly to the influence of the war tending to retain for rapid production types truly antiquated in design. However, this may be, our study must be with the possible minimum to which the useless or structural branch of the aerodynamic aspect may be reduced. Reference to the divisional tree will show that this resistance may be grouped under four heads. Since by supposition we have no room within the wing for motor, pilot, useful load, etc., these should be grouped within the smallest space possible, disposed in a longitudinal relation to each other, and then surrounded by a streamline body. This represents the fuselage or body resistance, and cannot be further reduced as an element; in fact, double use is made of this body in utilizing it not only as the housing referred to, but as the lever arm for the empennage moments (Directional and Longitudinal).

We next meet the problem of providing a truss for the wings which will distribute the weight of the fuselage, centrally located, to the wings with a uniform safety factor; but we find the ratio of wing span to wing cambre so disproportionate that a wholly enclosed cantelever truss becomes impractical (I do not say impossible, for at great sacrifice of the useful load, and using a very thick wing, this could be done) and it remains to select the simplest form of external truss, i.e., one having the least projected area and trussing the stresses at natural concentrated points of advantage. Here again we meet the forks in the road, and must choose between the monoplane and aeroplane of superposed aerofoils. During the period from 1910 to 1913 it was the consensus of opinion among aeroplane constructors that the cellule truss, with its interference, must always remain at a disadvantage to the monoplane, but the advent of the early Bristol scouts showed that the tractor biplane could attain more speed than the simplest trussed monoplane of the same horse power and that at speeds of 100 m.p.h. and over, the comparative simplicity of the biplane trussing was more than enough to offset the losses due to plane interference. The reason for this will be more readily comprehended when we understand that a portion of the interference in the conventional double strut biplane is due not to affect of plane upon plane, but to affect of wires and struts upon both upper and lower plane and that the interference on the upper surface of a wing is roughly three times as detrimental as a proportionate disturbance on the lower surface. We find the monoplane has more projected area in a truss of comparative strength to the single lift truss biplane cellule and also has some interference.

Now, to what extent may the projected area and interference of the biplane cellule be reduced? A very simple computation will show that the conventional one-to-one gap-to-cord ratio is about the best obtainable with the double truss cellule commonly in use, the reason for this being that the increase of structural resistance and weight in struts and wires due to using greater gap than cord more than offsets the slight reduction of the interference due to separating the superposed wings; neither is there any total advantage in staggering the planes relative to each other.

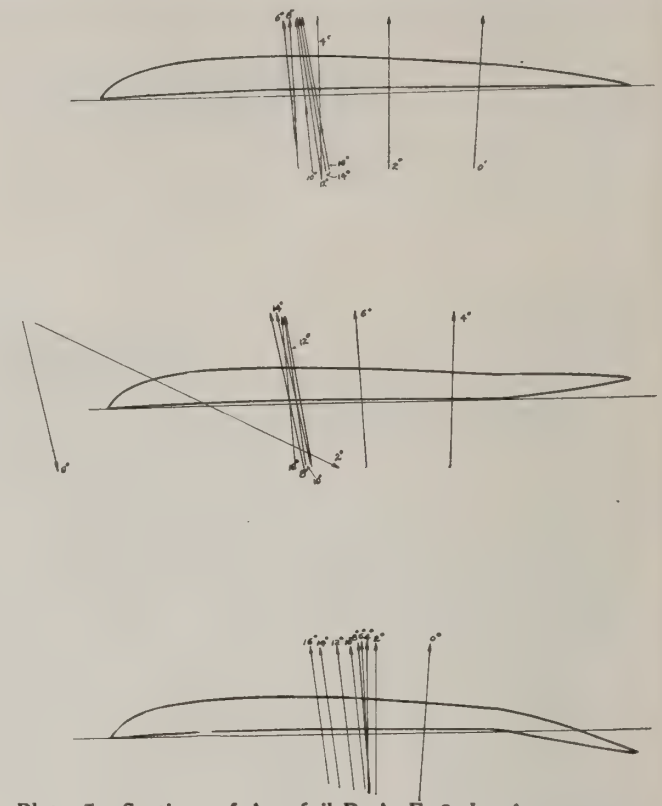

Plate 5—Sections of Aerofoil R. A. F. 6 showing movement of centre of pressure caused by flexing the trailing edge

Since the intercellule struts and wires constitute the undesirable structural resistance and also cause a considerable percentage of the interference, it follows that the most direct remedy will be to reduce these members in number, size and wind resistance. The last mentioned was the first means to be employed, namely, forming struts and wires so as to give them streamline form. The size of the members is more or less definitely determined by the stresses applied so that a reduction in the number of members seems the most hopeful means of securing the advantage we seek. This is accomplished by using a single instead of a double cellule truss.

An inspection of Plate 5, Fig. 1 will show the position of the center of pressure or life on a standard aerofoil for normal flying angles. Our problem is to truss this force directly and simply throughout its normal movement and to care for the displacements due to abnormal movements. It should be noted that if we can meet the above requirements we gain in four distinct ways:

1. A direct reduction of structural resistance due to elimination of parts.

2. A reduction in weight due to the concentration of stress in one rather than in several members,

3. A reduction of the interference due to partial elimination of struts and wires.

4. A reduction of interference due to increased gap/chord ratio which the single truss permits.

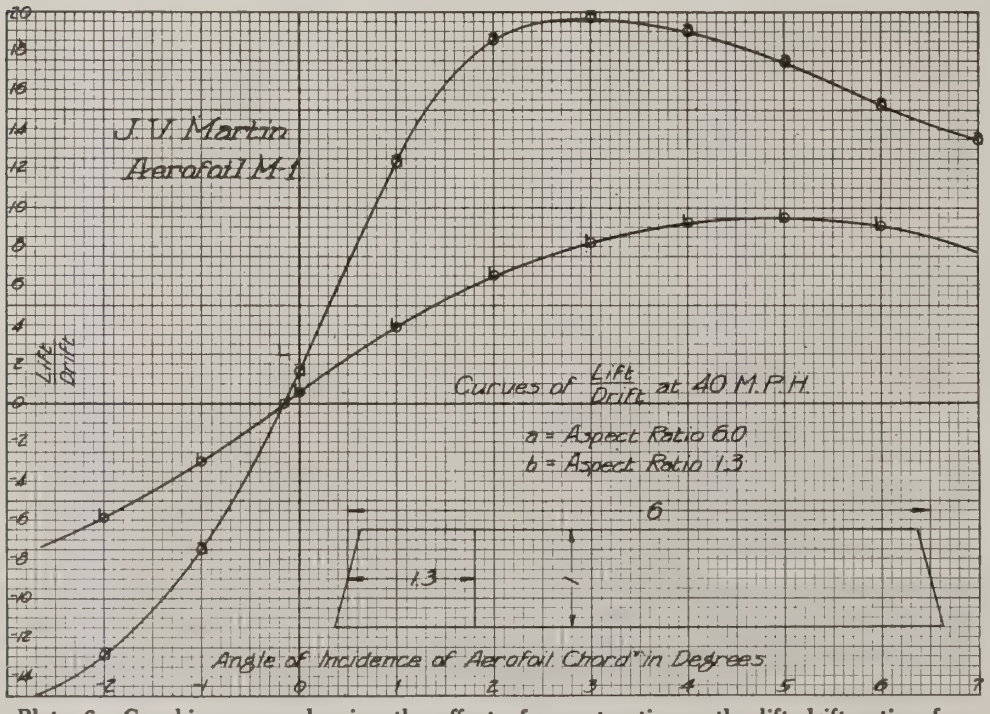

Plate 6—Graphic curves showing the effect of aspect ratio on the lift drift ratio of an aerofoil

(To be Concluded)

THE MANUFACTURE AND USE OF GLUES IN AEROPLANE CONSTRUCTION

By B. C. BOULTON, B. S., A. E.

PART II.

(*Continued from page* 396)

Mixing of Casein Glue: To obtain satisfactory results with casein glue it is of extreme importance that the glue be properly mixed and applied. The directions issued by the best manufacturers with each brand of glue can be relied upon, and should be carefully followed.

Thorough mixing before use of the contents of a freshly opened barrel of prepared glue is advisable in all cases, because in shipment the heavier ingredients of the glue tend to separate out. The contents of the barrel, or barrels, are emptied into a box of suitable size and turned over with a clean shovel until the mass is uniform throughout.

Rapid stirring during the first few minutes of mixing is necessary with casein glues to prevent the formation of lumps. For this reason the slow machines used for mixing animal glues are unsatisfactory. The best type is a vertical, compound movement power mixer of variable speed, similar to the cake mixers used by bakers. In such a machine the glue is mixed in a relatively small, detachable kettle that is easily removed and cleaned. The small size of the kettle makes it possible to mix up no more than will be used before the glue hardens so that it cannot be spread. Except for larger work, the glue should be furnished the men in one-pint, enameled iron cups. Copper, brass, or aluminum vessels should not be used for mixing casein glues, as the alkali in the glues attacks these metals. To prevent spattering of the glue outside the mixing kettle a metal hood, fitted with a feed hopper, will be found effective.

Since, with very slight modifications, the procedure used in mixing Certus glue can be adapted to other casein glues it will be given here. The requisite amounts of water and glue, which are in the proportion of 18 parts by weight of water to 10 parts of glue, are carefully weighed out in separate containers. Owing to slight variations in the dry glue, this proportion may have to be altered slightly to give a glue of uniform consistency. The water is poured in the mixing kettle; the machine speeded up to about 350-450 r.p.m. of the blade, which for most mixers corresponds to about 140 r.p.m. of the vertical shaft; and the glue gradually introduced through the hopper. It is of great importance to avoid the formation of lumps. The rapid stirring is contained 3-5 minutes after the last of the glue has been added. The mixer is then stopped to permit the scraping down of any glue that may have spattered on the sides of the kettle. When this has been done the machine is again set in motion, but at a slower speed (60-90 r.p.m. of the shaft) and the mixing kept up for at least ten minutes, or until all the fine particles of casein are dissolved. The purpose of the reduction in speed during this second mixing is to allow the escape of air bubbles that may have been whipped into the glue. Should there still be an appreciable amount of air in the glue it is advisable to permit the mixture to stand a short time before using, so that the air can separate. Some casein glues require the addition of various ingredients singly, and it is necessary to change the above practice to conform to the manufacturer's directions.

On important work it is best not to make any changes in the consistency of the glue. But if the mixer is familiar with the nature of the glue being used, it is permissible to alter its consistency before the glue has been removed from the mixing kettle. In case the glue is too thick, an extra part or two of water may be added, or if it is too thin a small amount of dry glue may be put in. Stirring at a slow speed should be kept up a few minutes until the water is thoroughly incorporated in the mixture, or the glue completely dissolved. With a glue in which the different constituents are added separately this method cannot be followed. It is possible, however, to mix up a thick glue and add this to the thin glue, but the practice is not good.

Application of Casein Glue: The results of tests show that, at any time during its working life, good results may be obtained from normal glue. In fact, the strength of the glue increases with its viscosity. But once it has become too thick to spread properly the remaining glue must be rejected. The working life of casein glue varies with different brands; Certus is one of the more satisfactory in this respect, as usually it is workable for 4-5 hours after mixing. Liberal application of the glue to all the surface of both faces of the joint gives the best results. Some glue should squeeze out of the joint when pressure is applied. The clamps should be put on as soon as possible, not more than 10 minutes after the spreading is begun, depending on the kind of wood, the amount of glue used, the temperature, and the glue consistency. About 150 lbs. per sq. in. is a suitable pressure; more than this tends to squeeze the joint dry of glue.

The minimum time the joints should be kept under pressure is about 3-5 hours, varying with the size of the glued surface. Upon removal from the clamps the wood should be dried to remove the moisture added by the glue, particularly if varnish is to be applied. Full strength and water-proofness are not attained until about two weeks after the gluing.

The most essential precautions may be briefly summarized: 1. Mix thoroughly each barrel of glue before using. 2. Weigh the glue and water; do not measure them. 3. Avoid lumpy mixtures. 4. Avoid mixtures which are too thick or too thin. 5. Mix until all the fine particles dissolve and a smooth mixture is obtained. 6. Do not attempt to use glue after it has become too thick to spread properly. 7. Never thin or thicken glue once it has left the mixer. 8. Keep all brushes, kettles, and pots sanitary to prevent bacterial infection of the glue.

Factors Affecting the Quality of Casein

The variation in caseins from different sources, or even in successive shipments from the same manufacturer, are often so great as to make necessary changes in standard glue formulae if satisafctory results are to be obtained. Regulation and standardization of the processes used in the production are essential if casein glue is to be made reliable in strength and water-proofing qualities.

The Forest Products Laboratory has recently completed extensive experimental work on this subject. It was found that, for the purpose of controlling the quality of the product, the following properties serve as suitable criteria: color, odor, fineness, and moisture, ash, nitrogen and acid content. Their conclusions may be summarized as follows:

1. Lack of uniformity in commercial casein is due, partly to lack of care in skimming the milk, drying the curd, and grinding the casein, but largely it is due to the different methods used in precipitating the curd and to insufficient washing of the curd.

2. The fat content should be as low as possible since, though it does not affect the waterproofness of the glue, it decreases its strength in proportion to the amount of fat present.

3. The acidity should also be kept low because acid affects unfavorably both the strength and waterproofness of a glue, increases the time required to dissolve the glue, and decreases its working life.

4. The fact that ash (mineral salts) is inert matter makes it undesirable.

5. Casein which will not pass a 60-mesh sieve does not dissolve readily, must be allowed to stand considerably longer before using than finer casein, and is not of such high strength.

6. To produce casein of low acidity, low ash and high nitrogen contents the curd must be thoroughly washed; with the natural sour method 3 or 4 washings are enough, with an acid curd cooking is the only safe way.

7. The sole method at present of producing a consistent, low ash content is the so-called ejector process. Further study of acid methods will probably develop means for better removal of the ash.

8. With care in the manufacture, and proper control of the product by chemical analysis, a uniform, commercial casein can be readily produced at the present time that will conform to these specifications:

Color, white; ash content, 2.5 per cent (max.) on a moisture free basis.

Odor, sweet; fat content 1.5 per cent (max.) on a moisture free basis.

Fineness, 60 mesh; nitrogen content, 14.5 per cent. (min.) on a moisture, fat, and ash, free basis.

Moisture, 8 per cent (max); acidity content, 2.5 cc. N/10 alkali per gram (max.) on a moisture free basis.

Testing of Glue

Two general types of tests have been developed, each type designed to serve a different purpose. The first is primarily

for the glue or aeroplane manufacturer who must have simple, inexpensive, and rapid means of checking up, from day to day, the relative quality and uniformity of his product. The second is essentially for a well-equipped, experimental laboratory for the purpose of determining, by more or less elaborate and extended quantitative tests, the suitability of certain glues for specific uses, or of developing and improving new glues. Viscosity, jelly, odor, foam and litmus tests fall under the first head; shear strength and the various deterioration tests come under the second. In doing all testing work it is extremely important that average working conditions be closely followed in the preparation of the test specimens, for otherwise, no indication is obtained as to the actual commercial product. If comparative results are to be obtained it is necessary, in each test, not only to have the strength of the glue solution the same, but also the conditions of temperature and humidity. In the preparation of specimens for shear strength tests care should be taken to use wood of uniform quality, and to have the surfacing of the joint, the spreading of the glue, and the pressure as nearly uniform as possible.

Animal Glues: Since these glues, even when treated with formaldehyde or potassium bichromate to render them insoluble, are only partially water-resistant and therefore must always be protected, severe deterioration tests are seldom made on them. Most of the testing is on those properties which are indexes of the strength, covering power, and keeping qualities of the glue. The determniation of the moisture content is of value in indicating the elasticity of a glue, or its power to stretch slightly without fracture. A dry glue is low in elasticity, and, though it may be very strong under steady stress, it fractures readily upon sudden application of even a small load. The moisture content varies between 5 and 18 per cent, but with a good glue it is not less than 10 per cent. The "water-absorption power" of a glue, or the amount of water a given amount of dry glue will absorb in 24 hours, is to a certain extent a measure of its quality. Generally speaking, the lower the absorption, the better is the glue. Another property that is usually indicative of the character of glue is the viscosity of a solution of specified proportions of water and glue. As a rule, glues of high viscosity are of high quality and strength; hide glue, for example, which is more viscous than bone glue, is superior to it. Another common test used to check up the quality of a glue is the determination of the consistency or strength of a jelly prepared in a specified manner. Strong glues usually have high jelly strength, though this is not invariable. The ease with which a glue may be spread, or its covering power, is another property of much interest. This may be estimated from the water-absorption, viscosity, and jelly strength. The covering power is high when the water-absorption is low, and the viscosity and jelly strength high. The keeping quality of a glue is one more important characteristic. Decomposition is due to bacterial action, and a slight acidity of the glue, which is unfavorable to the growth of bacteria, is desirable. Whether a glue is acid or alkaline, is determined by testing a solution with litmus paper.

The tests mentioned above are of a qualitative nature, and serve only as general guides. Below are given briefly the methods used in making the tests required by specifications for glue used on government work.

Tests for Hide Glue:

1. The viscosity is determined by allowing 200 cc. of glue at a temperature of 140° F. to flow through an orifice. The time required for water to flow through is taken as the standard. The approved instrument for this test is the Engler viscosimeter.

2. The jelly strength is determined upon a mixture of 12 parts water to 1 part glue. The glue is soaked, melted, and poured at once into a vessel of standard shape and size. It is then allowed to stand at least 15 hours in a refrigerator at a temperature between 40° and 50° F. The test is made, either by comparing the relative strengths of two or more jellies by pressing the jelly with the fingers, or by causing a small plunger to sink down in the jelly a certain distance, and noting the weight required to do this.

3. The test for grease is made by mixing a dye with a portion of the glue and painting the mixture on a piece of unsized white paper. Should the glue contain no grease the painted streak will have a uniform appearance, otherwise it will appear mottled or spotted. An excessive amount of grease is undesirable because grease has no adhesive qualities, but a small amount helps to prevent foaming, particularly where the glue is to be used in a gluing machine in which it is agitated much more than when applied by hand.

4. The test for foam shall be made on the sample used in the viscosimeter. The sample, after being heated to 140° F. shall be beaten for one minute with a power egg-beater and allowed to stand one minute before the height of the foam is measured. Glue that foams badly is objectionable because air bubbles are liable to get into the joint and reduce the area in which the glue is in contact with both the joint faces.

5. The odor of the glue when in hot solution must be sweet, and remain sweet for 48 hours; that is, free from any suggestion of decomposing animal matter.

6. The adhesiveness of a glue is determined by a shear strength test made according to the following specifications. The specimens used in this test shall be of maple with a shearing strength of at least 2400#/sq. inch, which requires a wood weighing 50 lbs. or more to the cubic foot. The dry glue shall be mixed with that proportion of water which gives the strongest glue, and applied to the wood in a manner in accord with the best practice. The glued blocks shall be put under a pressure of about 150#/sq. in. for 15-20 hours, and when this is removed they shall be allowed to stand for 6 days more before testing. The specimens shall be finished to conform to the dimensions shown in fig. 1. They shall be tested to destruction in a standard testing machine. This specification covers shear tests for animal, albumen, and casein glues.

With the exception of the last, the above tests are not used for waterproof glues.

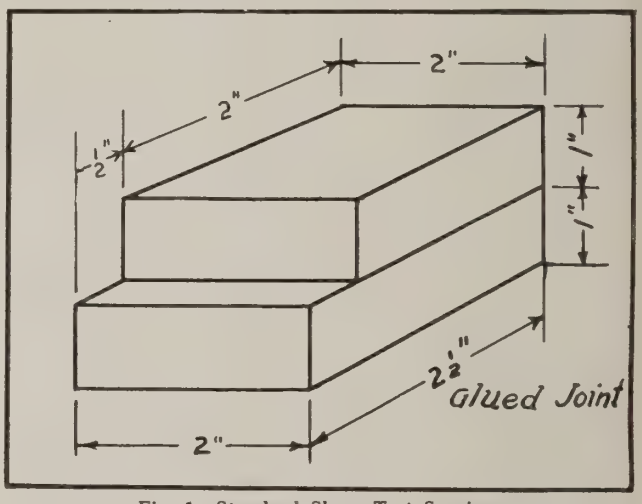

Fig. 1—Standard Shear Test Specimen

Deterioration Tests: Beside the shear test just described, waterproof glues are subjected to the water test. Specimens, prepared exactly as for the dry shear test, and with no protective coating whatever, are soaked for 15 hours in water at 70° F. They are then tested in shear, without any preliminary drying, within thirty minutes after their removal from the water.

For waterproof plywood panels further deterioration tests are required. 1. The boiling test; two specimens are boiled in water for 24 hours. The plies should show no signs of separation at the end of this time. This is an accelerated soaking test and has largely superseded the latter. 2. The baking test: two specimens are baked in an oven at 212° F. for 24 hours. The baking test may be made separately, though it is common practice to subject specimens, first to the boiling test and then to the baking test. No separation of the corners or plies should occur in this test. 3. The soaking test: two specimens are soaked two weeks in cold water and their condition noted from time to time.

It may be said in general that panels made up with animal glues, when unprotected with varnish, will never stand the soaking, boiling, or baking tests without serious injury, and

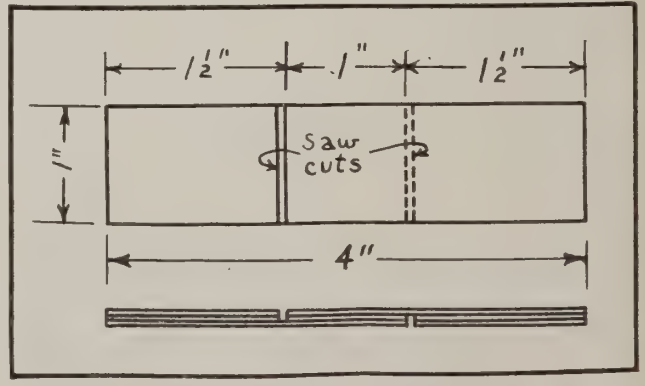

Fig. 2—Standard specimen for Plywood Shear Test

for the most part without complete failure. On the other hand, the best grades of both casein and albumen glues show very little or no deterioration under any of these, or other deterioration tests.

Strength Test Data: In the standard shear test with maple blocks, individual specimens will give maximum glue strengths of 2600-3000#/sq. in., with minimum values of 1800-2200#/sq. in. for hide, casein, and albumen glues.

The strength of glue as determined by shear tests on 3-ply veneer specimens is very low by contrast. It ranges from about 150#/sq. in., to 400#/sq. in. under favorable conditions. Test specimens are made up according to the dimensions shown in Fig. 2. They may be tested in an ordinary, cement briquette testing machine, but special means of gripping the specimen must be provided so that the pull will be kept parallel to the direction of the joint. If this is not done the plywood tends to bend, because of the eccentricity of the loading, until the pulls are in line, and failure occurs from a combination of shear and cleavage. This effect is more pronounced as the thickness of the plies, and hence the eccentricity of the pulls increases.

Bureau of Aircraft Production Specifications for Glues

No attempt will be made to give complete, detailed specifications; only the more important requirements will be mentioned.

Hide Glue Certified for Use in Aeroplane Construction: 1. The glue must be a high-grade glue, sweet and free from any deleterious substances. 2. The glue shall be tested, in accordance with the methods previously outlined, by comparison with a standard sample furnished by the Forest Products Laboratory, for adhesiveness, viscosity, jelly-strength, grease, foam and odor. 3. The glue used in the adhesiveness test should be mixed with water in four proportions, by weight:

Water	2	2¼	2½	2¾
Glue	1	1	1	1

4. That proportion of water which gives the greatest glue strength shall be used. For this best proportion no specimen may fail at a load less than 2200#/sq. in., and the average shearing strength must be 2400#/sq. in.

Handling and Testing of Hide Glue: This specification covers the methods and precautions to be used in the proportioning, soaking, melting and applying of hide glue. These have been given in detail in the section treating of hide glue. A shear-strength test must be made to ascertain the quality of the glue and the character of the work being done. For test specimens, 1-inch boards, of the same class of material as used in the work on hand, shall be glued up under the same average conditions as those under which the regular work is conducted; no special precautions may be taken; these boards shall be clamped and dried, as for the usual shear test. Ten specimens, conforming to Fig. 1, shall then be cut out and tested immediately. In at least eight specimens the strength of the glue shall not be less than that of the wood.

Casein for Casein Aeroplane Glue: 1. The casein shall be made from straight skimmed milk of low fat content and free from starch, dirt and other foreign material of adulterants. 2. The casein shall be precipitated by lactic acid, sulphuric acid, or hydrochloric acid methods. 3. The precipitating temperature should be about 120° F., never more than 130° F. Only sufficient acid to secure a clear separation shall be used. The curd shall be well pressed, and dried without delay to prevent moulding. Casein made from mouldy curd will not be accepted. 4. With the sulphuric acid process of precipitation, the cooked curd method is preferred. The temperature of cooking shall be about 190°-195° F. 5. All vats, cloths, and other apparatus employed in obtaining the curd must be washed each day the equipment is used. 6. The specifications as to the properties of casein and the proportions of some of its constituents follow closely the specifications suggested by the F. P. L. in the section, "Factors Affecting the Quality of Casein," though allowing in some instances slightly more leeway.

Casein Glue for Airplane Construction: 1. The certified glue shall be in the form of a powder not coarser than 50 mesh. 2. It must consist principally of certified casein. 3. The manufacturer shall prepare definite instructions for mixing the glue, and when these have been approved they must be exactly followed. 4. The test for adhesiveness shall be made on four standard shear specimens, prepared and tested in the specified, regular manner. 5. The average shear strength must be 2200#/sq. in. and the minimum in any single case 1800#/sq. in. 6. In a similar manner four more tests specimens shall be made up and subjected to the "water test" previously described. 7. The average shear strength must be 1500#/sq. in., and the minimum 1400#/sq. in. 8. The casein, after certification, must be properly stored in a dry sheltered place, such as is required for the storage of all glue and casein.

Application of Certified Casein Joint Glue: The specifications regarding the mixing and application of this glue and the precautions to be observed, are embodied in the sections describing these processes for casein glue.

Relative Merits of Different Glues

Of the animal glues, only hide glue is suited to aeroplane work. This glue possesses the advantage of being inexpensive, familiar to most work-men, comparatively easy to apply, reliable if careful supervision is exercised, and of high strength. It has the great disadvantage, in many classes of work, of being difficult to protect from moisture, and of being very seriously affected if exposed to moisture. Blood albumen glue is more in the nature of a special glue. Its chief disadvantage is that skilled workmen and elaborate machinery are required in its use. Unless conditions are very nearly right, its strength is apt to be uncertain. This glue shares with hide glue the disadvantages that are associated with hot glues; for the best results, the gluing should be done in an uncomfortably warm room, care must be taken to warm the wood and to prevent sudden chilling of the glue; because of the quick setting qualities of such glues, haste is necessary in spreading the glue and in applying pressure to the joint. On the other hand, blood-albumen glue is strong and very resistant to deteriorating conditions. For certain classes of work, as the manufacture of plywood, it is eminently satisfactory. More important than this glue is casein, because of its strength, reliability with proper care in its mixing and application, waterproofing qualities, ease of manipulation, and general adaptability to all classes of work. Some brands, however, give trouble by too rapid setting, and usually most casein glues must be mixed fresh every three or four hours. The development of this glue has been the most important accomplishment of all the research work on the subject of glues during the past year. Eventually, casein will probably largely replace other glues for general aeroplane construction, and even for propeller work.

(The writer wishes to acknowledge the value, in the preparation of this article, of certain reports issued by the Forest Products Laboratory and used with the permission of the Government.)

(*Continued from page 442*)

noticed that at the rear end is a small air pump, operated by an eccentric on the vertical shaft, for maintaining pressure in the petrol tank in such machines as rely upon air pressure for the service of petrol to the Zenith carburetors. On the same casing, and just below the air pump, is fitted the interrupter gear for a machine-gun. The centrifugal water pump is mounted immediately over the oil pumps and is concentric with reference to the vertical shaft.

Although not a standard fitting, arrangements are provided for fitting a rotary distributor upon the forward end of the camshaft housing, for use with a compressed air starting installation. For the same purpose small non-return valves are fitted in each cylinder, these valves being of the mushroom type and normally held in a closed position by means of light springs.

A few interesting figures concerning the Siddeley Puma engine are as follows:

Output at 1,500 r.p.m.	260 B.H.P
Output at 1,700 r.p.m.	290 B.H.P.
Petrol consumption	0·575 pts. per B.H.P. per hour
Oil consumption	0·040 pts. per B.H.P. per hour
Weight—dry	630 lbs.
Compression ratio	5·4/1.

Officers Rated as Observers

The following-named officers, having completed the required course, are hereby rated as Observers: First Lieuts. Sidney P. Le Boutillier, James P. Carberry; Second Lieuts. Glennen K. Vars, Benedict Fox, Jerry L. Bennett.

Air Service Officers Discharged

Washington, D. C.—The following officers are honorably discharged from the service of the United States: Majors Harold R. Eyrich, Robert Marsh, Jr.; Captains Paul B. King, Edwin J. Fredell, Edwin F. Kingsbury; First Lieuts. Alvin C. Goetz, Charles R. Jacobus; Second Lieuts. Charlie D. Coleman, Thomas J. Naughton, Irwin Wheeler, Wilson S. Zimmerman.

Colonel Woods in Charge of Division of Information

Col. Arthur Woods, formerly Police Commissioner of New York City, has been placed in charge of the Division of Information, a bureau for the sole benefit of those men who have been discharged from the military service and wish to be directed to information concerning their bonuses, War Risk Insurance, civil rights, vocational training, and in general just what the Government is doing to help them re-establish themselves in civil life.

Ruggles Orientation Demonstrated to General Menoher

Washington, D. C.—The operations of the Ruggles Orientator used by the Army Air Service for instructing fliers was demonstrated on April 16th, at the Air Service building. Major-General Charles T. Menoher, Brig.-General Wm. Mitchell, Colonel M. F. Davis, Colonel T. de W. Milling, Colonel George H. Crabtree and other officers of the Air Service were present. The machine was demonstrated by Mr. W. G. Ruggles, the inventor, and Major F. J. Martell, General Mitchell and Col. Davis also had rides.

Personnel Board For Air Service Appointed

Washington, D. C.—A Board of Officers to consist of the following personnel has been appointed to consider such matters affecting the personnel of the Air Service as may be brought before it: Colonel Thomas de W. Milling, Military Aviator, Air Service Aeronautics; Lieutenant-Colonel Rush B. Lincoln, Air Service Aeronautics; Lieutenant-Colonel Daniel M. Cheston, Junior, Air Service Aeronautics; Major Horace M. Hickam, Junior Military Aviator, Air Service Aeronautics; First Lieutenant James A. Healy, Air Service Aeronautics, Recorded.

Army Aviators Pass R. M. A. Test

Washington.—The following-named officers, having completed the required tests are rated as Reserve Military Aviators:

Major Louis B. Knight.

Captains William S. Reyburn, Daniel Buckley, William M. Marrs, Walter R. Lawson, Albert C. Lord, Charles H. Schumacher.

Souther Field Notes

A committee of four prominent Thomasville, Ga., citizens motored to Souther Field recently for the purpose of securing a flight to that town on April 26th. They took back with them Lieutenant John MacRae, through the courtesy of Major Schofield, to advise on the proper selection of a landing field. The visitors were Mr. E. R. Jerger, Editor *Times-Enterprise*, F. B. Harris, R. G. Mays and J. C. Vaughn. Thomasville's enterprise is admirable.

On April 19th, the third Souther Field Victory Loan squadron left for Atlanta

to cooperate with the flying circus there and distribute literature en route. Four Souther Field Victory Loan squadrons left Souther Field this week to cover Georgia and surrounding states.

Airships More Efficient for Patrol Duty Than Aeroplanes in British Anti-Sub Service

Washington, D. C.—The following figures on the British anti-submarine patrol were recently given out by the War Department:

	Airships	Planes	Ratio in Favor of Airships
June-Dec., 1917			
Patrols per craft....	42	18	2-1
Hours flying per craft	228	36	6-1
Miles flying per craft	6452	2201	3-1
Escorts flying per craft	6	1.6	4-1
Jan.-April			
Patrols per craft....	37	17	2-1
Hours flying per craft	241	34	7-1
Miles flying per craft	6316	2081	3-1
Escorts flying.....	9	1.3	7-1
Men per hour flight..	2.3	4.7	2-1
Hours flight per man..	.65	.24	2½-1
Miles per man.....	52	47	—

Surplus Property Board Appointed

A Board of Officers to consist of the following personnel is appointed to determine the amount of surplus property of every kind in the Air Service: Major Harry Graham, J. M. A.; Captain Ralph J. Moore, Captain Louis B. Montfort, Captain Frazer Hale.

Construction and Electrical Engineer A. W. Duff will proceed from Washington, D. C., to Langley Field, Hampton, Va., reporting upon arrival to the Commanding Officer for temporary duty in connection with photography of bomb sights and bomb trajectories.

Second Lieutenant Walter L. Perley, Air Service Production, will proceed from Washington, D. C., to Chicago, Ill., thence to Toledo, Ohio; thence to Swissdale, Pennsylvania; thence to New York City, New York, on temporary duty in connection with the Air Service of the Army, for the purpose of obtaining the history of Lawrence OX-5, Gnome and Le Rhone aviation engines from the manufacturers.

Spherograph to Aid Training

Under direction of Professor Henry Lane Eno, of Princeton College, and Mr. O. V. Fry, of the Psychological Department of Princeton University, has designed and developed a device known as a spherograph in the operation of which on the ground a person experiences all the movements of an aviator in flying. In fact, with his eyes closed it would be impossible to detect whether he was in the air or on the ground. This remarkable device is intended for the training of aviators, with special stress laid on aerial gunnery.

It is so arranged as to develop the actual movements of a plane in the air with the exceptions of the movement of translation. By means of controls, similar to controls of a plane, the prospective combat-flyer aims his gun by moving his entire machine. When a target or objective is presented to him by the man in charge of the test, he pulls his trigger and a recording apparatus records the location of the moving trigger, the way the flyer manipulated his machine and the exact location of his sights at the moment his trigger was pulled. This enables the officer in charge to determine just what defects in marksmanship are shown and just what the flyer will have to do to remedy those defects. Insomuch as it is possible to tell the location of the machine at any given moment, as well as the rate of speed of either of the planes, the apparatus lends itself to very careful tests and the activities that go to make up the mental and physical work of an aviator.

The Long Island Aviation Flying School

Pilot-Instructor Bruce Eytinge, of the Long Island Aviation Company has drawn up an interesting form upon which detailed progress records are kept of his pupils at the Central Flying Field.

The record sheet is provided with space for recording the dates of each step in the instructing beginning with "lesson 1" "ground lecture" to "lesson 19"—"certificate flight," in successive steps as follows: Ground Lecture; First Initiation; Demonstration of Controls; Flying Straight and Level; Proper Climbing Angle; Proper Gliding Angles; Gentle Turns; Misuse of Controls; Gliding Turns; Side Slipping; Approach and "S" turns; Take-off and Landings; Getting out of Difficulties; Cross Country and Forced Landings; Final Landings; First Solo; More Dual if Necessary; Second Solo; Certificate Flight.

In advance instruction, "lessons 20 to 29" following manoeuvres are included: *Advance Instruction;* Forced Landing-Solo; Spinning Nose Dive; Stalling and Tail Slide; Steep Turns and Vertical Banks; Immelman Turns; Looping; Falling Leaf; Half Roll; Roll.

Favorable weather continues to bring out many visitors to the school, where the machines are always in readiness for flight. On Saturday, May 3rd, a short flight was made with Mr. George F. McLaughlin, Technical Editor of AERIAL AGE. By means of the Meissner Intephone system conversation was carried on between Pilot Eytinge and his passenger and intimate demonstration of the facility with which instruction is given the pupils. A continued stiff wind did not in any way prevent the perfect handling of the machine. Mr. Eytinge is especially familiar with the training plane, a Canadian Curtiss, having recently been in the Royal Flying Corps.

Cadets' Pay

Under a recent decision of the Comptroller of the Treasury, the Director of Finance has been authorized to make payment of all arrears in cadets' pay while in training for commission, in accordance with the following:

Cadets in the air service in training for commission should have been paid $100 per month as follows: Those at flying schools from July 13, 1917, to include June 30, 1918; those at ground schools from August 21, 1917, to include June 30, 1918.

After July 1, 1918, their pay was reduced to $33 per month at both flying and ground schools. Cadets serving at flying fields, if placed on flight duty by special orders of the commanding officer of the field at which serving, are entitled to 50 per cent. increase on $33 per month, for the period covered by such orders.

Cadets serving overseas in the American Expeditionary Force who received $100 per month are not entitled to increase for foreign service.

All cadets who have a just claim for arrears in pay while serving as cadet in training for commission will write to the Director of Finance, Discharged Enlisted Men's Pay Branch, Room 3303, Munitions Building, Washington, D. C., requesting that they be furnished with the necessary blank forms to enable them to properly file claim for back pay which is due them.

Dorothy Dalton Flies for Victory Loan

Dorothy Dalton, whose dimples and smile have charmed millions in Thomas H. Ince productions for Paramount pictures, achieved the distinction of being the first lady passenger to travel by hydro-aeroplane from Keyport, N. J., to Albany, N. Y., on April 29. Miss Dalton made the journey to carry a message from Governor Benjamin Strong, of the Federal Reserve Bank, to Governor Smith. It would have been much cheaper to have sent the message by mail, and also quicker, for Miss Dalton and her pilot, C. J. Zimmerman, came near making the world's record for slow flying. This, however, was because whenever Miss Dalton spied anybody down on the ground who looked as if he had the price, she would alight and sell him a Victory Loan bond.

In fact, the whole affair was arranged to boost the Loan. Miss Dalton has been indefatigable in placing bonds where they would do the most good ever since she arrived in New York some days ago. The start was originally scheduled for the Hudson River off the Columbia Yacht club at the foot of Eighty-sixth street. A big crowd had gathered, but before Miss Dalton could make up her mind how much she ought to get out of the bunch, Lieutenant Lloyd Bertrand, who has charge of aeronautics for the Victory Loan Committee, ordered a change to Keyport on account of wind conditions. As it is a good two hours and a half by motor to Keyport, the Eighty-sixth street crowd escaped with its loose change, for the time being, at least.

The start was made from the factory of the Aeromarine Plane & Motor Company at Keyport at 3 p. m. At 8:40 p. m. Miss Dalton handed Governor Smith Governor Strong's message.

After delivering her message Miss Dalton was rushed to various Victory Loan meetings, at each of which she was accorded an enthusiastic reception. At the first meeting she sold $5,000 worth of bonds in three minutes. Other meetings also yielded results so satisfactory that Miss Dalton forgot that she had not had any dinner and that luncheon had inadvertently been overlooked. Next morning she headed a Victory Loan parade in Albany, receiving acclaim which undoubtedly was worth thousands of dollars in bond selling. She returned to New York in the afternoon after the busiest 20 hours in her experience. Now she is an enthusiast on the subject of flying.

FOREIGN NEWS

Peru Establishing Military Aviation School

The Government of Peru is arranging for the establishment of a military aviation school. It is proposed to secure the services of French aviators who have seen service in the war to instruct the Peruvian aviators.

North Sea Service of the Blackburn Aeroplane Company

Directly the bar to civilian flying is removed the North Sea Aerial Navigation Company will begin to operate aircraft between Hull, Esbjerg, and Copenhagen, in Denmark, with three branch services—one north to Gothenburg and Christiania; another north-east and east to Stockholm, Helsingfors, and Petrograd; and the third to Amsterdam and Rotterdam.

Armstrong, Whitworth Co. Made Over 1,000 Aeroplanes

London—The enormous war production of the Armstrong, Whitworth Company is indicated by the following summary of their war production record: 13,000 guns and mountings. (This number, which includes the guns for tanks, represents about one-third of the total national output.) 14,500,000 shells; 18,500,000 fuses; 21,000,000 cartridge cases; 12,500,000 complete rounds of field-gun ammunition; 6,000,000 projectiles, completed and filled; 1,075 aeroplanes; 3 airships; 47 warships; 22 merchant ships; 583 merchant ships, equipped with anti-submarine guns and gear; 100 tanks.

British Entry for French Competition

At least one British entry has been made for the long-distance utility competition which is being organized in France, the British Aerial Transport Co. having entered through M. Pierre Maréchal, one of the B.A.T. commercial machines. It may be recalled that the competition will consist of a flight round France in stages, aggregating 2,500 miles, and the prizes will be awarded according to the showing of the machine under the headings of safety, comfort, lifting power, speed, ratio of weight to speed and cost per ton mile.

Commercial Aviation Attracts Large Capital in India

Plans are going ahead energetically for the establishment of commercial aviation in India, and arrangements are progressing to organize a company with a capital of $15,000,000 to start a number of air routes. The first lines, it is said, will be Calcutta-Delhi-Simla, Calcutta-Bombay, Calcutta-Darjeeling, and Calcutta-Puri. It is expected that the Government will support these enterprises by extending them postal subsidies and helping to provide landing grounds and intermediate stages, of which upward of 200 will be required.

The passenger rate for aeroplane travel is set down tentatively at about 6d. per mile at first, with a probability of a reduction when the organization is working smoothly.

In the Calcutta-Simla route the distance by rail is put at 1,135 miles, occupying forty-two hours, and costing first-class just over £8. By air the distance is 950 miles, the time taken about twelve to fifteen hours, and the fare about £15 17s. The Calcutta-Darjeeling route by rail is 386 miles, occupying twenty-one hours, and the rail fare is nearly £3; by air the distance is 320 miles, the time three and a half hours, and the fare about £4 17s.

French Aviator Carries American Officer from Brussels to Paris in 85 Minutes

Adjutant Larmande, Squadron 472, French Air Service, carried an American officer bearing important diplomatic correspondence from Brussels to Paris in 1 hour and 25 minutes, averaging 125 miles an hour.

Congress of Human Flight in Session at Paris

In 1913 M. F. Roidor-Séville organized the first Congress of Human Flight at the Grand Palais, at which 52 representatives of European countries were present. There was to be another congress, in 1914, but the war intervened. Several members are no more, but the remainder have been convoked and have resolved to continue the good work.

Farman 6-Passenger Planes for Paris-Bordeaux Service

Farman Frères are establishing a Paris-Bordeaux passenger service. An F.50, piloted by Lieutenant Constantin, accommodating six passengers will be used.

French Aviation Appropriation Nearly $200,000,000

After an all-night session, which resulted in the reduction of the appropriation to a figure $3,500,000 less than the original budget, which amounted to $200,500,000, criticism was made of the non-utilization of captured German planes, but it was pointed out that considerable alteration would be required to make these planes fit for commercial use. Unsuccessful efforts were made to take the control of civil aviation out of the hands of the military.

Regular Passenger Service Between Rome and Naples Operating

On April 6th an airship of a large type began a regular passenger service between Rome and Naples. The ship carries 36 passengers.

Swiss Government Aids Aircraft Industry

In order to awaken general interest in aeronautics and to assist the industry, the Swiss government has sanctioned the use of military planes for passenger carrying flight. All flights commence at Dubendorf. The minimum rate is 50 fcs. for a quarter of an hour's flight, but if over 12 kilometers it is 75 fcs., and the same sum is charged for flying over the region situated south of the line Rohrschach-St. Gall-Jonschwil-Wattwil-Uznach-Einstein-Lucerne-Napi-Thoune-Guggisberg Bulle-Dent de Jaman-Bex-Monthet.

Each landing made at the request of the passenger will cost him 25 to 100 fcs., and a supplement of 5 fcs. for each quarter of an hour the machine is kept waiting. A flight from Dubendorf to Lucerne, without any intermediate stops, will be 300 fcs. From Thoune-Jungfrau and return is 500 fcs., whilst the flight Lausanne-Avenches-Neuchatal costs 150 fcs. single.

The authorities are taking no undue risks. Payment must be made in advance, and should the passenger wish to take a camera or cinema-camera with him he must pay another 50 fcs. for each quarter of an hour. Minors must, in the absence of their parents, have a certificate showing their parents' consent to the flight.

In general, all persons under 18 or over 60, or who suffer from heart trouble, anaemia, epilepsy and other nervous maladies are not to be allowed the privilege of flying.

Five Seaplane Carriers in British Atlantic Fleet

The arrangements made for the composition of the British Atlantic Fleet, in full commission—provisional, until the settlement of peace—include the use of five seaplane carriers *Furious, Vindictive, Argus, Pegasus* and *Nirvana*. No mention is made of seaplane carriers with the other fleets and squadrons.

Aero Union of the Transvaal Formed

As an indication that aeronautics is spreading to all corners of the earth, it is of interest to learn that an aero club has been formed in Africa.

At a meeting presided over by the Mayor, at Johannesburg, on March 27, it was decided to form an Aero Union of the Transvaal, the objects of which are "the education of the people in the development and possibilities of aeronautics; to encourage the establishment of aerial services of all kinds; to foster under its auspices the formation of aero clubs in different centers; to associate itself with similar institutions throughout the country, and generally to promote the interests of aviation in this country." Lord Buxton was elected honorary president, and Mr. Sturrock, President of the Chamber of Commerce, was elected chairman.

Work of French Seaplanes in War

The following statement has been issued regarding the work of the French Naval Air Service:

ACTIVITY OF THE SEAPLANES, OCTOBER, 1917—AUGUST, 1918

Month	Number of Flights made	Hours of Flight	Distance covered (miles)	Submarines sighted	Submarines attacked	Mines discovered
1917						
October.....	1,667	3,094	184,730	7	6	..
November..	1,680	3,265	191,000	15	12	..
December..	1,730	2,671	147,000	7	7	..
1918

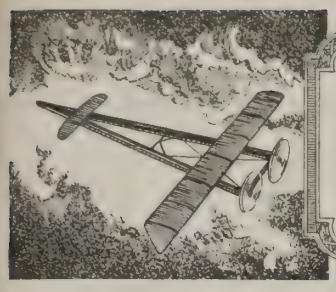
British Airmen Fired 10,500,000 Rounds at Ground Targets in War

London, April 24.—The Air Ministry, in a published report of the work of the air force during the war, says that before the war the air force consisted of 272 machines and 1,647 men, while in October, 1918, there were 22,171 machines, 27,006 officers, and 263,842 men.

From July, 1916, to the time of the signing of the armistice, the air force on the western front brought down 7,054 enemy aircraft, dropped 8,042 tons of bombs, and fired more than 10,500,000 rounds at ground targets.

Argentina Watching Aeronautical Developments

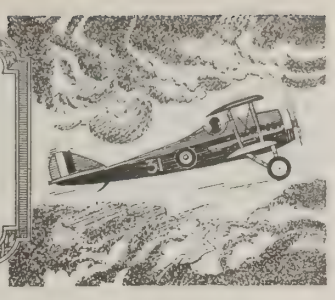
According to statements appearing in the British aeronautical press, a large number of aviators who have been discharged from the Royal Air Force have been approached by the Argentine Legation in London with reference to their utilization in the Argentenian Army. Aviators have been warned, however, that no authorization or instructions have been issued to the legation in that connection, but that, on the other hand, the Argentine authorities are very keenly interested in aeronautical developments, especially in relation to military aircraft, and British manufacturers who are at liberty to supply aircraft of war to foreign countries would do well to make their products known to the Argentine Military Authorities. Such photographs, specifications and so forth as are permitted by the Air Ministry to be transmitted to foreign Governments should be sent to the Military Attaché of the Argentine Legation.



British Airship Patrolled 66,200 Miles in 2,500 Hours Flying Time During War

There have been some wonderful endurance records of British airships during the war. One airship had a life of 2 years 75 days, during which it flew 66,200 miles in 2,500 hours' flying time. Another airship (C2) averaged 100 miles a day during a year—a total of 36,500 miles. In all, the airships of the British Air Force flew 2,250,000 miles during the course of the war.

Bristol Company Builds 14-Passenger Commerce Plane



The Bristol Aeroplane Co. of England has constructed a new passenger aeroplane, according to a commerce report from London. The plane has a seating capacity for 14 passengers in addition to the necessary mechanics and pilot. On its trial trip it carried 12 passengers, pilot and one mechanic, climbed 6,200 ft. in 7 min. 15 sec., with an air speed of 125 m.p.h. The passenger salon is ventilated to avoid drafts.

The machine stands 20¼ ft. high and from tip to tip measures 81½ ft. It weights 16,500 lb., the power being sufficient to lift this load to a height of at least 3 miles and at 10,000 ft. to give the aeroplane a speed of 113 m.p.h. The engine houses are built on the middle of the three pairs of wings. On each side there are two 410-h.p. engines, the total power being 1640 h.p. Flight can be maintained by any two of the four engines should the others break down.

ELEMENTARY AERONAUTICS *and* MODEL NOTES

By John F. McMahon

A Scientific Flying Model

WHILE on the subject of flying models, we must not forget one very important type of model known as the Scientific Model or one in which a regular tested wing curve is used.

If you are building models and the only reason you are is the pleasure you get from flying and building these models, I would like to have you start on one like the one shown in the accompanying drawing, as this model is not only a good flyer, but will show many advantages you have never seen in any of your previous models.

Some years ago it was custom among the model clubs and model flyers to have efficiency contests for flying models. The contest was decided by the model carrying the greatest load for a certain surface area, etc. In this way many little things were found that never dawned on us before and the result was we built some of these ideas into our racing models, and made longer and better flights.

I would suggest selecting a certain fixed area, about 144 square inches (as I have in the model shown in the drawing) for the main plane, and about 40 inches in the elevator. This is a fair average for this type of model and the one from which we will get the best results.

Many little experiments can be carried on by the aero-modelist such as using raked edges, then wings without the rake, arrow shaped wings (that is, with a sweep back) with or without a dihedral, or even a reverse dihedral, that is, have the wings sloping downward instead of upward. Different loads can be carried at different angles of incidence and the most efficient angle can then be found.

In fact almost every conceivable kind of an experiment must be taken into consideration and I claim that when you have finished with this model you will be able to build long distance flying models that will go hundreds of feet farther than your previous models.

New tricks in design are what make an aeroplane better and it is not necessary for one to be an expert engineer to invent or develop some little thing that will improve the aeroplane or make aviation safer and more interesting. The field is large and you, the model fliers, have the same chance as those who went before you and who are to-day making aviation history.

The building of the model shown herewith is really simpler than it looks; the only catch is to get the Balsa Wood that is needed for the wings and motor stick.

While the wings look as if there are too many ribs, this is not the case, as we are using a true wing curve and it is necessary to preserve the wing section along the whole length of the wing, otherwise the fabric would cave in between each rib and the wing section would be correct only at each rib.

The ribs of the wings are made of this Balsa Wood. (Balsa Wood is the lightest wood known, its weight being about one-tenth the weight of spruce.) And it can be purchased from almost any model supply house. If your particular supply dealer does not carry it you can purchase it from The American Balso Co., New York City.

To construct the ribs, select a block of the wood and shape it like the wing profile shown at the right hand lower side of the cut.

The wood should be so shaped as to have the grain running the length of the ribs when you finish.

After shaping the wood to the proper wing curve holes should be drilled for spars. Then ribs 1/16" thick should be cut from this block with a saw.

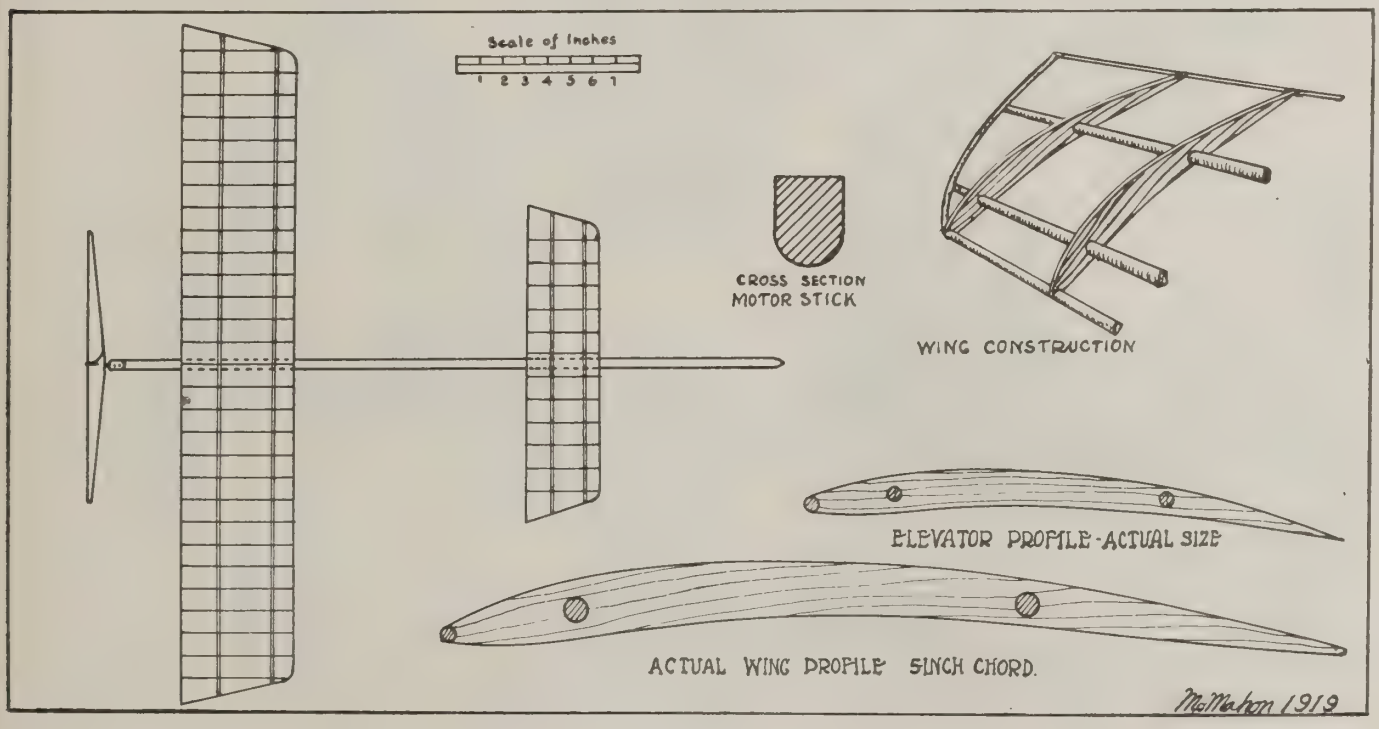
Tne ribs for the elevator are also made in this way and when all are finished they should be run on round spars made of dowel sticks and glued in place. Care should be taken not to split the ribs when putting them on. It would be good practice to make the hole in the ribs a trifle larger than the diameter of the spar. The spars in the large plane are ⅛" and in the elevator 3/32". The entering edge of both elevator and main plane is of 1/32" bamboo rounded with sand paper.

When the wings are finished cover them both sides with thin China Silk or Bamboo paper, and dope with Ambroid Varnish.

The motor stick is made of a piece of Balso Wood 3¼" x ¾" and shaped to the cross section in the centre of the drawing.

One propeller drives the model and this is twelve inches in diameter and is made from a block of clear grained white pine.

Aero Science Club Note



The Aero Science Club recently held its annual meeting and elected the following officers:

Mr. Edward Durant, President; Mr. Arthur N. Ott, Vice-President; Mr. Ladis Gladki, Secretary and Treasurer; Mr. Wm. J. Buch, Director of Model Const.; Mr. Stanley Y. Beach, Director of Pub. and Membership; Mr. Harold McMickle, Technical Advisor.

In order to increase the interest in the power driven model (the record for the compressed air driven model being about 423 feet) the club has decided to offer a suitable cup to the builder and flyer of the first mechanical driven model to surpass the record, in a contest to be held at Van Cortlandt Park, New York City, in the near future.

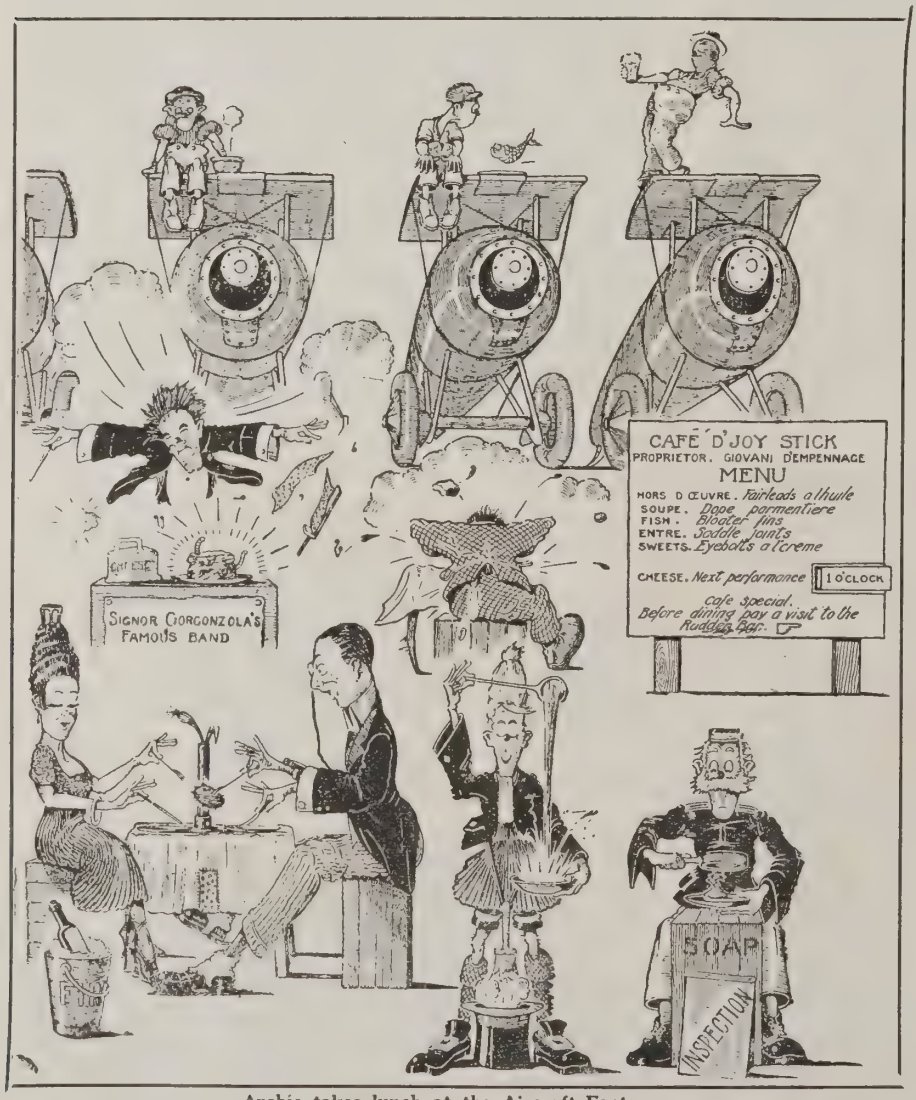
The club is rapidly recruiting new members and is one of the few "live" organizations as well as the oldest aeroplane club in America.

Applications for membership should be sent to the secretary at the Beach Building, No. 125 East 23rd Street, New York City. Anyone interested in models or model flying is eligible and there is also a Junior division for the younger model enthusiasts.

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

Aeronautic Journalism

In a newspaper report of the flight of Mr. J. H. Thomas, M. P., to Paris, our contemporary, *Flight,* noted the statement that when Mr. Thomas arrived on the aerodrom "H.M. airliner 'Silver Star,' a twin-engine converted Handley Page bomber, resplendent with new alumminium paint, was ready with the engines running." Mr. Thomas immediately entered the machine and "a moment later the pilot, Major McCrindle, called out 'contact'; the blocks were knocked away from the wheels, and Mr. Thomas was away on his journey."



It was thoughtful of the pilot to call out "contact" while the engines were running so nicely with the switch off. And what a voice for the parade ground Major McCrindle must have!

So There's Nothing to Worry About

"Suppose your parachute didn't open, my good man?"
"Ah, let's suppose, madam."
"But what would you do?"
"I should probably 'do' the undertaker, madam. My bank account is fearfully overdrawn."—*From Aircraft.*

Invent One for Both

She: "Do you think women will take to the air?"
He: "Not for five or six years."
She: "Why?"
He: "Because it will take that time to evolve a perfect silencer for the engines."
(Dear Reader: We ran short of jokes this week, so please excuse this one.—NUTTY EDITOR.)

Archie takes lunch at the Aircraft Factory

—*From Flight.*

Quentin Roosevelt

Birdman who gave up your life,
For the noblest cause in the world,
Aiding the world in its strife
For the fairest flag unfurled.
Liberty credits you,
Who fought for us in the blue—
You who have given all
Without a word of protest;
Who answered the final call,
And went to a glorious rest—
No enemy hated you,
Warrior who winged the blue.

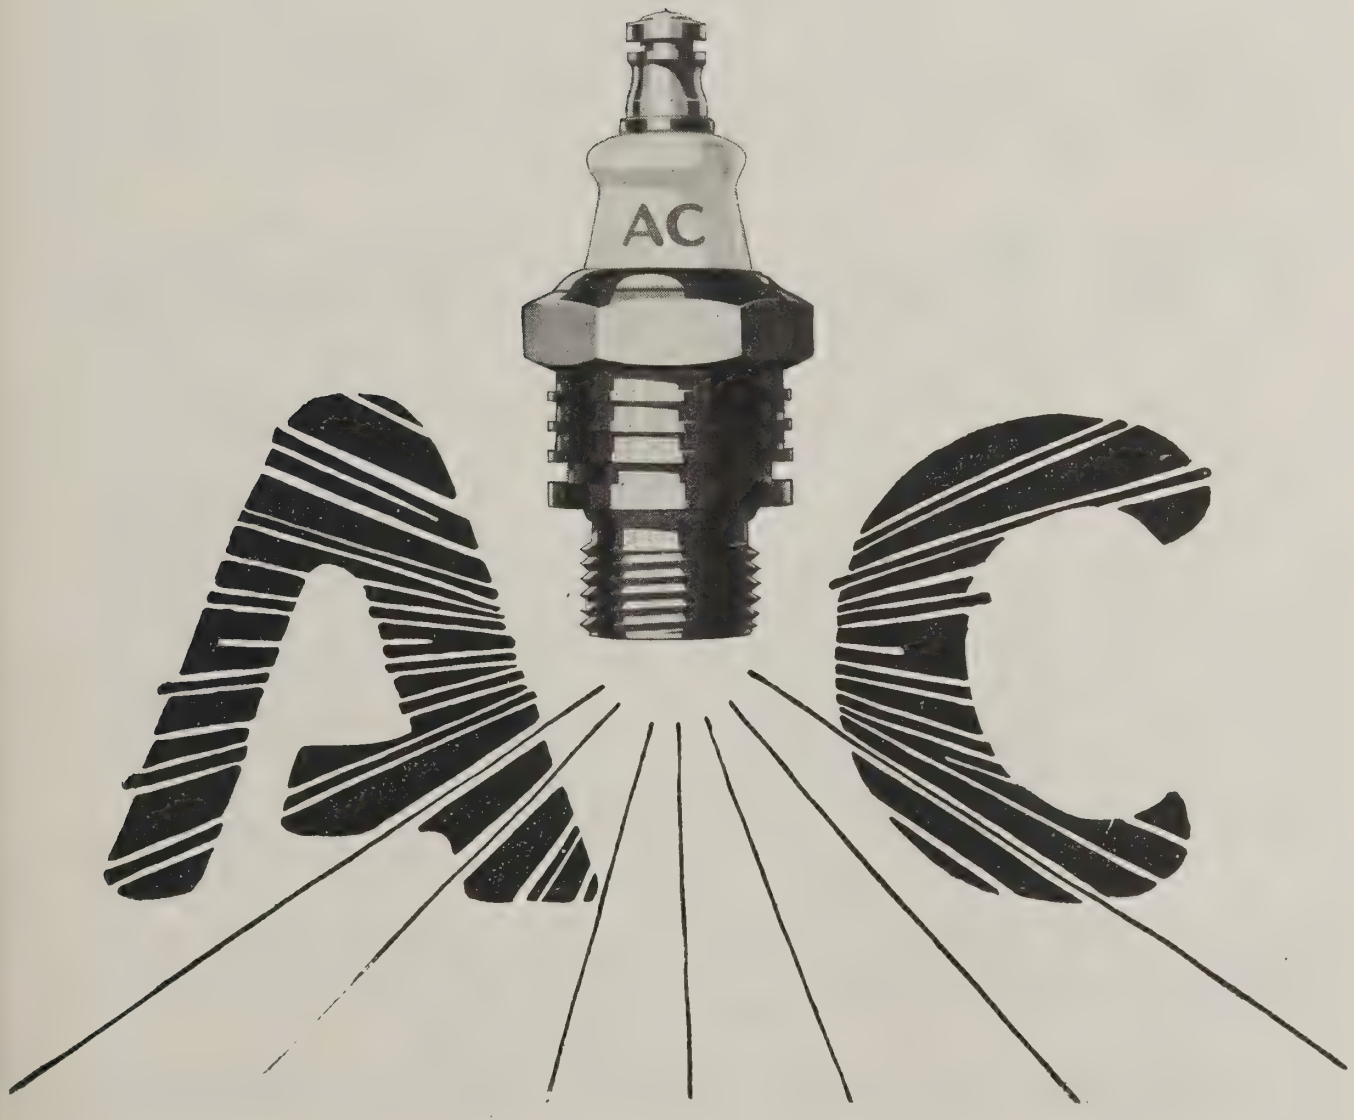
For who could question the cause,
And see its leader's sons
Never thinking to pause,
While sons of leading Huns,
Knew naught of do nor dare,
Or conquest in the air?

The Huns have spoken to me
And have said it time and again,
That you were one of a free
And undaunted union of men.
That your name would ever live,
With a halo shining bright;
That your life was given to give
That the wrong might learn the right.
Now we are learning today,
That which you knew before—
That the life which you gave away,
Was *not* a loss in the war.

—*Arthur Winfield Scott,*
2nd A. I. C., France.

At the Scratch

The butterfly
Has Wings of gold;
The firefly
Wings of flame;
The Cootie
Has no wings at all
But
He gets there just the same!



A C Spark Plugs have always met the emergency. For years they have been standard equipment on most fine motor cars. When the government needed aircraft plugs A C's led all others in the competitive tests and as a result were chosen as standard equipment for all Liberty and Hispano-Suiza airplane engines. We are now in position to execute private orders for aviation plugs promptly.

AEROPLANE INSURANCE

Merchants Fire Assurance Corporation of New York

announces the appointment of

MR. AUSTEN B. CREHORE

as Manager of their newly established Aviation Insurance Department.

Mr. Crehore was for two years a Pilot of the Lafayette Flying Corps and is an insurance man of considerable experience and for these reasons we consider him especially qualified to manage this branch of insurance. We are therefore prepared to furnish all forms of aerial insurance coverage, and quotations will be gladly given and full information submitted.

The Royal Flying Corps

used over eight thousand quartered oak, variable pitch, Paragon Propellers—all of one design. Not one of these propellers was ever returned as unsatisfactory from the field. Only four failed to pass final inspection. Average shipment was 200 per week on this order alone. In October 1918 official tests showed two miles per hour faster speed and one third faster climb than any one of four competing designs. The new Paragon Booklet will tell many more interesting things.

WALNUT PROPELLERS WILL WIN

We are sure you can profit by the information and advice which we are able to give you by reason of our experience in propeller designing. If you will give us an opportunity to fit your motor and plane with the proper propeller, we are quite confident we can extract every ounce of thrust your motor will develop and all the speed of which your plane is capable.

We are able to back up the above statements by the performance records of planes designed by some of the best Aeronautical Engineers in this country.

have to be carried, and in spite of the lower power the speed is over 100 m.p.h. A military Martinsyde machine with the same engine is the holder of speed records for machines of this type, and it may safely be assumed that the trans-Atlantic type is not inferior in any way to the standard type.

The Fairey Machine

The machine entered by the Fairey Aviation Co. has the distinction of being the only seaplane entered. It is of more or less standard type, resembling the well-known type of 3C Fairey seaplane. The most remarkable feature of this machine is, of course, the variable camber wings fitted. This forms a Fairey patent, and has been used with good results on machines employed by the Navy. Briefly speaking, the variable camber is obtained by having the entire trailing edge of the planes hinged along the rear spars in such a manner that the pilot can, by turning a wheel, pull down the whole trailing edge to give greater lift, and again raise it to provide less resistance and hence greater speed. In the ordinary way the chief aim of this variable camber is to provide a low speed on alighting and getting off, but for the Atlantic flight it will also be found useful in providing greater lift while the machine is heavily loaded, allowing of gradually flattening out the wing section as the load becomes less owing to the fuel being consumed. In this manner the first part of the flight will probably be made at a slower speed than that obtained towards the finish of the journey. The engine is, as in two of the other machines entered, a Rolls-Royce "Eagle" of 375 h.p., and the speed of the machine is stated to be about 120 m.p.h. This figure probably refers to the speed with the trailing edge in line with the rest of the wing section. With the trailing edge pulled down the speed will be considerably lower.

The Whitehead Machine

We have not, for the moment, been able to obtain any particulars of the machine the Whitehead firm propose to use, and can only wait until Mr. Whitehead is prepared to disclose the type with which they may make a bid for the prize.

The Handley-Page Machine

The Handley-Page machine is one of the standard type four-engined bombers, slightly altered in details, and fitted with a very large petrol tank in the fuselage. The four engines—in this case Rolls-Royce "Eagles"—are placed between the planes, one behind the other. The front engine of each pair drives a tractor screw, while the engine behind it drives a propeller. As the pusher screw has to deal with air already set in motion by the tractor, its pitch is made slightly greater than that of the tractor.

The amount of fuel carried will be about 2,000 gallons. Assuming that each engine develops 365 h.p., and that the fuel consumption is .5 lb. per h.p. hour, this amount of fuel should last for 21 hours at open throttle. The speed at full power may be expected to be in the neighborhood of 100 m.p.h., which would give a range of about 2,100 miles. Since, however, the machine will fly at a somewhat lower power for the sake of fuel economy, and the prevailing winds are westerly at this time of the year, it is reasonable to suppose that this speed of 100 m.p.h. may be maintained with the engines partly throttled down, thus further increasing the margin in hand. After a few hours' flight two of the four engines will probably be sufficient to keep the machine going, although at a reduced speed, and this would give the engineers a chance to put right any little defect that one or more of the engines might develop. The number and names of the crew have not yet been announced, but one of them will be a Marconi operator, who will attend to the directional wireless set, which will have a range of about 250 miles. An installation of smaller radius will also be carried to facilitate communication with ships. To provide for emergencies, a small wireless set is installed in the tail of the machine. The reason for placing it here is that in case of a descent in the sea, the tail will probably stick up out of the water, thus enabling S. O. S. messages to be sent. In view of the fact that four engines are fitted, it is improbable that complete engine failure will be encountered.

The following brief particulars of the Handley Page machine should be of interest:

Span, 130 ft.; length, 75 ft.; height, 23 ft.; weight, empty, 14,000 lbs.; weight, fully loaded, 32,000 lbs.

Champion Dependable Spark Plugs

Champion Aeroplane Plug

Withstand Shocks of 300 Sledge Hammer Blows Per Minute

THE RESULTS of various exhaustive factory tests imposed upon Champion Spark Plugs completely demonstrate their ability to endure every punishment your car's engine can impose.

The test illustrated here is known as the "shock test." The shock, which the Champion Spark Plug must survive without injury, is the equivalent to a weight of 3½ pounds, dropping with the rapidity of 300 times per minute.

The qualities that enable Champion Spark Plugs to successfully withstand such severe trials are largely a result of ten years' study and experimenting that developed our patented gasket construction and our Number 3450 Insulator.

This superior Insulator offers 2½ times the resistance to shock and vibration compared with the best previous insulator. That is one of the several reasons why Champion Spark Plugs are more durable and dependable than ordinary spark plugs.

SECOND PAN-AMERICAN AERONAUTIC CONVENTION DISCUSSES AERONAUTIC PROBLEMS OF GREAT IMPORTANCE

Meetings and Field Events Well Attended

VISITORS from all sections of the United States and from twenty other nations have been present at the meetings, field events and contests of the Second Pan-American Aeronautic Exposition at Atlantic City during the past week, notwithstanding the somewhat adverse weather conditions.

R-34 to Make Atlantic Trip

Official word that the R-34, one of the new type British dirigibles, is slated to make a trans-Atlantic dash within the next three weeks, was given at the "inside" dedication of the Atlantic City Air Port—a luncheon given in honor of Brig.-Gen. L. E. O. Charlton, British Air Attaché, and the first officer in the world to be appointed to such a post.

The luncheon, held in the submarine grill of the Hotel Traymore was notable for the representative aerial experts of many nations who were at the table as well as the message of Gen. Charlton that the Atlantic City Air Port was the probable destination of the British dirigible now undergoing final tuning up for the big hop to American shores.

"It is intended to send a dirigible across to this coast this month or, if some unforeseen holdup occurs, as early as possible next month," Gen. Charlton said. "As to the actual terminus, I have strong hopes it will be Atlantic City, although I have not received any official notification of the landing place so far."

It is believed, however, that the world's first air port will receive the honor because of the strong invitation that has been sent to the British Air Ministry and by reason of the cordial relations early established by the General with the officials of the Aero Club of America, the Aerial League, the Pan-American Aeronautic Federation. In the course of his speech Gen. Charlton said:

"I might prognosticate that the era of aerial trans-Atlantic bridge building is today having its foundations laid. Heretofore the oceans have been the sole connecting link between the Americas and Europe but the time when the air will unite them is now very near.

"I have visited your great air port here and been impressed with its wonderful facilities and possibilities. Atlantic City is a happy augury. Its cosmopolitan roster of visitors assures wide dissemination of the aerial developments that are bound to be an integral part of the resort's life in the future through the splendid courage and confidence of the men responsible for the creation of this port.

"Aviation is the new child of civilization. The steam engines and all the rest—the means of transportation to which we have been long accustomed—are its elder brother. In the short span of time covered by the period of the war we have jumped from the activities of that elder brother until now fighting in the air is the rule rather than the exception; parachutes have been tested and found to be in fact the life preservers of the air, adding to the safety of air travel and giving the general public the confidence in the greatest creation of mankind; night flying is something common now—the infant new-born when the armistice was signed has now reached the age of reason, adolescence and maturity are of the near future."

President Alan R. Hawley, who presided at the dinner which was substituted for the outside ceremonies in the dedication of the big air port when inclement weather interfered, referred to the fact that Atlantic City was the base of the first effort at a trans-Atlantic aerial dash by dirigible back in 1911 when Walter Wellman, the explorer, made a start from the inlet here in a "blimp" only to bump into storms at sea that swept the aerial leviathan down the coast where the crew was finally rescued from the peril of the elements and of the second effort a year later when Melvin Vanamin, who was chief engineer for Wellman, met with disaster while testing out finally over the inlet for the voyage overseas.

International notables who were introduced at Dedication Dinner at the Traymore included Mr. Alan R. Hawley, president of the Aero Club of America, Brig.-Gen. L. E. O. Charlton, C.B., C.M.G., D.S.O., and Legion of Honor, General Collardet, French High Commission, Colonel T. E. Gilmore, O.B.E., Assistant British Attaché, Captain Pierre Edgarde Bos, French High Commission, Captain Dibovsky, Russian Navy Aviation Service, A. Touchkoff, Commander, Russian Navy Aviation Service, Captain Harold Sylwan, Military Attaché Swedish Legation, Captain Stellan Elliott, Royal Swedish Commission, Lieutenant Santiago Campuzano, Cuban Air Service, Captain C. L. Berriso, Military Attaché, Uruguayan Legation, Honorable Harry Bacharach, Mayor of Atlantic City, Mr. Albert T. Bell, president Aero Club of Atlantic City, Mr. Henry Woodhouse, vice-president Aerial League of America, Major Reed G. Landis, second ranking American Ace, Rear-Admiral Bradley A. Fiske, U. S. N., Captain Robert A. Bartlett, Captain Granville A. Pollock, Lieutenant Marion Sulzberger, Lieutenant (j. g.) C. H. Payne, U. S. N., Lieutenant G. W. Shaw, U. S. N., Mr. Edward Stinson, Mr. Earl L. Ovington, Ensign A. A. Beckwith, Mr. Samuel P. Leeds, chairman Atlantic City Chamber of Commerce, Captain Hugh L. Willoughby, Mr. Augustus Post, secretary Aerial League of America. Mr. W. W. Young, Mr. Charles E. White, Mr. George F. Kerr, Mr. Walter Buzey, Mr. Daniel S. White, Mr. Hubert Somers, Mr. Harry B. Cook, Mr. C. A. Clausson, Mrs. May Brown-Dietrich, Mrs. Robertson, Mrs. Brown J. White, Mrs. D. F. White, Mrs. Emery Marvel, Mrs. V. T. Middleton, Mrs. Harry B. Cook, Mrs. Hubert Somers, Mrs. J. H. Lippincott, Mrs. John R. Schermerhorn, Mrs. Wm. H. Peters, Mrs. A. S. Abell, Mr. A. S. Abell, 3d, Mr. George Wm. Abell, Miss Mabel Abell, Miss Anna Abell, Miss May Abell.

Establishment of Engineering Experiment Stations Advocated

Establishment of engineering experiment stations in each state and territory of the country to do for engineering, industry and science what the agricultural experiment stations have been doing for agriculture and the farmers during the past thirty years, was advocated at a meeting on the Steel Pier by P. V. Stephens, of New York, consulting engineer for the Georgia School of Technology.

Mr. Stephens, who is the author of what is to be known as the Smith-Howard bill that will be introduced and pushed in the special session of Congress, covering the subject, declared that such a mobilization of the nation's resources and the training of research men would have frightened Germany off from any acts that would have brought America into the war.

"The university and technical school has and always will be the chief source of all new scientific truths and men trained in the science of engineering. The sooner the courses of aviation are in the colleges the quicker we will see aeronautics take its true place in the civic and industrial life of the nation. A chain of experiment stations of an engineering and industrial character in every state, with each commonwealth probing into its own peculiar resources and the central control located in one of the departments at Washington, with both the state and Federal Government financing the stations, would so mobilize the nation's industries that America's position as the world's leading nation would be permanently established.

"Our agricultural industry was so well systematized that without much additional expense over the regular annual appropriations we were enabled to not only feed ourselves but the world in addition during the world period," Mr. Stephens declared.

The bill has the backing of the executive committee of the Aero Club of America.

Navy Congratulated on Trans-Atlantic Start

Enthused over the progress of the trans-Atlantic "hop" of the big Navy seaplanes, delegates and members of the Second Pan-American Aeronautic Convention adopted resolutions, felicitating the Navy and the members of the overseas crew upon their successful completion of the first two legs of the voyage.

The resolution which was adopted amid cheers at an afternoon session of the convention read:

"The officers, delegates and members of the Second Pan-American Aeronautic Exposition, now in convention assembled at Atlantic City, send you God-speed, good luck and best wishes for a successful voyage with greetings from the new world to the aviators of the old."

The message bore the signature of Alan R. Hawley, president of the Aero Club of America, who was the author. The message was cabled to Trepassey, N. F., to the commanders of the airships.

Resolution of Condolence

The convention today also adopted resolutions of sympathy to General C. T. Menoher, chief of the Air Service, over the death of his wife. The resolution declared:

"Whereas, the officers, delegates and members of the Second Pan-American Aeronautic Convention have learned with extreme sorrow of the death of Mrs. Menoher, it is resolved that the earnest and profound sympathy of the Second Pan-American Aeronautic Convention be extended to General Charles T. Menoher to whom our every condolence is extended at this time of his great loss."

"Mother's Day" Memorial Service

Posthumous honors for the 935 gallant Americans who lost their lives while fighting the battles of civilization and humanity in the air were awarded by the Pan-American Aeronautic Convention as the feature of "Mother's Day"—the diplomas, following the reading of the roll of honor from the platform of the convention by Secretary Augustus Post, of the Aero Club of America, being forwarded to the mothers or wives of the dead heroes.

Forty different states were represented among the 935 airmen whose memory was honored by the impressive services on the pier, when the Memorial Committee, consisting of Rear Admiral Robert E. Peary, Alan R. Hawley, Captain Robert A. Bartlett, Captain Granville A. Pollock, Rear Admiral Bradley Fiske, U. S. N., Major Reed Landis, Albert T. Bell, Thomas F. Powers, John Hays Hammond, Jr., Colonel Lester Jones, U. S. A. M. S., Colonel J. DeM. Thomson, Colonel Charles Elliott Warren, Major Thomas S. Baldwin, Henry Woodhouse, Joseph A. Steinmentz, K. M. Turner, W. W. Niles, G. Douglas Wardrop and A. S. Abell, 3rd, presented their report through Mr. Post.

The awards, from the Aerial League of America, read: "This diploma of Honor of the Aerial League of America is awarded to ....., in recognition of the patriotic service which he rendered to the cause of humanity and civilization in the service of the United States during the war" and bore the signature of Robert E. Peary, as president.

Aerial Mail Day

Aerial Mail Lines had their inning Wednesday at the Convention. Although unfavorable weather conditions prevented the delivery of the first bag of mail to the shore post office by use of a parachute dropped from an aeroplane in demonstrating how this means of "smashing" can expedite delivery by permitting the mail pilot to continue on his route in full wing instead of making stops as now necessary. Interesting facts regarding the success that has attended the air post not only in America but on long hauls in and between other countries were revealed in lectures at the convention hall. The experiments that have been in progress at the air port since the opening of the convention a week ago by Lieutenant Jean Ors and his parachutes, as well as the drops made by A. M. Watkins, a Seattle parachutist, have been convincing proof of the practicability of the "floating" method of delivery will be made of postcards written at the air port, carried through the air by Eddie Stinson and dropped in a mail bag at the Atlantic City Post Office where they will be taken in charge by officials and forwarded by the regular channels.

In checking up on the work of the skyline post as conducted by the United States Postal authorities, W. W. Young, in a lecture pointed out that the air plan was working out on a very business-like basis. He showed that despite the 50 per cent. increase in the amount paid pilots, helpers and mechanics, and the extra cost of rebuilding one machine and entirely overhauling two others, the cost of operation had been reduced 6 per cent. in April over March. That the Government has at last located the types of machines peculiarly adapted to the mail service is indicated in the report from a recent checkup which shows that but four of the sixteen original types placed in the service at the start are now being used. He also observed that clinching evidence of the growing interest and popularity of the air mail service is shown by the fact that the mileage is increasing at the rate of a thousand miles a month.

Lieutenant Edgar Garland, of the Royal Air Force, discussed the developments of aerial mail in New Zealand and Australia, and prophesied a great future for the service. Pilots Gardner and Shank, of the U. S. Aerial Mail Service, related some of their experiences.

Extensive Art Exhibit

The largest aeronautic art exhibit ever held has been assembled on the Steel Pier, Atlantic City, being part of the Second Pan-American Aeronautic Exhibition and Convention.

The twenty official paintings of aerial warfare by Lieutenant Charles E. Ruttan, the official painter of the U. S. Navy, who has just returned, are shown for the first time. There is also exhibited the hundred aerial warfare paintings of Lieutenant Henri Farre, the official painter of the French Army and Navy Departments.

American Balloon Progress

The tremendous strides made in dirigible construction during the past few years were enumerated by R. H. Upson, of the Goodyear Company, speaking before the evening session of the Congress at the Steel Pier. "Since 1911 the improvements worked out in the dirigible industry have been over 2,000 per cent.,". Mr. Upson declared. "The war has helped but the big interest taken by manufacturers in the practical features of the giant 'blimp' for commercial purposes has also had considerable to do with the refinements that are now in evidence.

"But despite the improvements of the past eight years, the end is not yet in sight—the 'ceiling' of improvements has not even been scraped. Right now the construction of a dirigible of ten million cubic feet hydrogen capacity is under consideration and dirigibles of large carrying capacity, capable of making a speed of over one hundred miles an hour are realities of the near future."

Mr. Upson, who won the International Balloon Race in 1913 and has just returned from Europe, brought out the possibilities and value of the dirigible for commercial uses.

He asserted that Great Britain has outstripped all other nations in dirigible construction, pointing out that where the

TROPHIES AND PRIZES TO BE COMPETED FOR AT ATLANTIC CITY IN MAY

THE following Trophies and Prizes have been offered for competition at Atlantic City, and from other points to Atlantic City from May 1st to May 31st. All contests are open to Army, Navy, Aerial Mail and civilian aviators.

(1) **$6,000 Curtiss Marine Flying Trophy.** Mr. Glenn H. Curtiss has offered a prize of $1,000 to go to the first entrant for the Curtiss Marine Flying Trophy who covers the distance of 1,000 miles without stopping. The contest for this prize will open on May 1st, and continue until it has been accomplished.

The entrants who wish to compete for this trophy and prize during the Convention can fly over the 60-mile course between the Steel Pier and Cape May Air Station. This magnificent trophy is exhibited at the Art Salon on the Steel Pier.

The entrant's record will be counted as a flight for the Curtiss Marine Flying Trophy and $1,000 under the rules for the 1919 competition for this trophy.

(2) **The $5,000 Pulitzer Trophy,** offered for annual competition, to be awarded this year to the aviator who makes the best record in flying land or water planes from anywhere to Atlantic City, and from Atlantic City to anywhere during the month of May.

Competitors for this trophy will start from or end at the Atlantic City Air Port, on Albany Avenue, Atlantic City, which affords unsurpassed facilities for both land and water aeroplanes.

(3) **The Boston Globe Trophy and $1,750** cash prizes to be awarded as follows: $1,000 and the trophy to the aviator who makes the best record in flying from Atlantic City to Boston, or from Boston to Atlantic City during the month of May; $500 and $250 to the aviators who make the second and third best records, respectively.

Start or ending will be on the Atlantic City Air Port.

(4) **The Cleveland Plain Dealer Trophy and $1,750** cash prizes to be awarded as follows: $1,000 and the trophy to the aviator who makes the best record flying from Atlantic City to Cleveland, or from Cleveland to Atlantic City during the month of May; $500 and $250 to the aviators who make the best records, respectively.

Start or ending will be on the Atlantic City Air Port.

(5) **The Detroit News Trophy and $1,750** cash prizes to be awarded as follows: $1,000 and the trophy to the aviator who makes the best record flying from Atlantic City to Detroit, or vice versa, during the month of May; $500 and $250 to the aviators who make the best records, respectively.

Start or ending will be on Atlantic City Air Port.

(6) **The Atlanta Journal $1,750 prizes,** to be awarded to the three aviators who make the best record flying from Atlantic City to Atlanta, Georgia, carrying the Journal.

Start or ending will be on Atlantic City Air Port.

(7) **Colonel William A. Bishop's "Ace of Aces Trophy,"** to be awarded to the aviator who makes the best record in flying from Toronto to Atlantic City, or vice versa, during the month of May.

Start or ending will be on Atlantic City Air Port.

(8) **The $3,000 New York Herald Aero Efficiency Prizes,** to be awarded as follows: $1,000 to the aviator who covers the greatest distance in a non-stop cross country flight, starting from or ending at Atlantic City between May 1st and May 30th with an aeroplane of any horsepower.

$250 to each of the aviators who cover the greatest distance in a non-stop flight from or ending at Atlantic City between May 1st and May 30th with aeroplanes of:

(a) not over 100 h.p.
(b) not less than 100 h.p. and not over 200 h.p.
(c) not less than 200 h.p. and not over 400 h.p.
(d) not less than 400 h.p. and not over 600 h.p.
(e) not less than 600 h.p. and not over 800 h.p.
(f) not less than 800 h.p. and not over 1000 h.p.
(g) not less than 1000 h.p., and over without limit.

Start or end of flight will be on Atlantic City Air Port.

(9) **$2,000 Intercollegiate Seaplane Speed Trophy,** for annual competition, to be awarded to the college whose representative makes the best record in flying ten times over a five-kilometer course at Atlantic City each Saturday off the Steel Pier during the month of May.

This trophy is to become the property of the college that wins it three years in succession.

(10) **$2,000 Intercollegiate Aeroplane Trophy,** for annual competition, to be awarded to the college whose representative makes the best record in flying ten times over a five-kilometer course at Atlantic City each Saturday during the month of May. To be held at the Atlantic City Air Port.

This trophy is to become the property of the college that wins it three years in succession.

(11) **$2,750 Cash Prizes for Intercollegiate Weekly Seaplane Races,** offered under the terms of the will of Mr. Samuel H. Valentine. These prizes are to be awarded in connection with the races for the Intercollegiate Seaplane Trophy described above. They are offered to assist the collegiate aero clubs and individuals making the entries to defray the expenses connected with entering a team. Competing for same will not, therefore, endanger the amateur status of the competitor.

There will be four prizes awarded each Saturday for the best speed made in competition for the annual Intercollegiate Seaplane Trophy as follows:

First prize	$250
Second prize	150
Third Prize	100
Fourth Prize	50

Colleges are permitted to appoint new entries and enter different machines for each race. The name of the entrant and type of machine need not be announced until half hour before the race.

(12) **$2,750 Cash Prizes for Intercollegiate Weekly Aeroplane Races,** offered under the terms of the will of Mr. Samuel H. Valentine, are to be awarded in connection with the weekly races for the Intercollegiate Aeroplane Trophy described above. They are offered to assist the collegiate aero clubs and individuals making the entries to defray the expenses connected with entering a team. Competition for same will not endanger the amateur status of the competitors.

There will, therefore, be four prizes awarded each Saturday for the best speed made in competition for the Annual Intercollegiate Aeroplane Trophy, as follows:

First Prize	$250
Second Prize	150
Third Prize	100
Fourth Prize	50

Colleges are permitted to appoint new entries and enter different machines for each race. The name of the entrant and the type of the machine need not be announced until half an hour before the race.

(13) **The Intercollegiate Dirigible Trophy.**
This may not be held until later in the season.

(14) **The Intercollegiate Balloon Trophy.**
This may not be held until later in the season.

All of these contests, except the intercollegiate, are open to Army, Navy, Marine Corps, intercollegiate and civilian aviators. The rules are similar, so that a competitor can compete for more than one trophy in one flight.

The intercollegiate contests are open to both graduates and undergraduates.

(15) **Open Seaplane Speed Contests** (with handicap) for twelve laps of five miles each. To be held on Decoration Day. Prizes to be awarded under the terms of the will of Samuel H. Valentine and sanctioned by the Aero Club of America.

First Prize.....$1,000
Second Prize..... 500
Third Prize..... 250

(16) **Aerial Commuting Prizes.**

1. To be awarded to entrants who cover the greatest total distance in commuting by air from anywhere to Atlantic City during the period of the Convention.

First Prize.....Gold Medal
Second Prize.....Silver Medal
Third Prize.....Bronze Medal

(Distance to be measured in straight line.)

2. To be awarded to entrants who make the greatest number of trips in commuting by air from anywhere to Atlantic City during the period of the Convention.

First Prize.....Gold Medal
Second Prize.....Silver Medal
Third Prize.....Bronze Medal

3. To be awarded to entrants who make the longest flight in commuting from anywhere to Atlantic City during the period of the Convention. (Distance to be measured in straight line.)

First Prize.....Gold Medal
Second Prize.....Silver Medal
Third Prize.....Bronze Medal

(17) **$2,000 Opening Day Prizes,** offered under the terms of the will of Samuel H. Valentine for land aeroplanes and seaplanes. To be awarded to the aviators making the best records in competing for any of the trophies and prizes on May 1st, flying from Atlantic City to anywhere, and from anywhere to Atlantic City. Competitors starting from Atlantic City will start from the Municipal Air Port at Albany Avenue, Atlantic City. Competitors from other points will end their flights at the Air Port.

(18) **$500 Aerial Runabout Races,** offered under the will of Mr. Samuel H. Valentine for speed competition between one-seater aeroplanes of not over 75 h.p. Two races are to be held as follows:

First race, Saturday, May 10th, at the Atlantic City Air Port, Albany Avenue, Atlantic City:

First Prize..... $250
Second Prize..... 150
Third Prize..... 100
Fourth Prize..... 50

(19) **The Akron Trophy,** presented by Major Thomas S. Baldwin, to be presented to the pilot who makes the best time with any type of aircraft in flying from Akron to Atlantic City, or Atlantic City to Akron, during the month of May.

Start or landing must be made on the Atlantic City Air Port.

(20) **$100 West Point Merchants' Association Prize,** to competitor of Pulitzer Trophy who starts from or ends at West Point, Mississippi.

(21) **Woman's Trophy for Flying,** offered by Mrs. May Brown-Dietrich, through the Aerial League of America, for competition by women under rules to be drawn by the Contest Committee.

DAILY PROGRAM FOR PAN-AMERICAN AERONAUTIC CONVENTION, EXHIBITION AND CONTESTS

SATURDAY, MAY 17TH

AFTERNOON—Aerial races and contests. Illustrated addresses on Aerial Photography.
EVENING—Ball.

SUNDAY, MAY 18TH

AFTERNOON AND EVENING—Illustrated addresses on "Aerial Exploration and the Use of Aircraft for Coast and Geodetic Survey."

MONDAY, MAY 19TH

AFTERNOON—Addresses on "Need of Broader Attitude Regarding Insurance for Aircraft and Aviators."
EVENING—Illustrated address on "How Army Medical Standards and Inspection Lessen Accidents." Insurance companies and agents invited.

TUESDAY, MAY 20TH

AFTERNOON AND EVENING—Illustrated addresses showing different ways of crossing Atlantic by air and the problems to be solved to accomplish same successfully.

WEDNESDAY, MAY 21ST

AFTERNOON—Aero Safety Day. Discussion of aero safety provisions made; improvements in aeroplane construction; increased reliability of aero motors; devices which make for safety in flying.
EVENING—"Progress Made in the Art of Piloting Aeroplanes." Illustrated.

THURSDAY, MAY 22ND

AFTERNOON AND EVENING—Addresses and discussions of meteorology—"How the Weather Forecasts Can Be Extended and Made More Efficient by the Use of Aircraft in Exploring the Upper Air," also "How the Weather Forecasts Help Aerial Navigation," and "Topographic and Climatic Factors in Relation to Aeronautics."

FRIDAY, MAY 23RD

AFTERNOON AND EVENING—Addresses on "Aerial Jurisprudence—Aerial Laws and Regulations of Air Traffic." (First day). Lawyers, traffic commissioners and police authorities of different countries invited.

SATURDAY, MAY 24TH

AFTERNOON—Races and contests.
EVENING—Illustrated address on "Need of Establishing Altitude Levels for International, Interstate and Interurban Air Travel."

SUNDAY, MAY 25TH

EVENING—Aeronautic Art Day. Address on "Aerial Painting and Sculpture of Different Countries, and Exhibition of Aerial Paintings," by Lieut. Farre, Lieut. Ruttan and others. All prominent artists, managers of art galleries and art patrons invited to attend.

ENGINEERING WEEK

MONDAY, MAY 26TH

EVENING—"Aeronautic Engineering Problems and Their Prospective Solution." Opening of contests for designs and ideas for large aeroplanes.

TUESDAY, MAY 27TH

EVENING—"Factors That Increase the Efficiency for Large Dirigibles." "Advantages of Veneer and Plywood for Aircraft Construction."

WEDNESDAY, MAY 28TH

AFTERNOON—Address on "Problems of Flying at 35,000 Feet and Over, and Their Prospective Solution."
EVENING—"Present Day Aero Engines."

THURSDAY, MAY 29TH

AFTERNOON—"Flying Boats Versus Hydroaeroplanes for Sport and Transportation."
EVENING—Contest for designs and ideas for large aeroplanes.

FRIDAY, MAY 30TH (Memorial Day)

AFTERNOON—Aircraft contests.
EVENING—Reception at the Aeronautic Hall, Steel Pier.

SATURDAY, MAY 31ST

AFTERNOON—Aircraft contests.
EVENING—"International Medical Standards for Aviators in War and Peace." Reports from different countries illustrated with attractive films. 50,000 medical men invited.

SUNDAY, JUNE 1ST

AFTERNOON AND EVENING—Award of prizes and diplomas for all events.

The News of the Week

Martin Bomber Covers 650 Miles In 7 Hours 55 Minutes

Washington, D. C., May 8.—A Martin bombing plane carrying four passengers completed a round trip flight from Macon, Ga., to Washington, D. C., and return with a non-stop flight from Washington to Macon. The distance of 650 miles was accomplished in seven hours and fifty-five minutes.

The passengers were: Lieut. Colonel T. E. Gillmore, of the Royal Air Force, Major W. H. Frank of the U. S. Air Service, Captain Roy N. Francis, Pilot, and Lieut. E. E. Harmon, second Pilot. The party left Bolling Field, Washington, D. C., for Macon, Ga., Sunday, May 4th. at 1:25 P.M. and arrived at Pinehurst, S. C., at 6:05 Sunday evening, stopping there over night.

From the Peace Treaty

The importance which is now attached to aerial transportation rights and aerial equipment in the enemy country may be realized by the extracts from the Peace Treaty on the air and aerial navigation:

"The armed forces of Germany must not include any military or naval air forces except for not over one hundred unarmed seaplanes to be retained till October 1, to search for submarine mines. No dirigible shall be kept. The entire air personnel is to be demobilized within two months, except for 1,000 officers and men retained till October. No aviation grounds or dirigible sheds are to be allowed within 150 kilometers of the Rhine or the eastern or southern frontiers, existing installations within these limits to be destroyed. The manufacture of aircraft and parts of aircraft is forbidden for six months. All military and naval aeronautical material under a most exhaustive definition must be surrendered within three months, except for the 100 seaplanes already specified.

"Aircraft of the Allied and Associated Powers shall have full liberty of passage and landing over and in Germany territory, equal treatment with German planes as to use of German airdromes, and with most favored nation planes as to internal commercial traffic in Germany. Germany agrees to accept Allied certificates of nationality, airworthiness or competency or license and to apply the convention relative to aerial navigation concluded between the Allied and Associated powers to her own aircraft over her own territory. These rules apply until 1923 unless Germany has since been admitted to the League of Nations or to the above convention."

Roy Knabenshue, W. E. Duersten and Col. W. N. Hensley, Jr., at Wingfoot Lake, Akron, Ohio, with the first army dirigible in the background

Aerial Sightseeing Service for Yellowstone Park

The Grand Canyon, Yosemite Valley, Yellowstone National Park, and the Little Zion Canyon will all be linked in a day's tour by the new airship sightseeing trip, that will be in operation this summer in the intermountain States of the Rockies. Lieut. George C. Beck, chief engineer of the new Utah Motor Corporation, is in New York contracting for the purchase of passenger carrying aeroplanes to be delivered by July 4.

Five Curtiss biplanes from Canada will reach the Utah Company's field at Salt Lake City this week, and exhibition flights will be made there Memorial Day.

The new corporation is capitalized at $2,500,000. L. J. Gilmer, a prominent Western automobile manufacturer, and J. C. Kinney, multi-millionaire oil magnate, control the chief interest in the new company. All the pilots of the ships are ex-army fliers.

Details of the Transcontinental Flight

Some interesting facts are coming out regarding Major Tom C. Macaulay's remarkable aeroplane flight in doubling the continent—San Diego to Jacksonville—Jacksonville to San Diego—although the Major's route was first to the west, Fort Worth to San Diego and return, thence east, Fort Worth to Jacksonville and return. The Major's flight was on a course between the 30th and 33rd parallel of latitude. This carried him from California, across Arizona, about one-third of southern New Mexico, across the entire state of Texas from El Paso to Marshall, then Louisiana, Mississippi, Alabama, Georgia and Florida, in all nine states. This was the Major's third continental trip, and the flying was done between April 12th and 18th. The total distance, coast to coast and return, was 4,642 miles—flying time 4¼ hours and 15 minutes.

The eastern flight, on account of favorable air currents was accomplished in 19 hours, 15 minutes.

The aeroplane used was a De Havilland Four equipped with Liberty Motors, and carried 60 extra gallons of gasoline and 10 extra gallons lubricating oil. The flight west across Texas was at an elevation under 1,000 feet, and guided wholly by the compass. The trip over the Coast Range Mountains at an elevation of 8,500 feet was uneventful, and San Diego reached without incident. Eastward over the snow-covered coast range an eleva-

Curtiss Flying Boat over the German submarine in the Hudson River during the Victory Loan Drive

tion of 11,000 feet was attained for the purpose of taking advantage of strong westerly currents. East of Fort Worth conditions were good at 6,000 feet into Souther Field, Georgia, and at 3,000 to Jacksonville, Florida; the return to Fort Worth was without incident. The summary distance and time was as follows:

	Miles	Time Hrs.	Mins.
Ft. Worth to El Paso...	580	7	15
El Paso to San Diego...	704	7	20
San Diego to Ft. Worth.	1284	10	10
Ft.Worth to Souther Field	852	6	55
Souther Field to Jacksonville and return to Jackson, Miss.....	812	8	5
Jackson, Miss., to Ft. Worth	410	4	30
Total	4642	44	15

The Pan-American Commercial Conference, June 2 to 5, 1919

The governing board of the Pan-American Union, Washington, D. C., having in mind the great present interest in Pan-American trade, believe that much good should result to governments, organizations, firms, and individuals from an informal but comprehensive exchange of views and information between the official and unofficial representatives and experts and others interested in the commercial development of both North and South America.

Among those invited to attend and participate will be the diplomatic, consular and special commercial and financial representatives in the United States of Latin American governments, representatives of Latin American firms and houses, and such unofficial experts as are able to attend, officials of the United States Government having to do with Pan-American economic, financial and commercial relations, as well as commercial and trade organizations, firms and houses which are directly interested in Pan-American trade.

The great interest which the Second Pan-American Aeronautical Exhibition, Convention and Race Meet at Atlantic City has aroused with the representatives of the Latin American Republics makes this commercial conference a particularly appropriate place to build up the rapidly growing trade importance of aeronautical equipment and supplies. The market for aircraft in South and Central America is a very broad one, and it is felt that the aircraft manufacturers will lose no opportunities to gather information and to cement trade relations which will prove of paramount importance.

Dirigible C-5 to Attempt Rockaway-Newfoundland Flight

St. John's, N. F., May 10.—The United States Navy dirigible C-5, now at Montauk Point, N. Y., will make a test flight to Newfoundland within a few days, according to officers of the cruiser *Chicago*, which arrived here from New York, flying the flag of Rear Admiral Spencer S. Wood.

The *Chicago* came here under special orders in connection with the dirigible flight, and brought a quantity of equipment, including containers of hydrogen gas. It is understood the flight will be undertaken immediately after the naval flying boats have cleared these waters. It has been decided to hold the trial at this time in order to utilize as a patrol the naval ships on duty for the seaplanes.

Two More British Competitors

Captain John Alcock and a party of aviators and mechanics have arrived at Halifax on the Mauretania to prepare for an attempt to fly across the Atlantic in a Vickers Vimy machine. Another candidate for the great international ocean-crossing contest by air is Col. John Cyril Porte's immense flying boat, which is entered for the *London Daily Mail's* $50,000 prize.

This giant plane, named the Felixstowe Fury, is a Handley Page, built from Col. Porte's own designs.

An Addition to the Sopwith Trans-Atlantic Equipment

A new device—a throat transmitting telephone—has been added by Hawker to the equipment of his trans-Atlantic plane. This telephone makes conversation between pilot and navigator easy despite the roar of the motor. The principle is the transmission of the vibrations of the throat by means of a band about it and the shutting out of the engine noises by permitting the roar to beat with equal force on both sides of the transmitting diaphragm. It is similar to that used by the American tank soldiers during the war.

Three Navy Seaplanes Made Seven Hundred Mile Non-Stop During War

Washington, D. C.—Owing to strict military censorship, it was not announced until recently that on Nov. 7, 1918, three navy planes H. S. flying boats left Bay Shore, L. I., for Brunswick, Ga., a distance of approximately 700 miles. The squadron was under the command of Lieut. Harold F. Selden. These three planes arrived in Brunswick twenty hours later, after stopping for fuel at Cape May, N. J.; Hampton Roads, Va.; Moorehead City, N. C., and Charleston, S. C. The boats were flown by the following officers: Ensigns Paul Storrer, Taylor, Titts and Shanks. This flight was so successful that a second flight was made the following week, three other planes leaving Bay Shore for Brunswick. Two of them arrived as successfully as the first three, but one was wrecked on the coast of North Carolina.

The Cleveland Aviation Club

Since the organization of the Cleveland Aviation Club in April, this enterprising body of one hundred and thirty members has obtained five Government planes for flight for the Victory Loan, and is working hard to persuade the city to furnish a municipal landing field. Besides entertaining Capt. Eddie Rickenbacker at their inaugural banquet at the Hollenden Hotel, they have appointed committees to entertain the U. S. Government circus flyers, and to act as hosts for all flyers who may visit Cleveland

Board on Aeronautical Cognizance Warns Against Flying Without License

The Joint Army and Navy Board on Aeronautical Cognizance has found it necessary to issue a warning on recent indiscriminate operation of aircraft and the serious dangers entailed in the operation of aircraft by inexperienced fliers. The warning was the result of a flight over New York during the parade of the 27th Division in a flying boat at low altitudes.

The board points out that there is no way of adequately providing for the public safety where aeroplanes fly at too low an altitude over cities or large assemblies of persons. In case of accident a pilot would be forced to descend immediately, and human life and property would be endangered to a serious degree. All persons operating civilian aircraft are cautioned against the repetition of an occurrence such as that at New York, and are warned that before engaging in the operation of any aeroplane or balloon they must first secure a license from the Joint Army and Navy Board of Aeronautic Cognizance.

Aviation on the Western Coast

Aviation in California is exceedingly active, and among the interesting demonstrations is a remarkable Sierra Nevada and Rocky Mountain flight, as well as a flight in two Curtiss planes, piloted by Lt. T. S. Curtis and Lt. Wm. Beck, to Ogden, Utah, from Mather Field. The course, which has never before been attempted by aeroplane, covers a distance of over 700 miles. At Mather Field special acrobatic demonstrations have been made for the benefit of some twenty-five thousand spectators, and owing to the superb weather conditions flights have been made to Berkeley, San Jose, Santa Cruz, Salinos, Hollister, Oreville, etc.

GLENN H. CURTISS ON THE TRANS-ATLANTIC FLIGHT

THE American N-C Planes will gain nine (9) hours from favorable winds if the average weather conditions for May prevail during the coming week. Such is the statement of Glenn H. Curtiss, inventor of the flying boat, and joint designer and producer with the U. S. Navy, of the Navy-Curtiss flying boats which are now at Newfoundland ready for the trans-Atlantic take-off.

"The conditions governing the trans-oceanic flight," said Mr. Curtiss, "are partly created by the weather and the route chosen, and partly by the flying craft themselves. The Navy has obviously given a long and careful study to both. In my opinion Naval flyers have chosen the best route and are employing a type of seaplane which gives them the largest possible factor of safety.

Advantages of the Azores Route

"There has been a difference of opinion as to whether the Newfoundland-Ireland or the Newfoundland-Azores-Portugal route is the better. The former is more direct. As one who has been interested in trans-Atlantic flight since 1914, however, I can see five distinct advantages to the southern course. They may be listed as follows:

1. It requires a maximum flight withiut landing of almost seven hundred miles less than does the northern route. The distance to Flores, the first Azores Island, is only 1200 nautical miles as against 1890 to the Scilly Islands, the nearest point off the Irish coast.
2. It avoids the dangerous fog belt which lies to the east and northeast of Newfoundland.
3. It is attended by more favorable weather generally,—warmer, clearer, and freer from atmospheric disturbances.
4. It is in the path of steamer traffic, and hence offers a greater element of safety in case it is necessary to make a descent in mid-ocean.
5. It is in the path of winds which, under normal circumstances, will increase by 40% the speed of the aeroplanes.

"The N-C planes could doubtless have gone by the northern route. It is shorter than the southern. If the trans-Atlantic voyage were to be admitted a hazard, better indeed to get it over with in the quickest possible time, like a cold shower. But the Navy, I believe, wishes to prove that for the right type of plane the Atlantic trip is not a hazard. The present flight is to be the demonstration of how others like it can be made regularly."

The Problem of Weather

Mr. Curtiss then discussed the question of wind and other atmospheric elements. The weather conditions for any part of the ocean during a given month are, he pointed out, in the large constant. Over the water lying between Trepassey Bay and the Azores the average winds blow from the northwest. This produces an exceptionally favorable condition, as the flying boats will be blown away from the fog belt (once they are through a small wind zone just off Cape Race) and almost directly toward the Azores. The velocity of these winds, rising so far as can be computed, to 30 miles per hour at 1500 feet elevation, is such that a course plotted to take full advantage of them will bring the aircraft to the Azores in about twenty hours, while if there were dead air the trip would take thirty.

Whether average weather conditions will prevail is a question. British flyers at St. Johns have been waiting over a month for the usual easterly winds, which they expected to find. It is not probable that the Navy boats will wait for ideal conditions, even though ideal conditions may be said to be the norm. They will be satisfied with conditions not distinctly unfavorbale.

Other Factors Governing Speed

"But wind," said the flying boat designer, "is not the only matter to be considered. It will be interesting to many to know that the speed at which an aeroplane flies is determined by a number of considerations. The N-C boats will not fly as fast as they can, for to fly at top speed would not be economical under the circumstances. Top speed uses up more fuel in proportion to distance covered than certain lower speeds, and in a trip like this gasoline and oil must be carefully conserved. In other words, an economy of energy is necessary for the purpose in view. The flying boats are in a sense like a runner. To start for the Azores at top speed would be somewhat like beginning a mile run with a 100 yard dash. They might draw on their fuel supply to a dangerous point. In any trip, therefore, where a saving of gasoline is desired, the motor is run at what is called *the economic speed.* This is the speed at which the greatest ratio of miles per hour to gasoline consumed may be obtained.

For instance, going at 75 miles an hour might demand a larger consumption of gas in proportion to speed than going at 70 miles an hour.

But the economic speed also varies with the amount of load carried. For instance, at the beginning of the present trip a speed of 71 miles an hour (regardless of wind) ought to be most efficient. This speed is higher than it would be if 28,500 lbs. did not have to be supported. Consequently as this weight is reduced by the consumption of oil and gas the economic speed lessens, less power being required to support less weight, and less power resulting in slower forward progress.

Thus if a flight of 30 hours were to be made, the economic speed would have decreased at the end of the voyage from 71 to 61 miles per hour. This would have followed a decrease in load of 11,000 lbs., the consumption for that period of oil and gasoline. The reduction would have been marked by the shutting off of one of the three motors with which the flying boat had been propelled after its take-off, it being possible to support the aeroplane with two motors after about 6,500 lbs. of gasoline and oil had been consumed, leaving a reserve of two motors during the remainder of the trip.

Prediction Possible Under Certain Conditions

If the speed of the flying boat were determined by wings and motor alone, we could thus estimate scientifically, knowing the load of 28,500 lbs., the position of our aircraft at any stage of the journey. Since the weather is an additional factor, however, we can only guess. With average wind velocity and direction, it should take just 21 hours for the N-C's to reach San Miguel, the Azores island at which they plan to stop unless it is advisable to descend at Flores.

If normal wind conditions should prevail, the boats would have, at the beginning, a flight for three hours against a cross wind. They would fly at 71 miles per hour in order to sustain their load of 28,500 lbs., and would gain from the

THE START OF THE TRANS-ATLANTIC FLIGHT

By G. DOUGLAS WARDROP

THE navy fliers have made a gallant and successful start. The longest, most difficult, and most dangerous part of their journey still lies ahead, and they may yet find some obstacle in weather conditions such as have held the British fliers so long at St. John's. But all praise to them for their good beginning.

The three United States Navy flying boats NC-1, NC-3, and NC-4, got away from Rockaway at 10 o'clock on the morning of May 8th. After several days of waiting, commanders and crews were on edge when gray dawn stole in this morning and were early down at the launching ways of the three big flying boats. Before 8 o'clock the "One" and the "Three" were taken out for test flights, and were found fit in every minutest particular. Victualled, fuel tanks filled, tuned up to the last minute, they were ready to go.

The only thing holding back the start was uncertainty as to the weather along the coast to the north. At Rockaway weather conditions were ideal for flying, with a gentle, steady wind out of the northwest which would put it almost at the fliers' backs. And as reports came in from northern points, showing the weather equally favorable all along the route, the impatience of men and commanders to be off became more and more marked.

At length the full weather report from Washington arrived at 9.30 A. M., and Commander Towers, standing among a group of officers, grinned broadly and cried:

"Well, boys, we beat it!"

The ensuing half hour was a busy time, with none except those officially attached to the navy permitted near the marine railways or launching ways which held the three big seaplanes. The watching crowd was small, however, consisting of some 500 to 600 attaches of the naval air station and of newspaper men. To this number was added presently a group of women, including the wives of Commander Towers and his brother officers.

Captain Noble E. Irwin, U. S. N., chief of the Bureau of Naval Aviation, Washington, escorted the women to the station and on arrival excused himself to run forward to the launching ways, waving some small object in his upraised hand. He was laughing as he greeted the first man, extending the object to him.

"A four-leafed clover," said the man. It was Lieutenant-Commander Richardson. "Gee!"

And he crammed it deep into a well-protected pocket.

Captain Irwin, a "four-striper," hustled along the launching ways, dealing out other four-leafed clovers from his pocket to officers and mechanics of the boat crews alike. Each man receiving his smiled beatificially, as if certain that now all would be well, and immediately stowed that clover away at the bottom of everything.

"Hey, Captain," a voice called out, as Captain Irwin was about to turn away, "don't forget 'Smoke'!"

The captain faced about and at the sound of his name being shouted, "Smoke" Rhodes, mechanic of the NC-4, looked up from his occupation of tinkering with something in the cockpit of the big boat, and peered over the edge, fifteen feet above Captain Irwin's head. With a wave of the hand, the captain started to provide a reserve personnel in to climb up and "Smoke" stretched a greasy hand down to meet him. He took the extended clover, and then the captain gripped his hand, grease and all, and shook it heartily.

At this sign of comradeship between "four striper" and mechanic, the sailors ashore let out a cheer.

And now the hour to start had come. The three boats were poised on the launching ways, bodies of battleship gray, wings yellow. Every man was in his place. Each boat held its crew of six, with an additional man to be carried as far as Newfoundland in order that minor mechanical difficulties which might occur in the first part of the trip could be quickly remedied, and also in case of any sickness developing among the regular crews.

The men obviously were laboring under great nervous excitement as they settled in their places, adjusting over their heads the instruments of the wireless telephone with which they could communicate with each other. The pilots gripped the wheels. The crowd stood clear.

With a tremendous roar, the four big Liberty motors of the NC-3, Commander Towers' craft, began turning over. The boat leaped down the launching way like a thing alive and slid far out into the water. It was 9.57.

Another roar, the NC-4 was on her way, 9.58.

Another roar, the NC-1 was off, 9.59.

For a few breathless minutes the boats manœuvred in the water. Then the "Three" suddenly soared upward. One minute later to the second the "Four" followed in the air. And another precise minute behind rose the "One."

There was little cheering. Everybody was too busy watching and thinking of what the start of the flight portended, perhaps, to give vent to his feelings.

Long before the flight was determined upon, the few spectators were assembled. Besides Commander Irwin, Commander A. K. Atkins, head of the aviation sec-

American and British Planes Ready for Ocean Flight

St. John's, N. F., May 14.—The American NC-1 and NC-3 planes are ready to attempt the ttransatlantic flight as soon as the storm area over the mid-Atlantic disappears. The NC-4 is expected daily from Chatham, Mass., where she was forced to descend on account of engine trouble encountered on the first leg of the flight from Rockaway Naval Air Station. Unfavorable weather conditions have prevented the NC-4 from rejoining the NC-1 and NC-3 at Trepassey Bay.

According to press dispatches, it is considered likely that the NC-4 will attempt to fly to Trepassey Bay from Chatham in one flight. It is considered improbable that the NC-1 and NC-3 will wait for the NC-4, and hence every effort is being strained to reach Newfoundland before the start of the remainder of the fleet.

Two aviation parties contemplating a transatlantic flight in Bolton and Paul and Vickers-Vimy aeroplanes, both of British make reached here on May 13. While Messrs. Hawker and Raynham, pioneer flyers at this "hopping off" place, studied weather charts which indicated continuance of unfavorable conditions which have held them landbound for more than a month. Captain U. S. Bennett began an inspection of a possible site for the Bolton and Paul three seater, while Captain A. A. Alicott and A. W. Brown conducted negotiations for the housing of their Vimy machine.

The NC-1, first of the NC flying boats built for the Navy's attempt to fly across the Atlantic

tion of the Bureau of Steam Engineering, which is responsible for the power plants of the planes, also came on from Washington.

Glenn H. Curtiss, builder of the planes; Commander G. C. Westervelt, who had much to do with the construction of the hulls of the ships; G. Douglas Wardrop, managing editor of AERIAL AGE; Mrs. Richardson, wife of Commander H. C. Richardson, pilot on the NC-3, and her little daughter Margaret Jane; Mrs. Ida Harding, aunt of Lieut. Barin, pilot on the NC-1, and Lieut. Commander George R. Murray, commandant of the naval aviation station at Anacosta, D. C.; Dr. Charles Olmstead, designer of the propellers used by the seaplanes, and Herbert Satterlee, formerly Assistant Secretary of the Navy, and Mrs. Satterlee, also were present.

When the planes leave for the Azores, 1,200 nautical miles distant from the starting point at Trepassey Bay, Newfoundland, they each will weigh 28,000 pounds, for they will carry two tons more of gasoline than they did on their first hop. In addition, instead of seven men the flagship of Commander Towers will carry only five, who, besides the commander, will be Commander Richardson and Lieut. David H. McCullough, pilots; Lieutenant-Commander R. A. Lavender, radio operator, and Machinist L. R. Moore. Lieutenant-Commander R. E. Byrd, who was on board yesterday to conduct special navigational experiments, and Lieut. B. Rhodes, reserve pilot engineer, will be dropped at Newfoundland.

Lieut. J. L. Breese will quit the crew of the NC-4 at Newfoundland, leaving it composed of Lieutenant-Commander A. C. Read, commander and navigator; Lieuts. E. F. Stone and Walter Hinton, pilots; Ensign H. C. Rodd, radio operator, and Chief Machinist's Mate E. S. Rhodes.

From the crew of the NC-1 Machinist R. Christensen will be eliminated, leaving Lieutenant-Commander Bellinger, navigator; Lieutenant-Commander M. A. Mitscher and Lieut. L. T. Barin, pilots; Lieut. H. Sadenwater, radio operator, and Chief Machinist's Mate C. I. Keslef, engineer, to make the next leg in the journey.

The Personnel of the Expedition

Commander John Henry Towers is in command of the division of three NC flying boats. He was one of the first to go into aviation, at a time when the officers of the navy thought a man was ruining his career to take up with what many thought was only a dangerous toy, and his record covers the whole period of the development of aviation in the navy. A happening in his early career is told as characteristic of the man. In 1910, just after he had become a student in aviation, he and Ensign Billingsly were up in the air 1,500 feet, in a machine of the primitive type of those days, with a bamboo frame. An accident happened, control was lost, and the machine swung over with such velocity that both men were thrown from their seats. Billingsly was flung clear of the seaplane and fell to his death. Towers managed to catch hold of a strut and held to this in the descent toward the water. Just before the machine reached the water, the wind caught it and it leveled off. This broke the fall and saved Towers's life.

In the course of the next year the navy made a definite start in the development of aviation. Towers was ordered to Hammondsport, N. Y., where arrangements had been made with Glenn H. Curtiss to build two flying boats and instruct two officers in flying. Lieutenant Towers, with Lieutenants John Rodgers and T. G. Ellyson, also pioneers, were soon ordered to Annapolis, where three small hangars had been built. The equipment (it sounds like 100 years ago compared with what the navy has today) consisted of one seaplane, one Curtiss landplane, and a Wright. There they continued to fly until January, 1912, when Towers was ordered to the San Diego experimental camp. Next year he was at Annapolis as the senior officer for the training of officers in flying. In the Fall of the year he made a new world's record for sustained flight in the air—six hours and eleven minutes. In 1913 he was ordered to Guantanamo, Cuba, to educate the fleet at that naval base in the possibilities of aircraft. All the time he was engaged in development work, and was one of the originators of the catapult and cable for launching a seaplane from the deck of a battleship.

When the trouble with Mexico arose he was placed in command of the aviation naval detachment in the expedition against Vera Cruz. On his return to Washington he was ordered to special duty to assist in the development and building of a seaplane to cross the Atlantic. At the start of the war he was ordered to Europe, on his own application, as an observer of aviation development there. He visited all the principal air stations, and, while making studies in England, served as Assistant Naval Attache to the American Embassy. In October, 1916, he was assigned to duty in the Office of Operations, Navy Department, where he was the only aviation officer up to the time we entered the war. Later, as a Lieutenant-Commander, he was made Senior Assistant to the Director of Naval Aviation. He received his appointment as Commander in July, 1918. In February of the present year he was placed in charge of the development of plans and the assembly of material for the proposed transatlantic flight. In the order of the latter part of April placing him in command of the transatlanic flight is the following:

"As commander of NC seaplanes Division 1, of regularly commissioned seaplanes, his status will be the same as of seagoing ships of the navy."

Commander Towers is a Georgian, 34 years old. He was graduated from the Naval Academy in 1906. He is married and has a daughter.

With Towers on NC-3

In describing the personnel of each of the seaplane crews separately the strength of the navy's position in attempting the transatlantic flight is brought out. Each commander is a line officer of the navy, and an expert in navigation. Then there are representatives of the Bureau of Construction and Repair, officers who bore an important part in the design of the NC seaplanes, and who therefore know well every part of the construction in case of any trouble. Then there are the representatives of the Bureau of Steam Engineering, with expert knowledge of any problem that will arise in that field; radio men whose inventive ability has added improvements to the apparatus in use, and mechanicians with rare skill for detecting engine trouble. In addition there are overlapping qualifications that bind the crews together. With the exception of the radio men all are pilots. Only the navy, it is evident, could have drawn all these varied experts from one organization.

On Seaplane No. 3, with Commander Towers, the construction end is represented by Commander Holden C. Richardson. He had a large share, it is understood, in the design of the hull of the NC planes. He has been an aviation pilot for many years, and was one of the men who, with Towers, developed the catapult for launching a seaplane from a battleship. He is a Pennsylvanian, born in 1878, and entered the Naval Academy in 1897. Graduating high in his class, he was assigned to construction. His first important connection with aviation came in 1912, when he was ordered to the navy yard at Washington for experimental work on naval hydroplanes. He became one of the first aeronautical engineers in the country, and for the last six years, with some interruptions, has been engaged in the design and construction of seaplanes. While at the Pensacola Station he was one of the first officers to risk his life in a seaplane driven for the first time by a Liberty motor. He is 41 years old.

Lieut. Commander Robert Lavender, the next member of the crew of No. 3, is the radio officer of that ship. He has played a leading part both in the early experimental work in radio telegraphy and telephoning and in their development. He is the officer who gave Secretary Daniels a new experience a short time ago—a talk from Washington wih an aeroplane miles away. Lavender was at the air end. Lieut. Commander Lavender was with Admiral Sims when he was in command of the destroyer force a few years ago. He went up at Guantanamo to test a radio telegraph set, then in its earliest stages. Lieut. Commander Chevalier was the pilot. The machine fell. Lavender sought to stay himself by catching hold of the sides of the boat, and when the plane struck the water both his arms were broken. Chevalier was asked afterward to tell how the fall felt when they struck the water.

"As if you ran into a stone wall when going at the rate of 200 miles an hour," he said.

The experience merely called forth a larger supply of grit in Lavender, though it took a year for him to recover from the effects of the accident. He was assigned to shore duty and placed in charge of all radio material for aircraft work and went to England, France, and Italy to inspect radio air plants there. Laterf, under his supervision, the radio telephone for speaking to and from aeroplanes was developed for long distances. He was born in Iowa in 1889, and appointed midshipman from that State in 1912.

Lieut. Commander Richard C. Byrd, navigator, appointed to the Naval Academy from Virginia in 1908, is a retired naval officer who on his return to active duty in 1917 entered the aviation branch. After completing his course he was ordered to Halifax, Nova Scotia, and placed in command of the United States naval forces operating in Canadian waters. There he made a reputation in the building up of our two stations, one at Halifax and the other at North Sidney, and it is evident that his quick grasp of aviation in view of the short time he has been in the service won him a place in the roster of the transatlantic crews. He is 31 years old

Lieutenant David H. McCulloch, pilot and experimenter in No. 3, member of the United States Naval Reserve force, has been flying many years and is known as one of the best pilots which the war brought to the service of the navy. In August, 1918, he flew from Garden City, L. I., to Hampton Roads, and was one of the first men to go up in the navy's big seaplane. At Hampton Roads he trained many navy aviators for overseas service. He was born in Port

The NC-4, which was delayed at Chatham, Mass., owing to motor trouble experienced in the first leg of the trans-Atlantic flight

Royal, Penn., in 1890, and entered the Naval Reserves in October, 1917. McCulloch is known for his daring. In laying out new types of machines he has been a chief test pilot for the navy during the war.

Next in No. 3 comes Lieutenant Braxton Rhodes, engineer. He is one of the best motor mechanics in America. He knows all the makes of motors like a book, and after several years' service in the navy his skill, steadiness, and nerve led to his alvancement from the ranks. In October, 1917, he was made an ensign in the United States Naval Reserve force. For a short time he was on the other side during the war, at the United States Naval Air Station at St. Trojan, France, in connection with the engineering of various types of motors, and thus not on a duty that barred him from selection for the transatlantic flight. Lieutenant Rhodes was born in Windsor, N. C., in 1892.

Boatswain Lloyd R. Moore is the last man in No. 3 seaplans. His genius as a motor mechanic raised him from the level of an enlisted man. A navy aviation officer said the other day aa Washington that Rhodes and Moore were undoubtedly two of the best motor enginemen in the world.

Moore was born in Grand Island, Neb., in 1892 and won his appointment as boatswain in May, 1918.

Fliers on NC-1

Lieut. Commander Patrick N. L. Bellinger, comander of the NC-1, like Towers, goes back to the very beginning of aviation in the navy. He was our fourth naval officer to qualify as an aviator. Before that he had specialized in gunnery. In 1910 he commanded the turret that made a new high record. Then his daring nature sought opportunity with the submarines, and during 1912 he was attached to the Atlantic Submarine Flotilla. In the following year the risks and promise in aviation appealed to him, and he was ordered to the Naval Academy, and he has been prominently identified with the development of aviation ever since. In 1914 he was sent to Guantanamo, Cuba, where an aviation camp was to be established for the Atlantic Fleet; then to the North Carolina to assist in the experiments for the launching of a seaplane from the deck of the ships by means of the catapult.

In the Winter of 1915 he took part in one of the first instances in which gunnery fire from a ship was spotted by means of an airplane. With Lieut. Commander Read as the observer, he flew over from the naval air station at Pensacola to the fleet, and spotted for the New York and Texas in firing at special emplacements at Fort Morgan, Mobile Bay. In 1916 the Lieutenant Commander had charge of the experiment and test department at the Pensacola Station, which included the trying out of all new machines. The next year, in November, he was placed in command of the naval air station at Hampton Roads, where he did important experimental work, besides serving on boards in connection with the location of new United States stations along the Atlantic Coast in the United States and Canada. Next to Lieut. Commander Chevalier, Mr. Bellinger has probably spent more time in the air than any other officer in the Navy. He is a man of remarkable physique, though of medium height, and will have his joke, even at the most ticklish times. He is a South Carolinian, born at Cheraw in 1885, appointed a midshipman from that Statae in 1903, and is married.

Next in No. 1 is Lieut. Commander Marc A. Mitscher, navigator. He took part in the aviation experiments on the battleship North Carolina, and is a graduate of the Navy aviation class of 1916. In 1918 he was placed in command of the Naval Air Station at Rockaway, L. I., and later was in charge of the Navy Air Station at Miami, Fla., one of the largest elementary training stations in the Navy during the war. His combined record as a pilot and an executive signaled him out for a place in the trans-Atlantic crew. He was born in Wisconsin in 1887, and entered the naval service as a midshipman from Oklahoma in 1904.

Lieutenant Louis T. Barin, pilot and experimenter, United States Naval Reserves, is both a designer and a pilot, with a combination of qualities hard to duplicate. At Pensacola, where he was stationed in 1917 to test out new planes, he acquired the name of "Daredevil Barin." There his nerve had to face a severe ordeal. He was up 6,000 feet with a new machine when it went wrong and, turning over, began to fall. Down it came, apparently a hopeless wreck, but Barin kept his head and worked with might and main to regain control. Within a few hundred feet of the water he succeeded, but his helmet and goggles were gone and his clothes partly torn off him by the air pressure of the descent at such a velocity from a great altitude.

Barin was born in Portland, Ore., in 1890, and entered the Naval Reserve Force in April, 1917.

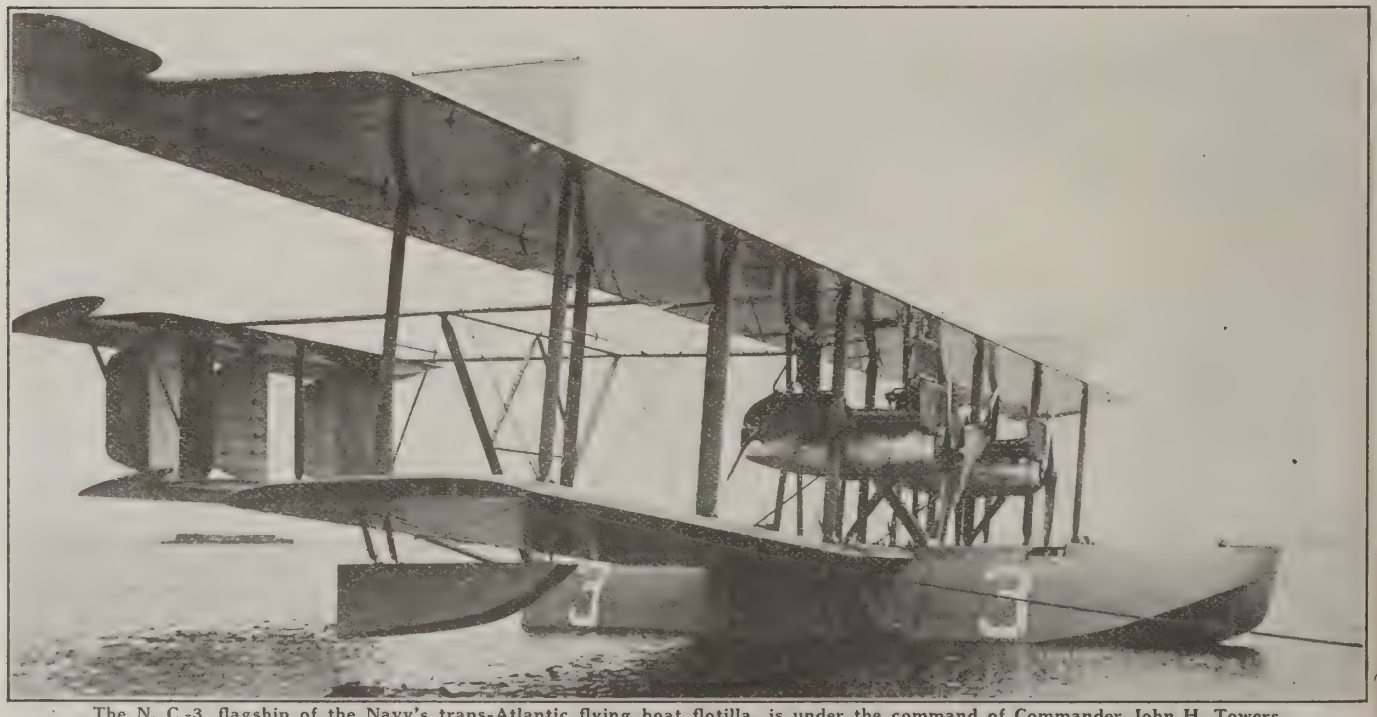
Lieutenant Harry Sadenwater, radio officer for Seaplane No. 1, has had unusual experience with the direction finder. Before he joined the Naval Reserves in April, 1917, he was radio instructor in in East Side Y. M. C. A., New York City, and was also radio inspector for the Department of Commerce in New York. In this capacity he adjusted the radio apparatus on every ship of importance coming into New York. Lieutenant Sadenwater was born in Brooklyn in 1894.

Machinist Rasmus Christiansen and Chief Machinist's Mate C. I. Kesler, mechanicians for No. 1, are both skilled in the highest degree and proved in previous emergencies. Christiansen was born in Germany in 1883, and is one of the old navy chief petty officers. Kesler entered the navy in 1905. He was born in Ohio in 1882.

On the Seaplane N. C.-4

Seaplane No. 4, the craft which alighted off the New England coast while trying to fly to Halifax on Thursday, is in charge of Commander Albert C. Read. He belongs to the second group, in point of time, in the development of Annapolis graduates in aviation. To the first group belonged Towers, Richardson, and Bellinger. The pioneers became pilots through individual training. Read is a member of the first aviation class of the navy, that of 1914. He had been graduated at the Naval Academy earlier, near the top of his class, and his ability advanced him rapidly in aviation. He not only won a place as one of the best pilots, but also as an administrator in the aviation division.

Commander Read was born in New Hampshire in 1887 and appointed a midshipman from Massachusetts in 1903. He is married and has one child, a boy. He is a small man, quiet and observing.



First Lieutenant Elmer F. Stone, pilot and construction, belongs to the United States Coast Guard and is one of the oldest fliers in that organization. His skill and daring when the war placed a greater pressure on the Navy led to his transfer to the Bureau of Construction and Repair as a test pilot for new machines, and the record he made won him a place in the trans-Atlantic list. Lieutenant Stone was born in New York in 1887 and appointed to the United States Coast Guard Academy from Norfolk, Va., from which he was graduated in 1910.

Lieutenant Walter Hinton, pilot, was an enlisted man who became an ensign in March, 1918, and on account of his skill as an aviator was designated as one of the pilots of the flying boat H-16 in its flight from Rockaway Beach to Hampton Roads last January. Hinton was born in Ohio and is 31 years old.

Lieutenant James L. Breeze, engineer, the next man in No. 4, is from the Bureau of Steam Engineering, Navy Department. During the war he served as a test pilot for experimental machines and was also engaged in the development of power plant accessories and apparatus as a member of the Havier-than-Air Engineering Section of the Bureau of Steam Engineering. In January, 1919, he was detailed to the special board, of which Lieut. Commander S. M. Kraus was the senior member, to make a study of equipment and power plant installation of the seaplanes being prepared for the trans-Atlantic flight. This is an illustration of how each member of the crews had previous thorough contact with the problems that would confront him on an ocean flight. Lieutenant Breeze is a member of the Naval Reserves, which he entered as an ensign in November, 1917. He was born at Newport, R. I., and is 34 years old.

Ensign Herbert C. Rodd, radio officer for No. 4, assisted in the development of the radio compass used on the three seaplanes. Before he joined the United States Naval reserves in August, 1918, Ensign Rodd served as radio operator on the Great Lakes. He was born in Cleveland, Ohio, in 1894.

In the original assignment of the crew of No. 4, E. H. Howard, United States Naval Reserve Force, and Eugene S. Rhoades, U. S. N., were the mechanicians of No. 4, Rhoades serving as assistant to Machinist Howard, but the accident by which Howard lost his left hand removed him from the list, and Rhoades was moved up to his place. Rhoades is serving for the second time in the Navy, which he entered as a coal passer, and is known as one of the best enginemen in the Navy. His home is at Somerset, Penn. He is 28 years old.

The N. C.-3, flagship of the Navy's trans-Atlantic flying boat flotilla, is under the command of Commander John H. Towers

FINDING AIRCRAFT LANDING STATIONS BY MEANS OF AUDIO FREQUENCY RECEIVERS

Address Delivered at the Second Pan-American Aeronautic Convention

By EARL C. HANSON

Expert Radio Aide, Bureau of Steam Engineering, Navy Department

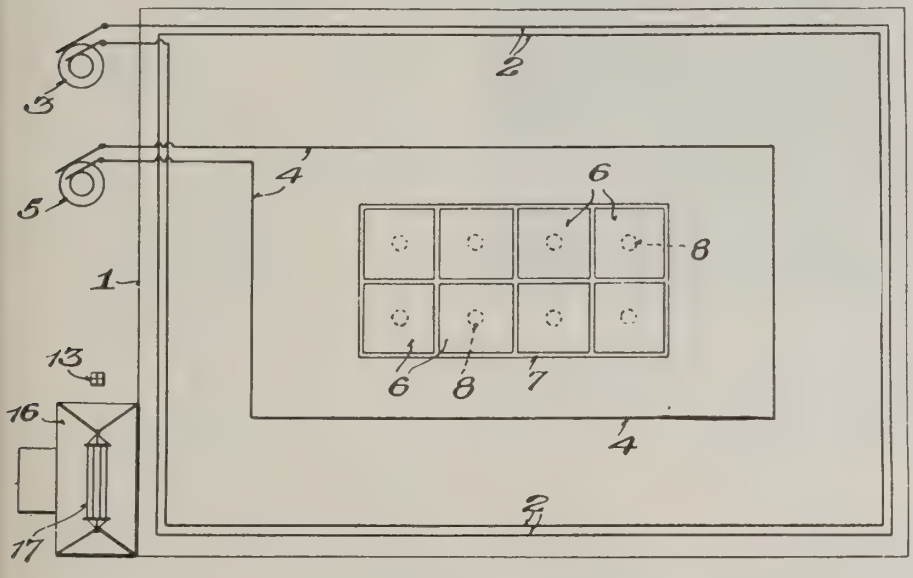
ONE of the most important problems confronting the successful future of commercial aerial navigation is the development of a practical means for the landing of aircraft with absolute safety in darkness and the densest fog. The purpose of bringing forth the following plan is to increase the safety in aviation and thus contribute to the advancement of this new art.

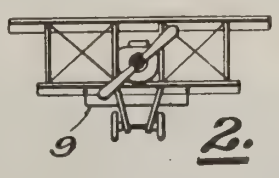
At present unless atmospheric conditions permit a clear vision of the field from a considerable distance and altitude, the bringing of aircraft to earth at the spot chosen is uncertain and hazardous. At night, even with the use of powerful searchlights, successful landings are exceedingly difficult. With this in mind we must now seek means of overcoming this difficulty

The Air Depot or landing station proposed is shown diagrammatically in Figures 1, 2, 3 and 4. It comprises broadly the combination of a radio directive transmission system to guide the aircraft at high speed in a direct course between separated cities or other points, audio frequency signal means to project audio frequency energy to predetermined altitudes but restricted to the area of the landing field; and an indirectly illuminated zone in the center of this landing field. The landing station is so equipped that aircraft flying between two ports can follow a direct course by noting the route in which the maximum strength of radio signals are received. If desired, visible electrical indicators actuated by the radio signals may be utilized. The purpose of the audio frequency transmission system is to indicate the exact location of the landing field in such a way that the aircraft in crossing the beam of projected audio frequency energy is not only aware that the field lies directly below but can determine under any condition the approximate altitude.

Before discussing the complete system it would be well to consider the development of the radio compass. Under the direction of Captain S. C. Hooper, U. S. N., head of the Radio Division of the Bureau of Steam Engineering, this new application of radio has progressed far beyond anything realized by the public. Captain Hooper is a firm believer in the radio compass as a means of promoting the safety of sea or aerial navigation. Upon his recommendation the experts of the Naval Radio Laboratory, Bureau of Standards, Washington, took up development in this important field. To-day all ships of substantial size in the Navy are equipped with this marvelous radio compass and shore compass stations are rapidly being constructed at the entrances of our principal harbors from which navigators may obtain bearings, although their ships may be enveloped in heavy fog. We are now ready to consider the application of the radio compass to aerial navigation.

Earl C. Hanson, radio engineer, Bureau of Steam Engineering, who is a pioneer in the development of radio telephone communication for moving trains, and the inventor of a system of wireless audio beacons for aero landing fields





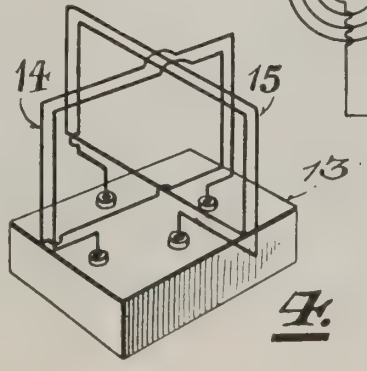


Fig. 1.

The proposed "Air Port" can be more readily understood by reference to the drawings. Referring particularly to Figure 1, the numeral 1 indicates the landing field of the Aircraft Station constructed preferably of solid material accurately leveled and equipped with drainage systems. 2 represents a plurality of insulated electric conductors located at the outer edges of the field and connected to a source of audio frequency current 3. 4 indicates a second loop of insulated electric conductors positioned nearer the center of the landing field and connected to a second audio frequency current source 5. Within loop 4 and at the center of the field is shown an illuminous landing zone. This zone comprises a series of translucent sections 6 supported in a suitable framework 7. The illuminated zone is level with the surface of the field. Beneath sections 6

2.

4.

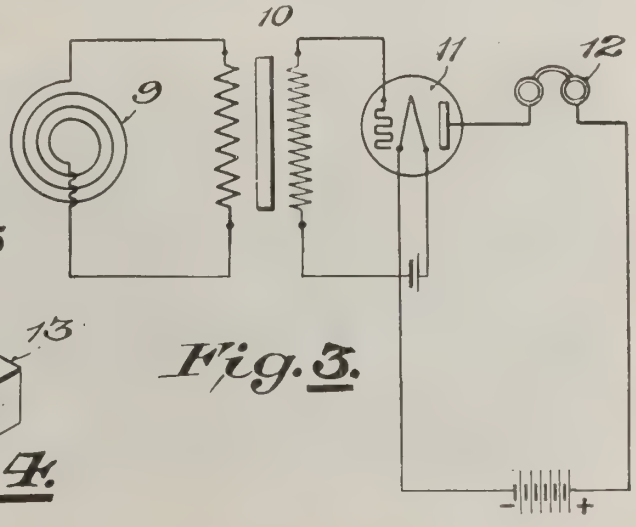

Fig. 3.

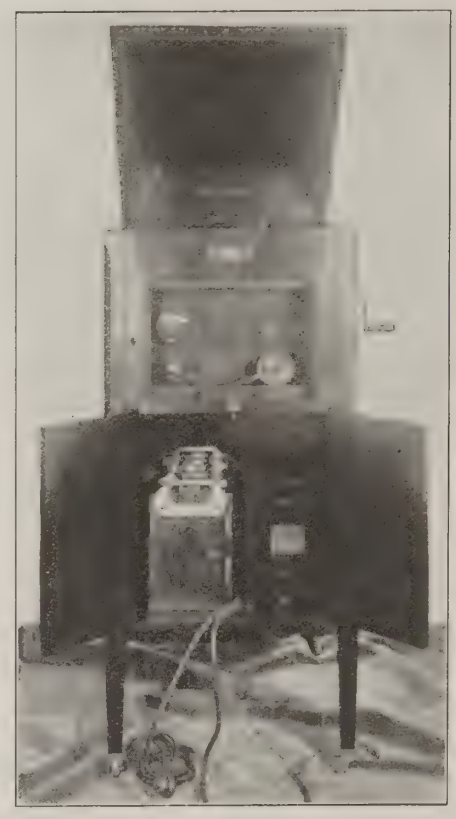
there are placed suitable lighting means 8 such that the entire translucent zone is rendered visible at a considerable altitude.

Figure 4 shows the radio compass signalling station represented by numeral 13 in Figure 1. The signalling apparatus is enclosed in casing 13, which may be of the usual form of radio frequency directive transmitting apparatus and is provided with coils 14 and 15 arranged at 90° to each other and positioned in vertical planes. The coils are arranged in predetermined directive lines such that signals transmitted will be propagated in line with the course of the aircraft between communicating stations in separated cities.

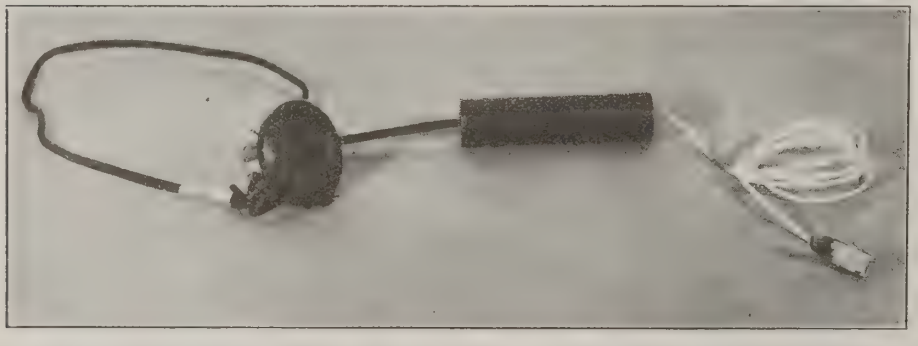
Figure 2 indicates an aeroplane provided with a looped conductor 9 connected to audio frequency responsive apparatus contained on the aeroplane. This audio frequency responsive apparatus is of the type using the well-known vacuum tube audio frequency amplifier and is in addition to the radio frequency apparatus The radio frequency apparatus is employed only in guiding the aircraft in their course between the communicating stations.

Figure 3 shows the wiring diagram of one form of audio frequency apparatus adapted to be installed on the aircraft The looped conductor 9 is connected to the terminals of the primary of an iron core transformer 10, the secondary of which is directly connected in circuit with the usual form of thermo-ionic tube amplifier 11 having the customary plate circuit with recording telephone 12. The circuit disclosed permits response to audio frequencies projected upward from the loops 2 and 4 at the landing field.



In the operation of the present landing station loops 2 and 4 are supplied with currents of different audio frequencies having different degrees of strength such that electro-magnetic energy will be projected upwards from loop 2 at high frequency and with relatively great strength, while energy projected from loop 4 will have a lower frequency and will be of weaker intensity. This combination of loops projecting electro-magnetic energy upwards at different frequencies to elevations of different heights provides means for aircraft approaching the landing station to readily locate the landing field and to determine immediately the elevation of the aircraft from the field. For example, the aviator wearing telephone receivers 12 within a helmet hears at a high elevation the audio frequency signal projected from loop 2 having a charactristic note and upon further descent comes within the field of energy projected upward by loop 4 having a different characteristic sound. As previously mentioned, the audio frequency energy could actuate visible indicators placed conveniently before the pilot.

Reference character 13 designates a radio compass signalling station located within the limits of the landing station.



The landing station is also provided with hangars, oil and gas service department, comfort facilities, a cafe, telephone booth, long distance radio telephone and telegraph installations. The radio antenna is shown at 17, elevated above the building 16.

The future success of commercial aerial transportation now awaits the establishment by municipalities the type of aircraft landing station presented.

The adoption of the proposed aircraft landing station together with strict regulations of aerial highways will result in the rapid development of this science and art.

Noiseless music transmitter installed at Walter Reed Hospital, Washington, D. C., the invention of Mr. E. C. Hanson. It sends music to all wards of the hospital, but is audible only to patients wishing to listen

By attaching this receiver to his bed-spring the wounded soldier at Walter Reed Hospital is able to hear the music or words transmitted by the electrostatic phonograph

Benzol for Engine Fuel

The Committee of the National Benzol Association has issued the following specification for benzol for use as engine fuel:

(1) Specific gravity, 0.870 to 0.885.

(2) Distillation test (by flask):

Benzol shall give a distillate of not less than 75 to 80 per cent at 100 deg. C.

Benzol shall give a distillate of not less than 90 per cent at 120 deg. C.

Benzol shall give a distillate of not less than 100 per cent at 125 deg. C.

(3) Sulphur shall not exceed 0.40 per cent.

(4) Benzol shall be entirely free from water.

(5) Color shall be water white.

(6) Rectification test: 90 c.c. of the sample shaken with 10 c.c. of 90 per cent sulphuric acid for 5 min. should not give more than a light brown color to the acid layer.

(7) Benzol shall be entirely free from acids, alkalis and sulphuretted hydrogen.

(8) Benzol shall not freeze at 25 deg. Fahr. below the freezing point of water.

Such a specification should insure general freedom from trouble with this fuel. The tendency which pure benzol has to freeze readily is amply provided against, and this is a good point. The negligible amount of sulphur allowed is also satisfactory, as with it no cylinder corrosion is likely to occur.

—*Motor* (London).

Book Review

ELEMENTARY AERONAUTICS, or The Science and Practice of Aerial Machines. Compiled by Albert P. Thurston, B. Sc. 126 illustrations.

The author has been persuaded to publish this work in the hope that it may be useful in leading others to the scientific study of aeronautics. The aim of the author, therefore, has been to present to the reader a simple and concise account of the action of air upon moving planes, aerocurves, propellers, bars and the like, and the application of these principles to practice.

The theory of the normal and inclined plane and aerocurve is dealt with in Chapters I and II.

An introduction to the important problem of stability has been given in Chapters III and IV. The theories and results deduced in Chapters III and IV appear largely to have been confirmed by various experimenters and scientists since these conclusions were arrived at.

The theory of the propeller and helicopter and the calculations relating to the design of a flying machine are set out in Chapters V, VI and VII. The principal instruments and apparatus used in an aeronautical laboratory are described in Chapter VIII, and the rest of the book is devoted to a description of the chief types of flying machines and engines.

Chapter I, Normal and Inclined Planes; Chapter II, Aerocurves; Chapter III, Automatic Longitudinal Stability and Manual and Automatic Control; Chapter IV, Automatic Lateral Stability; Chapter V, Propellers; Chapter VI, Helicopters; Chapter VII, Calculations Relating to the Design of a Flying Machine; Chapter VIII, Laboratory Instrument and Apparatus; Chapter IX, Types of Machines; Chapter X, Engines. This publication can be purchased at The Aeronautic Library, Inc., 299 Madison Avenue, New York City, at the price of $1.75 post paid.

THE O. W. TIMM MODEL T-18 TRACTOR

THE T-18, designed and built by O. W. Timm, Venice, Cal., is one of the latest types of two-place advance training and sport planes. It has a high safety factor to withstand the severe strains of stunt flying and rough landing. Dual controls are installed.

Tanks contain 40 gallons of gasoline and 5 gallons of oil, which is sufficient for a flight lasting about four hours.

General Dimensions

Span, upper plane	44′ 0″
Span, lower plane	36′ 0″
Chord, upper plane	5′ 0″
Chord, lower plane	3′ 6″
Gap between planes	5′ 0″
Overall length	25′ 0″
Overall height	9′ 6″

Areas	(sq. ft.)
Upper planes	180
Lower planes	118
Ailerons	40
Stabilizer	13.5
Elevators	23
Fin	5
Rudder	10
	pounds
Loading per square foot	5.63

Weights	pounds
Net weight (empty)	988
Gross weight (fully loaded)	1903
Useful load	915
Loading per sq. ft.	5.63

Performance

Maximum speed	97 M.P.H.
Minimum speed	38 M.P.H.
Climb in 10 minutes	7,600 feet
Range of endurance	4 hours

Main Planes

Incidence angle of both planes 2.5 degrees. Main planes are in five sections. Clearance between the sections is ¾″.

Upper plane has no dihedral; lower plane 2½ degrees dihedral.

Ribs are designed from U. S. A. No. 1 data, and are built with 5/32″ 3-ply white poplar webs and 5/32″ by ⅝″ spruce battens. Beams are of I section, spruce.

Ailerons attached to the upper plane are 12′ long and have a chord of 20″. They are constructed entirely of steel tubing. Main members 1⅜″ 18 ga., ribs 5/16″ 20 ga.

Fuselage

Length overall, 19′ 10″; width, 27″; depth, 36″.

The fuselage is built in two sections, being detachable directly back of the rear seat. Front section is built up of ash, channeled for lightness. Longerons are laminated.

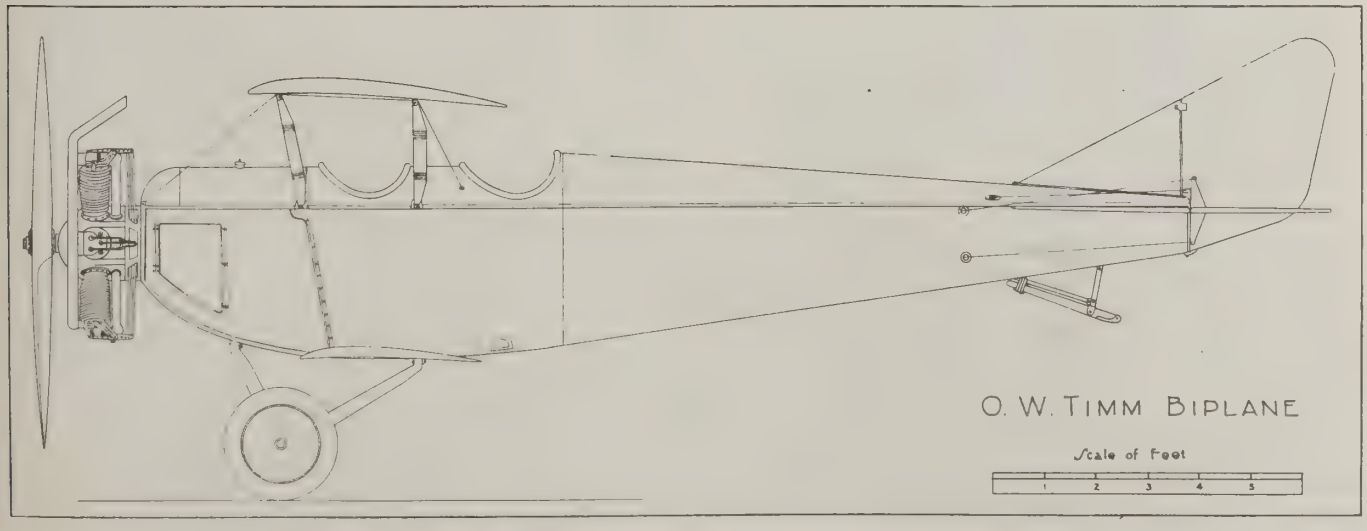
Rear sections is of spruce.

Engine mounting is a steel stamping. Complete power plant can be removed in less than twenty minutes by removing 8 bolts and the gasoline line connection.

Landing gear is of the V type. Ackerman wheels, with 26″ by 4″ tires.

Tail Group

Tail group is built entirely of steel tubing, and is as light as wood and much stronger. No wires or braces are used. Stabilizer planes are built in two sections, and the angle of incidence is adjustable.



Overall width of stabilizer planes, 8′ 10″; overall depth, 3′ 4″; overall width of elevator, 10′ 9″; overall depth, 33″; overall width of rudder, 36″; overall depth, 52″.

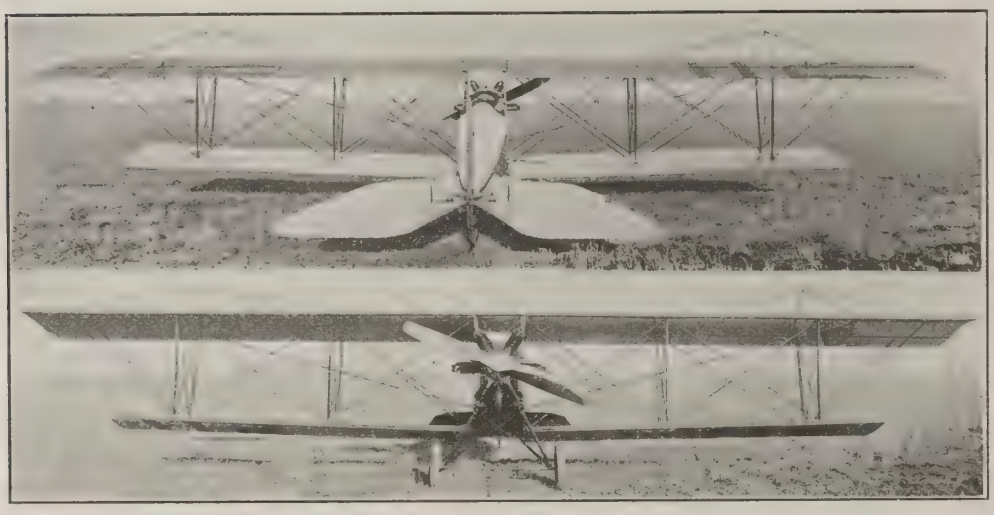
Engine

The O. W. T. engine is a six-cylinder radial type air-cooled, rated 125 H. P. at 1475 R.P.M. Bore 5″, stroke, 6″. The weight, complete ready to run is 325 lbs.

Cylinders are machined from solid steel forgings. Cylinder heads are of semi-steel castings, and are screwed and welded into the cylinders. Each cylinder is attached to the crankcase by means of 8 studs.

Pistons are of cast iron. The heads are flat, and well webed for strength and cooling. Three double seal rings are used on each piston.

Side elevation of the Otto W. Timm Tractor, with an O. W. Timm H.P. radial engine



A double throw counterbalanced crankshaft of chrome nickel steel is used.

Connecting rods of chrome nickel steel. They are round, of constant section, and hollowed for lightness. They are machined all over. Bearings of bronze, babbit lined with steel retainers. Wrist pins of nickel steel and float in the rods.

One cam shaft with two cams operate all the valves. The push rods have ball and socket ends, and are adjustable. Valves are of tungsten steel. Two exhaust valves 1 15/16" in diameter and one intake valve 2⅛" in diameter to each cyl.

Two magnetoes and a 2" Miller carbureter are used.

A special type of oil distributor working under a constant pressure of 20 to 40 pounds, and timed with the pistons supplies the engine with the correct amount of oil at all speeds.

The O. W. Timm Model T-18 Tractor, which has a speed range of 38-97 m.p.h. with an O. W. T. 6 cylinder 125 H.P. radial engine

TWO SIMPLE TESTS FOR INSPECTION OF AEROPLANE STRUTS

IN the field of testing, slender struts are unique. No other structural members can be tested to maximum load without injury, nor will they permit of the securing of data for an accurate computation of the maximum load, but with slender struts either of these things can be done very simply. The following two methods have been developed and verified by the Forest Products Laboratory as of practical application in strut inspection.

First Method of Test

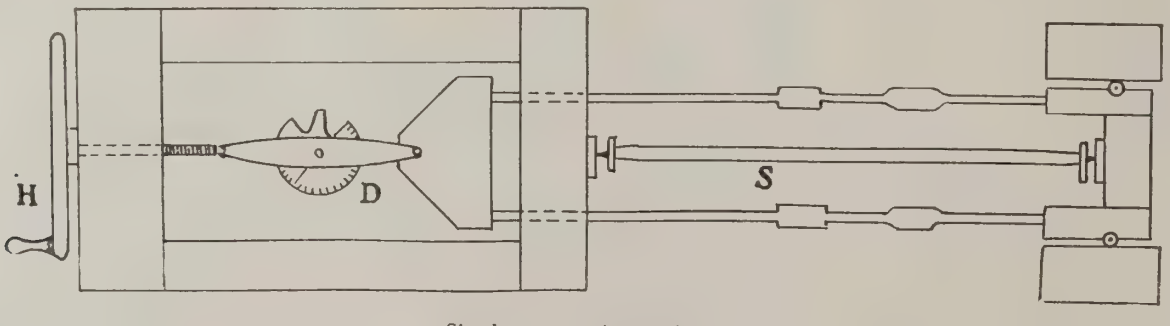
The strut may be loaded as such, increasing the load gradually till the maximum is reached—that is, until the load ceases to increase with increasing deflection. Repeated experiments on Sitka spruce and Douglas fir aeroplane struts of various patterns have shown that, if stopped at this point, the test does not injure the strut, provided the slenderness ratio (L/r) is 100 or more. The accompanying sketch illustrates a simple machine by which struts may be tested in this way at the rate of 100 or more an hour.

Simple Strut Testing Machine

The strut *S* is supported on knife edges. The load is applied by a handscrew *H* and is measured by a dynamometer *D*. The screw is turned until the pointer of the dynamometer ceases to move; the load then recorded is the maximum load of the strut.

Second Method of Test

The strut is tested as a beam. It is supported by a knife-edge at either end and loaded in the middle, one knife-edge being placed on a platform scale to measure the reaction. The reaction R and corresponding deflection are carefully measured for one or more loads (safely within the elastic limit). The ratio



$$\frac{2R}{d} = p,$$

which is constant up to the elastic limit, may now be substituted in the formula,

$$Q = 0.206 \quad \frac{l}{L^2} p$$

where l = span used in beam test
L = effective length of strut
Q = Euler or maximum load of the strut as such (pin-end conditions).

Numerous tests on Sitka spruce and Douglas fir struts have proved that this method can be relied upon to give the maximum load to within about 5 per cent. of the correct value for struts which have a slenderness ratio of 100 or more, and are uniform in cross-section or tapered not too severely.—Technical Notes of the First Products Laboratory, U. S. Forest Service.

Simple strut testing machine

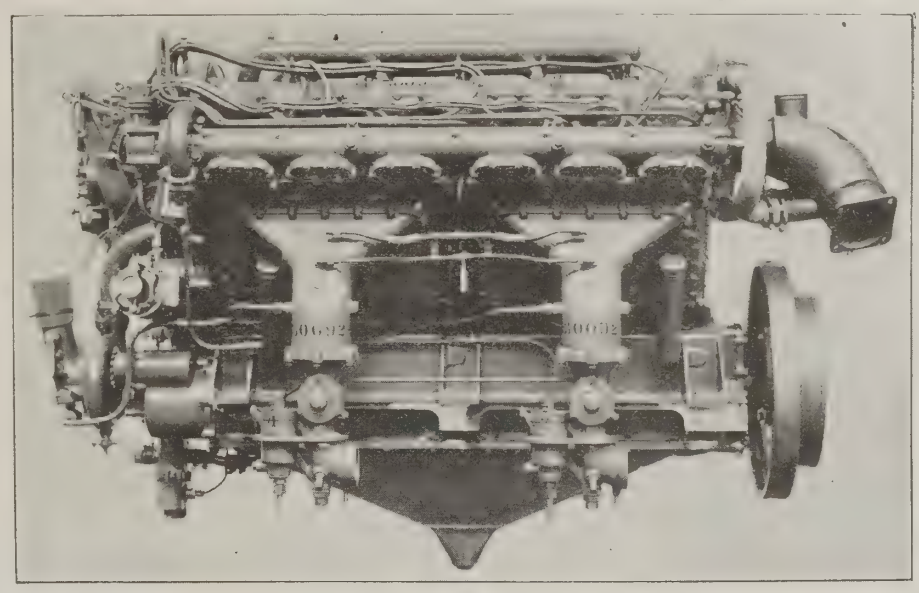
THE SUNBEAM AIRSHIP ENGINE

THE Sunbeam Company carried out the supply and manufacture and erection of the whole of the machinery for the British Airships R-33 and R-34. This machinery comprises in addition to the engines the clutches, intermediate shafts, reduction gear, propeller shafts and propellers, together with the piping, radiators, oil and water tanks.

The Sunbeam "Maori 4" type have been specially designed for airship use. These have 12 cylinders in two rows of six each set in "V" form at an angle of 60 degrees. The cylinders are of 110m/m bore and 135m/m stroke, each having four overhead valves which are actuated by two camshafts to each row of cylinders, the camshaft drive being by a train of gears.

The articulated system is adopted for the connecting rods and a flywheel is fitted to the crankshaft. These engines are designed to run at 2100 revolutions per minute, the B.H.P. at this speed being 275.

Carburetors, of which there are four, are of the Claudel Hobson B.Z.S. 38 type, and are fitted outside the "V", petrol being fed to them either by gravity or by pressure. The ignition is by two 12 cylinder magnetos.



The water pump is of specially large dimensions and a governor is fitted so that when the engine speed reaches 2500 r,p,m, or when the oil pressure falls below 20 lbs. per square inch, the ignition is cut off.

A hand starter and compressed air starter are provided. The exhaust pipes are provided with a special arrangement for cooling by water. The flywheel carries one element of a friction clutch. This element is driven from the flywheel by means of a series of composite leather and brass driving pieces which are interposed to equalize the stresses on the teeth of the main wheels. The clutch itself is of the multiple disc type with a single central spring and contains a series of ten phosphor bronze plates of special alloy making frictional contact with ten similar plates of steel. The central spring is operated by a lever on the control station in connection with the engine through a pair of collars fitted with an eccentric link in such a way that the pressure of the spring is balanced when driving, and the end load on the crankshaft is reduced to a minimum when declutching.

From the clutch the power is led by means of an intermediate shaft, fitted with a dog coupling for permanent disengagement when necessary, to a gear box fitted to the after end of each gondola. The gear boxes are of three types. In the forward gondola the gear box is a plain reduction type without reverse gear, reducing the speed from the crankshaft revolutions of 2100 to 540 per minute.

The second gear box is of reversing type and is used on the wing cars, and gives similar reduction, but allows by means of sliding gears for the direction of rotation of the propeller to be changed for manoeuvring purposes.

THE 400 H.P. FIAT AERO ENGINE

THE latest type of aviation engine to be produced by the Fiat Company is a particularly interesting 12-cylinder developing 400 horsepower. In this new engine the designers have succeeded in obtaining very complete accessibility, in getting a reduced overall area, and a very low weight per horsepower.

The cylinders, which have a bore of 120 mm. and a stroke of 150 mm., are of steel, with a common water jacket for each group of six. The valves are placed in the cylinder head, but are covered by a metal housing which prevents any oil leakage. Operation of the overhead camshafts is by means of a vertical shaft and bevel gearing for each group of cylinders. There are four carbureters, carried on the outside of the cylinders. Equal accessibility is obtained for the magnetos by driving them from a central cross shaft, each magneto thus being placed between two carbureters. With this design the mechanics have complete accessibility, merely by the removal of the engine housing, to the carbureters, the plugs, and the magnetos, the only parts likely to require frequent attention.

The propeller is the geared-down type, with a ratio of 1 to 1.51, and for war purposes was designed for a gun to be fired through it. Normal engine speed is 2,300 revolutions, at which speed 400 h.p. is developed. At the maximum engine speed of 2,500 revolutions the power is 450. Weight of the engine empty, 770 pounds; weight with cooling water, 826 pounds; weight with all on, 890 pounds. Weight per horsepower, with water and radiator, 1.9 pounds. The engine has a fuel consumption guaranteed of 8.4 ounces per horsepower-hour, and a minimum consumption of 7.7 ounces per horsepower-hour.

The 400 H.P. Fiat Aero Engine

THE PRINCIPLES OF AEROPLANE CONSTRUCTION

By CAPTAIN JAMES VERNON MARTIN

(Continued from page 450)

THE types of single truss which have been tested are quite numerous (see Plate 7) and the fact of their discard proves that most of them have disadvantages in excess of their promise. The first single truss to prove practicable was the Breguet tractor biplane single strut type of 1911, which utilized flat steel springs to hold the ribs and wings in constant relation to the plane of the fuselage. It was found that after use and exposure to varying temperatures the springs varied so much to impair the efficiency of the aeroplane through lack of uniformity in the angle of incidence.

Another method of employing the single truss and retaining a rigid wing was tried by Mr. Sigrist of the Sopwith concern in England (Fig. 2, Plate 7), shows a semicircular arc passing through the strut and arranged so the incidence could be varied with ease, but practice showed this construction to be weak in introducing bending movements into the strut and in failing to provide sufficient rigidity to care for rearward movements of the center of pressure. Another disadvantage was found in the excessive structural resistance of the arc. A modification of this structure was the elimination of the forward portion of the arc, which lessened the structural resistance but retained the other disadvantages.

One of the most promising of the single truss types has been found in the so called pillar strut (see Fig. 4, Plate 7), which is used in a few planes of recent design, but this structure has been very fully tested and condemned by the Royal Aircraft Factory since it fails to provide the desired rigidity and increases the weight and structural resistance of the strut at the ends.

Fig. 5 shows a form of single truss approved by certain officials of the U. S. Navy. This form provides a rigid wing structure without introducing bending moments into the strut and also provides a ready means (by turning the tension rods) of varying the incidence of the planes. It is proposed to further reduce the structural resistance of this truss by paneling in the rods with the strut (Fig. 6, Plate 7) but to do this would seriously interfere with both vision and stability.

I have urged upon our authorities the substitution of the K-bar cellule truss (Plate 8) since it answers all the requirements without attendant disadvantages. It provides a rigid wing structure without introducing bending moments into the strut, since a rearward center of pressure movement causing a compression in the bar b will cause an almost equal tension in bar a, but the horizontal components of these forces neutralize each other in the bolt and only the sum of their vertical components is introduced into the strut. This is a most desirable feature because the lack of vertical dimension in the average rear wing bar renders it relatively incompetent to resist multiple lift stress, especially since it has the task of resisting practically all of the drift stress in compression of the wing. Thus the K-bar functions to concentrate the lift stress of the cellule about the central wing bar and the drift stress can be entirely trussed from the leading edge bar to the rear wing bar. Such a truss greatly simplifies the calculation of cellule stresses and eliminates the necessity of bridging the lift stress through the ribs as in the double truss type. By use of the K-bar truss we achieve an elimination of considerable structural resistance and a two-way reduction of interference while obtaining a saving in weight and securing a rigid wing structure. It will also be noted that by revolving the bars a and b, which are threaded into fittings at their ends, the incidence of either plane may be varied at will.

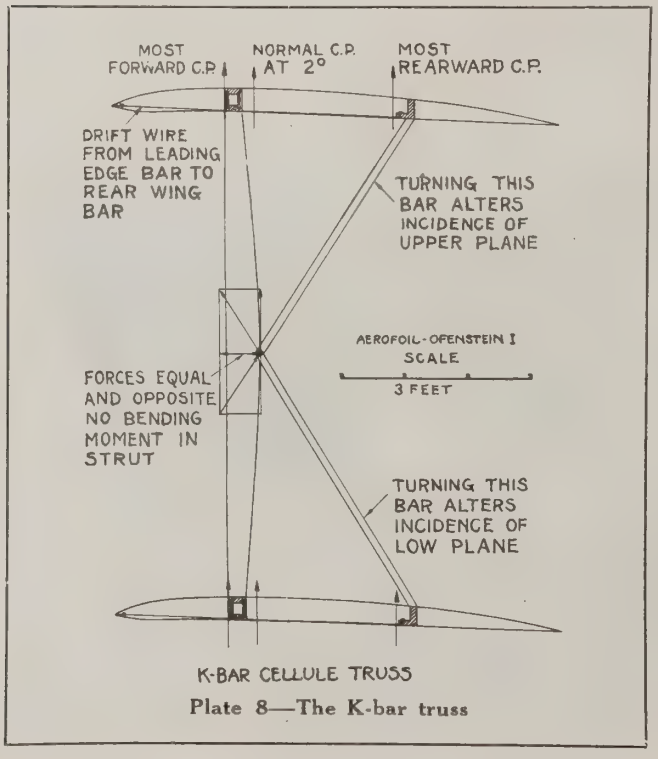

Plate 8—The K-bar truss

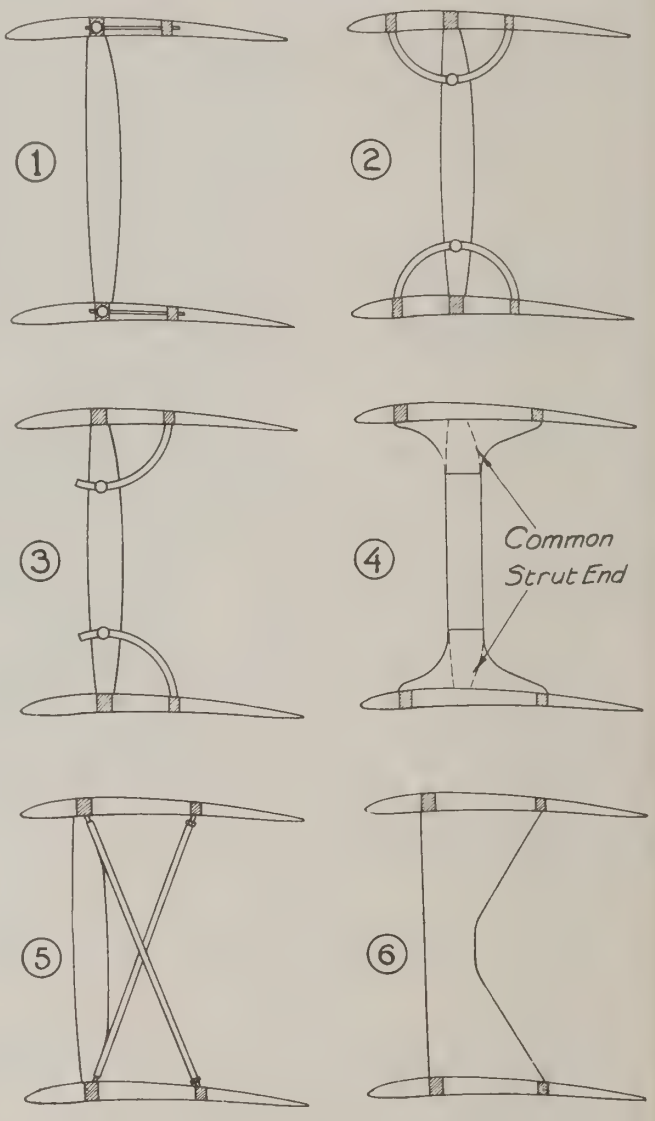

Plate 7—Various single lift trusses

Comparison of Resistance and Weight of K-Bar and Double Lift Truss Systems

At a speed of 100 m.p.h.,
Wing loading of No. 9 sq. ft.,
Safety factor of 8,
Aspect ratio of six,
Gap/chord ratio of K-bar Truss—1.143,
Gap/chord ratio of double lift Truss—1.

Resistance of K-bar Truss is $\frac{97.2}{185.0} = 52.5\%$ of resistance of Double Lift Truss.

Weight of K-bar Truss is $\frac{106.45}{146.57} = 72.7\%$ weight of Double Lift Truss.

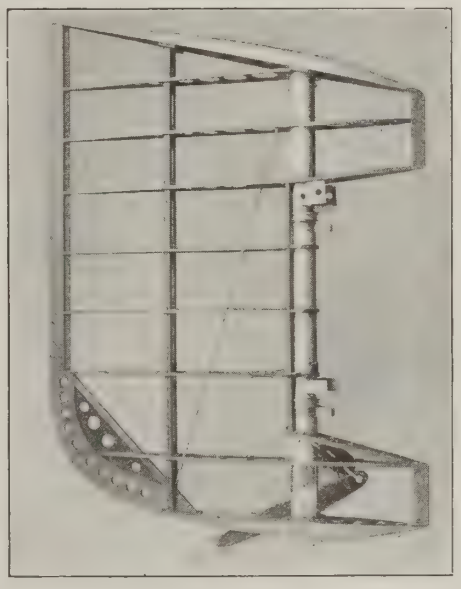

Plate 10—Shock absorbing rudder

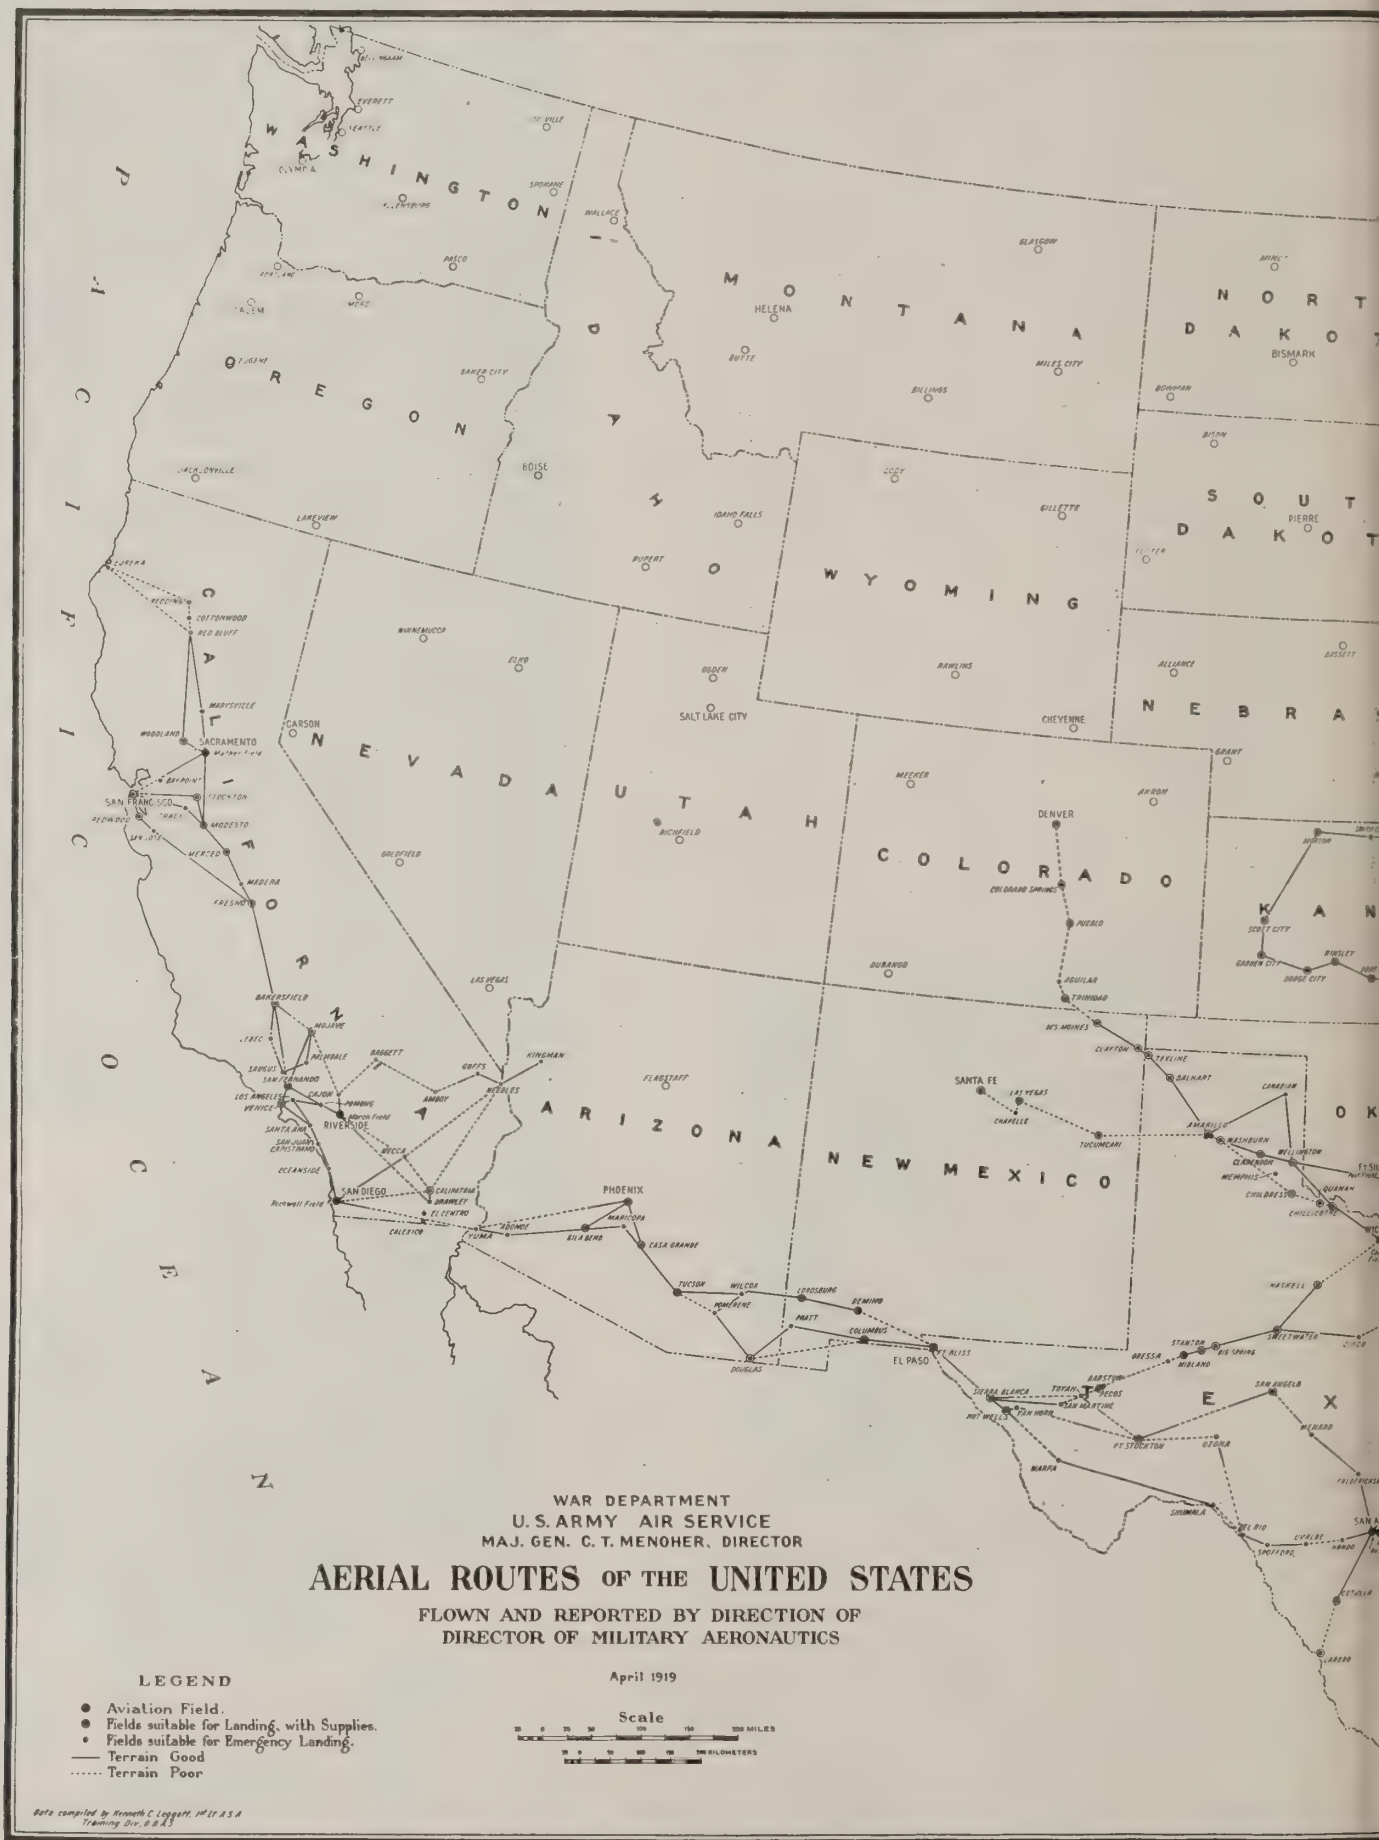

Plate 9—Chassis structure

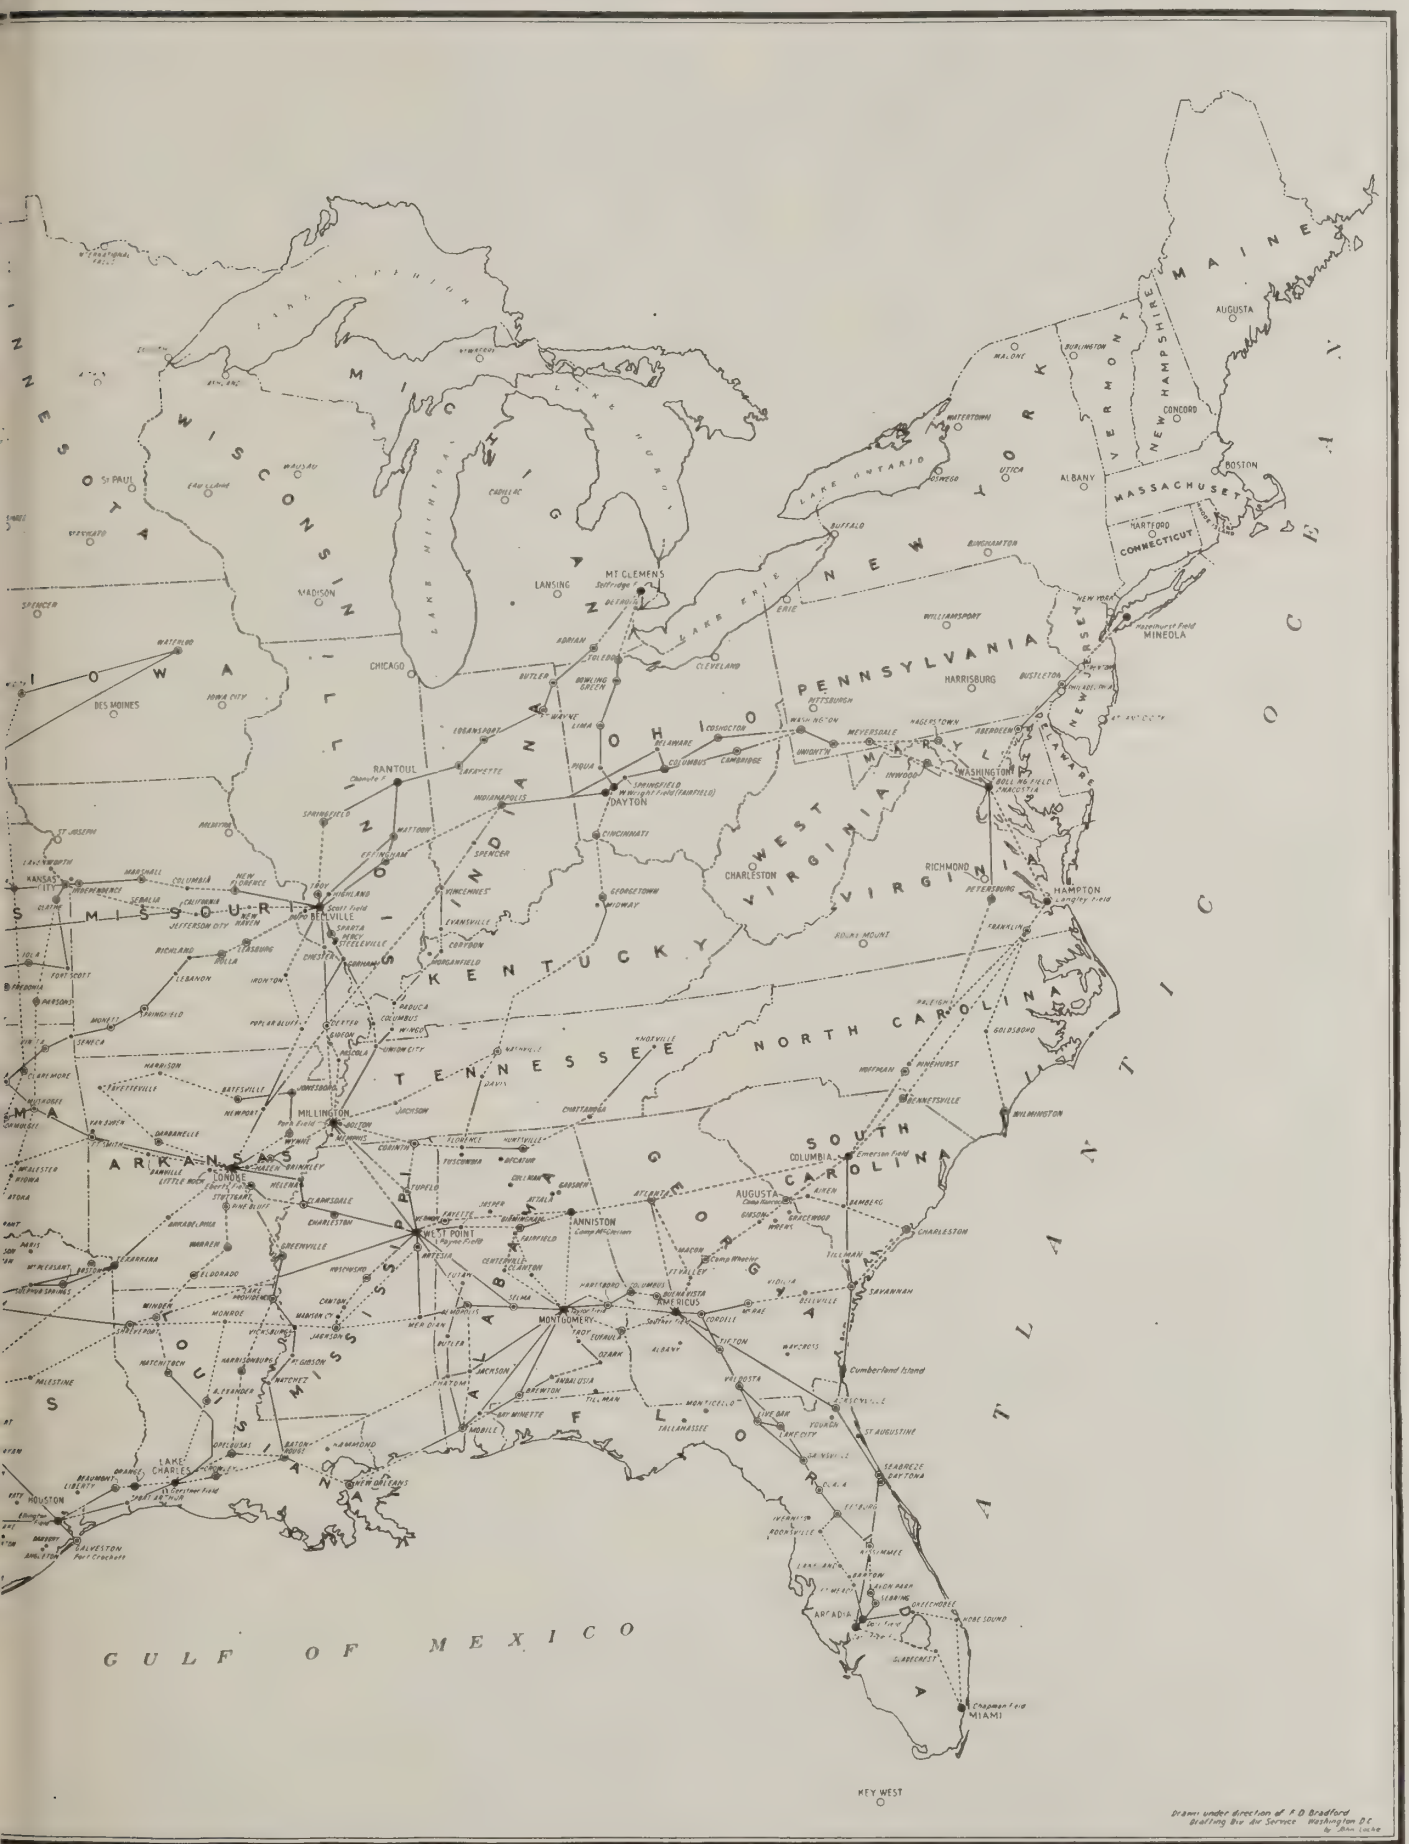

It does not seem to me possible at this writing to further reduce the element of useless resistance and interference in the cellule truss, so let us pass to the third portion of our division the chassis. This element represents from 10 to 12% of the total drift in the average aeroplane at 100 m.p.h. and from 15 to 20% of the structural resistance.

The simplification of the parts of a chassis is no easy matter and there is little basis other than practice to guide the engineer. Fortunately, this is one of the features of an aeroplane which has had much attention and the process of elimination by trial has left us a type of chassis almost universally in use and of great simplicity. Roughly, it consists of an axle member spaced from the fuselage by two V's in the longitudinal plane, while two sets of wires truss transversely for sheer. A still greater simplification is the replacement of these four wires by a single diagonal in the front frame to take sheer in both directions and the location of the shock absorbing means in the wheel so that the axle itself may form the transverse lower member of the front frame. Thus the rear members of the V's are used only to steady the front frame in the desired position.

Without adding to the weight or structural resistance of this simple form the members of the front frame may be welded together and the upper forward ends journaled with-

in the fuselage. (See Fig. 1, Plate 9.) Slots can then be provided in the external skin of the fuselage, so shaped as to house the chassis frame members when the chassis is swung backward and upward. (Fig. 2, Plate 9).

Leaving the forward portion of the frame members flat, very slightly increases the resistance of these members and permits them to form a flush surface with the bottom skin of the fuselage when retracted. (See Fig. 3, Plate 9).

Of course there are other ways of retracting a chassis, but in order to meet both aerodynamical and practical demands the following will be recognized as indispensable features:

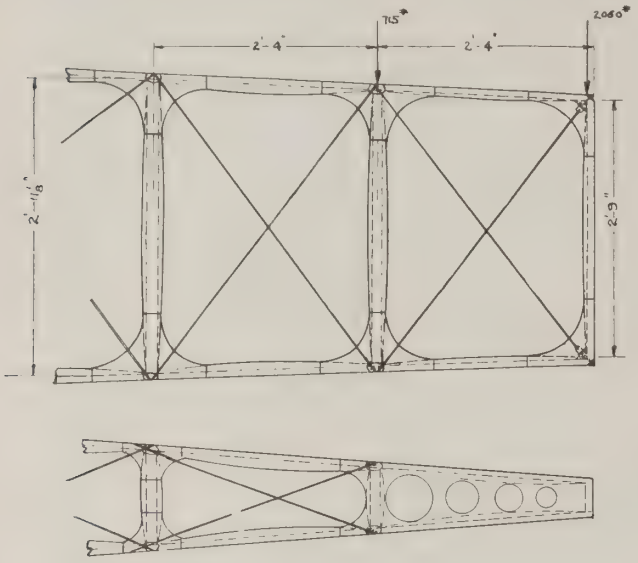

Plate 11—New type Plywood Truss

1. The chassis should be equally strong in spite of its retractable feature;
2. It should neither occupy useful space when retracted nor require an enlarged fuselage to house it;
3. It should not weigh more, including retracting mechanism, than the ordinary chassis;*
4. It should be adapted in strength as an alighting device in any intermediate position between fully extended and fully retracted both in case the pilot should make a hurried descent and in order to make available a handy means of varying the position of the chassis relative to the center of gravity of the aeroplane;
5. It should automatically close the housing recesses so that the fuselage or wing skin forms a flush surface when retracted;
6. The gage of chassis should be independent of the width of the fuselage;
7. It should utilize the forces of flight, since they are always available, for power to retract and extend and such action should be entirely automatic when released by the pilot.

A chassis answering the above requirements has been installed on a plane for the U. S. Army, but further details are not now available for publication. Thus we dispose of the third member of our subdivision and in a like manner we can dispose of the fourth, for it requires no great ingenuity to completely enclose all control leads and brackets and to internally truss the empennage members; as a proof of the latter see Plate 10, which shows an entirely successful method of disposing the tail skid within the rudder skin and in addition adds to the maneuverability of the machine when taxying on the ground.

We have now disposed of two of the four members of our useless division and reduced the remaining two to a minimum. For instance, it appears to the writer that in a machine like the U. S. Liberty Reconnaissance Fighter, where the empennage has been reduced to its two fundamental elements, the directional and longitudinal members must always remain, no matter how many years of aeroplane evolution transpire.

A Tractor Biplane has already been designed on the principle herein enunciated and the wind tunnel tests show a lift/drift ratio of nearly 11 with an aspect ratio of 6. An increase to more than 12 could be expected with an aspect ratio of 10.

These considerations form the basis of the writer's opinion that the conventional type of tractor biplane has a better chance of surviving from the aerodynamic standpoint than has the perfect or wing type aeroplane of small aspect ratio.

* It is relatively unimportant whether it creates slightly more resistance when extended, since a modern aeroplane always has surplus power to get away and structural resistance is an aid in reducing the landing speed.

Useful or Aerofoil Resistance

An aerofoil is a form or body projected through the atmosphere for an aerodynamic reaction. Thus a strut, wire, fuselage or chassis is not an aerofoil, but the main wing, the propeller blades, the ailerons, elevator damper and rudder are aerofoils because they function through the lift/drift ratio which might well be called the aeroplane first principle.

The lift or Ky of an aerofoil is the force, exclusive of inertia or gravity, which tends to deflect the aerofoil from the plane of propulsion.

The drift of an aerofoil is the resistance it offers to propulsion, exclusive of inertia or gravity.

We discover empirically that certain forms when propelled through the atmosphere have the properties of lift and drift and also that the ratio of lift to drift amounts to as much as 24 to 1 at 40 m.p.h. with an increase of 10% for double increments of speed, etc. Although there have been many theories as to the cause or causes of the properties of aerofoils and these theories are responsible for the shape of some aerofoils, I believe it can truthfully be said that what we know about aerofoils to-day is simply the result of testing flat aerofoils and haphazard forms of all varieties.

This statement will no doubt offend several of my esteemed contemporaries who have well nourished theories of air influences on aerofoils, but the fact remains that given any of these pet theories as a guide for the construction of an aerofoil, and the aerofoil tested almost infallibly proves surprising in its lack of substantiation. On the other hand, the nearest thing to a principle for guidance in designing an aerofoil that the writer knows anything about is the injunction to copy an aerofoil known to possess specific qualities, and even this is a most precarious procedure unless the copying be exact, for the smallest changes produce results all out of proportion to expectation and my own experience in this field of aerodynamics woud lead me to say that test of the particular model is the only reliable criterion as to its peculiarities. In short, the study of aerofoil theory and form has not yet reached the stage where any general conclusions can be drawn from which it would be safe to deduce the exact properties belonging to a specific form. Of the laboratorial work now definitely planned and urgently needed fully 90% is not underway for want of facilities and it is a shame that our government does not appropriate for further wind tunnels and an adequate computing force.

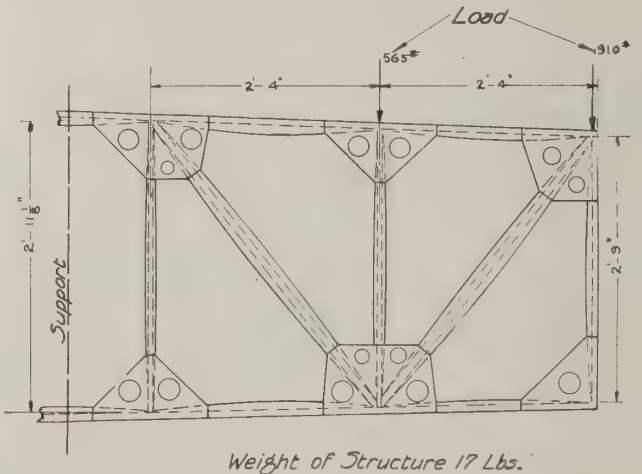

Plate 12—Plywood truss test

Of course the subject of aerofoils is a specialty in itself and cannot be discussed in a resume of the herein-undertaken sort. That branch of the study of aerofoils which deals with propulsion is a work in itself calculated to engage all the energy and intelligence of the best specialist.

This is a good place to introduce to the reader the Third Factor Aeroplane Principle as follows: You will observe that in the ordinary aeroplane we oppose the large component or Ky of the aerofoil resultant to the gravity of the aeroplane, fuel and useful load we wish to carry and the small component of Kx of the aerofoil to the thrust we develop. But in an aeroplane having a total lift/drift of 10 the thrust we expend is actually only one-tenth the air pressure in pounds we generate by virtue of the property of the sustaining aerofoil. Both these pressures exist simul-

taneously and the greater as a consequence of the lesser; but we compound the use of this advantageous principle by opposing the Ky or large element of the propeller blade to overcome the Kx or small element of the main aerofoil while we overcome the small or Kx element of the propeller blade by the gas pressure in pounds developed within the cylinders of our motor.

Now, if the total lift/drift ratio of the propeller equals ten or better then the actual pounds pressure in thrust of the propeller equals ten times the pounds pressure required to propel the propeller applied at the center of resistance of each blade, but if a smaller propeller were arranged at this point on each blade and the lift/drift of the smaller blade were ten or better, then only one-tenth the pounds pressure required to drive the large blade would be needed to drive the small blade, but the small blade would develop the thrust required to drive the large blade!

Control Aerofoils

Turning now to the control branch of aerofoils, we discover certain principles as fundamental as those in other fields and in practice we often find them ignored.

In general terms a control aerofoil is distinguished by its function of producing a moment about one of the three axes of an aeroplane. When the aeroplane is in flight at a given speed, these moments are determined by the area, leverage, incidence and lift/drift ratio of the aerofoil. The member used to create the moment about the normal vertical axis is termed a rudder. The aerofoil employed to exert a moment about the transverse axis is termed an elevator (poor word) and the aerofoil functioning to produce a movement about the longitudinal axis is termed an aileron. Among the important principles which should govern the form and disposition of controls are the following:

1. *There should be no cross functioning such as attempting to utilize a control surface at one time for sustentation and at another time for control. This principle is fundamental and thoroughly defendable.*

2. *A control aerofoil should be disposed free of interference or if this is impossible, the interference should be calculable and uniform in effect. A wing end aileron is so disposed, a trailing edge aileron is not.*

3. *A control aerofoil should be so disposed as to exert its moment on an axis at right angles to that about which it functions, i.e., ailerons should be on the transverse axis, elevator and rudder on longitudinal axis. A wing end aileron is so disposed, a trailing edge aileron is not.*

4. *Since the required moment may be created by less area and more leverage, a control aerofoil should be disposed as far from the axis about which it functions as is practical structurally. (A wing end aileron has a much greater leverage than a trailing edge aileron.)*

5. *A control aerofoil should be of a double convex symmetrical form in order to conform to the folowing:*

A control aerofoil should have a very slight Kx coefficient at neutral position.

A control aerofoil should have no Ky at neutral position and equal Ky coefficients at equal and opposite angles of incidence.

A control aerofoil should have practically no movement of its center of pressure for small angles. (See Fig. 1, Plate 1).

A control aerofoil should have both its greatest cambre and its axis of support at its center of pressure.

A control aerofoil should be of deep cambre to entirely enclose its support and operating mechanism.

Lateral control aerofoils should be neutralized so that they always create equal head resistance and are independent of the incidence of the main aerofoil.

The justification and application of the above principles is beyond the scope of this outline. I hope to prepare a treatise on aeroplane stability; such a treatise will also deal with the disposition of the mass within an aeroplane which is very properly an aerodynamic subject, but one too broad for more than a reference here. I shall close this branch of our subject by stating that practice indicates a neutral aeroplane to be the best and a neutral aeroplane is obtained by designing an aeroplane with concentric centers of gravity, lift, thrust, and drift (in short one having a Cutex) (see Plate 3), and eliminating all modifications of the wing for inherent stability, I believe cellule decalage, swept back wings, dihedrals, staggers, variations of cambre and incidence and varied plan form are taboo so far as stability is concerned.

Aerodynamic Aeroplane Control

What is meant by the "Principle of Aerodynamic Aeroplane Control?"

Briefly, I understand that aerodynamic aeroplane control comprehends use of the variations in the direction and velocity of the air flow local to an aeroplane extremity to produce an incidence of a control aerofoil.

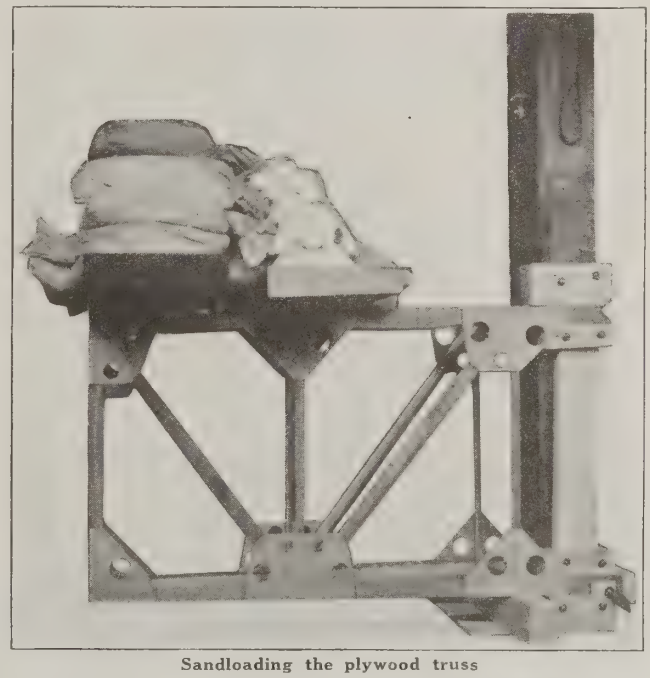
There are six possible means as follows:

1. Increase of the air velocity;
2. Decrease of the air velocity;
3. Updraft or increased incidence;
4. Down draft or decreased incidence;
5. Right oblique airs;
6. Left oblique airs.

In order for a neutral aeroplane to be deflected from a normal position, one or more of the above variations must be present, local to either the lateral or longitudinal extremity.

When sensitive aerofoils are disposed at the aeroplane extremity so connected to the ailerons or empennage controls as to operate said controls to counteract the effect of the air variations on the aeroplane the plane may be said to be aerodynamically controlled.

The accuracy and instantaneousness of such control will be apparent as contrasted with manual or automatic control which operates as a consequence of deflection from the normal instead of through the cause of deflection, thus anticipating and curtailing such deflection.



The subject of aerodynamic control will be fully treated in the treatise on aeroplane stability.

Internal Aspect

The first principle of the structural aspect may be tersely phrased as "Greatest strength for least weight."

Unless the structural features of the aeroplane are well cared for, the lift of the plane may be vitiated and the advantages gained by an excellent aerodynamic aspect lost.

The dimensions and total stresses are determined by the aerodynamic aspect and the structural engineer's first job should be the preparation of a plan in perspective of the external surfaces and lines of the plane with the essential weights such as motor, tanks and useful load placed in positions of advantage for simplified trussing.

Sandloading the plywood truss

Of course the motor, pilot, gun, camera, mail or other weights to be carried should be so disposed relative to the transverse axis of the machine that the algebraic sum of their moments at that axis is zero.

Plate 3 shows a fuselage outline as an example of the above. The periphery of this body obtained by giving the minimum required enclosed cubic the best streamline form provides the dimentional limit for the structural engineer and his special task is to truss the allotted weight to the best advantage, always maintaining a uniform safety factor and selecting both materials and form of construction with a keen sense of discrimination to save weight and make accessible the various instruments enclosed. The most direct procedure is to sketch in the points of attachment for cellule, chassis and empennage and then construct a line stress diagram.

Having in this way determined the amount and location of the stresses, we next enter the intensely practical field of electing the material and form of construction to be employed.

The AIRCRAFT TRADE REVIEW

Curtiss Co. Fights Plane Sales Here

The Curtiss Aeroplane and Motor Corporation started suit in the United States Court yesterday to restrain the United Aircraft Engineering Corporation from selling aeroplanes which the corporation purchased from the British Government in Canada to purchases in the United States. The Curtiss alleges that the sale of these would be an infringement on thirteen patents owned by that concern, some of them controlling and basic and others covering certain structural features of the planes.

In the bill filed yesterday the Curtiss Company alleges the planes were manufactured in Canada and are exact copies of the Curtiss planes. This type of aeroplane was selected by the British Government as training planes at outbreak of the European war, and large numbers were ordered sent to Canada for training pilots there. The Curtiss Company alleges that the demand for them was so great that in order to expedite production a contract was entered into with the British Government by which the latter was granted the right to manufacture the Curtiss plane on condition that the planes were to be used only by the British Government for war purposes, and only in Canada. It is alleged that these planes are the ones United Aircraft Engineering Corporation has been selling in the United States.

The court, after hearing arguments from attorneys for the Curtiss concern, issued an order requiring the United Aircraft Engineering Corporation to show cause why a restraining order should not be granted.

S. A. E. Summer Meeting

Plans are rapidly being completed for holding the Summer Meeting of the Society of Automotive Engineers, June 23 to 27, at Ottawa Beach, Michigan, which has been chosen because of the ideal facilities it affords for a meeting combining professional sessions with social features and recreation. One of the greatest advantages of the S. A. E. summer gathering is the opportunity for the engineers in the automotive field to become better acquainted and to exchange ideas and information.

It is planned to have the meeting include papers on all important automotive subjects general interest to warrant their presentation at a meeting of the Society. Aeronautic subjects will be treated by engineers who have made a long and intensive study of various phases of aeronautic work. A paper on engine cycles of the future is in contemplation, and it is possible that there will be papers on motorcycle design and on motor boat subjects. Representative exhibits of automotive apparatus such as seaplanes and hydroplanes used for Navy work, and high speed motor- boats used in the International Cup race, may be arranged.

N. Y. Amends Law to Permit Aero Insurance

Albany, N. Y.—Three bills amending the state insurance laws to permit marine, fire and casualty insurance companies to insure against loss or damage to aeroplanes, seaplanes, dirigibles and other aircraft have been signed by the Governor. The Governor also signed the Booth bill requiring motor trucks operating on state highways to be equipped with mirrors or some reflecting device giving drivers a view of the road in the rear.

Sell Castor Oil and Castor Beans

Washington, D. C.—The Bureau of Aircraft Production sold castor oil and castor beans, forming a surplus above the needs of the Air Service, value at $332,-927.89.

Dorothy Dalton and Pilot Zimmerman in the Aeromarine flying boat in which they flew from New York to Albany for the Victory Loan

Aeroplane Patrol in National Forests June 1

Patrol of national forests by Army aeroplanes to give early warning of fires developing in the forests will begin June 1, according to arrangements completed with the War Department by the Forest Service, United States Department of Agriculture. On the same day observations covering a large part of the Angeles National Forest will be begun from a captive balloon stationed over the Army Balloon School near Arcadia, Calif.

Two routes of aeroplanes patrol work will be operated from March Field, Riverside, Calif., and two planes will be used on each route, the routes will each be approximately 100 miles long, and each will be covered twice a day.

This will be the beginning of experimental work in which the adaptability of aircraft to forest patrol work is to be thoroughly tried out. If the tests should prove successful it is expected that the aeroplane patrols will be extended before the end of the 1919 season, and that aeroplanes will become a permanent feature of the ceaseless battle against fires in the National Forests.

The aeroplanes are not equipped with wireless telephone apparatus of such a nature that they can communicate with the ground without the installation of expensive ground instruments. Warnings of fires will be transmitted by means of parachute messages dropped over a town, the finder to telephone them to the Forest Service; by special landings made to report by telephone; and by returning to the base and reporting.

Fires will be located and reported by squares drawn on duplicate maps, one to be in the possession of each aeroplane observer and another to be in the office of the forest supervisor. A fire-fighting truck, with ten enlisted men, will act as part of the fire suppression forces, and will be subject to the call of the Forest Service.

Johns-Manville Denver Office in New Quarters

New York.—The Denver office of the H. W. Johns-Manville Co. moved from the Denver Gas & Electric Building to the Iron Building, 1021 Seventeenth Street. Louis H. Inglee remains as manager of this branch.

Ungar Becomes Vice-President of SKF Ball Bearings

New York.—G. A. Ungar, who has been engineer and technical director of the SKF Ball Bearing Co. for several years, has resigned to become vice-president of the company, of which he has been a director since its organization.

Steel Spring Piston Ring Organized

New York.—The Steel Spring Piston Ring Co. has been formed by A. J. H. Kuhsiek, formerly factory superintendent of Edward V. Hartford, Inc., and A. Meyer, formerly production manager of the same concern, to make the Bull Dog ring, a three-piece ring having several novel sales points.

The Aerial Mail Service—One Year Old

In his address before the Southeastern Aeronautical Congress at Macon, Ga., today, Second Assistant Postmaster General Otto Praeger reviewed the operation of the Air Mail Service as the pioneer employment of aeroplanes for commercial service.

"When we started the aerial mail with the assistance of the army," he said, "we were told if we scored 50 per cent of the schedule trip, we ought to be satisfied, and that we might be compelled to suspend operation during at least three months in the winter."

When the first anniversary of the Air Mail Service was celebrated on the 15th of this month, the same two planes with the same motors that flew the aerial mail on May 15, a year ago, carried the mail on that day, after a year of continuous and strenuous service through sunshine, rain or gale. The Air Mail Service is a success, both in the efficiency of its flying and as a postal facility. The record of the service is more than 92 per cent of perfect, millions of letters being delivered to the people of New York on the afternoon of mailing instead of on the following morning, as would have been the case if they had gone by rail.

A total of more than 125,000 miles have been flown in every kind of weather—one in a gale of 58 miles per hour and snow storms over New York on March 28, and one in a gale of 80 miles an hour on March 29. In our total mileage, covering nearly twelve months of regular service, we have had but thirty-six forced landings, all due to mechanical trouble. We have never had a plane carrying mail drop out of the sky beyond control. We have never killed a pilot of a mail plane. There have been six cases of minor injuries, such as contusions or cut sustained in a plane turning turtle in a forced landing.

He said that to restrict aviation development and operation to a single bureau of the Government, whether civil or military, would be a blunder, and that at this formative state the Army, the Navy and the Post Office should each be provided with ample appropriations to develop commercial flying, and that the whole aviation industry should be given the amplest assistance that our Government can give.

Chicago-Cleveland Air Mail Service Shortens New York Mail Time Six Hours

Second Assistant Postmaster General Praeger, in announcing the inauguration of the Air Mail Service between Chicago and Cleveland May 15, states that this service will advance the carrier delivery of letters at Cleveland, Ohio, and Boston, Mass., by 16 hours, and at Albany, New York City, and Springfield, Mass., six hours.

At Cleveland the air mail from Chicago and western points will catch the New York Central train at 4 p.m. for the East.

Under this arrangement the air mail will be delivered in Cleveland and Boston on afternoon deliveries instead of the following morning. At Albany, New York City and Springfield, Mass., this mail will catch the morning delivery instead of the afternoon following.

Letters mailed in New York City in time for N. Y. C. train No. 19, leaving at 5:31 p.m., will reach Chicago in time for 3 o'clock afternoon deliveries by carrier instead of the following morning carrier delivery, as would be the case if sent through by train.

Lieut. General Tso-Ting at Mineola

Lieut General Tfient Tso-Ting, of the Chinese Army, while visiting American flying fields was given his first flight at Mineola in a Curtiss aeroplane.

From Long Island to Langley

Col. Archie Miller, commanding officer Air Service Activities on Long Island, with Capt. L. G. Cleary as pilot, made a non-stop flight to Langley Field, Va., on May 10.

Navy Balloonists Obtain Meteorological Data in Ohio

Akron, Ohio, May 11.—Seven balloons took the air here late this afternoon in a drifting race to test air currents and obtain other data, held under the direction of the Navy Department. The balloons headed in a southeasterly direction.

Six of the balloons were reported passing over Alliance, 30 miles from Akron, an hour later.

Preseutation of Banners to American Air Units in France

On the afternoon of Saturday, April 12th, under the auspices of the "Pays de France" a ceremony was held at the Opera-Comique, Paris, at which banners of the organization known as the "Femmes Francaises" were presented to the American air units in France; one banner to each organization. Twenty-three balloon companies, which were serving with American troops at the front on November 11, 1918, were each presented with one of these banners; these companies are: 1st, 2nd, 3rd, 4th, 5th, 6th, 7th, 8th, 9th, 10th, 11th, 12th, 13th, 14th, 15th, 16th, 24th, 25th, 26th, 42nd, 43rd, 44th, and 69th.

Air Service Recruits to Receive Plane Ride

Colonel Rader, of Souther Field, has ordered that all men enlisting and sworn into the Air Service shall have an areoplane ride upon reporting for duty. This is to acquaint the men with flying and to assist in deciding their fitness to be pilots.

All men receiving their discharge from the Service are also to have a flight if they desire.

Air Service Officers Now Civilians

"By direction of the President, and under the provisions of Section 9, Act of Congress, May 18, 1917, and Circular No. 75, War Department 1918, the following officers are honorably discharged from the Service of the United States, for the convenience of the Government, to take effect this date, their services being no longer required."

Captains: John Gordon, Jr., George P. Sweet, William P. Field, Daniel Cushing, Philander R. Gray, George Bleistein, Jr., James W. Osgood.

First Lieutenants: William Knight, Paul N. Edwards, Howard C. Babcock, Bruce D. Reynolds, Henry M. Hoyt, Jr., Robert E. Hill, James A. Stone, Frank I. Wheeler, Jr.

Second Lieutenant: Stephen Philbin, William M. Sweet, Roy T. Robling, Preston B. Wilkes, Jr., Dean B. Fraser, Oscar R. Zipf, Emmett R. Tatnall, Paul M. Muller, William T. Wilkinson, Kenneth B. Warner, William A. Taylor, Theodore H. Sloan.

Civilian Flying Regulations

The War Department authorizes publication of the following statement from the Joint Army and Navy Board of Aeronautic Cognizance:

Before operating civilian aircraft, including aeroplanes, seaplanes and balloons, all persons must secure a license to do so from the Joint Army and Navy Board of Aeronautic Cognizance, Building D, Sixth and B Streets, Washington, D. C., according to the Presidential Proclamation, February 28, 1918.

During the parade of the 27th Division in New York City, a flying boat, piloted by an unlicensed civilian, flew up and down Fifth Avenue above the parade at a dangerously low altitude, estimated as between three and five hundred feet. In case of engine failure, the pilot could not have reached a landing place, but would have been forced to land in the crowd on the avenue. The board cautions aeroplane operators against a repetition of such an occurrence, and warns that licenses must be secured by civilian flyers.

The Army and Navy Board has control of all aircraft licenses for civilians, and points out that there is no way of adequately providing for public safety when aeroplanes fly at too low altitudes over cities or large assemblies of people. A heavy penalty is attached to violations of the regulations requiring licenses. Applications for licenses should be sent to Lieut. A. J. Clayton, Acting Secretary, Building D, Sixth and B Streets, N. W., Washington, D. C.

Artillery Adjustment by Radio Telephony

The experiment of adjustment of fire by radio telephony was recently conducted with gratifying success at the School of Fire at Fort Sill, Okla. Qualified observers though without previous radio telephone training, conducted shoots using radio telephony instead of the radio telegraphy with gun crews also untrained in this new method.

On April 22 one observer adjusted two guns on a two-gun emplacement in 28 minutes from the time the plane left the ground until the end of the problem. his was the first time he had ever conducted a problem from the air with the radio telephone, having bothway communication direct with the battery, and the gun crews were also new. It is believed that with trained personnel a precision adjustment can be accomplished in twenty minutes, or a zone adjustment in three or four minutes.

The rapidity with which sighting can be accomplished by radio telephone is due to the high speed of transmission. Radio telegraph is limited to sixty characters a minute.

New R. M. A.'s

The following-named officers, having completed the required tests, are rated as Reserve Military Aviators, to be effective from the dates set after their respective names:

Captain Louis R. Crawford, A. S. A., March 29, 1919.
Captain William G. Renwick, A. S. A., March 29, 1919.
First Lieutenant Ward R. Clark, Infantry, March 29, 1919.
First Lieutenant James C. Nabours, A. S. A., March 29, 1919.
First Lieutenant Clarence J. Moors, A. S. A., March 29, 1919.
Captain Paul R. Turpin, A. S. A., March 29, 1919.
First Lieutenant George E. King, A. S. A., March 6, 1919.
Second Lieutenant Howard C. McGregor, A. S. A., March 6, 1919.
Second Lieutenant Roy W. Chilson, A. S. A., March 6, 1919.
Second Lieutenant Henry C. Gamble, A. S. A., March 6, 1919.
Second Lieutenant John F. Dresing, Jr., A. S. A., March 10, 1919.
Second Lieutenant James A. B. Roddie, A. S. A., March 10, 1919.
Second Lieutenant John Wilson Albright, A. S. A., March 25, 1919.
Second Lieutenant Ralph J. Leeds, A. S. A., March 29, 1919.
Second Lieutenant Lester N. Stockard, A. S. A., March 29, 1919.
Second Lieutenant Woodward C. Riley, A. S. A., March 29, 1919.
Second Lieutenant William D. Jones, A. S. A., March 29, 1919.

Ten Fields To Be Abandoned

The War Department has decided to abandon the following flying fields:

Barron Field, Ft. Worth, Texas,
Call Field, Wichita Falls, Texas,
Carruthers Field, Ft. Worth, Texas,
Eberts Field, Lonoke, Arkansas,
Love Field, Dallas, Texas,
Payne Field, West Point, Miss.
Richfield, Waco, Texas.
Taliaferro Field, Ft. Worth, Texas,
Taylor Field, Montgomery, Ala.,
Gerstner Field, Lake Charles, La.,

as soon as equipment now in storage at these fields can be disposed of.

The abondonment of Gerstner Field will be completed by June 30, 1919. It is intended to sell or salvage the buildings and improvements unless they can be utilized to advantage by some other department of the Government.

The War Department has requested information from these other departments as to whether they desire to make use of any of these fields, and, if so, that further details will be supplied by the Construction Demobilization Committee of the General Staff.

Souther Field Notes

Major Tom C. Macaulay who holds the transcontinental records will probably be in command of the squadron using seven De Haviland fours 400 horsepower Liberty Motors in the flight from Dallas, Texas, to Boston, Mass.

A Caproni biplane, built entirely by the American workmen shown in the photograph, was built at the Caproni factory at Milan. The civilian in the center is Gianni Caproni

FOREIGN NEWS

New British Airship

Vickers, Ltd., of London, has announced the approaching completion of the R-80, a new rigid airship, which it is believed will fly the Atlantic with ease. It is expected that the machine will be ready for trials in May. It has been designed entirely by Vickers. The ship has bow-mooring attachments that will permit it to be moored out from a tower in such a manner that it can turn in any direction and lie with the wind. Four cars are attached to the hull—a forward control car and machinery car, and two wing cars for machinery fitted on opposite sides of the ship. Thee are four Wolseley-Maybach engines of 240 nominal brake horsepower each. The airship will carry a crew of sixteen and will have accommodation for a good number of passengers.

Australia to Have Air Service

The Australian government has completed a plan for aerial defense and proposes to establish aviation schools with squadrons of aeroplanes, seaplanes, and airships, according to an Associated Press dispatch from Melbourne on April 21. The peronnel will number 1,400 men. The initial expenditure will be $2,500,000 and the annual expenditure thereafter $2,500,000.

A Flight from Brussels to Peace Session

Paul Hymans, Belgian Foreign Minister, recently made a flight to the Peace Session, leaving Brussels at 1 P. M. and arriving in Paris at 2 P. M. in time to attend the plenary session.

Aeroplane Carrying Twenty-Five Goes Up More Than Three Miles

The giant Farman Goliath, which has been flying between Paris and Brussels, ascended to a height of 5,100 metres (approximately 16,732 feet) while carrying twenty-five passengers. The ascent was made in one hour and fifteen minutes and the descent in twenty-five minutes.

British Plan for Air Mails

The British press generally asserts that the commercial development of the aeroplane is much further advanced in Great Britain than in any other country. According to the American Chamber of Commerce in London, a mail service from Cairo to India is to be inaugurated. The air route already has been surveyed and a route from Cairo to the Cape of Good Hope is being laid out.

Aerodromes are to be established at suitable spots in the British Isles and British possessions and equipped with sound and light signals, balloons, aerial buoys and wireless telegraph and telephone outfits.

"Already cargo aeroplanes are in sight," the Chamber of Commerce announces. "A huge British seaplane of novel type, equipped with five motors, has been flown, carrying six tons, at 100 miles an hour. Experiments are being made with another having a carrying capacity of nine tons."

London Flying Club

To the tremendous attention now being given to aviation for various commercial and governmental purposes in England, it is interesting to note that the social features are not being overlooked. A social aviation club is under construction not far from London covering an area of 30,000 square feet and which will contain eighty bedrooms.

The club is the London Flying Club at Hendon. It is rapidly nearing completion, and will be the largest, if not best appointed club, in the world devoted to the problems and sport of air flying. The main salon will be a hall 130 by 80 feet and will be used not only for social affairs, but for lectures with moving pictures of aeroplane progress. Annual dues for the first five hundred members have been fixed at ten guineas for men and seven guineas for women, with no entrance fee. Members will be able to hire machines at reduced rates.

Germans Planned Using All Metal Aeroplane

The Germans never had a chance to use their latest aero creation on the front against the Entente airmen—the entirely metal plane.

The metal plane was made of aluminum, body, wing struts and all. The most recent development included metal wings, except the edges, which have to be flexible for guiding the plane. The metal plane was almost bulletproof, except direct hits, and came as near being an armored plane as any developed.

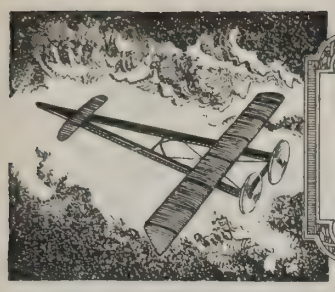
In the Zeppelin factory at Staalen are almost a hundred of these planes nearly finished, most of them without wings. They are bright and shiny aluminum and are the most deadly looking machines imaginable.

The aluminum plane had been tested very carefully in the rear and at the factory and was found entirely satisfactory. It was as fast and almost as light as the planes made of wood.

Chile's Interest in Aviation

General A. Pinto, Chief Staff of the Chilean Army, and Capt. C. Garfias, are touring the world inspecting the various aviation fields. They have been at Hazelhurst Field, Mineola, accompanied by Col. A. Ewing, Military Attache of Chile in the United States. General Pinto established the Chilean Flying School in 1913.

The Aeroplane for Colonial Trade



In the adaptation of the aeroplane to commercial requirements the wearing capacity of all its parts becomes of prime importance. It is in some of the lesser developed lands where communications are still poor that we may look for a rapid adoption of aerial transport; and it is just these climates, featured by tropical heat or northern cold, that may have a detrimental effect on the aeroplane constructed principally of wood. The possible ravages of the ant alone merit consideration. It is to cope with this that The British & Colonial Aeroplane Co., Ltd., of Milton, Bristol, England, have evolved a biplane of all-metal construction. The fuselage is a special construction of aluminum and steel, in sections which can readily be dismantled for transport. The struts are of high tensile steel throughout, the wings are made of aluminum and high tensile steel. The performances with a comparatively low-powered engine (180 h.p. Hispano Suiza) have proved that the all-metal construction does not adversely affect its speed or rate of climb, while the weight (1700 lbs. with engine) compares very favorably with that of a wood-built machine. When loaded it can carry 450 pounds of cargo. At ground level it has a speed of 110 miles per hour, can climb 5,000 feet in eight minutes and has a landing speed of forty-seven miles per hour.

The Up-to-date English Movies

In the speedily developed cinema industry, one of the most knotty questions the film producer and distributor has to face, is that of delay and uncertainty in the delivery of films from one area to another. The producers of the film, "Power of Right," in which the Prince of Wales plays a part, have already decided that the aerial route is the solution of the difficulty. Through the Air Ministry they have had a "Bristol" Fighter Aeroplane, piloted by Capt. West, R. A. F., placed at their disposal.

A 1915-1916 Nieuport Fighting Scout

ELEMENTARY AERONAUTICS *and* MODEL NOTES

By John F. McMahon

Model Aeroplane Contests

The contests to start June 1 will consist of the following events:

Hand launched for distance.

Three individual prizes will be given for this contest; that is, a first, second, and third prize.

The Villard Cup, which has been won two times by the Illinois Model Aero Club, will be offered again to the club making the best showing as a team. This cup was donated by Mr. Henry Villard, of the Aero Club of America, and was to be the property of the club winning it three times. The Illinois Club has two legs on it, and if they win it again it is their property.

R. O. G. contest for distance.

Three prizes will be given in this event.

Construction contest for scale models. Only one prize will be offered for this contest, and will be exceptionally good.

Prizes have not been decided on as yet, but you can rest assured they will be best ever offered for Model Aeroplane Contests.

The rules for conducting these flights are simply that they must be witnessed by at least three prominent men, or if there is a branch of the Aero Club of America in your city, invite some of these men to witness the flights.

A contest is not official where there are less than five contestants. It is not necessary for all the contestants of one club to live in same town. A model flyer living in one town can compete with a club having its address in another town.

The construction contest will be decided by sending in photos of the model to this office. (Only clear photos will be accepted.) A description of the model must accompany the photograph.

If these events are well attended, it is our idea to run more contests later in the year.

Description of the prizes will be given in next issue of AERIAL AGE.

The Dowd R. O. G. Model

The model shown in the accompanying drawing is interesting, inasmuch as it is somewhat on the plan of the Efficiency model drawn in the last issue of AERIAL AGE, both having a true wing section and the rubber motors running inside the covered or hollow "A" frame spars.

This is not a late model, as it was built in 1916 by Raymond E. Dowd, but the design is so well worked out that it is in line with the present-day models. Features of the model are the large span of the main plane and the non-lifting tail with the main plane in front.

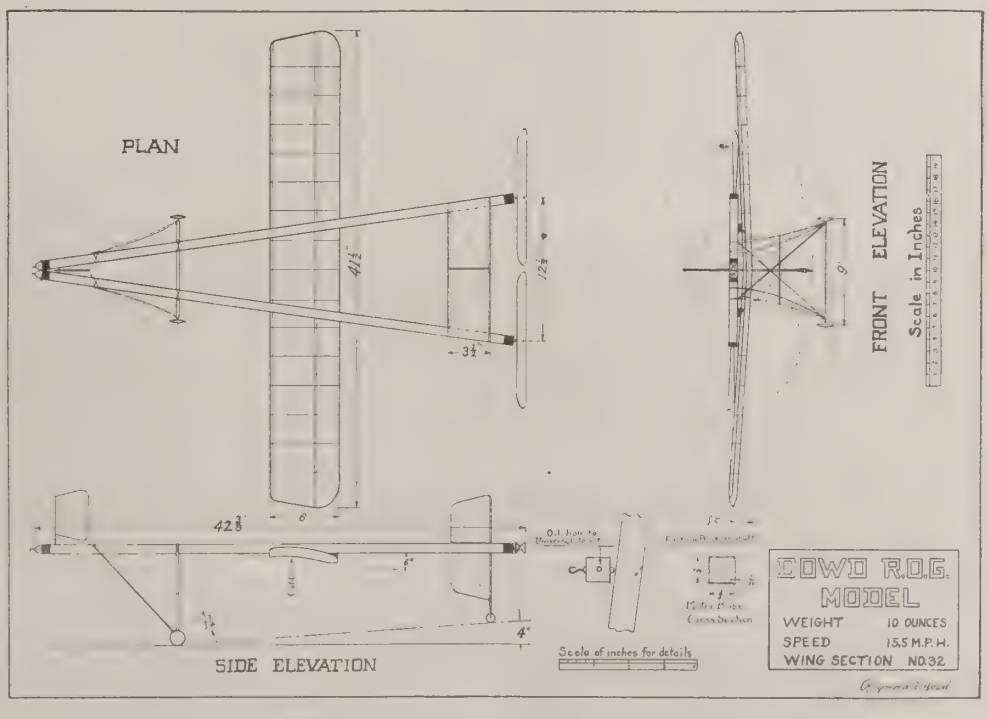
Its appearance is different from from the average pusher type, and it would be well for model builders to take into consideration a few of the interesting features when designing models for coming contests.

The main plane has an aspect ratio of about 7, the span being 41½ inches and the chord 6 inches, giving a surface area of about 1.7 square feet. The wing profile is the Eiffel No. 32, covered both sides with thin paper and set at an angle of 6° with the frame or fuselage. The entering edge is made to conform to the shape of the wing section. The trailing edge is very thin and inserted into the ends of the ribs. The ribs are cut to the Eiffel No. 32 section, but flattened in front to butt against the entering edge and and drilled to decrease weight. The plane is then attached to the frame members with dress snaps. Two streamline plane-hangars hold the plane securely.

The tail plane is of the non-lifting type, and has a surface area of about ¼ square foot. It is built around the cross braces of the frame and has one rib in the center.

The propellers, two in number, are 12 inches in diameter and have a 20-inch pitch. They are readily detached from the hooks by removing a pin which passes through a hole drilled in a slightly flattened section of the shaft, which is 3/64-inch brass spring wire. They are driven by fourteen strands of ⅛-inch flat rubber, which gives a propeller speed of 800 R.P.M. and a slight increase in dynamical speed.

The keel surfaces, two in number, are set at the extreme front and rear of the model, the smaller one in front and the larger in the rear, built in with the non-lifting tail plane.



The forward fin is adjustable for steering, and is held on a mast set in the triangular block at the front of the fuselage. This fin, although not inclined in the original design, was found necessary to prevent the model from spiralling.

The landing gear, so fashioned to hold the model at an angle of 4° when resting on the ground, is made of ash members for the pieces under compression and of bamboo where they are in tension. These parts are then streamlined and fastened with thread and glue.

The wheels are cut from pine and are 1¼ inches in diameter. The rear wheel is ¾ inch, and is held in a fork of brass wire on the extension of the rear keel. It is cross-braced with fine wire and can withstand the severest shocks.

For the bearings, the rubber is held at the forward and on wire hooks passing through streamline blocks where they are formed into hooks for attachment to the winder. A pin through this wire prevents it from turning in the blocks.

When starting on a flight the model rises from the ground after a short run, all the wheels getting off together. It climbs steadily without stalling as its fiying angle is only 4° less than its angle when resting on the ground. The flight is firm and steady, owing to the high degree of inherent stability contained in the Eiffel No. 32 wing section. As a result of the careful elimination of head resistance the model attains a flight speed of over 15 miles an hour. The total weight is 10 ounces, which means that the model carries over ¼ pound to the square foot, considerably over the average for rubber-driven models of the flling stick type. The average length of flight is slightly under 1,000 feet with a duration of one minute from 800 turns of the propellers.

Aeronitis is a pleasant, a decidedly infectious ailment, which makes its victims "flighty," mentally and physically. At times it has a pathologic, at times merely a psychologic foundation. It already has affected thousands; it will get the rest of the world in time. Its symptoms vary in each case and each victim has a different story to tell. When you finish this column YOU may be infected, and may have a story all of your own. If so, your contribution will be welcomed by your fellow AERONUTS. Initials of contributor will be printed when requested.

Plea

(From an Aviation Inspection Department)

We answer countless calls a day
Upon our phones—cause for dejection;
The tenor is in much this way:
"Fix it, Inspection."

A tail skid's missing or a wing
Is so we've really to correct it;
Diurnal memorandums bring
"Plane"—dash—"inspect it!"

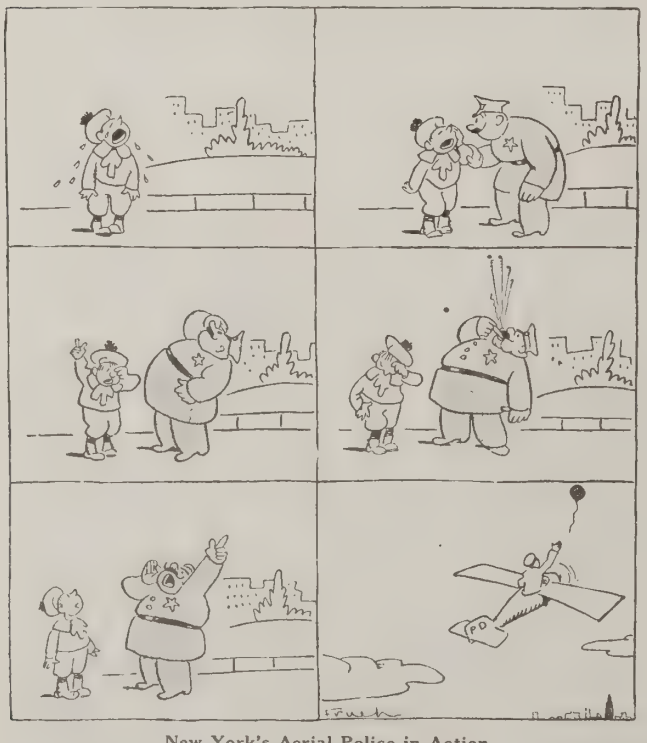
It flatters us more ways than one
To note in such and such connection
The thoughtful things forever done
For our inspection.

And we would but one kick inflict
From out a rather large collection
Upon our friends—why so restrict
Us in Inspection?

We'd love examining the lines
Of those of feminine inflection—
When you're with Sue, May, Rose, betimes,
Phone "6," Inspection.

Sgt. Roy Harris Russ.

For Real Estate Agents



An old joke in a new setting:

Aviator: "I say, sir, that confounded land you let to me is badly drained. My aeroplane hangar has a foot of water in it."

"Indeed."

"Yes, a pool of water, sir. What do you suggest?"

Landlord: "I suggest you keep a seaplane."

New York's Aerial Police in Action

—From the N. Y. World.

Precocious

Fond Mother: "And do you know, dear, baby is always interested in aeroplanes. Every time he hears one he says 'Goo!'"

Baby: "Goo goo!"

Mother: "The little darling. And look, dearest, the little man's quite right—there are two of them."

A Rigger Inspector's Lament

For years it seems I've tightened wires
And added wind to rubber tires,
Fixed the stagger, stabilizer,
(Death's respects to an ex-kaiser)
Worked like fury on turnbuckles,
Longerons and scraped my knuckles;
Lord, I wonder when I go
To Heavenly rest will it be so
That e'en the angels fly wing low?

Sgt. Roy Harris Russ.

Revised Editions of General Orders Issued

The reversed set of general orders for the armed forces of the United States following has been appearing in several of the aviation newspapers, and is said to have been first published by the Fort Omaha Gas Bag:

1. To accept my discharge, take charge of all government property in view and beat it home.

2. To accept my discharge in a military manner, keeping always on the alert and observing that it will not be revoked before I get out of sight.

3. To take the quickest train and not stop at any military post on my way.

4. To repeat all dope and rumor which has been spread through buildings closer to headquarters than my own.

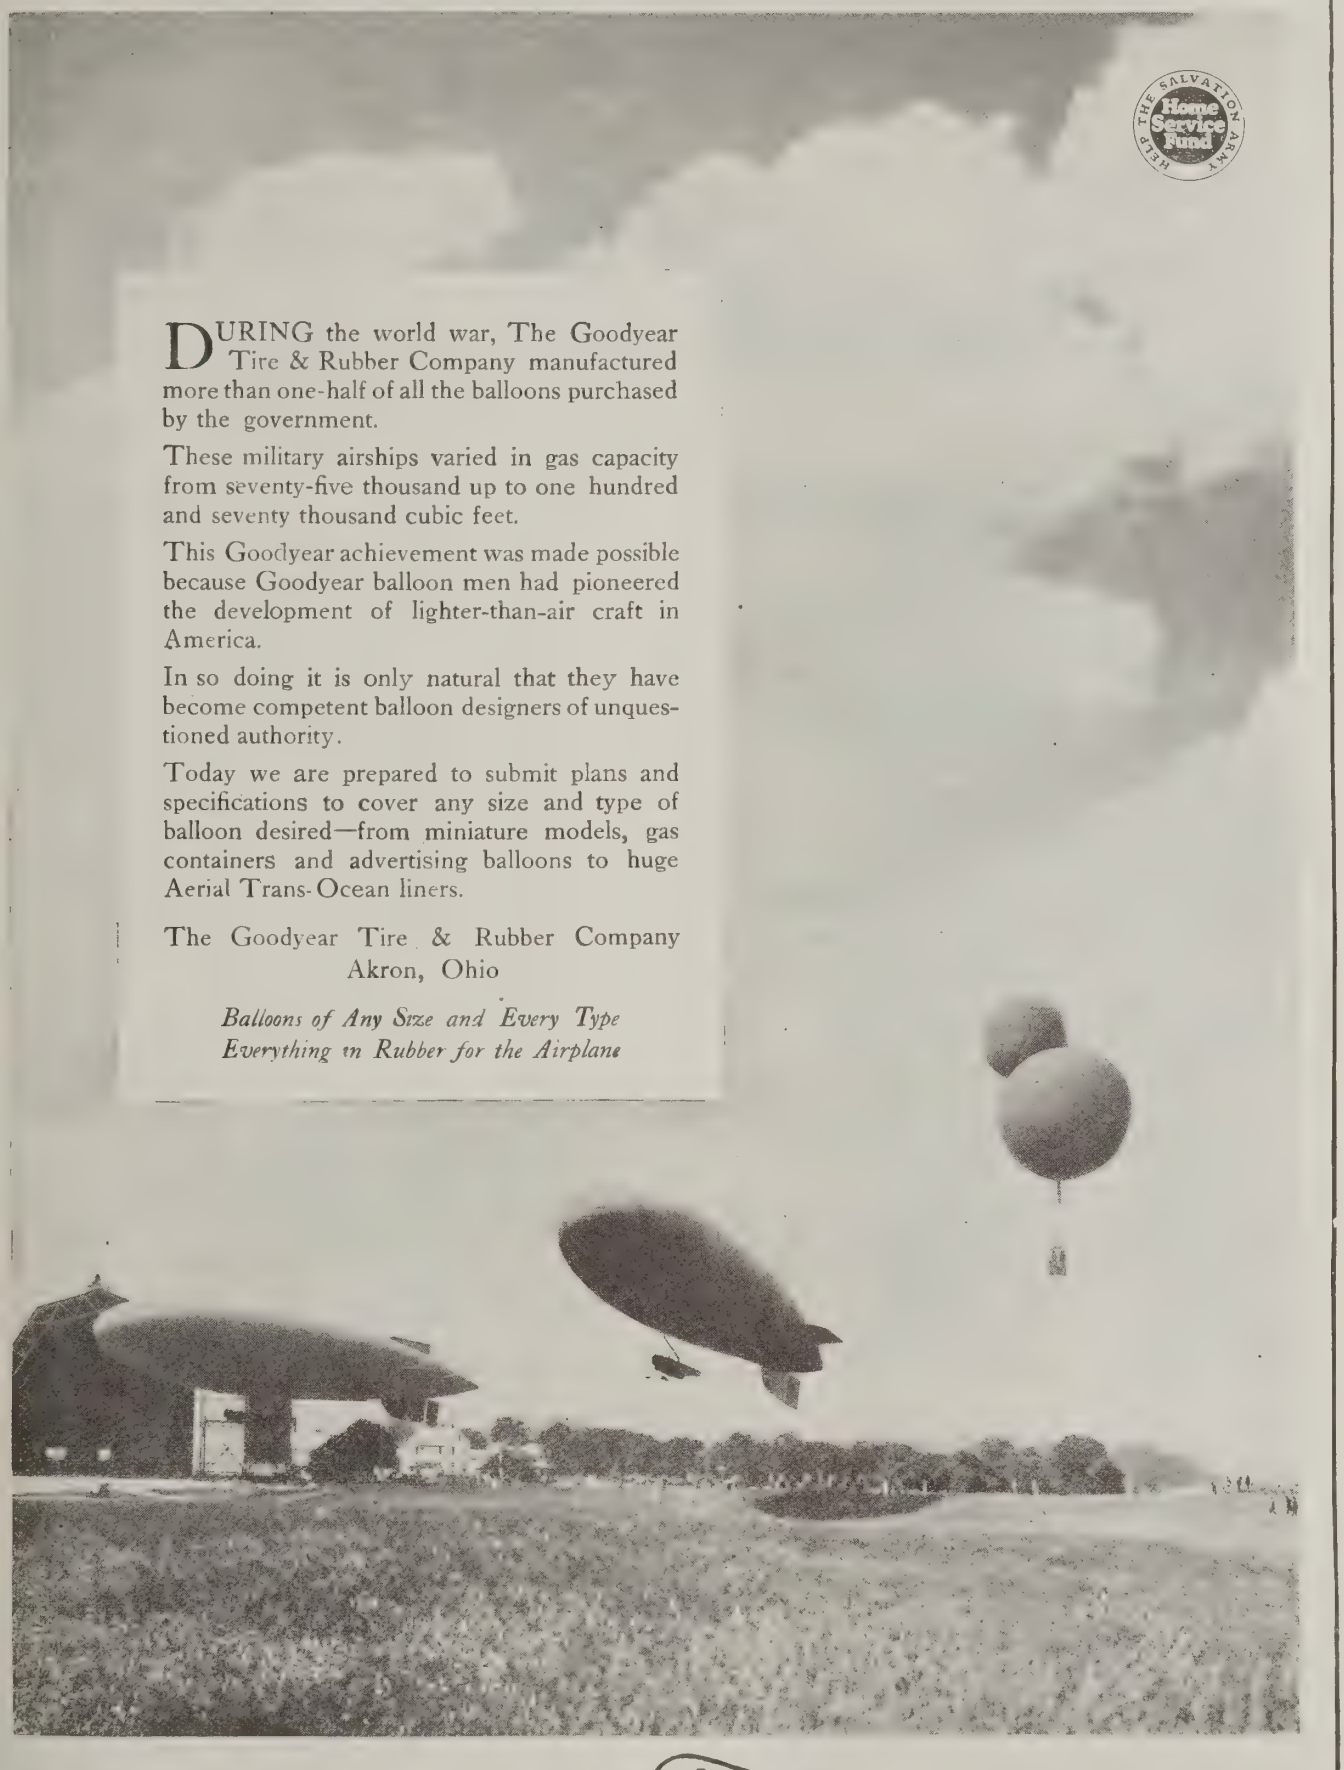
5. To receive, believe and pass on to my children the experience I have acquired while in the service, or shall acquire in the future.

6. Not to again quit civilian life after being properly discharged from the service.

7. To talk to no one about re-enlisting.

8. In case of the presence of a recruiting officer to give the alarm.

9. When the girls are home to allow no soldiers or militia on or near my premises.



10. In all cases not covered by instructions to claim exemption.

11. To salute all officers who have aided me in getting my discharge and all the Budweiser and whiskey now cased.

12. To be especially watchful at night, and allow no one to pass without buying a drink.

—By Order of General Nuisance.

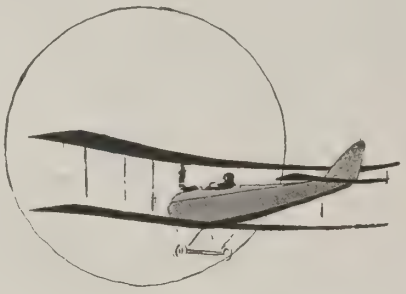
"Ex-Lieutenant" writes to the editor of the *Army and Navy Journal:* "Having at last resumed my normal habitat and clothing, and feeling, therefore, extraordinarily irresponsible, mentally, and peculiarly loose from the knees down, I beg to offer the following suggestion for service in foreign territory: For each period of six months' continuous active service in the state of Texas, one chevron of salmon pink, a cactus rampant and a mule couchant embroidered thereon, the same to be worn over the right lung, or as near thereto as the conformation of the blouse permits."

DURING the world war, The Goodyear Tire & Rubber Company manufactured more than one-half of all the balloons purchased by the government.

These military airships varied in gas capacity from seventy-five thousand up to one hundred and seventy thousand cubic feet.

This Goodyear achievement was made possible because Goodyear balloon men had pioneered the development of lighter-than-air craft in America.

In so doing it is only natural that they have become competent balloon designers of unquestioned authority.



Today we are prepared to submit plans and specifications to cover any size and type of balloon desired—from miniature models, gas containers and advertising balloons to huge Aerial Trans-Ocean liners.

Disposition of Motors

Among the special problems which have arisen during the war is that of obtaining sufficient horse power to drive the large bomb carrying planes called Bombers. These aeroplanes weighing from seven to ten tons loaded required from 800 to 1200 horse power.

No power plant of more than 400 h.p. has been available so two or more power units have been required to drive the Bombers.

These motors have been mounted in the cellule on a special truss erected on either side of the fuselage and at sufficient distance from it to permit propeller clearance. This method of placing the motor has many serious and even dangerous features and requires engine bed supports trussed out into the open space ahead of the leading edge of upper and lower wings in order that the center of gravity of the motors may form a portion of the forward gravity moment arm of the Bomber.

There are several other arrangements, which involve considerable experiment and I have listed below the respective advantages of two of these plans.

1. Bevel Gear Transmission Drive	1. Direct Reduction Drive
A. Two motors compactly located within the fuselage, where they do not create the dangerous inertia moment due to placing motors in the cellule.	Both Motors located within a fuselage on common engine bed, which includes bearings for single propeller shaft reduction drive.
B. Complete failure of either motor leaves efficiency of Bomber unimpaired, since:	Same
1. Either motor will drive both tractor screws.	1. Either motor will drive the single tractor screw.
2. Either Sunbeam 300 h.p. motor will drive plane 74 m.p.h. with 2 ton useful load. (Refers to Martin Cruising Bomber.)	2. Either Liberty 400 h.p. motor will drive plane 81 m.p.h. (Refer to M.C.B.)
C. Motors are conveniently located for repairs as contrasted with their present inaccessible location in exposed portion of cellule.	Same
D. Safety and dependability of Bomber are considerably increased due to	Same
1. Independent transmission support, for	
a. Propeller breakage will not endanger cellule truss as it does in existing two motor machine.	Same
2. Cellule stresses are less and more accurately calculable than they are when motors are located in the cellule.	Same
3. Bomber in spite of its large size can be manoeuvred with the same facility as single-motored planes, for,	Same
a. Motor weights are similarly disposed within fuselage.	
E. Transmission system decreases structural resistance, in that,	Same
1. Fuselage is no more resistance than that of the present two-motored planes and no motor housing is required in exposed portion of cellule.	Same
F. Protection from fire.	Same

Letters of (another) Self-Made Merchant to His Son

With Apologies to Mr. George Horace Lorimer

Loneyville. Ill.
May 4th 1919

My dear Son

You sure have got your old dad going and mom too. I always said you had something in you but did not want to get your young head all swelled up by telling you so.

Your advertisement has been cut out of the "Bugle" and been put up at the railroad depot and outside the Post office. I mean that part of it that says SPECIAL ORDERS DELIVERED BY AIRPLANE (WITHIN 75 MILES RADIUS OF OUR STORE) WITHIN ONE HOUR OF RECEIPT OF ORDER. Everybody talking about it.

It looks good to me. John, real good. This quiet old burg is all wrought up and you will get a big bunch of orders and a bigger advertisement believe me.

So you are bringing Edith and the boy over Sunday a.m. in your busy Bellanca as you call it. Better get here after church is in this time as the collection was mighty slim last. Deacon Grouch kicked.

Mom and I send our best to you all.

Your affect Father
Ezra Smith

P.S. Suppose you got your name painted big under the wings and the long narrow part.

(*Continued from page* 493)

The third gear box is of a special reduction type, in which two pinions are used, both engaging with one common spur wheel attached to the propeller. This is fitted to the after car, which is of larger dimensions than the others and carries two engines. All gear boxes are of similar detail design, the gear wheels being of large diameter, case hardened, and are fitted with pumps so arranged as to ensure a constant supply of lubrication to the teeth and bearings, etc.

Small tanks are supplied containing the supply of oil for the gear boxes, and are fitted to the cars near the gear boxes.

The radiators are coupled by aluminum piping to the engines and to an aluminum tank arranged in the hull of the ship.

Special arrangements are made to enable the effective cooling of the radiator to be adjusted to suit the temperature of the surrounding air and the speed of the engines. Branch pipes are supplied for heating when on the ground and supplying cold water for stationary trials.

The fuel leads fitted by the builders of the ships were connected by the Sunbeam Company to filters and petrol cocks on the gondolas, the filters, etc., being duplicated so as to enable them to be cleaned while the machinery is in motion.

In addition to the usual lubrication fittings supplied with the engine, special oil cooling tanks placed outside the gondolas are fitted, which are in direct communication with the oil circuit on the engines through a series of connections made with oil cocks fitted with indicating plates so that the amount of oil passing the coolers can be adjusted to suit the running and temperature conditions, and a fresh supply added to the oil in circulation from a tank situated in the main structure of the ship.

The oil circuit also incorporates a special filter so arranged that one half of the filter is continually in use while the other half is taken apart for cleaning purposes.

In addition, the work of the Sunbeam Company includes the erection of all these parts, and the carrying of the whole of the machinery through the initial trials which included air-borne trials in the shed, and flight trials of eight hours duration. The whole of the machinery is designed by the Sunbeam Company, the general arrangement of the gear being from data supplied by the Admiralty.

The two bladed propellers are also manufactured by the Company, and those propellers, one of which is 19 feet 6 inches in diameter, were all tested by the Admiralty on a special rotary apparatus before being placed on the ships.

(*Continued from page* 485)

wind three miles an hour, flying 222 miles at the end of the first three hours. The next three hour period would find them with a wind directly on their tails, going at a speed of 70.5 miles, raised to 100 miles an hour by the wind. The sixth hour would thus find them 522 miles out. From that point on the winds would be favorable. Making from 99 to 95 miles an hour, the aeroplanes would swing slightly to the southeast for the first nine hours, and would then change to an almost due east course to take advantage of changing winds, swinging again to the southeast at the fifteenth hour of flight. Flying this course they would arrive at the Azores."

It would be possible, Mr. Curtiss pointed out, for the flyers to steer directly for the Azores, allowing for drift. This would not be as economical a procedure as the one just described, but might be preferred on account of its simplicity. If there were no winds at all, or contrary winds, the trip to the Azores would be one of thirty hours or more, as the speed of from 71 to 61 miles an hour would require that length of time for the flight.

Margin of Safety

As the Azores route follows for a considerable distance the course of trans-Atlantic steamers going from the United States to Europe, or from Europe to the United States, these will join with the Government destroyers on duty in eliminating any chances of disaster to the flying crews. It is not prboable, however, that these vessels will have an opportunity to practice life-saving. The N-C boats, if forced to descend, can ride a fairly high sea. Repairs made, they can ascend again. But even the possibility of their descending is remote. Of the four motors which each "ship" mounts, one will always be in reserve, and after the first fourteen hours, two will be in reserve. It is scarcely probable that with the quality of engines used and the expert care given them any difficulty necessitating descent will arise.

Gasoline, another important element, had in Mr. Curtiss's opinion been adequately provided for.

"For a twenty-hour flight such as that described above, about 8,000 lbs. of gas would be required. A thirty-hour flight, with consumption lessening as the motor power required is less, would need 11,000 lbs. This, I should estimate, will be the capacity of the N-C planes, and in case unfavorable winds prevail, a stop will be made at Flores instead of at San Miguel, and a saving made of almost five hundred miles. In any case the supply of gasoline will be ample."

AMERICAN PROPELLER & MFG.CO. PARAGON BALTIMORE MARYLAND U.S.A

A Million Dollar Order

Quite a fair sized order for Paragon Propellers. Our largest single fixed price contract amounted to $1,056,-000. We made our deliveries on time and handled the entire order without friction or delay. Our smallest orders receive the same care and attention as the largest. If you need **one** or **one thousand** talk it over with us.

largest 'blimp' of the United States Navy has a hydrogen capacity of 180,000 cubic feet, the British have constructed airships of over 2,000,000 cubic feet of capacity.

The speaker also announced that it is known that Great Britain has designs completed and even now under construction, dirigibles of from five to ten million feet capacity, capable of skooting through the heavens at a greater speed than 100 miles an hour and that the great leviathans of the air are capable of round-trip, non-stop flights across the Atlantic. Basing his opinion on observations he has just made in the industry in Europe and this country, Mr. Upson predicted that trans-Atlantic dirigible traffic would be so common within the span of another year that the air-liner constructors would be working on ships for round-the-world flights.

Regulations for Airways Discussed

The convention on the evening of May 15 took up the problem in its application to the United States and Canada, proposing regulations which delegates believe will both safeguard and popularize aerial traffic. As defined in the "dictionary" of the regulations the term "airways" is used to designate all transcontinental or coastal air lines, while the connecting links are known as "air routes." The regulations declare:

"An airway is a belt eighty miles wide. All cities and communities located within this belt are designated as being on the airway. An aviator flying on a clear day can see forty miles each side of his machine, and it is desirable to have the airway as wide as the aviator's range of vision."

The proposed regulations to govern air traffic provide: That aircraft navigating between points less than 500 miles apart shall not go over the 5,000 feet altitude level; aircraft navigating between points from 500 miles to 1,000 miles apart shall travel at a height of between 5,000 and 10,000 feet; aircraft navigating between points 1,000 miles apart or over shall travel at heights of not less than 10,000 feet.

Dividing air travel into different levels, it was argued, will prevent accidents due to loss of altitude in flight. Some delegates, however, contended that such traffic regulations would be impossible of enforcement.

The regulations also provide that to guard against accidents due to drifting in fogs and darkness the airways are to be eighty miles wide. The aircraft will travel to the right side of the centre of the airway until they approach their destinations. Each airway becomes, therefore, divided into two "one way streets" thirty miles wide, respectively. The ten mile belt in the centre is a neutral-safety zone.

The American airways are the Wilson airway, extending from New York to San Francisco; the Wright Brothers, extending from Washington, D. C., to San Diego, Cal.; the Langley airway, named after Professor Samuel Pierrepont Langley, the pioneer experimenter in aeronautics, extending from Philadelphia to Santa Barbara, Cal.; the Chanute and Bell airway, named after the experimenters in aviation, Octavo Chanute and Alexander Graham Bell, extending from Boston to Seattle and Portland, Ore., and the Rodgers airway, named for Galbraith Perry Rodgers, first transcontinental flyer, extending from Newport News, Va., to Los Angeles, Cal.

Those running along the coast are: The Atlantic airway, extending from Bangor Me., to Key West, Fla.; the Gulf airway, extending from Key West to the mouth of the Rio Grande, and the Pacific airway, extending from San Diego to Puget Sound.

There are two Canadian airways:—The "All Red" airway will extend from St. John's, N. F., gateway of the trans-atlantic air route, to Vancouver, the gateway of the Pacific; the "Sunset" airway will extend from St. Johns to Prince Rupert, on the Pacific.

The various airways were shown on a large map which has just been completed and was displayed publicly for the first time.

Mrs. May Brown Dietrich, of New York, qualified on the afternoon of May 13 as the first woman golfer to fly to the links from the Atlantic City beach. Aboard "Eddie" Stinson's aeroplane, she left the strand in front of the Hotel Traymore at two o'clock and eight minutes later was at the Sea View Country Club clubhouse, ready for a game of golf. A large white sheet has been spread out near the clubhouse by the management as the "range finder" for aviators. The success of the golf-taxi exploit has made a hit with the golfers, who are booking engagements ahead for the eight mile run to the greens.

IMPORTANT INTERNATIONAL AERONAUTIC AUTHORITIES IN ATTENDANCE AT SECOND PAN-AMERICAN AERONAUTIC CONVENTION

Who Has Aeroplanes for Sale?

NOT less than a hundred people, including aviators, college men, representatives of different countries, sportsmen and sportswomen, are asking this question.

It seems preposterous that the aeroplane manufacturers are unable to make deliveries, but such is the case. Large firms with large output are sold out until the middle of the summer, and orders are piling up faster than machines can be produced.

This is another evidence of the invaluable work done by the Second Pan-American Aeronautic Exposition held at Atlantic City during the month of May. The usual daily discussion of the possibilities of employing aircraft for different purposes coupled with the enthusiasm and interest created by the Aerial Races have resulted in hundreds of people wanting to use aeroplanes for pleasure, sport, and utilitarian purposes.

As the Collegiate Races and other contests and events are to be held weekly throughout the summer at the Atlantic City Air Port, and over a million people visit Atlantic City each month throughout the summer, the demand for aeroplanes will, undoubtedly, assume very large proportions. Let us hope that the manufacturers will be in a position to supply the demands.

Among the exceptional scientific papers presented to the Convention during the past week were remarkable papers by Colonel E. Lester Jones, Director of the Coast and Geodetic Survey, on "The Aeroplane in Surveying and Mapping," and by Lawrence B. Sperry on "Scientific Instruments for Aerial Navigation." These papers will be presented in forthcoming issues of AERIAL AGE.

Luncheon in Honor of General Guglielmotti

A delegation of distinguished visitors, including representatives of seven different nations, guests at a luncheon given in honor of Gen. Amelio Guglielmotti, Italian Military Attaché, by officials of the Second Pan-American Aeronautical Convention, rose to their feet and cheered for several minutes when President Alan R. Hawley, of the Aero Club of America, read a message ainnouncing the safe arrival of the NC-4 at the Azores. It was the chief feature of the dinner given in the submarine grill at the Traymore.

"I wish to extend my congratulations to your great Navy," declared Gen. Guglielmotti, when he had been introduced. "Two months ago at the annual dinner of the Aero Club of America I expressed the wish that Americans would be the first to fly across the Atlantic and now I am very

One of the many official affairs held at Atlantic City, in connection with the Second Pan-American Aeronautic Convention and Exposition. Present at this affair were: Brig.-Gen. L. E. O. Charlton, C.B., C.M.G., D.S.O.; General Collardet, French High Commission; Col. T. E. Gilmore, Asst. British Attaché; Capitaine Pierre Bosc, French Mission; Mr. Alan R. Hawley, President, Aero Club of America; Mr. Augustus Post, Mr. Henry Woodhouse and many other notables

glad to say my wish has been fully accomplished. The regular flying of ships overseas will enable the nations of the world to know and love one another better."

The guests at the luncheon included:

General Emilio Guglielmotti, Italian Military Attaché; Captain Carlo Tappi, Acting Air Attaché of the Italian Embassy; Col. Wm. A. Bishop, "ace of aces"; Mrs. Bishop; Alan R. Hawley, President Aero Club of America; Mayor Harry Bacharach, of Atlantic City; Captain Pierre Edgard Bosc, French High Commission; Lieut. E. G. Garland, Royal Air Force; Henry Woodhouse, Vice-President, Aerial League of America; Lieut. (j.g.) C. H. Payne, U. S. N.; Captain Hugh L. Willoughby, Ensign A. A. Beckwith, Lieut. Jack Frost; Augustus Post, Secretary, Aerial League of America; Lieut. D. Gregg, Mr. and Mrs. Mark Ovenden, Mr. and Mrs. Hamilton Peltz, Mr. and Mrs. Dan Clarke, Joseph H. Shinn, W. W. Young, A. S. Abell, 3rd, A. Day; George F. Kerr, Chairman, Aviation Committee, A. C. Chamber of Commerce; Albert T. Bell, President, Atlantic City Aero Club; Edward Marshall, Miss Donna Easley, Miss Hortia Willis, Mrs. Willis, Mrs. A. S. Abell, Miss Abell, Miss Helen W. Bell, Mrs. Mary Brown-Dietrich, Mr. H. C. Kinne, Mr. and Mrs. C. G. B. Sprotto, Lieut. George A. Zabriskie, Earle L. Ovington, Eddie Stinson, Mrs. William Allen Bartlett, Lieut. Dixon, Paul Favour; Dr. A. Bangachea, official representative of Guatemala; W. Lee, Mrs. Hamilton, Fred Wagner; Mr. K. Asoki, representing Major General K. Inouye, Military Attaché, Imperial Japanese Embassy; Mrs. C. T. Show, President, Springfield, Mass., Aero Club; Walter J. Buzby, Harry B. Cook, Joel Hillman, Henry W. Leeds, Mr. Samuel P. Leeds, Earl R. Ovington and Mrs. Leeds, Mr. and Mrs. J. Haines Lippincott, Mrs. Emery Marvel, Hubert Somers, Dr. J. B. Thompson, Mr. and Mrs. Daniel S. White, Mrs. John J. White, Mrs. Henry W. Leeds, Mr. Robert W. Leeds, Mrs. Marion Wright; Col. Edwards, President Columbia University Aero Club; Lt. Craigmyle, Columbia University; G. Douglas Wardrop, Rear Admiral W. N. Little, U.S.N., E. J. David.

Commercial Aerial Photograph

Paul Favour, formerly chief of the Photographic Section of the Bureau of Aircraft Production, addressing the Second Pan-American Aeronautic Convention, declaring the aerial photography is certain to play a dominating part in future surveying and map making. He said in part:

"The rapidity with which topographic surveying can be accomplished by means of the aeroplane and the camera, together with the infinite detail the photographs reveal does work that is impossible for engineers equipped with transits, levels and plane tables to secure," he declared.

"The accuracy of the photographic survey, especially over areas where great work would be difficult, is one of the strongest features. Many problems will come up that should be worked out in conjunction with the engineers.

"One of these is the possibility of making contour maps from stereoscopic negatives. Another the stabilization of the camera in the plane so that the axis of the lens is always perpendicular to the terrain. This is a very important feature when it comes to piecing together pictures to complete a certain territory because the least angle of the aeroplane will cause trouble when it comes to joining the pictures because of the list of the objects photographed.

"Another is the possibility of supplying filters that will give reasonably accurate information regarding shoals or obstructions beneath the surface of the water.

"In my opinion the work is of sufficient importance to warrant an extensive experimental program to determine the exact limitation and aerial photo-topography.

"We have found that the best results are obtained from an altitude of 3,500 feet."

The Art of Navigation

In an address on the "Recent Advances in the Art of Navigation" at the Steel Pier, Professor Charles Lane Poor of Columbia University, said in part:

"The underlying principles of modern navigation were explained without the use of mathematics. These principles were discovered by Captain Thos. H. Sumner, of Boston, in 1837, but were not developed and made practicable for the ordinary navigator until toward the end of the century. At that time Admiral Marcq St. Hilaire, of the French Navy, developed, under the name of 'new navigation,' a modification of the Summer method, which is theoretically more perfect, and which lends itself to every day use.

"However, with the facilities in use only a few years ago, the calculation involved was long and tedious. It was the bugbear of navigators. But even with this great handicap the method was so simple and its advantages so great, that it gradually became more and more used. With this increased use, there arose a demand for some simple solution, some way of avoiding the tedious calculations. De Auino tried to accomplish this, and in 1912 published his 'Altitude and Azimuth Tables.' They are really a revision and extension of tables published in 1876 by Sir William Thomson (Lord Kelvin). They are double entry tables, require double interpolation, and are difficult to use if exactitude is essential. By using an assumed position of the ship, instead of the position by 'dead reckoning,' however, the calculations by means of these tables can be greatly reduced; but the way of determining this assumed position differs with each 'sight' and the precepts to be taken into account in each reduction make the use of these tables a rather 'fussy' affair.

"The real difficulty with the old tables which were used twenty years ago was that these tables were made by mathematicians to solve any and all problems, problems in trigonometry, in surveying, in astronomy, as well as working out sights at sea. These tables were, therefore, long and cumbersome, contained many, many things that were never used at sea. In 1914 a new set of mathematical tables were prepared, a set of tables arranged with one end in view, to solve this navigational problem in the shortest and quickest way; a set of tables which does not contain an unessential figure. The principles and arrangement of these tables were adopted by the Hydrographic Office of the Navy Department, and such tables are now in use on nearly all naval vessels.

"While these tables simplify the calculations and reduce the paper work to a minimum, yet they involve the use of logarithms and the chances of error in making additions.

Representatives of twelve countries, leading aeronautic authorities and other notables at one of the many official gatherings held at Atlantic the months of June, July,

"In 1917 the possibility of long flight by aeroplanes was already recognized, and the officials of the Aero Club of America took up the question of aerial navigation. I undertook to investigate the various methods of navigation, with a view to eliminate, or simplify all calculations. The St. Hilaire method was adopted as the basis on which to work and the various logarithm tables, de Aquine tables, Johnson tables, and other short-cut tables and methods of making the necessary calculations, were carefully examined. All these were rejected as requiring too much time in working out a sight. In an aeroplane travelling at the rate of one hundred miles per hour, an observer would be carried nearly nine miles in the five minutes necessary for the practiced computer to make the calculations by any one of the three recognized methods. Besides this. the aviator has had little or no practice in mathematical calculations and it would take the average trained aviator, not five, but fifteen minutes to make the computations, and to this would be added the chance of making errors in all the additions and the nuisance of handling books, and turning from one page to another.

"The principle of the slide rule was thought of and it was applied to the solution of the problem. Early in July, 1917, several forms of slide rules were made, each of which accomplished the desired result. The earlier forms had several sliding scales; the form as finally adopted discarded all sliding parts. It consists of a fixed circular disc on which are engraved a series of concentric logarithmically graduated circles, and two rotating members, which may be moved separately or clamped together.

"The navigational slide rule, or, as it has been named by the Navy, 'The Line of Position Computer,' apparently solves the difficulty. On it one actually performs, without knowing it, all the logarithmic calculations involved in working out a sight with an accuracy sufficient for all practical purposes at sea and in the air. The entire work can be done in less than a minute and a half, and with an average error of less than two miles. Experiments made in Washington show that, after half an hour's practice, the average time required to work out a sight is one minute and six seconds. Reports from naval officers who have used these instruments constantly for months, and who have carefully checked their results against logarithmic calculations, show that the average discrepancy between results as worked out on the Computer, and as obtained through logarithmic calculations, is about one mile; that the average time saved in working out each sight is about seven minutes.

Aerial Transport and Airways

Epochal development of countries of vast territorial sweep whose visions of commercial growth have been throttled by the enormous expense involved in the construction of railroad lines, is to come on the wings of the aeroplane. Aeronautic authorities, speaking on the subject of "The Pan-American Aerial Transport and Airways Over Land and Sea" before the second Pan-American Aeronautic Congress, expressed the conviction that aircraft offer immediate opportunity to such countries to actualize ambitions to take their place in world trade and prosperity commensurate with their territary.

Augustus Post, secretary of the Aero Club of America, who presided, introduced the subject by pointing out that inventions—particularly those that have increased the speed of transportation and intercommunication, like the steamship, the railroad, the telephone—have changed world conditions. He asserted that the advent of the steamship made the Atlantic the central basin of the world, succeeding the Mediterranean Sea, and observed that it does not require undue prescience to foresee that the Pacific will succeed the Atlantic as the central basin of the world, with the commercial development which aerial transportation promises to bring in South and Central America, the northwestern part of the United States, Alaska, Canada, Australia, New Zealand, Japan and China.

Boston-Atlantic City Flight

Three hours and 55 minutes flying time was the record established by Melvin W. Hodgdon, of Somerville, Mass., in a flight from Boston to Atlantic City Air Port—a distance of 340 miles by the air route, May 16th. Aviator Hodgson carried Ralph J. Dale, of Allston, Mass., as his passenger.

The start was made from Saugus Field, six miles north of Boston, at 2:35 o'clock, in a steady west wind. At 4:50 the plane was soaring over Long Island, where it made a landing at Central Park. The aviators had to go seven miles by automobile to secure enough gas to replenish their supply for the run to the shore. They took supper at a nearby inn and took to the air at 6:10 for their trip to Atlantic City.

The machine appeared over the air port at 7:46, circled over the field and made a landing at 7:50 o'clock. They were given a dinner by the aero officials in recognition of their feat in making the long flight from an outside point to the shore.

By their trip here they quality first for the prizes offered by the Boston Globe for the aviator who makes the best record in a flight to or from Boston during the month of May with the air port here as the landing or take-off point. A trophy and $1,000 goes to the winner. They also become contenders for the Pulitzer trophy for the aviator who makes the best record in flying land or water planes from anywhere to Atlantic City or from the port here to anywhere during the month, and the New York Herald Efficiency prizes for the aviator making the longest non-stop run from any point to the shore or from Atlantic City to some other point, the first prize being $1,000.

New University Entries

Entries from four more prominent universities for the intercollegiate aeroplane contest has created keen interest in the new form of sport by the institutions in this section.

The race will be run around the pylons which are erected as turning points on the five kilometer course over the

(*Continued on page* 552)

City, last week, in connection with the Second Pan-American Aeronautic Convention, Exposition and Contests, which are to continue throughout August and September

RECORD OF THE COMPETITIONS

MAY 1st CONTEST:

ROLAND ROHLF. Hon. Victor Hugo Barranco, passenger, 90 h.p. Curtiss "Oriole" Biplane, from Westbury, Long Island, to Atlantic City Air Port, 118 miles; two hours and eight minutes. Return flight, one hour and twenty-five minutes. Both flights in driving storms.

EDDIE STINSON. Lieut. G. W. Shaw, U. S. N., passenger. 90 h.p. Curtiss Biplane, from Queens, Long Island, to Atlantic City Air Port; two hours, thirty-three minutes, in driving storm.

E. K. JACQUITH. 90 h.p. Flying Boat from Atlantic City to Rockaway Naval Air Station in driving storm; one hour, forty-five minutes.

MAY 2d CONTEST:

B. H. KENDRICK. 90 h.p. Flying Boat from Newark to Atlantic City; two hours, fifteen minutes.

E. K. JACQUITH. 90 h.p. Flying Boat from New York to Atlantic City; two hours, twelve minutes.

MAY 3d CONTEST:

A. LINVINGSTON ALLEN, with John P. Davis as passenger, flew from Roosevelt Field, L. I., to Atlantic City Air Port in one hour, twenty minutes.

MAY 5th CONTEST:

EDWARD V. GARDINER left Bustleton, Pa., at 1:57 P.M. and flew to Atlantic City, arriving 3:07 P.M. Time, one hour and ten minutes.

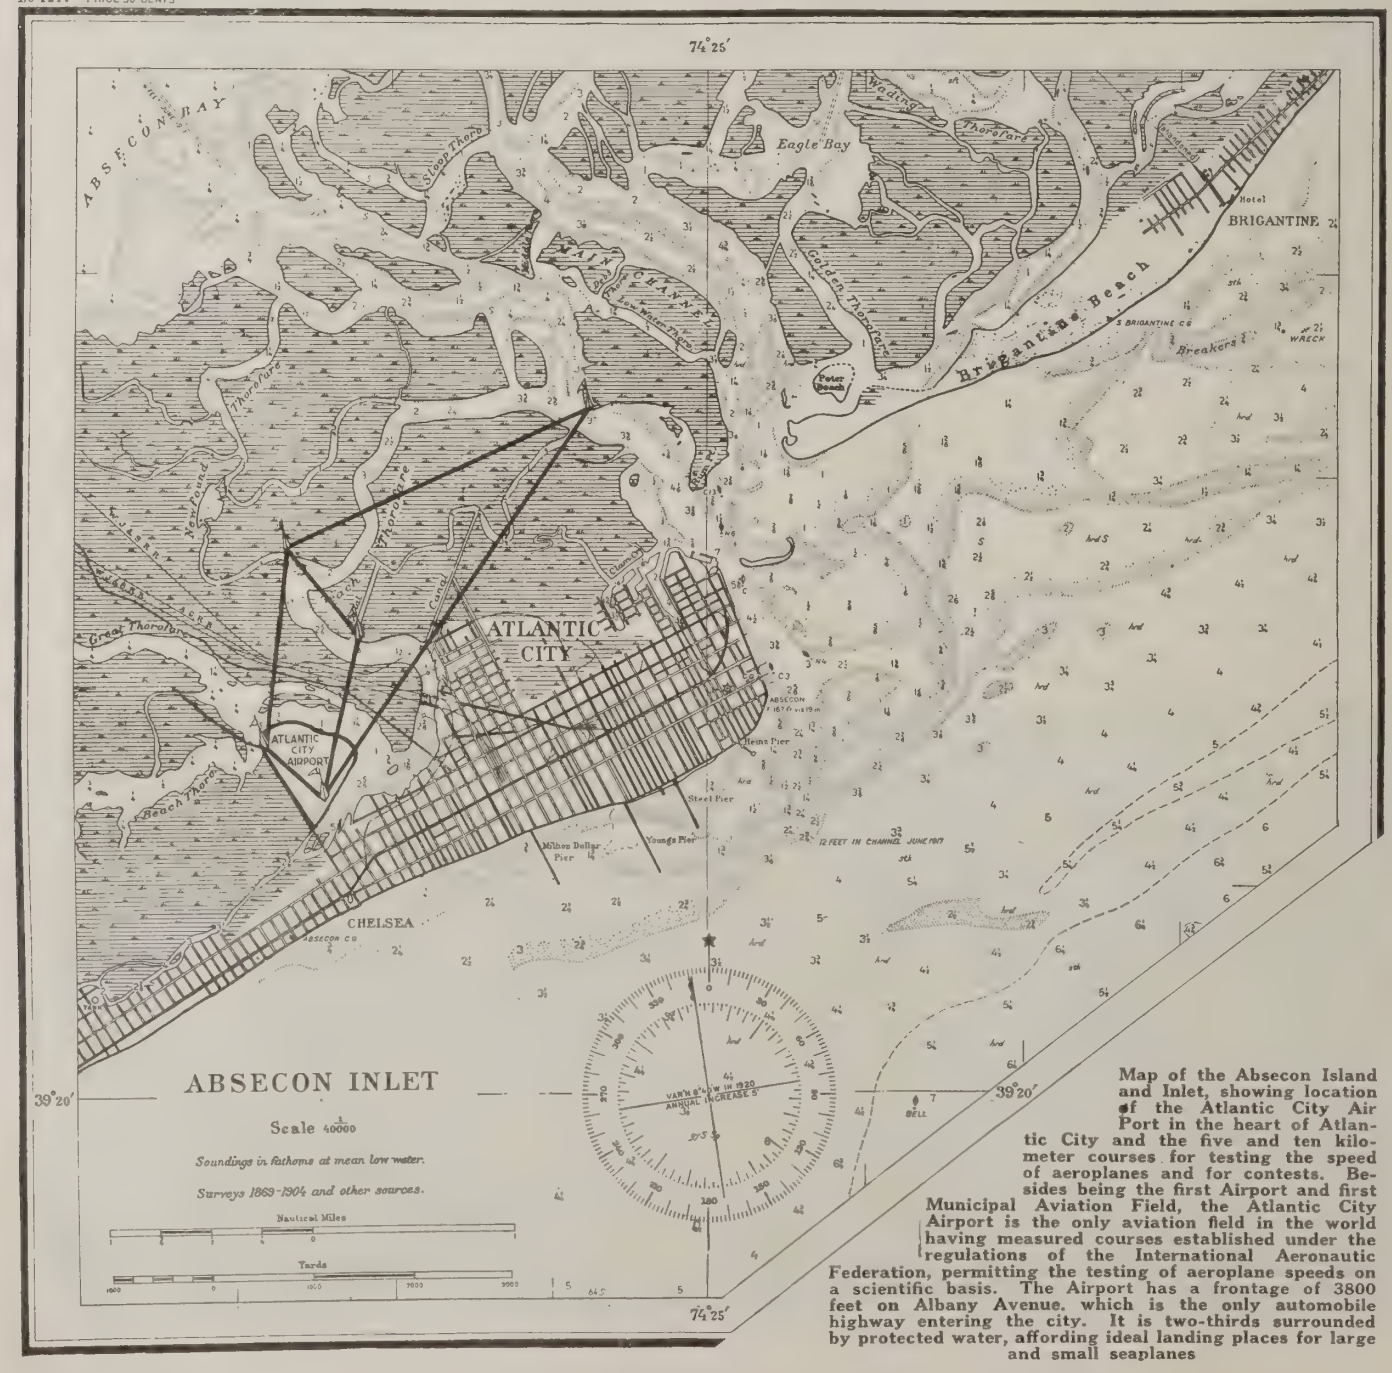
ROBERT SHANK accomplished the same flight in the same time, but carried Pathe News operator as passenger.

MAY 6th CONTEST:

. ORTON HOOVER, in Curtiss M.F. boat, flew from Atlantic City to Walnut Street Bridge, Philadelphia, in two hours and twenty-five minutes, leaving at 5 P.M. and arriving 7:25 P.M., in driving electrical storm, carrying Charles Henry Davis as passenger.

MAY 8th CONTEST:

ROBERT SHANK, with Wm. O. Burton of No. 755 Park Avenue, N. Y. C., flew from Atlantic City to New York via Long Branch in two and one-half hours, exact time of departure and arrival unknown.



MAY 13th CONTEST:

ROBERT SHANK, with Miss Hazel Allen as passenger, flew from Belmont Field, N. Y., to Atlantic City in one hour and twenty-one minutes, hour of departure unknown here, but time is correct.

The above flights were in competition for the Pulitzer Trophy and Herald Efficiency Prize.

On May 10th, Mr. W. L. Watkins gave a demonstration of his parachute, dropping bag weighing 75 pounds in a very successful demonstration of accuracy of drop. Also on May 13th he dropped a crate of eggs from 700 feet in 20-mile wind without breaking an egg.

No 1217 PRICE 50 CENTS

Map of the Absecon Island and Inlet, showing location of the Atlantic City Air Port in the heart of Atlantic City and the five and ten kilometer courses for testing the speed of aeroplanes and for contests. Besides being the first Airport and first Municipal Aviation Field, the Atlantic City Airport is the only aviation field in the world having measured courses established under the regulations of the International Aeronautic Federation, permitting the testing of aeroplane speeds on a scientific basis. The Airport has a frontage of 3800 feet on Albany Avenue, which is the only automobile highway entering the city. It is two-thirds surrounded by protected water, affording ideal landing places for large and small seaplanes

THE NEWS OF THE WEEK

Professor Todd Sails for Montevideo to Observe Solar Eclipse from Seaplane

New York, May 14.—Professor David Todd, who has charge of the Amherst College Astronomical Observatory, sailed May 13 on the American steamship Elinor, bound for Montevideo, to take observations of a solar eclipse on May 29. Professor Todd will make his observations from a naval aeroplane at an altitude of 10,000 to 15,000 feet, taking photographs of the phenomenon from the vantage in height thus gained, which is an innovation in astronomical observations.

Prof. Todd is accompanied by Ensign G. L. Richard, Ensign W. H. Cushing, N. V. Copwell, J. P. Briggs, E. C. Leonard, and A. D. Hallington, all machinist mates, first class. A big naval hydroaeroplane was on the after deck, from which it will ascend to make this experiment.

Before sailing Professor Todd described the plans for his expedition as follows:

"When the Elinor is in latitude 2.30 north and longitude 18 west at high noon on May 29, when the sun will be 15 degrees north of the zenith. The ship will be stopped and the biplane-hydroaeroplane in charge of the navy crew will ascend to an altitude of from 10,000 to 15,000 feet above the sea, where it is hoped that we shall be able to get some fine pictures of the eclipse, which will last six minutes and fifty seconds.

"The object in going above the clouds to observe the eclipse is to get some clear pictures of the solar corona. Fully 50 per cent of the former expeditions to observe eclipses on land from the sea level have been failures because of clouds. I have been practising flying and making observations with my telescope from the naval station at Miami, Florida.

"The rays from the corona which affect the human eye are the red ones, while the blue affect the photograph plates. These blue rays are absorbed by the atmosphere in their descent toward the earth from the corona, and the theory of ascending, say, 13,000 feet is that being one-third of the whole of the atmosphere the pictures will be much clearer."

Trap Shooter Flies to Tournament

Plainfield, N. J., May 16.—Lieut. E. E. Ballough, formerly of the 89th Aero Squadron, with T. K. Apgar, arrived at the grounds of the Arrow Head Rod and Gun Club, to participate in a trap shooting contest held by the club, in a Curtiss JN4B biplane. The aviators carried a message from Mayor John F. Hylan of New York City, wishing success to the meet.

McAlpine-Traymore Passenger Service Has Its First Trial

New York, N. Y.—The first trip of the Traymore Air Service between New York and Atlantic City was made on May 14 with Miss Hazel Allen, hostess of the McAlpin Hotel, as the passenger. The journey was made in a Canadian Curtiss 100 horsepower two-seater, with Aviator "Bob" Shanks as pilot, and the distance was covered in eighty-five minutes. A favorable wind aided in making the trip.

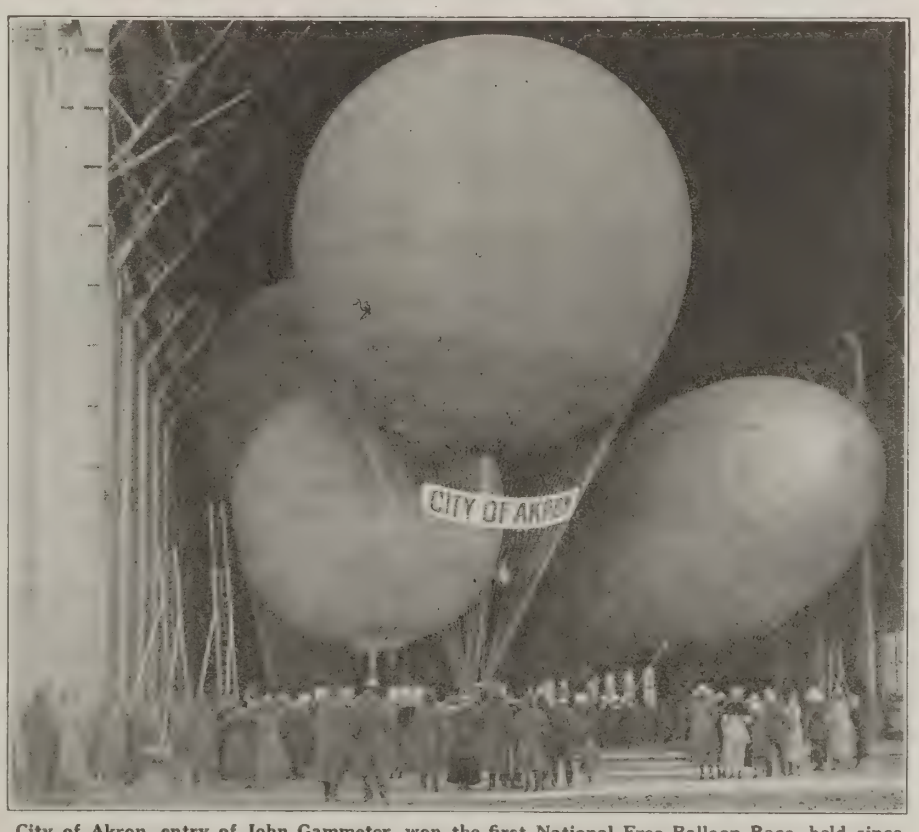
The start was made from Belmont Field. The flight was made under the auspices of the Traymore Hotel of Atlantic City, and there was a large crowd in front of the hotel to watch the aeroplane land on the beach.

Packard Company Building Aviation Field Near Detroit

Detroit, Mich.—Packard Motor Car Company has acquired a tract of land on the outskirts of Detroit for use as a private experimental flying field in the development of its aviation program. The field lies between Detroit and Mt. Clemens, almost midway between Morrow Field in Northwest Detroit and Selfridge Field near Mt. Clemens; it is large enough to permit of the landing of any kind of aeroplane; it is accessible by improved highway and interurban railway; and it is easily susceptible of improvements which will be begun at once to make it a model experimental field.

Through the efforts of Messrs. Deeds and Kettering, a fine field has been established at Ohio State University, in Columbus. Prominent citizens of Detroit are supporting a movement to have the municipality take over the present U. S. air service field, known as Morrow Field, in the Northwest outskirts of Detroit.

Officials of the Packard Company realize that the establishment of a series of fields within flying distance of their own will be of mutual advantage, and state that they will encourage the full utilization of every facility.



Liquidation Commission Balances British-American War Supplies Account With $35,000,000 Payment to Us

The Liquidation Commission in Paris, of which Judge Parker is chairman, assisted by Mr. Chester W. Cuthell, Special Representative of the Secretary of War, dealing with Inter-Allied claims, went to London on April 30, and they have just cabled that after a series of conferences they have reached a complete and satisfactory adjustment of all outstanding claims which the British have against us and which we have against the British, growing out of war supplies manufactured in this country or abroad, and that the net result is a payment of $35,500,000 to us by the British. This covers the production of spruce, Liberty motors, wood distillates, nitrocellulose powder, cotton linters and wool.

Akron Balloonists Fly 400 Miles in 22 Hours

Washington, May 13.—Announcement has been made that the balloon entered by the ex-navy men of Akron won the Akron Flying Club Race by a 22-hour flight ending at Ocean City, Md. The balloon was piloted by Ensign P. D. Collins of the U. S. N. R. F. Second place was won by C. H. Roth and C. E. Earle, with C. W. Seiberling, vice-president of the Goodyear Co., as passenger. Landing was made at Millsboro, Delaware.

The balloons left Akron, Ohio, at 1 o'clock Sunday afternoon, all flying the American colors and each covered an approximate distance of 350 miles, except the one that made its forced descent in Pennsylvania, it having been fired at seventeen times by some unknown person or persons, and four of the shots took effect in the balloon, forcing a descent. The balloon shot down made its descent in Pennsylvania.

City of Akron, entry of John Gammeter, won the first National Free Balloon Race, held since 1914, by a 400 mile flight to Ocean City, Md.

Crew of the Navy dirigible C-5. From left to right: Com. E. W. Coil (commanding pilot), Lt. J. V. Lawrence (pilot), Lt. M. H. Easterly (radio operator), Ensign D. P. Campbell (2nd assistant pilot), Chief Mach. Mate T. L. Moorman (engineer) and Chief Mach. Mate S. H. Blackburn (engineer)

Flying Field for Brighton Beach

New York, May 19.—Announcement was made that a group of former Army aviators of the British and American service will open a flying field at the old Brighton Beach Race Track, near Coney Island. Passenger carrying will be conducted at reasonable rates and a regular flying course given. A service between the Brighton Beach Field and New York City is contemplated, if permission for landing at Van Cortlandt Park or some other point can be secured from the municipal authorities.

Four aeroplanes will be in constant service and no admission to the field will be charged.

Aerial Motion Picture Photographers Form Company on Pacific Coast

San Francisco, Cal.—A company has been organized to take aerial films and photographs and carry passengers for advertising purposes throughout the State of California. B. M. Spencer, formerly chief instructor at McCook Field, is chief pilot. Several educational films have been taken from the air and the company is prepared to take photographs of cities and towns, real estate developments, rivers, lakes, irrigation projects, farms, ranches and estates.

Salt Lake City Aerial Sightseeing Service

Salt Lake City.—On Decoration Day an aerial transportation and sightseeing service will be inaugurated, according to an announcement made by a group of Salt Lake City capitalists who are backing the project. Lieut. G. C. Beck, a former army aviator, is active head of the company and J. C. Kinney, an oil promoter, and L. J. Gilmore, president of the Utah Motor Company, are interested in the service.

The Pioneer Wing of the Police Reserve Air Force inaugurated at Sheepshead Bay. The mascot, little Miss Dyer, is presenting a letter to her father, Police Inspector Dyer, for delivery in Philadelphia

Army Aircraft to Fight Forest Fires

Washington, D. C.—Army aeroplanes and captive balloons will cover portions of the national forests of California, Arizona, New Mexico and other States this summer to aid in detecting and suppressing forest fires. In compliance with an order from Secretary Baker directing the Air Service to co-operate with the Forest Service of the United States Department of Agriculture in this work, conferences are under way to determine where and to what extent the air scouts will supplement the forest rangers.

That there is a distinct and important place for aircraft in fire protection of timberlands is regarded by the forestry officials as beyond doubt, but experimenta trial of methods and possibilities will have to be the first step. This is now being planned for the coming fire season. Army aerodromes and bases will be utilized for the experiments. Some of the bases near enough to national forests to be used advantageously are the flying fields at San Diego, Riverside and Arcadia in southern California. Other points in the West and in the East are under consideration, including one near the White Mountains in New Hampshire.

One of the interesting possibilities to be tested is bombing fires to put them out. It is believed that bombs charged with suitable chemicals can be used with good results. Another plan to be tested is transporting fire fighters by dirigibles from which ladders can be lowered to the ground.

The chief use of the aircraft this summer, however, will be for fire detection. At present the foreign service relies for this partly on patrol, usually by men on horses, motorcycles or railroad speeders, and partly on watchers stationed at lookout points.

Lookouts in a very broken country, cut up by deep canyons or where mountain ridges obstruct the view, or in a flat country that affords no good points of vantage, are often unable to pick up all fires quickly by the rising smoke, or to locate them accurately. For precise location the system in use depends on triangulation through reports telephoned from separate observation points. Aeroplanes will use wireless in recording fires, as they have done in communicating with the artillery, and would locate fires by co-ordinates in the same way that gun fire in war is directed to a particular spot or object.

Secretary Crowell to Study Civilian Aviation in Europe

Washington, May 17.—Benedict Crowell, Assistant Secretary of War, and a number of military and civilian aviation experts will leave for Europe on May 24 aboard the transport Mt. Vernon to study possibilities of developing the science of aviation along the lines of civilian usages.

Included in the party will be Lieut.-Col. James A. Blair, of the General Staff; S. S. Bradley, of the Manufacturers' Aircraft Association; G. H. Houston, president of the Wright-Martin Aircraft Corporation; C. M. Keys, vice-president of the Curtiss Aeroplane & Motor Corporation, and Howard Coffin, of the Council of National Defense.

Colonel Halsey Dunwoody, Chief of the Air Service overseas, will join the party in France.

RECORD TRIP OF NAVAL DIRIGIBLE C-5

AFTER an historic flight, during which it was in the air over twenty-five hours, the Navy dirigible C-5, which left Montauk Point, Long Island, and reached St. John's, Newfoundland, broke her moorings and was carried to sea. At the time of writing the dirigible has not been located, and it has officially been given up as lost. It is stated that plans are now being pushed by the Navy authorities to substitute another dirigible for the flight.

The C-5 arrived at the Pleasantville base, near St. John's, after being in the air continuously for twenty-five hours and forty minutes. A perfect landing was made within the narrow confines of the old cricket field which was chosen as the anchorage for the airship. Lieutenant J. V. Lawrence was at the wheel at the completion of the voyage, and the manner in which he handled the ship while the landing was being performed evoked a cheer of admiration from the crowd which had gathered.

As soon as she had been secured at her anchorage a big force, under Lieutenant Little, was set to work preparing the ship for the transatlantic flight. It was not long before the treacherous wind began to play upon the dirigible, and early in the afternoon she was torn from her anchorage, but was recaptured and secured again.

Immediately after arrival, Lieutenant Commander Coil and his crew got out of the car and prepared to take twelve hours sleep before continuing their flight across the Atlantic. Before turning in, however, he told the story of the trip to Newfoundland.

In it he gave all the credit to Lieutenant Campbell and Lieutenant J. V. Lawrence, both of whom, he said, were weary "and almost seasick," but stuck to their posts. He also described the period of several hours during which the airship was "lost" over Newfoundland.

"We made a 'landfall' at St. Pierre," he said, "but found ourselves on the west instead of the east shore of Placentia Bay. From this point we attempted to follow the Chicago's radio directions, but they did not work. For the moment we were lost.

No Trouble From Fog

"We started 'cross lots' and saw about all of Newfoundland, and I must say that this is the doggondest island to find anything on I ever struck. Eventually we hit the railroad track and followed it to Top Sails, which we identified, and then continued on to St. John's. There was considerable fog, but it did not trouble us.

"Throughout the time we were trying to find ourselves we had difficulty with our wireless set, and part of the time it was out of commission.

"Our troubles started just after midnight, when the sky become overcast. Before then we had been flying under a full moon at an altitude of 1,000 feet. We lost our bearings while approaching Little Miquelon Island, off the south coast of Newfoundland, about 170 miles from St. John's.

Commander Coil praised the work of the landing crew which moored the dirigible. Rear Admiral Spencer S. Wood, commander of the aviation base, greeted the C-5's commander.

The flight of the C-5 established, it is believed, a world's record for non-rigid airships for total distance covered without a stop.

The C-5 is 192 feet long, 43 feet wide, and 46 feet high;

(*Continued on page* 552)

The Naval Dirigible C-5, which made a successful flight from Montauk Point to Newfoundland, was unfortunately torn from her moorings shortly after landing

THE TRANSATLANTIC FLIGHT

THE NC-4 arrived safely at Horta, the Azores, after covering the distance of 1,200 nautical miles between that point and Trespassey Bay, Newfoundland, in 15 hours and 18 minutes. She took off at 6:07 P. M., New York time, on May 16, and arrived at Horta at 9:25 A. M., New York time, on May 17.

Her two sister ships, the NC-1 and NC-3, took off at Trespassey Bay at 6:09 P. M. and 6:07 P. M. respectively, but did not complete the trip to the Azores, owing to the serious weather difficulties encountered. The NC-1 lost her bearings in the heavy fog and landed at 8:19 A. M. 200 miles west of the island of Corvo, where her crew was picked up and the seapalne taken into tow by the steamship Iona. Later dispatches reported that the NC-1 was abandoned after being towed a distance of 80 miles.

Considerable anxiety was felt for the safety of the NC-3, the flagship of the fleet, when no news of her was received for a period of over fifty hours. She finally taxied into Ponta Delgada at 1:50 P. M. (N. Y. time) on May 19, after having landed 205 miles out at sea at 9:30 A. M. on May 17. The crew is safe and well, but the flying boat so damaged by the pounding of the heavy seas that she is being dismantled.

That the NC-4, which is commanded by Lieutenant-Commander A. C. Read, should be the only plane to complete the flight to the Azores, after her difficulty in arriving at Tespassey Bay from Rockaway, is a surprise to some, who predicted that the NC-4 would prove the least successful of the three seaplanes. She was forced to drop out on the way from Rockaway to Halifax on May 8 and stop for repairs at Chatham. On May 14, she made the flight to Halifax and on the day following covered the 461 nautical miles from Halifax to Trespassey Bay in rapid time. Her average, however, was reduced by an enforced stop for repairs during the flight. The time for the three flying boats for each stage of the journey is as follows:

NC—4	Left	Arrive	Knots	Hrs. Speed
Rockaway to Chatham (May 8)	10.04 A.M.		(Not announced)	
Chatham to Halifax (May 14)	9.05 A.M.	1.15	340	4h 10m 85
Halifax to Trepassey (May 15)	9.52 A.M.	5.37	461	8h 45m 58
Trepassey to Horta (May 16)	6.07 P.M.	9.25 A.M.	1,200	15h 18m 80
NC-1				
Rockaway to Halifax (May 8)	10.04 A.M.	7.08	540	9h 4m 60
Halifax to Trepassey (May 10)	8.45 A.M.	3.41	461	6h 56m 65
Trepassey to Horta (May 16)	6.09 P.M.			
NC-3				
Rockaway to Halifax (May 8)	10.04 A.M.	6.58	540	8h 56m 60
Halifax to Trepassey (May 10)	12.39 P.M.	7.31	461	6h 52m 65
Trepassey to Horta (May 16)	6.06 P.M.			

(Time is reckoned by New York time and distance and speed are reckoned by nautical miles, sixty nautical miles being equivalent to sixty-nine land miles.)

The official log, as issued by the Navy Department, shows the progress of the planes during the entire flight. The log follows:

May 17, 1919, 8:45 a.m.—From naval radio station, Bar Harbor: "Progress of three seaplanes from Trepassey to Azores: Ahead of estimated distance at 06:25 by 125 nautical miles. Above time 'planes reported passed Station Ship No. 13, 650 nautical miles out. Cape Race still in communication with No. 4."

8:58 a.m.—From Horta: "NC-4 passed Station No. 18 at 09:45 (5:45 New York time); NC-3 passed Station No. 13 at 06:23 (2:23 New York time); NC-1 passed Station No. 18 at 10:14 (6:14 New York time); NC-1 passed Station No. 16 at 09:17 (5:17 New York time)."

9:32 a.m.—From Horta: "NC-4 passed Station No. 22 at 12:10 (8:10 New York time)."

9:47 a.m.—From U. S. S. Melville: "NC-1 passed Station No. 16 at 09:17 (5:17 New York time); NC-4 passed Station No. 18 at 09:45 (5:45 New York time)."

10:07 a.m.—From U. S. S. Melville: "Last report received NC-4 passed Station No. 16 at 08:80 (4:30 New York time); NC-1 passed Station No. 13 at 07:13 (3:13 New York time); NC-3 passed Station No. 9 at 04:10 (12.10 a.m. New York time)."

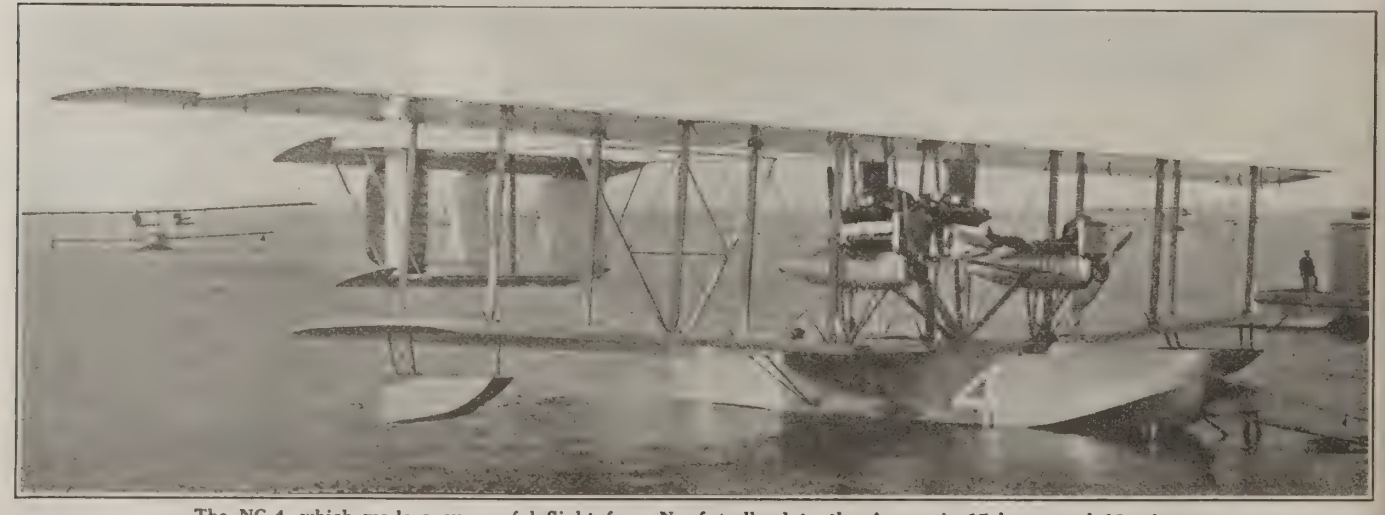
10:59 a.m.—From Horta at 13:25 (9:25 a.m., New York time): "NC-4 arrived Horta."

11:05 a.m.—From U. S. S. Melville: "NC-4 reported sighted land at 11:35 (7:35 New York time)."

11:06 a.m.—From U. S. S. Melville: "NC-1 passed Station No. 19 at 10:14 (6:14 New York time); NC-3 between Station No. 17 and Station No. 18 at 09:15 (5:15 New York time), but off course; NC-4 passed Station No. 22 at 12:10 (8:10 New York time), weather foggy."

11:08 a.m.—The Melville: "No. 4 passed Station No. 22 at 12:10."

11:10 a.m.—From Horta to naval radio station at Arlington following message received from NC-4: "We have picked up land again; think it is Pico."



11:11 a.m.—From Melville: "Last information received from NC-3 at 09:25 5:15 New York time), 'we are off our course somewhere between Station No. 17 and Station No. 18.'"

11:12 a.m.—From Melville: "Last information received NC-4 passed Station No. 22 at 12:10 (8:10 New York time); NC-1 passed Station No. 18; NC-3 off course somewhere between Station No. 17 and Station No. 18."

11:46 a.m.—The Prairie: "Progress of three seaplanes from Trepassey to Azores ahead of estimated distance at 06:25 (2:25 New York time), by 125 nautical miles. At above time 'planes reported passed Station No. 13, 650 nautical miles out. Cape Race still in communication with NC-4."

2 p.m.—From Melville: "NC-4 arrived at Horta this morning. Weather conditions Ponta Delgada: Weather around islands misty with frequent rain squalls."

2 p.m.—From the Prairie: "Extraordinary perforanne NC 'planes all done on load of 1,630 gallons petrol and six men, except NC-3, with crew of five men. Lieutenant Rhodes not taken. With Rhodes NC-3 would have 185 pounds excess of any other 'plane. Successful start due in large measure to tireless work of

The NC-4, which made a successful flight from Newfoundland to the Azores in 15 hours and 18 minutes

crews of seaplanes, plus coöperation all officers and men Trepassey ships. Aerography most important factor. Arrangements for weather reports complete and accurate.

3:30 p.m.—From U. S. S. Columbia at Horta: "NC-4 at Horta waiting for favorable weather before proceeding to Ponta Delgada. Not expected to leave until tomorrow."

May 16, 1919, 6:03 p.m.—From U. S. S. Aroostook: "Seaplane NC-3 began taxying for Azores flight 20:56 (4:36 p.m., New York time)."

6:23 p.m.—From U. S. S. Aroostock: "Seaplane NC-4 began taxying for Azores flight 20:53 (4:53 New York time)."

7:10 p.m.—From U. S. S. Aroostock "Seaplane NC-1 began taxying for Azores leg, 20:53 (5:13 New York time)."

7:17 p.m.—From U. S. S. Aroostook: "Seaplane NC-4 took off water on Azores flight, 21:36 (5:36 p.m., New York time)."

7:27 p.m.—From U. S. S. Aroostook: "Seaplane NC-4 landed Trepassey harbor 21:53 (5:53 p.m., New York time) after circling harbor."

7:52 p.m.—From U. S. S. Aroostook: "Seaplane NC-4 took off water on Azores flight, 22:07 (6:07 p.m., New York time)."

7:53 p.m.—From U. S. S. Aroostook: "Seaplane NC-4 left water for Azores leg 22:06 (6:06 p.m., New York time)."

Note—See 8:32 p.m.

7:55 p.m.—From U. S. S. Aroostook: "Seaplane NC-1 took off water on Azores flight 22:09 (6:09 p.m. New York time.)"

8:27 p.m.—From U. S. S. Aroostook: "Seaplanes NC-1, NC-3, NC-4 passed from flight at 22:20 (6:20 p.m., New York time)."

8:30 p.m.—From U. S. S. Aroostook: "Seaplanes NC-1, NC-3, NC-4 passed from flight on historic voyage at 22:20 (6:20 p.m., New York time)."

8:32 p.m.—From U. S. S. Aroostook: "Seaplane NC-3 left Trepassey 22:04 (6:04 p.m., New York time.)"

8:41 p.m.—From U. S. S. Aroostook: "Seaplane NC-1 left water at 21:36 (5:36 p.m., New York time), on Azores leg"; (delayed).

8:44 p.m.—From U. S. S. Aroostook: "Seaplane NC-4 left Trepassey 21:36 (5:36 p.m., New York time)"; (delayed).

9:08 p.m.—From U. S. S. Aroostook: "Seaplanes NC-3 and NC-1 left water 22:11 (6:11 p.m., New York time), on Azores leg"; (delayed).

9:09 p.m.—From U. S. S. Aroostook: "Seaplanes NC-4, NC-3 and NC-1 left Trepassey at 22:11 (6:11 p.m., New York time), for Azores"; (see 7:55, 7:52, 8:32, 22:09 taken as official time of start by Navy Department).

11:12 p.m.—From U. S. S. Aroostook: "Last night new engine placed on NC-4. All 'planes given complete inspection this morning, warmed, and given finishing touches in early afternoon. Wind fresh, west, late afternoon, favorable for start. NC-3 got under way taxying at 20:36 (4:36 p.m., New York time); NC-1 got under way taxying at 20:56 (4:56 New York time); NC-4 got under way taxying at 21:13 (5:13 p.m., New York time); NC-4 stopped all motors at 21:18 (5:18 p.m., New York time), but began taxying again after delay of four minutes at 21:22 (5:22 p.m., New York time). All 'planes taxying around harbor to warm up motors. NC-4 got off the water at 21:37 (5:37 p.m., New York time), and after circling around harbor and to the mouth of Mutton Bay she landed at Trepassey Harbor again at 21:53 (5:53 p.m., New York time), on account of seeing other 'planes not yet up. All 'planes made a long run down the harbor three points

Harry G. Hawker, who took off from Newfoundland at 1:55 P. M., on May 18, has not been reported within 72 hours from his start

off the wind and took off, NC-3 leading at 22:06 (6:06 p.m., New York time), NC-4 following closely at 22:07 (6:07 p.m., New York time; NC-1 in the rear at 22:09 (6:09 p.m., New York time). They were flying low and circling around point across mouth of Mutton Bay. Three giant 'planes passed out of sight in the direction of Mistake Point at 22:20 (6:20 p.m., New York time). Weather conditions for Azores run good; with present wind continuing during night she should reach Azores in nineteen hours. The crews are in the pink of condition and are happy to leave on the 1,372-mile run."

11:44 p.m.—From U. S. S. Prairie: "All seaplanes passed Station 6 at 02:05 (10:05 p.m., New York time)."

11:50 p.m.—From U. S. S. Prairie: "'Planes passed Station Ship 3, NC-1 passed at 24:03 (8:03 New York time); last plane passed at 00:15 (8:15 p.m., New York time)."

May 19, 1919, 2:00 a.m.—From United States steamship Melville: "Seaplane NC-2 passed station ship 7 at 02:58 (10:58 p.m., New York time)."

2:09 a.m.—From United States steamship Melville: "Seaplane NC-4 passed station ship 8 at 03:29 (11:29 New York time)."

2:11 a.m.—From United States steamship Melville: "Seaplane NC-3 passed station ship 9 at 09:10 (12:10 a.m., New York time)."

2:11 a.m.—From United States steamship Melville: "All three 'planes had passed station ship 8 at 03:50 (11:50 p.m., New York time)."

2:36 a.m.—"NC-1—have you heard anything NC-3? We have just passed station ship 13. Signed NC-1."

2:53 a.m.—"Thanks to the S. S. Norger. Good wishes." Same plane was calling station ship 18).

3:56 a.m.—From Naval Radio Station, Bar Harbor: "Last heard of seaplanes at 3:21 a.m. and signals were getting weaker. However, freak work may avail itself early in the morning, and it is probable that we may hear seaplanes until 6 a.m."

4:30 a.m.—From United States steamship Melville: "Seaplane NC-4 passed station ship 14 at 07:06 (3:06 a.m., New York time)."

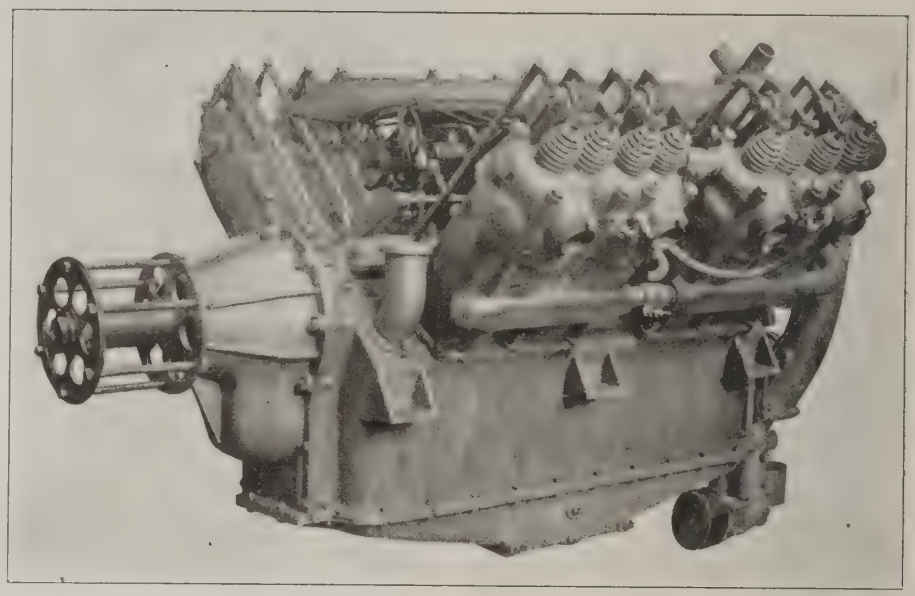
5:56 a.m.—From United States steamship Columbia: "Seaplane NC-1 passed station ship 13 at 07:13 (8:13 a.m., New York time)."

7:04 a.m.—From United States steamship Prairie: "NC-4 passed station ship 11 at 05:50 (1:50 a.m., New York time)."

On the day following, May 18, Harry G. Hawker and Lieutenant Commander Grieve started on their attempt to cross the Atlantic in a Sopwith biplane. Hawker will use the direct route from Newfoundland to Ireland, a distance of 1,760 nautical miles. He took off at 1:55 P. M. Immediately after taking off, Hawker released his landing chassis and headed eastward at a speed of more than ninety miles an hour. No news of Hawker has been received within 72 hours of his start.

The Sopwith Biplane which Hawker attempted to fly across the Atlantic

THE STURTEVANT AEROPLANE ENGINES



PERFECTED developments of many years' experience in building aeroplane engines is represented in the Sturtevant 8-cylinder engines. All features of design and construction are predicted on reliability and emphasis is laid upon this point in test.

Balance of reciprocating parts has received individual attention because only by accurate balance both static and running can the engine operate without vibration and stand out under the great strain which flying imposes.

Exhaustive study has been given to the subject of heat treatment of high grade alloy steels with the result that important improvements in methods have increased the strength of these materials at the same time reducing the weight of the parts.

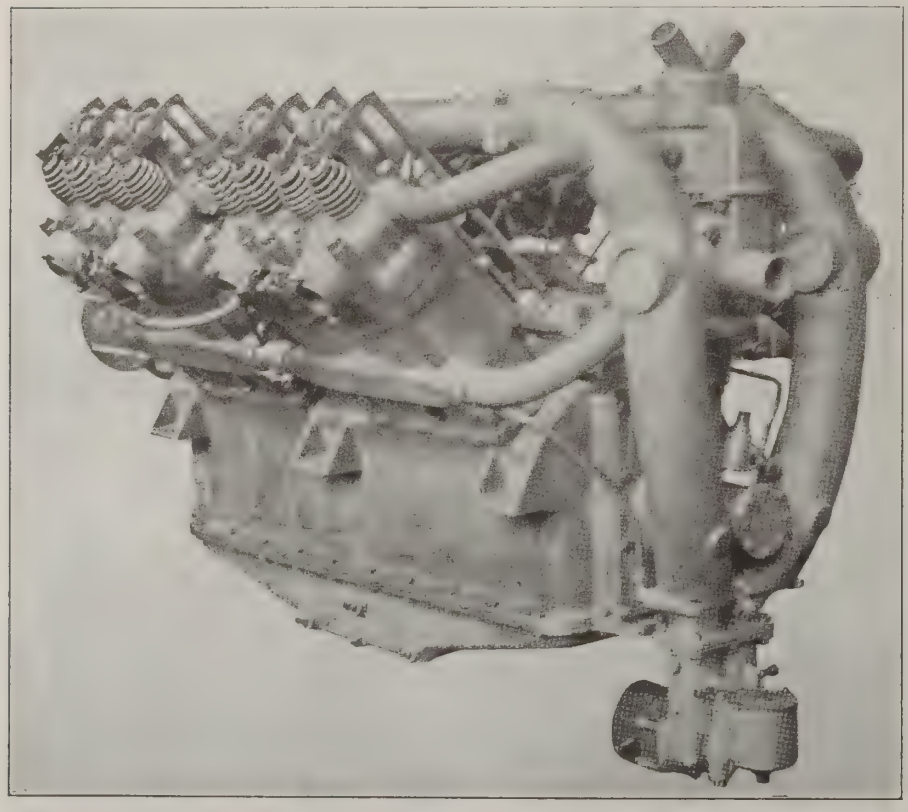
With the exception of some small accessories, all parts of the engine are made, assembled, and tested in one plant, and guaranteed by one concern. This applies to forgings and all other processes in the manufacture of the engines.

A large completely equipped test house is maintained with facilities for testing under conditions closely approximating actual service requirements. Each engine is subject to rigid preliminary tests for several hours at full speed, full load, after which it is taken apart, examined, and again given a strenuous final run for several hours under full load, full speed conditions. A complete record of the test performances of each individual engine is kept and a copy of the test record given to the purchaser.

The Sturtevant Model 5A-4½, 210 H. P. engine, showing magneto accessibility

General Specifications

The engine is of the eight-cylinder "V" type, four-stroke cycle, water-cooled. It is made in two models, as follows:



Model 5A-4½, 210 H. P., has a bore of 4½" and a stroke of 5½", equivalent to 114 mm. x 140 mm. The normal operating crankshaft speed is 2,250 R. P. M. The propeller shaft, driven through reduction gears with a ratio of 5:3, operates at 1,350 R. P. M.

Model 5A, 140 H. P., has a cylinder bore of 4" and a stroke of 5½", equivalent to 102 mm. x 140 mm. The normal crankshaft speed is 2,000 R. P. M.; that of the propeller 1,200 R. P. M.

The larger engine is designed for maximum power at high altitudes and is equipped with devices for this purpose. It is essentially an engine for the high-speed express type of aeroplane.

The smaller engine is articularly fitted for use in the training type of aeroplane and is designed with view to maximum reliability and durability.

The engines are similar in all major features of design and construction. Illustrations and descriptions of parts which follow apply to both models.

Sturtevant Model 5A-4½, 210 H. P. engine, showing water jacketed inlet manifold

Table of Specifications

Model 5A

Bore.....4" (102 mm.)
Stroke.....5.5" (140 mm.)
Displacement.....555 cu. in.
Number of cylinders.....8
Arrangement of cylinders.....90°-"V"
Cooling,

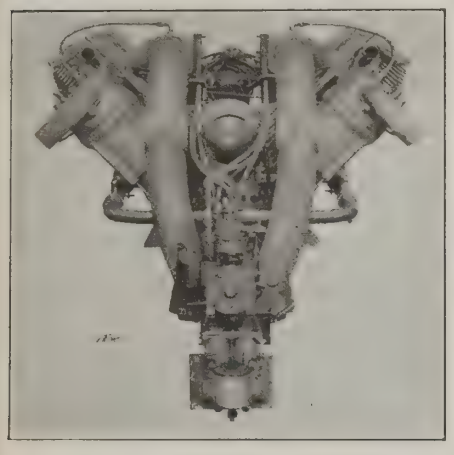
Water circulation by centrifugal pump
Cycle 4-stroke
Ignition,

Two 8-cylinder high-tension magnetos
Carburetor,

Zenith. Water jacketed manifolds
Oiling system,

Dry sump, complete forced feed
Normal engine speed.....2,000 R.P.M.
Propeller speed .....1,200 R.P.M.
Rated horsepower 140
Maximum horsepower 170
Weight with all accessories but without oil or water.....500 lbs. (227 kilos)
Weight of water in engine.33 lbs. (15 kilos)
Weight per B.H.P. dry,
2.95 lbs. (1.34 kilos)
Fuel consumption..55 lbs. per H.P. per hr.
Oil consumption.....6 lbs. per hr.

Model 5A-4½



Bore.....4.5" (114 mm.)
Stroke.....5.5" (140 mm.)
Displacement.....700 cu. in.
Number of cylinders.....8
Arrangement of cylinders.....90°-"V"
Cooling,

Water circulation by centrifugal pump

Cycle 4-stroke
Ignition,
Two 8-cylinder high-tension magnetos
Magnetos....Two 8-cylinder high-tension
Carburetors,
Zenith. Water-jacketed manifolds
Oiling system,
Dry sump, complete forced feed
Normal engine speed.....2,250 R.P.M.
Propeller speed .....1,350 R.P.M.
Rated horsepower 210
Maximum horsepower 240
Weight with all accessories but without oil or water.....480 lbs. (218 kilos)
Weight of water in engine,
28 lbs. (12.7 kilos)
Weight per B.H.P. dry..2 lbs. (.91 kilos)
Fuel consumption..55 lbs. per H.P. per hr.
Oil consumption.....8 lbs. per hr.

Cylinders

Cylinders are cast in pairs from an aluminum alloy and are provided with

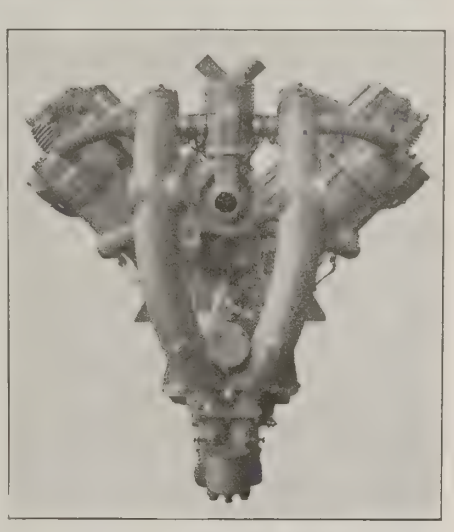
Sturtevant with Christensen air starter

carefully fitted steel sleeves. A perfect contact is secured between cylinder and sleeve; nevertheless a sleeve can be replaced without injury to the cylinder proper. No difficulties due to expansion occur, on account of the rapid transmission of heat and the fact that the sleeve is always at a higher temperature than the cylinder. A moulded copper asbestos gasket is placed between the cylinder and the head, permitting the cooling water to circulate freely and at the same time insuring a tight joint.

Cylinder Heads

Cylinder heads are cast in pairs from an aluminum alloy and contain ample water passages for circulation of cooling water over the entire head. Trouble due to hot valves is thereby eliminated, a most important consideration in the operation of an aeroplane engine. The water jacket of the head corresponds to the water jacket of the cylinders, and large openings in both allow unobstructed circulation of the cooling water. The cylinder heads and cylinders are clamped to the base by means of six long bolts.

Valves



Valves located in the cylinder heads are mechanically operated. The valves and valve springs are especially accessible and of such size as to permit high volumetric efficiency. The valves are constructed of hardened tungsten steel, the heads and stems being made of one piece. The valve rocker arms located on the top of the cylinder are provided with adjusting screws. A check nut enables the adjusting screw to be securely locked in position, once the correct clearance has been determined. The rocker arm bearings are adequately lubricated by an oil wick and reservoir. Cam rollers are interposed between the cams and the push rods in order to reduce side thrust on the push rods.

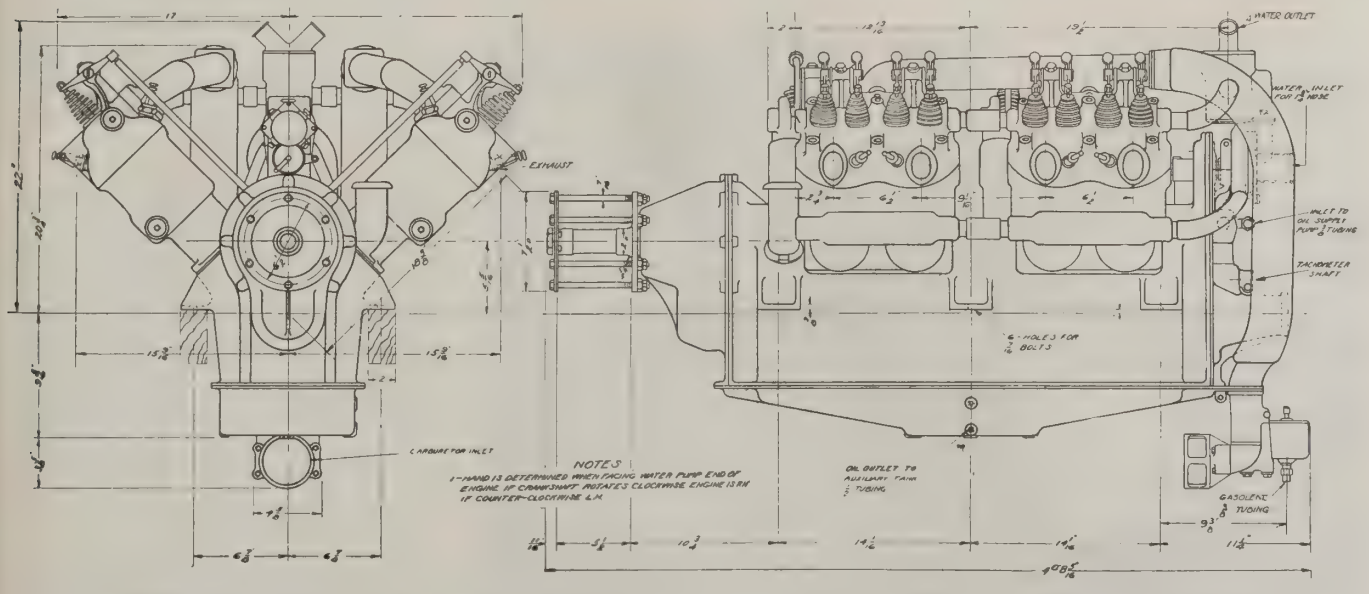
Valve Springs

Valve springs are of unique Sturtevant design, made of the finest alloy steel, and subjected to an elaborate heat treatment. The springs are of extremely large diameter and operate under low stress. Liability of valve-spring failure has been reduced to a negligible point.

Pistons

Pistons made of special aluminum alloy are deeply ribbed in the head for cooling and strength, and provided with two piston rings. These pistons are of exceed-

Rear view of the Sturtevant Model 5A-4½, 210 H.P. engine, showing thermostat, pump, and carburetor



ingly light weight in order to minimize vibration and prevent wear on the bearings. The piston pin is of hardened chrome nickel steel, bored hollow. It is allowed to turn, both in piston and connecting rod. The piston rings are of special Sturtevant design, developed after years of experimenting in aeroplane engines.

Connecting Rods

Connecting rods are of "H" section machined all over from forgings of a special air-hardening chrome nickel steel. The steel, after being heat treated, has a tensile strength of 280,000 pounds per square inch. Rods are consequently strong and yet unusually light and, being machined all over, are of absolutely uniform section, giving as nearly perfect balance as can be obtained. Big ends are lined with white metal and the small ends are bushed with phosphor bronze. Connecting rods are all alike and take their bearings side by side on the crankpin, the cylinder being offset to permit of this arrangement.

Crankshaft

The crankshaft is machined from the highest grade chrome nickel steel heat

Outline Dimensions Sturdevant Model 5A-4½, 210 H.P. Engine and Model 5A, 140 H.P. Engine

treated in the Sturtevant furnaces in order to obtain the best properties of this material. The shaft is 2¼" (57 mm.) in diameter, bored hollow throughout to insure minimum weight with maximum strength. It is carried in three large bronze-backed, white metal bearings. A new method of producing these bearings insures a perfect bond between the two metals and eliminates breakage.

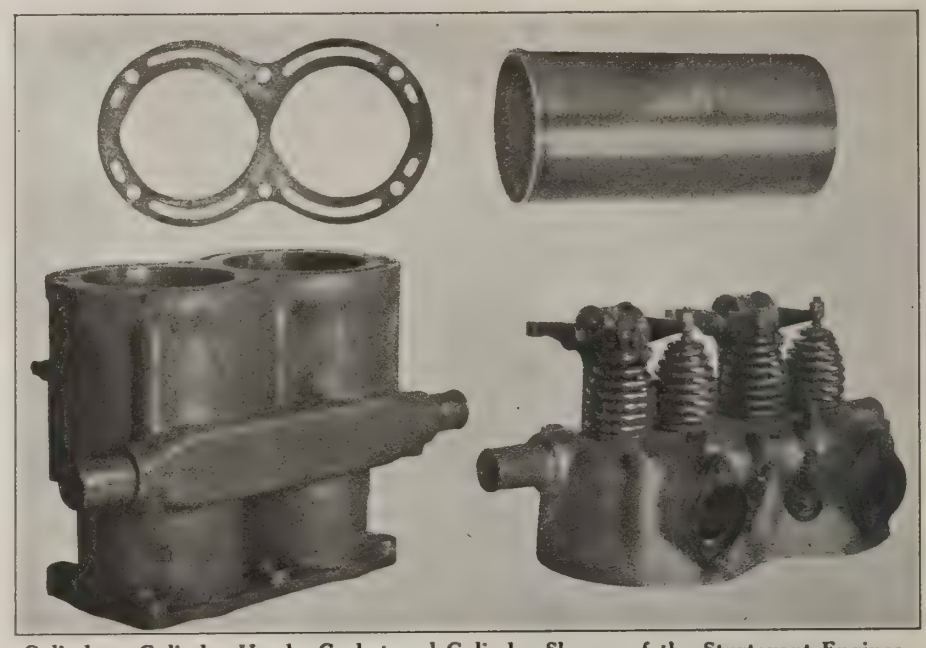
Base

The base is cast from an aluminum alloy. Strength and rigidity are combined with light weight. The sides extend considerably below the center line of the crankshaft, providing an extremely deep section. At all highly stressed points, deep ribs are provided to distribute the load evenly and eliminate bending.

Sump

The lower half of the base is of cast aluminum alloy of extreme lightness. It collects the lubricating oil and acts as a small reservoir for same. An oil filtering screen of large area covers the entire surface of the sump. A small pad is provided at one end on which is mounted the double-gear oil pump.

Propeller Shaft



The propeller shaft is carried on two large annular ball bearings and driven from the crankshaft by hardened chrome nickel steel spur gears. These gears are contained within an oil-tight casing integral with the base on the opposite end from the timing gears. A ball thrust bearing is provided on the propeller shaft to take the thrust of a propeller or tractor, as the case may be.

Camshaft

The camshaft is contained within the upper half of the base between the two groups of cylinders and supported in six aluminum bearings. It is bored hollow throughout. Cams are formed integral with the shaft and ground to the proper shape and finish. An important development in the shape of cams has resulted in a maintained increase of power at high speeds. The gears operating the camshaft, magneto, oil and water pumps are contained within an oil-tight casing and operate in a bath of oil.

Lubrication

Lubrication is of the complete forced circulating system, the oil being supplied to every bearing under high pressure by a rotary pump of large capacity. This is operated by gears from the crankshaft. The oil passages from the pump to the main bearings are cast integral with the base, the hollow crankshaft forming a passage to the connecting-rod bearings and the hollow camshaft distributing oil to the camshaft bearings. The entire surface of the lower half of the base is covered with a fine mesh screen through which the oil passes before it is recirculated. A scavenging pump draws oil from the sump as rapidly as it accumulates and delivers it to an outside reservoir which may be of any desired capacity.

Cylinders, Cylinder Heads, Gasket and Cylinder Sleeves of the Sturtevant Engines

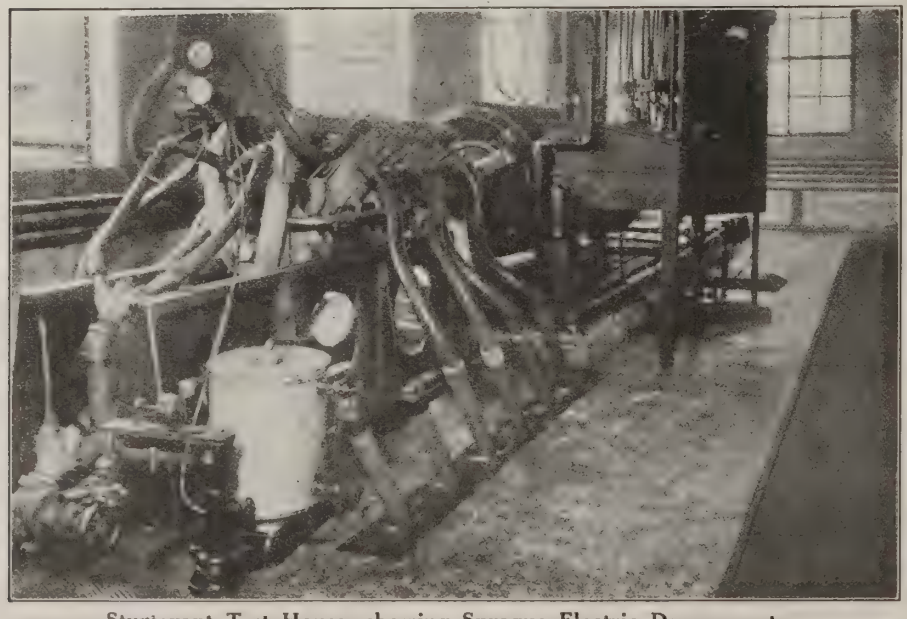
Carburetor

A Zenith duplex type carburetor is used. It is of a double-barrel design with one float chamber and two jets, each supplying one group of four cylinders. It is located on the rear end of the engine beneath the level of the base, permitting of gravity fuel feed, and connected to the cylinders by means of special, water-jacketed aluminum manifolds, the water jackets being cast integral. This type of manifold not only provides the cylinders with an homogeneous mixture, but increases materially the fuel economy. There is less carbon formed in the cylinder, and the exhaust is noticeably clean. The carburetion is entirely unaffected by outside temperature changes, the latter being of great importance at high altitudes.

An overhead type of carburetor installation can be supplied. In this case two single-barrel carburetors are used, one for each bank of cylinders. They are located in an accessible position between the cylinder blocks, are attached directly to water-jacketed intake manifolds, and have interconnected throttles.

Carburetor Altitude Compensator

The Sturtevant Automatic Altitude Compensating device for the carburetor is another important feature, which was developed and perfected through two years of constant experimentation. The function of the compensator is to regulate the amount of fuel entering the cylinders in accordance with the density of the atmosphere. The effect of this device, besides maintaining smooth running of the engine, is to decrease the fuel consumption at high altitudes. Actual tests indicate a fuel saving of approximately 50 per cent. at extremely high altitudes. Uniform mixture and engine temperature insure maximum engine speed and maximum power at all altitudes.



Ignition

Ignition is accomplished by two reliable eight-cylinder waterproof magnetos placed face to face between the two groups of cylinders in a most accessible position. Each cylinder is provided with double ignition by means of two spark plugs located in water-cooled bosses on the sides of the cylinder heads. This feature not only increases the reliability of the engine operation, but in addition tends to improve operation and power at high speeds. The magnetos are synchronized by a vernier coupling, allowing most accurate adjustment.

Cooling

The water circulation is accomplished by a centrifugal pump which delivers a large quantity of water through the cylinder jackets and maintains a uniform tem-

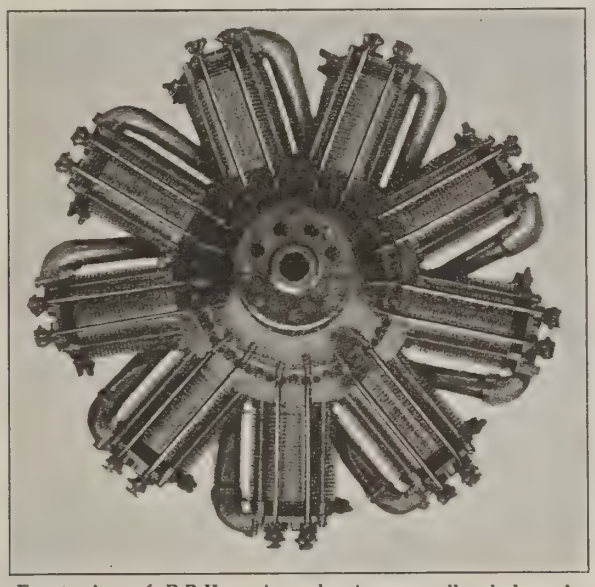
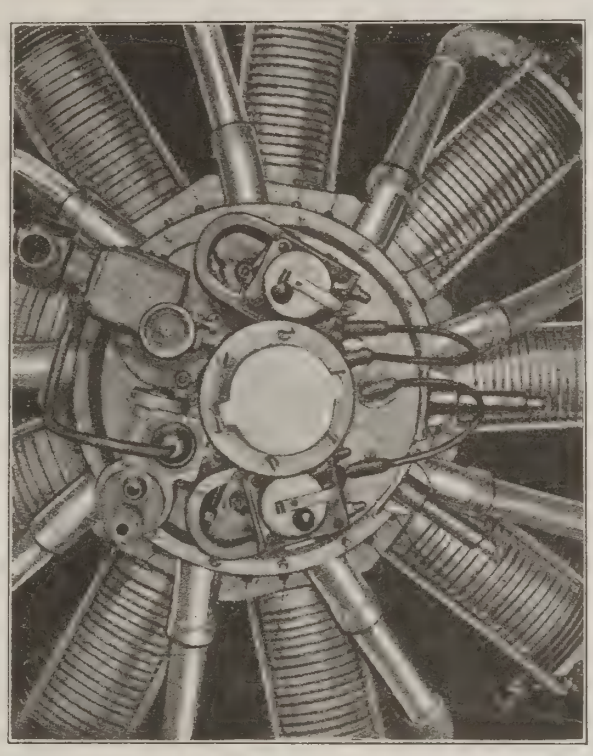
THE B. R. I AND B. R. II AERO ENGINES



THE B. R. 1 and B. R. 2 aero engines produced by Humber, Ltd., Coventry, were designed by Capt. W. O. Bentley, M.B.E. The Humber Co. were the first to take up the building for the B. R. 1 engine, which was developed while Captain Bentley was at their works, and considerably improved upon. The result of these improvements was the B. R. 2 engine. This was originally manufactured by the Humber Co., but later, owing to the success of the engine, other companies were engaged in its manufacture.

In the early days of the war, when the French Clerget rotary engine was very much in favor, it occurred to Capt. Bentley that some improvement might be made in this, and the result was the designing by him of the B. R. 1. Capt. Bentley saw the vital importance of weight in this engine, and it is interesting to note that, where in the case of the French engine steel cylinders were used, th principle of the B. R. engine is an aluminium cylinder shrunk on to a steel liner, with an aluminium piston, the result naturally being a very much lighter engine with consequent increased efficiency.



This engine, a nine-cylinder rotary type, was used principally for scouting purposes, and became very much sought after by the best flying men in the Royal Air Force. Perhaps the most notable achievement of any machine fitted with the B. R. 2 engine was the bringing down of the famous German, Baron Richthofen, by the Canadian airman, Captain A. R. Brown, who was at the time using a Sopwith "Camel" scouting plane. The following wire, received by Humber, Ltd., on that occasion from the Air Ministry, is naturally prized as a curiosity:—"Boyd Cable wires from the Front: Inform Humbers famous star fighter, Baron von Richthofen, the Red Hun, crashed to-day in our lines by a B. R. 2 engine scout."

The detail measurements, etc., of the B. R. 1 and B. R. 2 engines are given below:

Rotary Engines.	B. R. 1	B. R. 2
Number of cylinders	9	9
Bore	120 mill.	140 mill.
Stroke	170 mill.	180 mill.
Cubic capacity	1922.65 c.c.	2770.83 c.c.
Normal b.h.p.	150	250
Normal speed	1,250	1,250
Weight per b.h.p.	2.67 lb.	1.9 lb.
Fuel consumption	11 g.p.h.	20 g.p.h.
Oil consumption	12 pints per hour	16.5 pints per hour

THE "UNION" AND "LIBERTY" MOTORS COMPARED

THE editors of AERIAL AGE have had prepared the following comparison of the "Union" and "Liberty" aero engines as a matter of historical record and interest to aeronautic engineers throughout the country. The comparison is of interest because of the efforts of two pioneer engine builders, located on opposite sides of the continent, working independently along similar lines and arriving at conclusions so nearly alike. From the data it will be seen that the two engines follow very closely the same lines. As the "Union" was designed to accommodate a larger cylinder than is at present used, the parts, consequently, have an exceptional factor of safety, which probably accounts, in a large measure, for its endurance qualities. In three conservative government tests it has set up three new endurance records.

In going over this comparison it is interesting to note that the "Union" engine was designed in September, 1915, over two years before the "Liberty" came out.

	"Liberty"	*"Union"*
GENERAL DESIGN		
Crank	Seven bearing; hollow pins and journals.	Same; with addition of radial bearing between propeller and thrust bearing.
Connecting Rods	I-beam section.	Same.
Pistons	Aluminum Alloy.	Same.
Valve Mechanism	Camshaft located above center-line of cylinder heads. "Packard" type of rocker arm used to prevent oil leakage. Seven bearings.	Same. Provision to care for oil leakage is of UNION design, rocker arm coming out of top of housing, then curving down to valve.—Same object in mind.
Water Manifolds	Water inlet and outlet manifolds connected to cylinders and pump by means of short lengths of hose, to absorb vibration.	Same.
Valve Springs	Double. Right and left helical.	Same.
Valve Cooling	Exhaust valve stem is provided with special jacketing and water leaving cylinders is drawn from about the exhaust guide, thus cooling the stem and valve.	Same.

Rocker Arm Contact	
Line contact (as compared to point contact) between rocker end and valve stem, eliminating excessive wear due to old style set-screws, which gave only a point bearing.	Same.
Cylinders	
Steel barrel, with steel water-jackets. Hold down flange located above cylinder bottom.	Same, except valve seats and passages are in a semi-steel head welded to the main cylinder forging.
Journal Studs	
To relieve crank-case of tension stresses resulting from cylinder explosions, studs holding main bearing caps terminate at upper end on top of crank-case.	Same. In addition, studs connect through short yokes to the cylinder flanges.
Ignition	
Two plugs per cylinder. Current transmitted through Kerite carried in grounded metal conduits.	Same.
Lubrication	
Force feed through hollow crank to all journals and pin bearings. Camshaft bearings and rockers similarly oiled through hollow camshaft. Dry sump with external cooling reservoir.	Same.
Carburetion	
One "Zenith" Carburetor connected to each three cylinders through water-heated manifold.	Same.
Dimensions	
Valve stem diameter	Same.
Valve lift	Same on exhaust. Inlet 1/16" less.
Cylinder flange thickness	Same.
Cylinder flange studs diameter	Same, plus four additional through studs to crank journals.
Cylinder barrel thickness	Same to 1/82" less below combustion span.
Cylinder head thickness.	1/16" greater.
Piston diameter.	¼" less.
Piston length.	1" greater.
Length to diameter ratio, 1 to 1	1.25 to 1.
Piston pin diameter	Same.
Piston pin wall thickness.	1/16" greater.
Connecting rod — type of section	Same.
Connecting rod — section, depth	1/16" greater.
Connecting rod — section, width	1/16" less.
Connecting rod — section, flange	Same.
Connecting rod — lower bushing, bronze, babbitt-lined	Same.
Connecting rod — lower bushing, thickness of babbitt	Same.
Connecting rod — inside diam. lower bushing	⅛" greater.
Connecting rod — length of lower bushing	½" greater.
Ratio, connecting rod length to crank throw, 3.49 to 1.	4 to 1
Camshaft diameter	⅛" less (for 4¾" cylinder)
Camshaft, number of journals	Same, plus radial at thrust
Crank pins, outside diameter	⅛" greater
Crank pins, inside diameter	¼" greater
Crank pins, length	½" greater
Crank journals, outside diameter	⅛" less
Crank journals, inside diameter	⅛" greater
Crank journals, length	½" greater
Crank webs, width	½" greater
Crank webs, thickness	Same
Crank webs, radius of fillets	Same

CLASSIFICATION OF LANDING FIELDS

THE War Department has issued the following memorandum concerning the classification of aeroplane landing fields:

Landing fields will be classified according to size, shape and accommodations into four classes; namely, first, second, third and fourth.

First Class Landing Field.

1. Shall conform with the general specifications as to size and shape or otherwise accepted by the Government.

2. Character of the ground must be such that will allow safe landing and take off in all kinds of weather. In case of poor drainage must have a landing cross (see specifications). If L shaped field it must have two wet weather runways corresponding to the bars of the cross for each arm of the L.

3. All approaches clear allowing for safe landing and take off.

4. Marking shall be a circle 100 feet in diameter with band 3 feet wide. Name of station and number in letters and figures 15 feet long by 3 feet wide. Number placed in Northwest corner of field.

5. The accommodations shall be:

(a) Hangar space, wind indicator, tools and other repair equipment.
(b) Supplies, gasoline, oil, water, sundry spares.
(c) Telephone communication.
(d) Transportation facilities.
(e) Attendants.
(f) Proper guard and enforcement of field regulations.

Second Class Landing Field.

1. Shall conform with general specifications as to size and shape or otherwise accepted by the Government.

2. Character of the ground must be such that will allow safe landing and take off in all kinds of weather. In case of poor drainage must have a landing cross (see specifications). If L shaped field it must have two wet weather runways corresponding to the bars of the cross for each arm of the L.

3. All approaches clear allowing for safe landing and take off.

4. Marking shall be a cross arrow with bars 3 feet wide and length shall be determined by the size of the field. Each bar shall be 90 feet long provided field allows 600 yards runway. Proportionate length or 1 to 20 if under or above that. In case of L shaped field bars shall cross each other proportionate to each arm of the L. Cross shall be placed in position, each arm indicating center of runway. Arrowheads shall point North and West. Number of station in figures 15 feet long by 3 feet wide. Number placed in Northwest corner of field.

5. he accommodations shall be:

(a) Hangar space, wind indicator with available tools and other repair equipment.
(b) Supplies, gasoline, oil, water and sundry spares.
(c) Telephone communication.
(d) Near transportation facilities.
(e) Attendants and guard available upon request.
(f) Enforcement of field regulations.

Third Class Landing Field.

1. Shall conform in general specifications as to size, shape or otherwise accepted by the Government.

2. The character of ground must be such that will allow safe landing and take off in all kinds of weather.

3. All approaches clear allowing for safe landing and take off.

4. Marking shall be a cross with bars 3 feet wide and length shall be determined by size of field. Each bar shall be 90 feet long provided field allows 600 yards runway. Proportionate length or 1 to 20 if under or above that. In case of L shaped field bars shall cross each other proportionate to each arm of the L. Cross shall be placed in position, each arm indicating center of runway. Number of station in figures 15 feet long by 3 feet wide. Number placed in Northwest corner of field.

5. Accommodations shall be:

(a) Supplies available upon request.
(b) Near city or town with available help upon request.
(c) Field regulations with available guard.
